REMARKS.

These figures have been obtained by enquiries and references to banya's books. Those of Ballabgarh do not always distinguish the quinquennial periods, and where this is so the average given is the general one for the whole twenty years.

APPENDIX No. IV. A.

Cultivation of Sugarcane.

In making these notes on sugarcane I would refer to the interesting account of the cultivation in the North West Provinces Shahjehanpur district by Mr. G. Butt, c. s., in the Revenue Reporter North West Provinces for 1874, Volume III, No. I. The order adopted by him I shall keep to as far as possible here that the points of difference as well as of similarity may be easily seen.

Sugarcane is the most important and profitable crop of the Kharif harvest in the Dehli and Sunipat Bāngar tracts that is (see para. 43) over of the district. The average acreage undercane in the district for the last ten years is given as 40,347. The land taken is the best in the village that is to say some of the best is taken every year it is a sign of weakness of resources when cane follows cane on the same ground.*

Nor without manuring is the cultivation profitable.† Cotton is a first rate crop to follow cane, and then after the cotton cane can be planted a second time if manure is available, otherwise wheat will grow well without it. It is not usual to try for a Rabi crop when cane is to be planted in the spring; if this is done the latter will suffer by being planted late (pachétr).

Ratooning (leaving the roots to produce a second crop in the succeeding year, called muridaík) is uncommon now though in old times it was often practised. The change may be put down to the decreased fertility of the soil, or, as the zamíndárs themselves say, to the increase in resources as shown in the greater power to buy seed, and the greater number of hands available for labour.

There are three kinds of sugarcane known in the district.

1.—Lálrí—said to be the original kind, and considered the best as no insects attack it. This is the only kind actually used in the district.

* According to the rhyme.

“ Bárí ki men bárí hōe

“ Munde rakhe ik

“ Wain tinou ghar jaenge

“ To mane pari sikh.”

“ To plant cotton after cotton

“ And sugarcane after sugarcane

“ To attend to other people's advice

“ These three things ruin a house.”

† So the rhyme

Mundé bōé bāré,

If cotton follows cane,

Kabhi na rahé ughári

No bare place will remain.

Cultivation of Sugarcane.

[Appendix No. IV. A.]

2.—Mírate—very productive and white, but if the gúr is kept long it gets worms, and it is weak also in the rains, and some times falls.

3.—Soratha—white and productive. Good for sucking, but sticky. Not so subject to worms as mirate.

Paunda, or Ganna, is distinguished from the ordinary sugarcane by its thickness. It requires more water for its cultivation, and gúr is not made from it. Its only use in fact—often a very profitable one, is for eating, it is sold in the bazar at prices varying from $\frac{1}{4}$ to 1 or even $1\frac{1}{2}$ anna the stick. The kind first sown is Mirate—then Soratha—and Lárlí last. Mirate is quickest in springing. A speciality is said to exist in Lárlí that it can be reproduced from any knot of the stalk (ganda) whereas for Mirate and Soratha only the top knot of each stalk will do.

Sugarcane for seeds is put in clamps (bijghara) in Phágán, where the earth keeps it moist and fresh, a damp situation being considered good. What is kept in the house is for use, it does not keep long. The ploughing generally begins in June unless there is a crop tried for in the Kharif preceding the cane crop. If a zamíndár has enough ground he will avoid doing this. When the Kharif crop is taken the ploughing for sugarcane begins in (Pohú) December and is continued at intervals according to leisure and other circumstances, the number of times varying from 5 to 12. The first two ploughings may well be made one directly after the other, but the subsequent ploughings should come at intervals. For the first ploughing, either rain or a first watering (palewa or palé6) is necessary. Sometimes the land is dug (with a 'kasi' or 'kahí') for the first time and this is fully equal to two ploughings. No cash estimate of the cost of this can usefully be made as it is never done by hired labour.

The quantity of manure used is very large, from three to six four-bullock waggon loads go to a kacha bigah. This at the lowest estimate gives $3 \times 3 \times \frac{8}{5} \times 20$ maunds = 288 maunds = nearly 11 tons to an English acre. The zamíndárs urge strongly that without such manuring the land will not be fairly productive. The time for putting in the manure begins in Mágħ and goes on to the end of Phágán, and sometimes even after planting. After manuring the land is ploughed unless of course it has been sown.

Ploughing takes place in the end of Phágán (February,

Appendix No. IV. A.]

Cultivation of Sugarcane.

March) and may be continued through Cheyt, but the best time is the beginning of the latter month. Water is given before planting. Furrows are made regularly along the field and a boy follows the plough putting in the seed pieces of cane (*gandirí*) which must have one or more points in each piece, horizontally at regular distances* usually rather less than a foot, along the furrow. The seed stalks are taken out of the clamp ; one man cuts it up, or rather two, as one cannot do it well alone. Another man carries it to the place where it is put in : four or five are wanted to plant for one plough. There is, however, no lack of hands as all the young boys of the family help in this in order to get the holiday food which is given on planting day. The food consists of rice, sugar, and 'ghí' and mixtures of these, and such food giving is called 'Mah Kálí' or 'gur bhata' the work begins in the morning and goes on till it is done. Three yoke of oxen can get through 10 'kacha bigahs' a day. One yoke ploughs, and the other two follow with the 'sohágá' (clod crusher). Water is given a month after planting, and if the rains are good, three subsequent waterings are enough, if they are not, as many as five may be necessary, at intervals of a month. Cultivation of cane by well-irrigation is not uncommon in the Khádar of Sunipat but is not usually if ever met within Delhi tahsíl. In Ballabgarh there are three or four villages which have it. Delhi too has some in the Dáhar circle from natural flooding. A fair well may water $\frac{3}{4}$ bigah in a day.

Hoeing is carefully kept up, the number of time depends much on the character of the season, and varies from 5 to 9 or 10. The first time comes a few days only after planting. A man's fair work per day at hoeing is put at 3 Biswas. When the canes get high they are generally tied together at the top.

Cutting begins in October, it is a practice for Hindús not to begin till after the Dasehra. Hired cutters get Rs. 3/- a month and their food, but the zamíndár unless lazy does much himself in this. A two-ox waggon should cart one bigah's cane in a month, but the animals do other work probably besides.

* The way of calculating the distance is by counting the number of "pulis" (or bundles) planted in a kacha bigah ($\frac{5}{6}$ of an English rood) 7 bundles are a large number making of course the intervals smaller, 6 a very frequent one. The way of getting at pula is rather curious. As many sticks as laid down in a line make up 21 háths (or cubits) make a 'parya' and either 20 or 21 'paryas' (according to two different standards) make a 'puli'. A rupee will buy 3 or sometimes 4 puli's.

Cultivation of Sugarcane.

[Appendix No. IV. A.]

Rent paid by 'zabti' is about Rs. 5/- per bigah, but in some villages it goes even up to Rs. 9/-. It is taken at the time the Government revenue falls due, and does not depend on the quality of the crop. No difference is made in the rent whether in the previous Kharif another crop was taken, but when the land was left fallow it is called 'tapar.'

The expenses of cultivation may be thus summed up:—

Ploughing ten times ...	10	0	0	pakka bigah
Manure	5	0	0	
Seed	5	0	0	
Irrigation	4	2	0	
Price of water ...	3	2	0	
Cleaning out water course ...	1	0	0	
	4	2	0	
Hoeing	4	0	0	
Tying up canes	2	0	0	
Cutting and stripping ...	7	0	0	
Rent	6	0	0	
Carriage to the 'kolhú' ...	3	0	0	
Planting (estimated) ...	2	0	0	

In describing the manufacture of 'gur' I would again refer to the description given by Mr. Butt. Where I do not notice points of detail it may be without harm assumed that the Delhi process is similar to that of Sháhjehanpur.

The 'kolhú' or sugar mill is made of four kinds of wood, first quality 'sal,' second 'kíkar,' third 'siris,' fourth 'farash,' 'kíkar' is the one most commonly used. The mechanism of the 'kolhú' is the same as in Shahjehanpur, the names too are much alike, 'kolhú' is the mill itself, 'páth' is the horizonted boom, 'láth' or 'mohan' is the pestle, and 'mánkri' (instead of mackam,) is the diagonal spar joining the 'páth' and the 'láth,' 'bánkmal' is the piece (not noted in Mr. Butt's description) which springs up from the boom and receives the lower end of the 'mankri.' The five pieces therefore form an irregular pentagon

Appendix No. IV. A.]

Cultivation of Sugarcane.

the 'kolhú' standing upright, the 'páth' working on its outside edge horizontally, the 'bánkmal' stands vertical to the 'páth' at its further end, from the upper end of the 'bánkmal' springs the 'mánkri' inclining to meet the 'láth' which also works slantingly in the 'kolhú.'

A 'kolhú' complete costs Rs. 80/- or Rs. 90/- or even more, the work being made as durable and thorough in every respect as is possible to the not inconsiderable skill of the local carpenter. The 'láth' often breaks, and must be replaced at the cost of a rupee. It is I believe always made of 'kíkar.' The wages of the carpenter who looks after the 'kolhú' are considerable.

The produce of about 40 bigahs of sugarcane is pressed in one 'kolhú'; a good many proprietors unite generally in working it. They bring their cane themselves from the field and put it together reckoning their several shares by the number of oxen they each have. A 'kolhú' lent on hire is said to cost Rs. 7/- to the hirer, but it is I fancy often more than this. The men who own the cane almost always own the oxen that work the 'kolhú.'

Four kinds of work are distinguished in the 'kolhú.' Two 'pindías'—put the short cut pieces of cane ('girariyán') into the 'kolhú,' and take out the cane straw (khói)—one man relieves the other at this arduous work, which is also rather dangerous for any but a left-handed person. Wages Rs. 10/- to Rs. 15/- a month. Two 'guriyas'—who cook the 'gur.' Four 'jhonknewalas' who keep up the fire and dry the 'khói.' Two 'muthiyas' who feed the 'pindiás' with cut up canes put into a basket. The man who sits on the 'páth' driving the oxen is not a hired labourer but one of the proprietors. Two men are employed with each pair of oxen. The sugarcane is generally cut by the proprietors or by hired labourers at 2 annas a day each.

The 'kolhú' goes on day and night but the workers are divided into day and night batches. A matka holding 20 sers is filled with the pressed juice in about an hour: and the oxen do this twice before they get taken off. The juice is thrown into the 'kúnd' a large earthen jar. From there it is put into the 'karaí,' or cooking cauldron and is boiled slowly till it becomes pretty thick, and then it is put into a second vessel smaller than the first, and the boiling process goes on till the 'gur' becomes thick and consistent enough to make the 'bhélis' or 'gur-balls.' These are always 4 sers each.

Cultivation of Sugarcane.

[Appendix No. IV. A.]

The place where the cooking goes on is called a 'gurgói'—It is merely a thatched shed with a hollow floor to allow of the 'kasais' being placed in it, and underneath them the cooking-fires.

Molasses (ráb) and course sugar (shakar) are not made in this district, or if made, very rarely. It would of course be a more delicate process than the primitive one above described ; yet this too requires care. If the boiling is too prolonged it spoils the 'gur,' and diminishes its selling value.

Delhi district gur goes to Baghpae, Biwani in Hisar and Rewári and Firozpur, Jhirka in Gurgaon.

The transactions noticed by Mr. Butt between [the cultivator and the banya for the most part have no counterpart in this district. The zamíndár generally manages his 'gur'-making himself, and there is no such commonly received rate of sale, but Baghpal rates more or less influence the market. There is no custom of 'kataotí' as in Shahjehanpur. The weight of juice turned out is commonly $\frac{2}{5}$ of the sugarcane. The straw is used for burning in the 'gurgói'—it is good for nothing else, and from the juice $\frac{1}{5}$ of its weight will turn out in 'gur'.

APPENDIX No. IV. B.

Cultivation of Melons.

Melons are chiefly cultivated on the sandy soil of the river side near Delhi: the soil considered good is Dumat, (*i.e.*, do matti) being $\frac{2}{3}$ earth and $\frac{1}{3}$ sand. The cultivators are chiefly tenants such as 'mális' káchís, 'malláhs,' and Sheikhs, but in some places proprietors cultivate themselves. Before the crop is sown an agreement generally in writing is made fixing Rs 5/- to Rs 15/- per acre as rent for Rabi. Manure is bought at a rate of Rs 6/- per 100 bullock loads weighing $2\frac{1}{2}$ maunds each when the field is within 2 miles from Delhi; when it is further off then from Rs 7/- to Rs 12/- per hundred—150 loads are required for an acre of land. The cost of manure per acre therefore is Rs 9/- for villages within two miles from Delhi and from Rs 10/- to Rs 18/- for villages beyond this. This includes both cost and carriage. When the manure has been brought to the field the cultivator must buy 'Pula' bundles of káns grass for fence and screen for the young and tender crop. This will cost him about Rs 10/- an acre—a thousand bundles ('pulas') being required at a Re. 1/- a hundred. This screen is called 'taota' and fence 'bheí.' Pits are dug in a line at distances of 3 feet 1 yard square and $1\frac{1}{4}$ yard in depth. It is not essential to have the depth so great but as the sand silts in from the side it is generally done. The object is to reach down to the Dumat soil above spoken of which is found sometimes at less sometimes at more than this depth. On every line the grass fence is stuck in to protect it from sand blown in by the wind. When the pits are ready the manure is mixed with earth and thrown into them, and a hollow bed ('thaonla') is made in the centre of the pit. Thirty men can thus prepare an acre of ground for seed in one day and get for it Rs 7/8/- at a rate of 4 annas per head. Three men are required to sow the seed when the 'thaonlás' are ready and at 2 annas a day each. Half a ser of seed will sow an acre and costs 8 annas. The labourers get into the pits and bury two seeds in each 'thaonla.' On the north side of the bed the screen ('tatti') is erected. Within 12 days the seed should sprout in every 'thaonlá' where it does not fresh seeds are sown. When the plants are a month old they are earthed up by hand to give strength to the roots three men do the work in an acre of land in one day and are paid four annas a piece. About a fortnight after this the screens and fences are pulled up and the pits are filled up with loose earth, the 'pulá' is spread

Cultivation of Melons.

[Appendix No. IV. B.

over it and the creeping plant laid carefully on it, 10 men will do this in an acre per day costing Rs 2/8/- The grass keeps the plant from getting too dry.

The crop is not irrigated except in years of drought when they get water once; the labour of 12 men at 2 annas each will manage for one acre in a day generally by digging kachchá wells on the bank of the river, and then using the dhenkli or watering by hand from earthen vessels. The crop is gathered in May and June and the crops are watched day and night to protect it from theives, biped and quadruped. Jackals and wild pigs are fond of melons. Fires are lit, chiefly of the useful grass which having done its work is thus disposed of. If the cultivator does not watch the crop himself he keeps a watchman to do so at Rs 4/- a month. The cost of the crop and income realized from it may be reckoned at Rs 50/- and Rs 120/- respectively and if the cultivator is his own Chaukidár the cost is reduced to Rs 42/-. In the villages at some distance from Delhi Rs 6/- must be added to the cost of manure. On the other hand land in such villages is obtained at a lower rent say Rs 5/- while near Delhi the rate of rent is often Rs 10/- per acre. The income is equal in both months May and June as in May the fruit is less in quantity but dear in price while in June it is abundant, fetches only a lower price.

The items of cost of cultivation per acre are shown here together:—

	Rs. A. P.
Manure 150 loads	9 0 0
Bundles of grass (pula káns) 1,000 ...	10 0 0
Labour for digging pits	7 8 0
Seed	0 8 0
Labour for sowing	0 6 0
Labour for earthing (thapna) ...	0 12 0
Labour for filling up pits and spreading out the grass	2 8 0
Irrigation	1 0 0
Rent	10 0 0
Watchman	8 0 0
TOTAL	50 2 0

Government demand is Rs 4/- per acre near Delhi and Rs 3/- and Rs 2/8/- for lands lying further off the city.
