CASPIAN SEA

CASPIAN SEA (the *Mare Hyrcanum* of the ancients), a great salt lake of W. Asia, between 36° 35′ and 47° 25′ N. lat., and 46° 15′ and 55° 10′ E. long. It is wholly inclosed, having no outlet whatever to the ocean, and is surrounded by Tartary, Persia, the Caucasian countries, and the Russian governments of Astrakhan and Orenburg. Its direction is from N. by W. ½ W. to S. by E. ½ E., but at its N. end it turns due E., terminating in a considerable gulf called Mervoi Kultuk, or the Dead Sea. It is here almost 400 m. from E. to W., but in general it is not much more than half that width, and at its narrowest part (about 40° 20′ N.) it does not exceed 120 m. across: its greatest length from N. to S. is 760 m., and its area may be estimated at 119,000 or 120,000 sq. m. (Hanway's Travels, i. 344, &c.; Great Russian Map, 1800; Rennell's Gen. View of W. Asia, pl. 6, 10, 12; Arrowsmith's Atlas.)

The coast of the Caspian is considerably broken, but its gulfs and bays are more remarkable for their number than their size; the most important after Mervoi, is the Balkhan Gulf, or *lake*, as it is sometimes, though improperly, called, which projects from the main body of the sea, near its SE. corner, and stretches E. over nearly 2° of long. The others are mostly little more than very large harbours, nearly surrounded by the land; such as Alexander Bay, Karabogas Lake, Astrabad Gulf, and others on the E. coast; the gulfs of Kezilgatch, Agrakhan, Kolpichi, and others on the W. The S. coast has an almost unbroken line, but the N. is frittered in pieces, especially towards the W., by a countless number of sandy marshy islands, the shores and positions of which are continually changing. The depth of the Caspian is very variable; on the N. shore there is nowhere more than 12 ft., and usually not more than 5 ft., water; and this extraordinary shallowness continues for more than 20 m. from the land; on the E., W., and S. shores, on the other hand, the depth is sometimes 150 ft.; though here, also, shoal water is far from uncommon. In the middle the bottom has not been reached at a depth of 2,800 ft. From the general result of the soundings it would appear that, in some parts at least, the bed of the sea descends by terraces; for, on the SE. coast, the depth lies very regularly between 12 and 15 ft. for some distance from the land, when it suddenly increases to 40 or 50 ft., at which depth the soundings run in a line, equal in extent and parallel to the former one. A similar phenomenon is observed on the N. shore, and in several other parts. (Georgi, Geog. Phys. and Stat. des Russ., i. 257–260; Gmelin's Reise durch Russland, iii. 231, &c.; Hanway's Travels, i. 135, 155, 392, &c.)

The basin of this sea is extremely limited on the S., as well as on the E. side. On the S. the Elburz mountains press so closely on the water that the fact of their allowing a passage for the road at one point on the SW. corner is remarked as a singularity,—the roads and passes being generally so impracticable that many lives are annually lost in travelling them, without reckoning those who fall victims to the robber population. (Hanway, i. 221–227, &c.) It seems that there is good reason to believe that the Caspian was formerly much more extended towards the E., but it is now shut in, in that direction, by high cliffs and sand hills close to its shores, beyond which a flat desert, full 90 ft. higher than its present surface, stretches to the shores of Lake Aral. (Hanway, i. 133, *et seg.*; Pallas's Trav. in S. Russia, i. 80, &c.) On these sides, therefore, the drainage is insignificant; the Elburz, indeed, gives forth a great many streams, but they are all of the nature of mountain torrents; and in the dreary desert to the E. scarcely a single rivulet is found between the Attruck, at the SE. corner, and the Yemba, at the extreme NE. (Hanway, i. 130–138.)

The W. shore presents a singular appearance. As high as 43° of lat. the whole space between this sea and the Euxine is filled by the immense masses of the Caucasus; yet from this region the Caspian receives rivers which have their sources at nearly 300 m. distant from its coasts; they flow, however, over high plateaux, and through narrow ravines, apparently cut by their own action, and which are sometimes scarcely wide enough to afford them passage. (Col. Monteith, Geog. Journ., iii. 39, *et pass.*) Col. Monteith believes the narrow bed of the Terek to be the Pilæ Caspiæ of the ancients; and it answers exactly, in both description and situation, to the pass which Pliny says (vi. 11–13) was *erroneously* so called; but the true Caspian gates were an artificial opening cut through the Elburz mountains on the S. coast. (See CAUCASUS.) N. of the Caucasus, the country W. of the Caspian spreads into a wide flat; but, remarkably enough, between the Terek and the Wolga, there is only one river mouth, that of the Kuma (an. *Cambyses* or *Udon*); for the land

though flat and sandy, is elevated suddenly at a little distance from the sea, so that the edge of the latter consists of extremely swampy ground, and all the running water that is not absorbed in soil flows N. and W. to the Don or the Black Sea. (Pallas, i. 78, &c.; Gmelin, iii. 236, &c.) On the NW. and N. the Caspian opens on the great European plain; its mighty rivers run courses varying from 300 to upwards of 2,000 m. (see URAL, WOLGA, &c.), and its basin becomes so mingled with those of the Euxine, Baltic, and Arctic oceans, that it is impossible to assign, with any accuracy, the limits of each. (See BALTIC SEA.) So closely, indeed, do the several branches of these waters approach each other, that a short canal near Tver, by uniting the little rivers Tvertza and Schlina, has connected the Caspian with the Baltic for upwards of a century; and much of the timber used in the imperial yard at Petersburg is cut in the woods of Kasan, being conveyed up the Wolga to this point of artificial communication. This canal was the work of Peter the Great; and the same prince projected the union of the Caspian and Euxine, by another, between two small streams, affluents respectively of the Wolga and Don, which in the neighbourhood of Tzaritzen approach each other within 2 m.; the whole distance between the larger rivers being here less than 15 m. (Algarotti's Letters, 67; Hanway, i. 98; Tooke's Russia, ii. 144; Pallas, i. 91.) With respect to its basin and drainage, therefore, the Caspian is much more of a European than an Asiatic lake; the former is extensive only on the side of Europe, and the latter carries off at least 1-6th of all the running water belonging to that division of the world. The rivers which descend from the Caucasian mountains, the only ones of consequence which the Caspian receives from Asia, are quite insignificant when compared with such streams as the Wolga and Ural; the former of which alone drains 140,000 sq. m. (Lichenstein's Cosmog., i. 328.)

There are, of course, no tides in this close lake, nor do there seem to be any regular currents, in the usual acceptation of the word; but, from the freedom with which the wind blows over so large a surface, many considerable and very irregular changes are effected in its motions and character. A strong breeze from the S. drives the waters over the low lands of the N. coast, sometimes to the distance of several miles; vessels, at such times, are said to have been carried so far inland, that, on the retiring of the sea, it was found necessary to break them up where they lay, from the impossibility of transporting them back to the shore. It must be remembered, however, that these vessels are of peculiar construction, the numerous and extensive shoals preventing the general use of any (on the N. coast) that would require much depth of water. Such a wind, too, by driving the sea into the mouths of the great rivers, causes these to rise in their beds, and, consequently, when the wind subsides, a very violent S. current is produced by the water returning to its usual level. A N. wind produces the same effect on the S. shore; only, from the nature of the coast, the water cannot extend so far over the neighbouring land; but it is frequently raised from 3 to 4 ft. above its natural level; the return to which, therefore, causes a rushing and confused motion of the waters to all points of the compass. Vessels drawing 9 or 10 ft. are, during these changes, exposed to great hazard, and, as the winds are extremely uncertain, the navigation of the Caspian, like that of most confined sheets of water, is one of very considerable danger. (Hanway, i. 142, 393, &c.; Georgi, i. 258; Monteith, G. J., iii. 23.)

There is another motion of the sea much more remarkable, however, than the preceding. It appears to increase and decrease in *actual bulk*, in periods, according to native report, of about 30 years each. When navigated by Hanway, its surface was incontestably rising, if the united testimony of the inhabitants upon the coasts be credited; and this testimony received confirmation from the appearance of the coasts themselves. Tops of houses were seen in water several feet in depth; the sea had visibly risen on the walls of fortified towns; and these encroachments were going on equally on all parts of the coast at the same time; so that the natives round the whole circuit were living in a state of great alarm. (i. 155–157, 371, &c.; see also Algarotti, 78, *et seq.*) Now Hanway makes his remarks in 1743, when the sea had certainly been rising more than 20 years—that is, from before the expedition of Peter the Great, in 1722 (i. 155); and, therefore, if the native tradition were founded on fact, it had nearly reached its greatest height. It is, at least, a remarkable circumstance that, in 1784, the sea was again (*or still*) rising, having, by its action, levelled the outer wall of Baku, which was standing in the time of Hanway. (Forster's Travels, 227); while, between 1811 and 1828, it had very sensibly decreased (Col. Monteith, Geog. Journ., iii. 23), and, in 1832, it had receded from the S. shore full 300 yards. (Burnes's Travels to Bokhara, ii. 121.) It is clear that, in the 41 years between the observations of Hanway and Forster, there had been time, upon the native hypothesis, for the sea to reach its greatest depression, and begin again to rise. At all events, the facts, meagre as they are, seem to warrant the conclusion of periodic variations; though what law these follow, the data are at present far too limited to determine. If a conjecture may be hazarded, they probably depend upon meteorological causes, and the general state of the atmosphere. Hanway (though he disbelieves the *periodic* variation) appears to hold an opinion similar to this; for he remarks, that the summers, from the time of Peter the Great to that of his own observations, had been less hot than formerly; that consequently evaporation had been less, while the supply of water had continued the same. (i. 156.) It would be a corroboration of this theory, could it be established that, from 1811 to 1832, when the Caspian was unquestionably and rapidly sinking, the summer heat had been peculiarly great; but on this point nothing certain is known. In the meantime it is worthy of remark, that, between the observations of Hanway and those of Monteith and Burnes, 90 years (a multiple of the asserted period) had elapsed; that the time during which the sea was known to be constantly rising in the one case, and sinking in the other, was the same, namely, 21 years; and that, on the supposition of the trigentennial alternation of the phenomena, it should have been found sinking, as it was, by the last named travellers. That there is something very peculiar in the atmosphere of this region is evident. Monteith found its extra pressure to be equivalent to a column of 390 ft. in height (Geog. Journ., iii. 22); Burnes, some 4 or 5 years later, to one of 800 ft. (Travels, ii. 122.) These results were obtained, not by the barometer, but by the boiling point of water; the difference of pressure would, however, cause a rise of nearly ½ an inch in the former (Nettleton, Phil. Trans., xxxiii. 308), and consequently a depression of almost 7 inches in the surface of the Caspian. This co-existence of phenomena is similar to that observed in the Baltic, only much more powerful and longer continued; it is, therefore, at least probable, that in both cases the varying level de-

pends upon the varying pressure, and that, with extended knowledge, the explanations of the Swedish mathematicians may be brought to bear, generally, upon this peculiar feature of physical geography. (See BALTIC SEA).

But whatever may be the variations in the present surface of this lake, there can be little doubt but that it was formerly much more extensive on three sides—the N., NW., and E.; and it is still, most likely, diminishing. The fact that it never increases, in any thing approaching to the ratio of the water poured into it, has been, combined with its want of outlet to discharge that water, a standing wonder for centuries; and the most extravagant hypotheses have been adopted to account for a phenomenon apparently so paradoxical: among others, a filtration through a shelly sand into an imaginary abyss; and a subterranean communication with the ocean. The latter is the prevalent opinion among the natives; the former, to the discredit of philosophy, has found abettors among Europeans, who should have known better. (Hanway, i. 156; Algarotti, 67; Tooke, i. 138; Burnes, ii. 188, &c.) But evaporation is in these regions great, beyond belief; not from the temperature, which is lower than might be expected, but from the extreme dryness of the air. In an experiment made by Dr. Gerard in the E. desert, a bowl full of water disappeared altogether in two days. (Burnes, ii. 189.) Without pretending to decide the proportion between this exhaustion and the supply afforded by the rivers, which could not be done without much more extensive data, it is clear that the first, unchecked by the latter, would be sufficient to dry up the Caspian, or a much larger body of water, in the course of a few years; and that the waste *is*, or at all events *has been*, greater than the supply, is shown by the appearance of the plain country in the neighbourhood of this sea. It has been observed that the present bed appears to descend in terraces, and on the E. and NW. shores the land rises in the same manner. This land presents, also, incontestable proofs of having been formerly covered with sea water; it is uniformly flat, except where it rises in sandy ridges, to form the terraces before mentioned; it is uniform in soil, consisting of sand combined with marine slime, without a trace of terrestrial vegetation except the common desert plants, or the slightest indication of minerals: the substratum is clay, at a considerable depth from the surface; and the surface itself abounds in sea salt, sea-weed marshes, salt pits and lakes, together with innumerable shells exactly resembling those of the Caspian Sea, and *which are not found in any of the rivers*. This uniform and dreary country terminates suddenly towards the N., at a comparatively high tract running from the Wolga to the Ural, near the 51st parallel; and on the NW. at a similar tract between the Wolga and Don, a little to the E. of the 46th meridian. The change of soil is here striking and instantaneous; salt, sea-weed, shells, and sand disappear, and are replaced by black mould, solid turf, and all the usual appearances of vegetable soil upon reasonably old land, though still belonging to a period *geologically* recent, as is demonstrated by its horizontal strata and the continued absence of mineral productions. These high grounds formed therefore, in all probability, the ancient shores of the Caspian; but that to the NW. terminates abruptly on the little river Mantysh, near the 46th parallel, between which and the Caucasian mnts. a low and narrow tract, exactly resembling that on the immediate borders of the Caspian, stretches without interruption to those of the Sea of Azoph, having every appearance of the deserted bed of a strait formerly uniting the two waters. Towards the E. the whole country has the same appearance of a deserted sea-bed; and the conclusion, therefore, appears inevitable, that, at comparatively no distant period, the Sea of Aral, the Caspian, and the Black Sea formed one body of water, uniting the present anomalous salt lakes of Asia with the ocean. This conclusion is further strengthened by the presence of the same species of fish, seals, &c., in the three seas; a fact which it is impossible to account for on the supposition that they were always separated. (Pallas, i. 78–87, 279–304, &c.; Gmelin, iii. 231–248; Georgi, i. 259, &c.)

When it is considered that Russia is extremely flat; that its slope from the Arctic Ocean to the Caspian is uninterrupted; and that this slope is so considerable, that the Wolga, though rising in a flat country, has *rather* a rapid current (Pallas, i. 25),—it will be evident that the position of the Caspian must be very low. A suspicion having long existed that it was lower than the level of the ocean, Messrs. Englehardt and Parrot, in the beginning of the present century, performed a series of barometric levelling between its shores and those of the Black Sea; the result of which gave a depression of 333 ft. (54 *toises*) for the surface of the Caspian. (Reise in die Krym und der Kaukassus, ii. 55.) It is to be remarked, that at this time the sea was *sinking*; and, therefore, if the opinion hazarded on the cause of its variations be correct (see *ante*), the atmospheric pressure on its coasts was greater than it would be in the ordinary state of the air. This seems, also, to be borne out by the observations of Monteith and Burnes, upon the boiling point of water. Results depending upon the height of the barometric column would, under such circumstances, be inevitably excessive; and this was, upon other grounds, suspected by Humboldt, from the very first publication of Messrs. Englehardt's and Parrot's memoir. (Parrot, Voy. à l'Ararat, ii. 192.) To determine the question, the Russian government, in 1836, despatched an expedition, which, after two years' labour, completed, in 1838, a splendid series of trigonometrical levelling; from which it appears that the Caspian is 101·2 Prussian ft. (about 116 ft. English) below the Black Sea. (Geog. Journ., viii. 135.) The known elevation of the desert steppe E. of the Caspian will, according to this survey, place the Sea of Aral very nearly on a level with, or even something higher than, the Euxine.

Considering its lat., that of S. France and Italy, the temperature of this sea and its neighbourhood is extremely low; the N. part is very frequently frozen, and the ice in the mouth of the Wolga (lat. 46°) does not usually break up till April. (Hanway, i. 140; Pallas, i. 89, &c.) Even the Aral, as low as 45°, is *sometimes* frozen; and the inhabitants have a tradition that one of its islands was peopled by a colony which crossed the ice, with all their flocks and herds. (Burnes, ii. 189.) This fact is the more remarkable, from the low, level, and S. aspect of the region round the Caspian; but the want of mountains towards the N. exposes it to the influence of chilling winds from the Arctic Sea, while the intervention of snow-capped ranges on the S. prevents the counterbalancing effects of the hot breezes from the equator. The summer heat is, however, generally great, and is towards the S. attended with a humidity, which renders it very unhealthy; though, from this very cause, the S. and SW. districts present a luxuriance of vegetation strongly contrasted with the bare salt deserts on the NW., N., and E. Rice, maize, cotton, fruits

of all kinds, and a countless variety of forest trees, are among the productions of these districts; which, with the exception of the Russian colony in the steppe of Astrakhan, are the only parts of the coast possessing a settled population; but such is the deadly nature of the climate, that all who are able leave the towns in the beginning of summer, and retire to the mountains, where the atmosphere is of course more salubrious. The deserts are occupied by the wandering Kalmucks, Kirghis, and Turkomans, who preserve unaltered the roving and predatory habits of their earliest ancestors. (Pallas, i. 92, 115, &c.; Frazer's Trav. on the S. Bank of Casp., 11, 15, &c.; Conolly's Narrative, i. 35–49, 146, &c.; Burnes, ii. 100–127, &c.)

The waters of this sea are less salt than those of the ocean, and considerably less so near the mouths of rivers than at a distance from the shore. The waters of Lake Aral are even drinkable (Burnes, ii. 189); but all have a bitter taste, ascribed by some to the great quantities of naphtha with which the soil abounds, but by others to the presence of glauber salts, among the substances held in solution. The fish are principally salmon, sturgeons, and sterlets; a kind of herring is also found, and there are likewise porpoises and seals. It has been already said, that the same inhabitants are found in the waters of the Caspian, Aral, and Black Seas. The fisheries employ many vessels annually, and the shores abound in aquatic fowl, storks, herons, bitterns, spoonbills, red geese, red ducks, &c. (Gmelin, iii. 233–257; Pallas, i. *pass.*; Tooke, i. 238, &c.)

It is somewhat remarkable that, though situated on the confines of Europe, this sea should have remained nearly unknown, except by name, till the beginning of the last century. It is scarcely less remarkable that the oldest observer, Herodotus, described it truly as an ocean by itself, communicating with no other and of such size that a swift-oared boat would traverse its length in fifteen days, its greatest breadth in eight days. (Clio, 203.) These proportions are accurate according to the best modern observations, and at 50 m. per day for the swift boat's progress, would give the actual measurement. After this clear account, it is startling to find the Caspian transformed by Strabo into a gulf of the Northern Ocean, and otherwise distorted, according to a theory which must be regarded as purely fanciful. (Geog., xi. 507.) Ptolemy restored the Caspian to its lake-like form: he had some knowledge of the Wolga, which he calls Rha; but he gives the greatest length of the sea from E. to W., and makes it a vast deal too large. (v. 2, vi. 9, 13, &c.) It is to be remarked, that Herodotus does not *state* in what direction lay the greatest length; but it may be very readily deduced, from his descriptions of the surrounding countries, that he meant it to be understood as stretching N. and S. The authority of Ptolemy remained paramount and unquestioned for many centuries; and the first modern account of the Caspian, at all consistent with the truth, is due to Anthony Jenkinson, an Englishman, who, in 1558, traversed its waters, and gave an account of its dimensions and bearings, agreeing in all its main points with the more brief description of Herodotus. (Hakluyt's Voy., i. 326–329.) Jenkinson's voyage did not, however, gain much attention; and in 1719 a regular survey was commenced, by command of Peter the Great. Vanverden's map, the result of that survey, and which was partly constructed by the emperor himself, is still, and justly, held in high estimation. The voyages of Hanway had for their object the tween Russia and Persia. The failure of that object was owing to the ambition of a Mr. Elton, who, attaching himself to the Persian court, gave such offence to that of Russia, that the latter eventually prohibited the English commerce on the Caspian. (Hanway, ii. 279, *et pass.*) A mass of valuable information was, however, collected, during these transactions, by Hanway himself, Elton, Woodroffe, and others. The more modern travellers, Gmelin, Georgi, Pallas, Englehardt, Parrot, Forster, Frazer, Conolly, Burnes, Monteith, Fuss, Sabler, and Sawitch, have added immeasurably to that information; but much still remains to be done; and as the Russian government seems fully alive to the importance of accurate knowledge on geographical subjects, and as their power or influence is nearly established on all parts of this sea, it may be reasonably hoped that every year will make W. Europe better acquainted with this very remarkable region.

The largest class of vessels that navigate the Caspian, are called by the Russians *schuyts*, and belong wholly to Astrakhan and Baku; their burden varies from 90 to 100, and sometimes 150 tons. They are not built on any scientific principle, and are constructed of the worst materials—that is, of the timber of the barks that bring corn down the Wolga to Astrakhan. There are supposed to be in all about 100 sail of these vessels. A second class of vessels, called *razchives*, employed on the Caspian, carry from 70 to 140 tons, and sail better than the schuyts, and there are great numbers of small craft employed in the rivers, in the fisheries, and as lighters to the schuyts. But steamboats will, no doubt, in the end supersede most of these vessels; they have already, indeed, been introduced, not only upon the rivers, but upon the Caspian itself. The trade of the sea is entirely in the hands of Russia; and, whatever objections may, on other grounds, be made to her conquests in this quarter, it is certain that, by introducing European arts and sciences, and comparative good order and security, into countries formerly immersed in barbarism, she has materially improved their condition, and accelerated their progress to a more advanced state.

The Caspian Sea, Κασπίη Θάλασσα (Herod. Clio, 203), is the oldest name of this water. It was derived from the Caspii, a people who inhabited its banks; as the *more modern* term Hyrcanian Sea, Θάλασσα Ὑρκανία (Strabo, xi. 507), was similarly derived from the more important Hyrcanii, a principal branch of the great Persian family. In the present day it is called *More Gualenskoi*, by the Russians; *Kulsum*, by the Persians; *Bahr Kurzum*, by the Arabs; *Kulzum Denghis*, by the Turks; and *Akdinghis*, by the Tartars. (Tooke, i. 232.)

CASSANO, a town of Southern Italy, prov. Cosenza, cap. cant., in the concave recess of a steep mountain, round an insulated rock, on which are the ruins of an ancient castle, 7 m. ESE. Castrovillari, and 10 m. from the Gulf of Tarentum. Pop. 8,125 in 1862. The town is well built; is the residence of a bishop; has a cathedral, four convents, a seminary, and a workhouse. The inhabitants are industrious, and manufacture macaroni, stamped leathers, and table-linen. Cotton and silk are also grown, spun, and woven; and the environs are productive of excellent timber, fruits, and corn.

CASSAY, KATHEE', or MUNNEEPOOR, a country of India beyond the Ganges, between lat. 24° and 26° N., and long. 93° and 95° E.; having N. Assam and the Birman empire; S. a hill country, inhabited by independent Khyens

Cachar. Area about 7,000 sq. m. Cassay consists of a central fertile valley of comparatively small extent, surrounded on every side by a wild and mountainous country. The Naga mountains bound it N., averaging in height 5,000 or 6,000 ft. above the sea; although in some parts they are as much as 8,000 or 9,000 ft. high. Two branches, passing S. from the Naga mountains, inclose the Cassay valley E. and W., and the S. boundary, from the confluence of the Chikoo *nullah*, or rivulet, with the Barak, is formed by the same ranges, which run E. and W., bounding Cachar S., and Tipperah NE. The W. mountain range is more elevated and extensive than any other, and runs from the banks of the Barak SSW. for 80 m., steep and precipitous, towards Cachar; but in some parts almost cleared of forest, and annually cultivated with rice and cotton. This range has nine principal peaks, varying in height from 5,790 to 8,200 ft. above the sea, which, from superstitious motives, are left covered with wood by the inhabitants of the hills, and are often capped with a dense stratum of clouds. The E. hills vary from 4,900 to 6,730 ft. above the sea. The valley thus inclosed is about 36 m. long and 18 m. broad, having an area of 650 sq. m. of rich alluvial soil, 2,500 feet above the level of the sea.

The chief rivers are the Khongta, or Munneepoor river, Eeril, and Thobal. The first rises in the Naga mountains, in lat. 25° 12′ N., long. 94° E.; it completely traverses the central valley N. to S. and falls into the Ningthee or Kyen-dwem river. It is the only outlet for the waters of the Cassay valley; and, as the latter is 2,000 feet above the Ningthee, it is probable there are several considerable falls in its course through the mountains. Almost all the centre of the Cassay valley is a series of jeels and marshes; there is a small lake (Logta) at its SW. corner; compact sandstone, slate, and limestone are the prevailing geological features of this region.

Iron is the only metal found in Cassay; it is met with under the form of titaniferous oxide, and is detected by thrusting spears into the ground, and, where iron is present, small particles soon adhere to them. (Pemberton.) The Cassay valley is rich in salt springs, especially on its E. side; and more than enough salt for home consumption is made. The climate of the valley is lower by many degrees than in Calcutta, but not so low as might have been expected from the elevation. There are more rainy days in the year, but less rain falls than at Calcutta: from March the showers become continual; the permanent rise of the streams begins in May, and continues till the middle of October, from which time they rapidly decrease. From Nov. to Jan. fogs settle during the whole night in the valley, and hoar frosts prevail on the hills; yet the climate of the former region is decidedly salubrious, and peculiarly healthy to European constitutions. The surrounding mountains are, in most instances, covered with the noblest varieties of forest trees, common both to tropical and colder climates; and, according to Capt. Pemberton, there is no part of India where the forests are more varied and magnificent; but, from the small number of streams, and the want of good roads, their utility is entirely local; there being at present no means of conveying the timber to any distance. The valley is perfectly free from forest, though every village is surrounded by a grove of fruit-trees: the soil of the detached hills, and their S. faces especially, are highly adapted to the culture of fruit. Herds of wild elephants are constantly seen in the glens and defiles of the N.: wild hogs and deer of the largest size abound everywhere; and the chase is a favourite sport with the Cassayers. Tigers are not common, and have retired to the mountain fastnesses: there are no jackals; but wild dogs, greatly resembling that animal, abound on the hills, where they hunt in packs. With the exception of woollen cloth, this country furnishes every article essential to the comfort and prosperity of its inhabitants. All the tribes N., W., and E. of the central valley partake strongly of the Tartar countenance, and are probably the descendants of a Tartar colony who passed hither from the NW. borders of China, during the sanguinary struggles for supremacy between the Chinese and Tartar dynasties, in the 13th and 14th centuries. They have much more affinity, both in person and manners, with the Hindoos, than with the Burmese, to which latter race they bear little similarity. They differ from the Kookies of the S. hills in their superior height, finer complexions, higher foreheads, inharmonious voices, and harsh language. They are highly ingenious, and are good horsemen, on which account they were formerly exclusively employed in the Birmese cavalry service. The upper classes are worshippers of Vishnu, and this country may be regarded as the extreme E. limit of Brahminism: the Cassay tongue is, however, widely different from Sanscrit. There are many other distinct tribes in different parts of Cassay and its neighbourhood. All cultivate tobacco, cotton, ginger, and pepper, and manufacture cloths; which articles they barter for others with the inhabitants of the neighbouring plains of Bengal, Assam, and Birmah. In the central valley rice is the chief object of agriculture, and the land there is well irrigated, and highly suited to it: but scarcely ¼ part of the land available for it is under culture, owing to a paucity of inhabitants. The whole pop. of the valley in 1835 was barely 20,000. Tobacco, sugar-cane, indigo, mustard, dhal, and opium are also grown, and each house is surrounded by a little garden, in which culinary vegetables are raised in large quantity. Almost all the garden produce of Europe is found here, having been introduced by the British since the Birmese war; and the pea and potato are found so acceptable, that their culture is nearly universal, and they are constantly exposed for sale in the bazaars. The pine-apple attains an excellence in Cassay not surpassed in any part of the world. Buffaloes are used for ploughing; there are about 3,000 in the central valley, and perhaps an equal number of bullocks, which are superior, both in size and symmetry, to those of Bengal.

The ponies of Munneepoor are much and deservedly esteemed, by both the Cassayers and Birmese, who use them for the *élite* of their cavalry. They average from 12 to 12½ hands, and are rarely more than 13 hands in height: they are hardy and vigorous, and have a peculiar blood appearance, but are now nearly extinct; and scarcely more than 200 could be found fit for active service. Formerly, every inhab. had two or three; and the Cassayers affirm that, in a military sense, they have lost one of their arms by the decrease of the breed. Sheep were unknown till introduced by the British; they thrive on the slopes of the central valley: goats are bred by the Naga tribes on the hills, but invariably deteriorate if brought into the lowlands: poultry are plentiful in the latter districts, and the mountaineers purchase fowls thence at a very high price. The chief manufactures are coarse white cottons; a very soft and light muslin; a coarser kind, used for turbans and jackets; silks, remarkable for the brilliancy of their colours, and which are much prized at Ava; iron articles; and salt. The chief iron articles made are axes, hoes,

ploughshares, spear and arrow heads, for home use; and blades, 1 or 2 ft. in length, which, fixed into wooden or other handles, form the *dao*, the inseparable companion of the Cassayer, Shan, and Singpho. Salt is got from wells, sunk in the valley to about 40 or 60 ft.; all of which are the property of the rajah, who levies a tax of 1-5th upon the water drawn. The quantity of salt obtained by evaporation is about 1-20th the weight of the water, or nearly double the quantity obtained by evaporation from sea water at Newcastle: the labourers engaged are paid in salt to the value of 3 or 4 rupees a month each, which they barter for other commodities. Wax, cotton, and elephants' teeth, form part of the tribute of the hill tribes; the same articles, with ponies, &c., are bought by the Chinese merchants of Yun-nan; and similar products, with silks, iron, dammer, wood, oil, sandal-wood, camphor, thread, &c., were taken in lieu of money payments by the British, for assistance to the rajah about the middle of the last century.

The records of Cassay bear some character for truth, and, it is said, reach back to a remote epoch. In 1475, the Kubo valley was annexed to Cassay by conquest; and in 1738, the Cassayers conquered Birmah, and took its then capital, Sakaing. Subsequently, Cassay was frequently invaded and devastated by the Birmese; and from 1774 to 1824 was subject to Ava. By the treaty of Yandabeé, in 1826, it became independent. In 1833, the valley of Kubo was ceded to the Birmese by British authority.

CASSEL (anc. *Castellum Cattorum*), a town of W. Germany, prov. Lower Hesse, of which, and of the electorate of Hesse Cassel, it is the cap., and residence of the elector. It is finely situated on both sides the Fulda, 72 m. S. by W. Hanover, and 89 m. NNE. Frankfurt-on-the-Mayne, on the main line of railway from Frankfurt to Berlin. Pop. 38,920 in 1861. The town is divided into three separate parts, and has three suburbs. The Old Town and Upper New Town, with the Wilhelmshöhe and Frankfurt suburbs, are built on the left or W. bank; while the Lower New Town, and the Leipzig suburb, are on the E. bank of the river. The two divisions are connected by a stone bridge across the Fulda, 273 Germ. feet in length. Cassel is walled, and has numerous gates; it was formerly well fortified, but its ramparts were demolished in 1764. The Old Town, by the river, consists of narrow dirty streets; but the Upper or French New Town, so called because originally built by French refugees, on a height above the former, is one of the best laid out and handsomest towns in Germany. It contains, among others of less dimensions, the largest square in any German city (the Friedrichs Platz), and one street, nearly a mile in length, and proportionally broad. Houses in the New Town and the Wilhelmshöhe suburb, generally well and tastefully built. In this quarter of Cassel are the elector's palace, a structure nowise remarkable; the museum, the handsomest building in the city, containing a library with 70,000 volumes; an observatory; and cabinets of natural history, mineralogy, coins, artificial curiosities, statuary, and antiquities; the latter comprising several interesting Roman relics found in Hesse Cassel; a picture gallery, containing some valuable paintings by Rembrandt, Rubens, and Vandyke; the Bellevue palace, with others belonging to the electoral family; the electoral stables, and riding-school, mint, town-hall, arsenal, old and new barracks, and an opera-house. In the Old Town are the Kattenburg, a large unfinished structure, begun upon the site of the old electoral palace destroyed by fire in 1811; the old town-hall; government offices; and St. Martin's, the principal church in the city, and the burial-place of the sovereigns of Cassel. The Lower New Town contains the castle, an ancient fortress, now used as a state prison; and several other prisons.

Cassel has 9 churches, 7 of which belong to the Lutheran or Reformed faith; and 1 synagogue. It has altogether 20 edifices devoted to military purposes, and 51 other public buildings. Amongst the institutions for public education are, a lyceum, academies of painting and design, a teachers' seminary, a military school, and a school of mechanical employments, called the *Bau-und-Handwerksschule*. There are societies for the promotion of agriculture, trade, and manufactures, and numerous charitable establishments; the latter includes the *Wilhelms Institut*, at which many poor are provided for, and taught different trades. Notwithstanding the Fulda is navigable, and that Cassel is on all sides surrounded by large commercial towns and districts, with which it has abundant railway communication, its own trade is not very considerable. It possesses manufactures of cottons, silk and woollen fabrics, leather, hats, carpets, snuff, gold and silver lace, porcelain, earthen and lacquered ware, playing-cards, wax-lights, chemical products, dyes (Cassel yellow and black), soap, starch, hardware, musical instruments, linen, damask, chicory, and some machinery. It has two fairs annually. E. of the Upper New Town is the *Karlsaue*, or *Augarten*, a fine park containing an orangery, a pheasantry, and a marble bath; but the last is overloaded with ornament, and in bad taste. A straight and handsome road, shaded by an avenue of limes, 3 m. in length, conducts from the Wilhelmshöhe gate to Wilhelmshöhe, the summer palace of the elector, a magnificent residence, with costly fountains and waterworks, sometimes called the German Versailles.

During the short period that Jerome Bonaparte was on the throne of Westphalia, Cassel was the cap. of his king. and the place of his residence.

CASSEL, a town of France, dép. Nord, cap. cant., on an isolated mountain in the middle of an extensive plain, 28 m. NW. Lille. Pop. 4,260 in 1861. The town is well built, and, notwithstanding its situation, is well supplied with spring water. It has fabrics of lace, thread, hats, oil, and earthenware. It is very ancient, having been the capital of the *Morini* when Cæsar invaded the country. It was united to France in 1678, by the treaty of Nimeguen. Several battles have been fought in its vicinity.

CASSIS, a sea-port town of France, dép Bouches-du-Rhone, in a narrow valley on the Mediterranean, 10 m. SE. Marseilles, on the railway from Marseilles to Toulon. Pop. 2,035 in 1861. The town has a tribunal of *prud'hommes*, an office of health, a workhouse, and yards for the building of small vessels. Its port is confined, and admits only vessels of small burden. The figs and grenades of Cassis are held in much estimation; and it has a considerable trade in excellent muscatel wine, produced in the environs. This is the native country of the learned and excellent Abbé Barthelemy, author of the 'Voyage d' Anacharsis,' who was born here on the 20th of January, 1716.

CASTEL-A-MARE, a city and sea-port of Southern Italy, prov. Naples, on the Gulf of Naples, 15 m. W. Salerno, on a branch line of the railway from Naples to Salerno. Pop. 25,843 in 1862. It is the seat of a bishopric, and the residence of a sott' intendente; and is well built, partly along the shore, but principally on the site of the mountain, rising immediately from it. It has a royal palace, a cathedral, 5 churches, several convents, a military hospital, fine barracks a royal dockyard, and hot baths. There are manufactures

of linen, silk, and cotton, with tanneries. The port, which is small, is defended by two forts. Being exposed to the N., and elevated, Castel-a-mare has acquired great celebrity as a summer residence, in consequence of its coolness, the salubrity of its air, and the beauty of its environs. But in autumn it becomes damp, chill, and disagreeable.

Castel-a-mare is built on the site of the ancient *Stabiæ*, which, having been destroyed by Sylla during the civil wars, was afterwards principally occupied by villas and pleasure-grounds. It was here, A.C. 79, that the elder Pliny, wishing to approach as near as possible to Vesuvius during the dreadful eruption that overwhelmed Herculaneum and Pompeii, fell a victim to his curiosity and thirst for knowledge.

CASTEL-A-MARE, a sea-port town of Sicily, prov. Trapani, cap. cant., on a gulf of its own name, 6 m. NW. Alcamo; lat. 38° 1′ 51″ N., long. 12° 52′ 43″, E. Pop. 11,959 in 1862. It is a mean dirty town, with a castle falling fast to decay. The bay is spacious, but it is not safe with northerly winds which throw in a heavy sea. The neighbouring country is well cultivated; and considerable quantities of wine, fruit, grain, manna, and opium are exported.

CASTELLON, or CASTELLON-DE-LA-PLANA (an. *Castalio*), a town of Spain, Valencia, cap. dep., 4 m. from the coast, and 41 m. NNE. city of Valencia, on the railway from Valencia to Barcelona. Pop. 19,340 in 1857. The town is finely situated in a well-watered, extensive, and fertile plain. This fertility is entirely the result of industry, the water which gives life and verdure to the plain being brought by an aqueduct, cut in great part through the solid limestone rock, from the Mijares, which flows about 5 m. S. from the town. This great work has been ascribed to the Romans and Moors; but others assert that it was constructed, about 1240, by James the Conqueror, king of Aragon. The town, which is well built, has 3 churches, 6 convents, 1 hospital, 2 houses of charity, and a public granary. The beauty of the situation, the mildness of the climate, and the abundance and excellence of the fruits, make this one of the favourite residences in the prov.

CASTELNAUDARY, a town of France, dép. Aude, cap. arrond., in an elevated fine situation, contiguous to the Canal du Midi, 21 m. WNW. Carcassonne, on the railway from Toulouse to Narbonne. Pop. 9,584 in 1861. The town is very indifferently built, and there are few edifices worth notice, except the church of St. Michael, said to be the finest in the dep. It has a tribunal of primary jurisdiction, a departmental college, and a philotechnic society. The canal has a superb basin contiguous to the town, surrounded by fine quays and warehouses, which, with the vessels by which it is sometimes crowded, give it the appearance of a sea-port. The public promenade commands this basin and a fine view extending as far as the Pyrenees. There are here manufactures of cloth and silk, with establishments for the spinning of cotton, print-fields, and tanneries; and a considerable trade is carried on in the manufactures of the town, and the produce of the adjoining country.

In 1632, in an encounter under the walls of the town, the Duc de Montmorenci, commanding the troops of Gaston, duc d'Orleans, was wounded and taken prisoner; and being conveyed to Toulouse, was convicted of treason, and executed in the same year.

CASTELO BRANCO, a city of Portugal, prov. Beira, on a hill on the Liria, 51 m. NE. Abrantes. Pop. 5,893 in 1858. The town is the see of a bishop, and the residence of the captain-general of Lower Beira. Streets narrow and steep, and the houses mean, except some modern ones without the walls; the latter are double, and flanked with seven towers. The cathedral also is without the city; and there is an old ruined castle on the summit of the hill on which the town stands. It has a college and two collegiate churches.

CASTEL-SARRASIN, a town of France, dép. Tarn-et-Garonne, cap. arrond., pleasantly situated in a fertile plain on the Songuine, 1 m. from its confluence with the Garonne, 13 m. W. Montauban. Pop. 6,838 in 1861. The town is well built, and the walls and ditches by which it was surrounded have been converted into promenades. It is the seat of a court of primary jurisdiction, and of a departmental college; and has manufactures of serges and other woollen stuffs, hats, and tanneries.

CASTELVETRANO, a town of Sicily, prov. Trapani, cap. cant., on a hill 6 m. from the sea, and 12 m. E. Mazzara. Pop. 14,540 in 1862. The town is well built with stone, the streets being spacious, and disposed with some attention to regularity; and there are several churches and convents. It has a good trade in wine and olives, the former grown in the neighbourhood, and much renowned.

CASTIGLIONE-DELLE-STIVIERE, a town of Northern Italy, prov. Brescia, on a hill 22 m. NW. Mantua. Pop. 5,237 in 1862. The town is surrounded by a low wall, and contains several churches, the ruins of a castle, and a conventual seminary; but is chiefly noted for a decisive victory gained here by the French over the Austrians, 5th August, 1796; from which Marshal Augereau derived his title of Duc de Castiglione.

CASTILE, the central and largest division of Spain, lying between lat. 38° 25′ and 42° 50′ N., and long. 1° 2′ and 5° 37′ W.; it has, N. and NE., the territory of Reinosa, Alava, and Navarre; E., Aragon and Valencia; SE., Murcia; S., Andalusia; W., Estremadura and Leon: length about 306 m. from N. to S.; mean breadth about 160 m. Area about 48,600 sq. m. It is divided into two parts by a range of high mountains, called in different parts Urbians, Carpetanos, Sierra de Guadarama, Gata, Somosierra, and de Estrella. The country to the N. of the ridge, having been the first recovered from the Saracens, is called Old, whilst that to the S. is named New Castile. Old Castile comprises the modern provinces of Burgos, Soria, Segovia, and Avila, so named after their chief towns. New Castile comprises the provinces of Madrid, Guadalajara, Cuença, Toledo, and La Mancha, each also so called after the names of their chief towns, except La Mancha, whose cap. is Ciudad Real. Principal towns, exclusive of the capitals, are Osma, Calahorra, Logroño, Caizada, Haro, Alfaro, Miranda, Briviesca, Almazar, Toledo, Aranjuez, Alcala de Henares, Talavera de la Reina, Illescas, Zurita, Temblecue, Villanueva, &c. The Ebro, Douro, Tagus, and Guadiana have their sources in this province. The first flows SE., along the NE. boundary, to the Mediterranean; the Douro and Tagus, to the Atlantic; and the Guadiana, WSW. to the same. There are many other rivers, affluents of the above. The Xucar, flowing E. to the Mediterranean, also rises in this province. Besides the chain of mountains that separate Old and New Castile, there are three other important chains that traverse these provinces. First, the Sierra de Toledo, which winds semicircularly past Daroca, from the Castilian chain, and then runs SW. nearly parallel to it, to the hills of Santa Cruz, near Merida. Next, the Sierra Morena, or Black Mountains, beginning above Alcarez, near the source of the Guadalquivir, and running like the two former, nearly SW., to the narrow pass of

Montegil. Lastly, the Sierra Nevada, or Snowy Mountains, that commence between the sources of the Xucar, Gaudiana, and Guadalquivir, and extend into Andalusia. These last are here extremely steep and bare, mostly schistose, and often coated with limestone. They have white quartz in considerable veins; and valuable dark green, and a profusion of other marbles. The NE. part of the Sierra Morena is of considerable height, and rather resembles table-land than a ridge of hills. The seasons are very different on the two sides of this range. In Andalusia, the vines are all in leaf, and the fruit is set, when, on the N. side, hardly a leaf is to be seen, or a bud to be found in the vineyards. There are here a few remains of former forests, which might have existed when Cervantes made these parts the scene of the exploits of his hero; and a variety of flowering shrubs, particularly the rock-rose, or gum cistus, from which manna is procured, and sumach. In this chain are vertical beds of argillaceous schist, and beds of grained quartz, with entire hills of pudding stone, and some porphyry, and the finest jasper. It is the richest in minerals of any in the kingdom; and has veins of gold and silver. The quicksilver mines at Almaden have been worked for nearly 3,000 years, and furnished the vermillion sent to ancient Rome. They produce annually 2,000,000 lbs. of quicksilver. (Bowles, Historia Natural de España, p. 12; A Year in Spain by a Young American, i. 199.) The Castilian mountains are composed of gneiss granite, which often terminates in peaks of great height; schist, limestone, sandstone, breccia, quartz, marble, gypsum, &c. The Guadarama mountains, about 20 m. NW. Madrid, are bleak, dreary and barren near their summits, which, in many places, are covered with nearly perpetual snow, indicating that they must be 8,000 or 9,000 ft. above the level of the sea; the limit of perpetual snow in these latitudes being about 9,900 ft. The height of Moncayo, the highest mountain in Castile, is estimated at 9,600 ft. The rock, being partly decomposed, forms a light soil that produces the *juniper europeus*, *Daphne mezereon*, *matricaria suavis*, *genista*, thyme, and a great many other aromatic herbs. The cistus tribes abound at every level on the granite mountains, not covered with snow: pines appear on the summits; the noble oak and the elm near their bases. (Townsend, ii. 106.) The scenery is often of the wildest description; the mountains full of deep cuts and ravines, mostly the beds of winter torrents; aged and stunted pines hang upon their edges, and are strewn upon the brown acclivities around; and bare rocks frequently project over the passes, and force them to the very edge of undefended precipices. (Inglis, i. 355.) The quality of the soil is various; in some parts a blackish or brown nitrous clay, which is extremely fertile; in others, light and stony, and little productive. New Castile is in great part clayey, and covered with ratchil. Besides the minerals mentioned above, the Castiles produce calamine, ochre, bole armeniac, fine emery, rock crystal, salt, many curious stones and fossil shells, hot and cold saline springs; and in the mountains are many remarkable caverns, that contain beautiful stalactites, in a variety of fantastic forms. Near Molina is the hill of La Platilla, which has a remarkable mine of copper, in masses of white quartz. Though the ore is near the surface, the hill is covered with plants. Townsend had no doubt that there is tin near Daroca. (i. 218, 219, 303; ii. 106; Miñano, Diccionario Geografico, ii. 467, *et seq.*; Dillon's Travels through Spain, p. 110, 112, 115, 196, 202, 205–207, 237, 239; Antillon, Géographie d'Espagne, p. 8–14.)

that of Old Castile is rather cold and moist. In new Castile it is excessively dry; but rendered healthy by the purity of the prevailing winds, and the great elevation of the country; but this altitude sometimes exposes it to strong dry winds, which, not meeting with the thick woods by which they were formerly tempered, are found very unpleasant, and at times even dangerous, at Madrid, in winter, by producing pulmonary complaints. The height of the *plateau* of Castile reduces the mean temperature to 59 Fahr., while on the coasts of Spain it is from 65° to 75°. The ordinary extremes of temperature, in Madrid, are 90° Fahr. in summer, and 32° in winter; but the thermometer often rises to above 100°, and falls below 14°.

Products.—The principal product of the Castiles is corn, some of which they export to Valencia, Andalusia, and Estremadura. No other province of Spain has wines so strong, and yet so sweet, though but little exported, or known abroad. The most celebrated is that of the Val de Peñas, or 'Valley of Stones,' in La Mancha. It is a dry, strong, red wine of the Burgundy species, and is said to be so plentiful and cheap that a bottle may be had in the country for 1½*d.* It is drunk by the better classes all over the Castiles; but in the greatest perfection in its native district, on account of the tint given it by the skins in which it is carried to a distance. The Castiles produce also pulse, and some fruit and oil. Hemp, flax, madder and saffron are partially cultivated. Garden stuffs are not abundant. On the mountains and in the pastures considerable numbers of black cattle, sheep, and mules are raised; but the increase of the latter has almost annihilated the race of good horses in the Castiles. There are fallow deer, wild boars, wolves, hares, peacocks, and all kinds of poultry and small game in abundance. The larger game has decreased through the breaking up of the land near the royal seats during the absence of Ferdinand VII. Bears are seen in some parts, and lynxes are not uncommon in the high mountains. Not only the fallow land, but the cultivated fields in New Castile, are full of two species of broom (*genista sphærocarpa* and *monosperma*), and the *Daphne gnidium*. They grow to nearly six feet in height, and have a great effect on the prospect. These plants, with the *asphodelus ramosus*, and several other bulbous plants that abound in the pasture fields, give a peculiar character to the landscape of Spain. There is a want of trees, which is partly attributable to the flat and unsheltered nature of the plains, and the dryness of the climate, but chiefly to a prejudice against them, entertained from time immemorial; the peasantry thinking that they are good for nothing, unless it be to attract and shelter vermin. They dislike them so much that they destroy those planted by government along the high roads. It is believed that the want of trees to attract humidity has promoted that drought which, next to bad government, is the curse of the Castiles. From the Douro to the Tagus there is not a stream ankle deep, except when swollen by floods. Agriculture is in the most backward state: the consequence of a comparatively thin population, having little interest in the soil, which is monopolised by the clergy and nobility. Irrigation, which in such a country is indispensable, is but very little practised, and even manuring is all but neglected: and thus, while three-fourths of the country remain fallow, the rest produces only poor crops of grain or potatoes. The great distance between the towns, the badness of the roads, and still more the

the farmer from living insulated on his farm, are additional checks to agriculture. Eight or ten miles frequently intervene without a single habitation, and the country looks poor and miserable in the extreme. Nothing can be more gloomy than the appearance of the towns, with old-fashioned towers projecting out of a dismal group of houses plastered over with clay. At the entrance of each is a gate for receiving the duties on all articles that pass; and in the centre a square, round which are the buildings occupied by the ayuntamiento, or municipality, the posada, or inn, and the butcher, baker, tailor, cobbler, and village surgeon, or barber. Most of the towns exhibit every symptom of decline. (Slidell, i. 136; Inglis, i. 56.) Before the construction of railways, there was nearly a total want of free communication, all but the main road to France being neglected. The old road between Madrid and Toledo was mostly carried over ploughed fields; sometimes with hardly a visible track. The new iron roads, established chiefly by English capital, and built by English 'navvies,' have greatly improved this state of things, and bid fair to raise even Castile from its state of poverty and misery. (See SPAIN.)

Manufactures, though formerly considerable, are now at a very low ebb. The cloths of Segovia were once the best in Europe; and there are still some woollen fabrics, among which is the famous vigogna cloth and coarse camlets, serges, and flannels, and some of wrought silks, silk stockings and gloves, galloons, blond lace, coarse linens, hats, caps, soap, saltpetre, gunpowder, the celebrated plate-glass of St. Ildefonso, white earthenware, tanned leather, and paper, but they are all inconsiderable. Castile has little commerce: wool is the staple commodity. The exportation of sheep was always strictly forbidden, till by the treaty of Basle the French were allowed to purchase 5,000 Merino rams and as many ewes; and from this stock, and subsequent exportations from Spain, the quality of the wools of France, England, Germany, and other parts of the world, has been greatly improved.

The following table shows the area and population of the two Castiles according to the census of 1857. Valladolid and Valencia are sometimes included in the Castiles; but they did not formerly belong to them, and are excluded in this table.

Provinces		Area in Eng. Sq. Miles	Population in May, 1857
New Castile	Madrid	1,315	475,785
	Guadalaxara	1,946	199,088
	Toledo	8,774	328,755
	Cuenca	11,304	229,959
	Ciudad Real	7,543	244,328
	Total	30,882	1,477,915
Old Castile	Burgos	7,674	333,356
	Logrono		173,812
	Santander		214,441
	Oviedo	3,686	524,529
	Soria	4,076	147,468
	Segovia	3,466	146,839
	Avila	2,569	164,039
	Leon	5,894	348,756
	Palencia	1,733	185,970
	Valladolid	3,279	244,023
	Salamanca	5,626	263,516
	Zamora	3,562	249,162
	Total	72,447	5,473,826

The Castilians have the character of probity, sobriety, and moderation: they are serious and contemplative, which makes them, at first, seem gloomy and haughty; but, after a time, they are found not deficient in the agreeable qualities. They have to boast of many illustrious men; at the head of whom stand Cervantes, the inimitable author of Don Quixote, and Lopez de Vega. They are not what would be called hospitable, but they are, notwithstanding, generous. The middle and upper classes are fond of display and ostentation to an extraordinary degree, while inconsiderateness and carelessness are conspicuous in the characters both of the lower and middle classes. Almost every one lives up to his income; even the *employées*, whose tenure of office is so uncertain, seldom lay by anything, and generally die penniless. But the love of ease and pleasure, and proneness to indolence, is less marked, perhaps, in Castile, than in the southern provinces. Their want of industry is the result of the circumstances under which they have been placed, and of their vicious institutions. No man will be industrious, where industry does not bring along with it a corresponding reward; and this it very rarely does in Spain. Had the Castilians the means of improving their condition by labour, their apathy and listlessness would speedily give place to activity and enterprise. In Madrid, and generally in Castile, there is something more of luxury at the table than in the N. provinces, though the Spaniards in general are abstemious, and little addicted to its pleasures. The dining-room is generally the meanest apartment; but the houses of respectable persons are scrupulously clean, particularly the kitchens and bed-rooms. Female education begins to improve; besides embroidery and music, a little history and geography is taught in the schools, though not in the convents, where the higher orders are educated. In the time of the constitution of the Cortes, there were two Lancastrian schools for boys and one for girls at Madrid; but those for the boys were suppressed on the king's return. The influence of the regular clergy is diminished much more than that of the monks, who are still, through the austerities they practise, and the alms they distribute at the convent doors, held in considerable veneration, except in Madrid, where less attention is paid to religious ceremonies and processions than in any other city of Spain. The large towns have a sombre aspect, the women being nearly all in black, without a bonnet or a riband. Every one has a mantilla or scarf thrown over the shoulders, which varies in quality with the station of the wearer. Besides a waistcoat and jacket of cloth, covered with abundance of silver buttons, the men usually wear a sheepskin jacket with the woolly side outwards; or, instead of this, an ample brown cloak, the right fold of which is thrown over the left shoulder with a Roman air. The head is covered with a pointed cap of black velvet, the ends of which being drawn down over the ears, leave exposed a high forehead and manly features. They have tight breeches, sustained above the hips by a red sash, and fastened the whole way down the outside of the thigh by bell buttons, woollen stockings, stout shoes, and leather gaiters, curiously embroidered, and fastened at top with a gay-coloured string. The love of dancing is universal among them: the ladies usually dance well, but in a style quite different from the French; they laugh and talk while they dance, and are strangers to that burlesque silence and gravity that prevail among the quadrillers of France and England. Music is much cultivated; and it is rare to find a female even in the middle ranks who is not a good pianist. Among their amusements, the bull-fights, to which all classes are passionately addicted, must not be forgotten. These have been prohibited several times; and the cruelties practised at them may seem sufficient to stamp them with the character of brutality and barbarism. Yet there is

nothing of deliberate cruelty in the character of the Spaniards, and they have as little, perhaps, of hard-heartedness as other people. The use of the toledo, or bravo, to revenge private wrongs, is now unknown. Horse-racing was attempted to be introduced by the Duke of San Carlos, at Madrid, in 1830, with an English horse against a Spanish one; but the English horse was beaten by foul play, and the duke insulted as he left the ground.

The Castilian is the standard dialect of the Spanish language. During the struggles with the Moors, many dialects of the *Romanzo*, or mixture of the Latin with the Germanic tongues, grew up in Spain, which finally melted into three—the Galician, Castilian, and Catalonian. On the marriage of Isabella, queen of Castile, with Ferdinand of Aragon, the Castilian Romanzo became the language of the court, and has maintained its pre-eminence ever since.

History.—The Castiles anciently formed parts of *Cantabria*, and the country of the *Celtiberi*, *Oretani*, and *Carpentani;* and, like the rest of Spain, were successively overrun by Romans, Goths, and Saracens. After the expulsion of the Saracens, and various vicissitudes, the sovereignty of Castile came by marriage to Sancho III., king of Navarre, whose son Ferdinand was made king of Castile in 1034. He married the sister of Veremond III., king of Leon, but afterwards killed his father-in-law in battle, and was himself crowned king of Leon, in 1037. The crowns of Castile and Leon were afterwards separated and again united several times, till, by the marriage of Isabella, who held both crowns, with Ferdinand, king of Aragon, in 1479, the three kingdoms were, as at present, consolidated into one. Castile, as well as the rest of Spain, has for a lengthened period been exposed to the scourge of a civil war carried on without zeal on either side, but with the most detestable perfidy and cruelty.

CASTILLON, a town of France, dép. Gironde, cap. cant., on the Dordogne, 11 m. ESE. Libourn. Pop. 3,516 in 1861. In 1451, an obstinate engagement was fought under the walls of this town between the English and French, when the latter were victorious. In the commune of Castillon are the remains of the *Château de Montaigne*, to which the illustrious essayist of that name retired in 1572, and where he breathed his last on the 13th of September, 1592.

CASTLEBAR, an inl. town of Ireland, prov. Connaught, co. Mayo, at the N. extremity of the lake of the same name, 126 m. W. by N. Dublin, on the Midland-Great-Western railway. Pop. 6,373 in 1831, and 3,022 in 1861. The town was taken by a French force under General Humbert, which landed at Killala in 1798, but was shortly after evacuated on the approach of the main army of the British under Lord Cornwallis. It is the assize town of the co., and consists of a square, and a long street with some branches. The par. church and a R. Cath. chapel are new, large and elegant buildings; there are also a meeting-house for Methodists, a large parochial school, a national school, an infirmary, and two dispensaries. There are barracks for artillery and infantry, fit to accommodate 650 men. The constabulary and the revenue police have stations here. By a charter of James I. in 1613, the corporation consists of a portreeve, 15 burgesses, and a commonalty, which returned 2 mem. to the Irish H. of C. till the Union, when it was disfranchised. The assizes for the co. are held here; also general sessions in Jan. and Oct., and petty sessions every Saturday. The court-house is a well-arranged building. The county prison, erected on the radiating principle,

and linen yarn are manufactured to some extent, and sold in the linen-hall; there are also tobacco and soap manufactories, & tannery, and a brewery. There is an extensive trade in grain, and other agricultural produce. Markets on Saturdays; fairs, 11th of May, 9th of July, 16th of Sept., and 18th of November.

CASTLECOMER, an inland town of Ireland, prov. Leinster, co. Kilkenny, on the Deen, an affluent of the Nore, 52 m. SE. Dublin. Pop. 2,436 in 1831, and 1,435 in 1861. The town, which suffered much in an unsuccessful attack by the insurgents in 1798, consists of a main street planted on each side, and of some others branching from it, and is remarkable for neatness and good order. The par. church on a neighbouring hill, a large R. Cath. chapel, a convent, a Methodist meeting-house, a court-house, a dispensary, and a barrack, are the principal buildings. Little trade is carried on, the place deriving its support chiefly from the neighbouring collieries, which furnish a copious supply of fuel to the adjoining counties. The mineral is of the carbonaceous or stone coal species, which burns without flame, being the slaty, glantz coal of Werner. Fairs are held on Mar. 27, May 3, June 21, Aug. 10, Sept. 14, Oct. 28, and Dec. 14. General sessions in June, and petty sessions every Friday; also a manorial court for small debts.

CASTLEDOUGLAS (formerly *Carlinwark*, from the name of a lake in its immediate vicinity), an inland burgh or barony of Scotland, co. or stewartry of Kirkcudbright, par. Kelton, on the railway from Dumfries to Portpatrick, 18 m. from the former, and 68 from the latter. Pop. 2,261 in 1861. The town is neat and well built, and consists of a main street along the road, with several lesser streets running at right angles or parallel to it. It is quite a modern town, and is wholly indebted for its existence and prosperity to the advancing wealth of the thriving agricultural district by which it is surrounded. Its consequence has been of late years materially increased by the transfer to it of the weekly corn and cattle markets, the most important in the co., originally held at Rhone House, a small village, distant 1½ m. The famous horse-fair of Kelton Hill is still held at Rhone House; but it has lost much of its original importance, as horses from Ireland, which formed its staple, are now generally sent direct to the fairs in England by steam, instead of taking a circuitous land route by Kelton Hill. It has an extensive retail trade, but no manufactures.

CASTLETON, a par. of England, co. Derby, hund. High Peak. Area, 10,100 acres. Pop. 1,157 in 1861. The village is 143 m. N. by W. London. The vale of Castleton is in the heart of the Peak district, about 1,000 ft. below the level of the surrounding hill ranges, and is 6 m. in length, and from 1 to 2 m. in width, with several smaller dales opening to it on the N. and S. It is a fertile tract watered by several rivulets, and approached from the Chapel-le-Frith side, through a long and deep chasm, crossing the mountain range, and called the 'Winnets,' or windgates, from the strong gusts and currents of air that usually prevail: the road winds down a considerable declivity, between precipices rising upwards of 1,000 ft. on each side, and opens, by a sudden turn, on the vale, in which there are three villages, Hope, Brough (both in the parish of Hope), and Castleton. The latter is at the base of a steep rock, whose summit is crowned by the ruins of the Castle of the Peak, considered a genuine specimen of the Saxon period; though the traditions of the neighbourhood ascribe it to Wm. Peverell, a natural son of the

tire, and some portions of the outer walls, in many places 20 ft. high and 9 ft. thick. The church is small, but considered a very interesting relic of the early pointed style: here are also a Wesleyan chapel, and an endowed charity school, in which 23 scholars are educated. The inhabitants are chiefly employed in the mines of the surrounding district, which produce lead, calamine, and the coloured fluor spar called 'blue John,' much in request for vases and other ornaments. The whole of the calcareous strata in the vicinity are remarkably deranged, and are also characterised by numerous cavernous fissures and the frequent disappearance of streams (through what are termed swallow-holes), which, after subterranean courses of various lengths, again emerge to the light. The outer chamber of the Great Peak, or Devil's Cavern, has a natural arch of about 120 ft. span; several small cottages have been built in it. The rest of the chambers are only to be explored by torches; they extend about 2,300 ft. from the entrance to the innermost end, where, though there are probably others beyond, the rocks close down so near a subterranean stream as to prevent further access: this stream has to be crossed two or three times in proceeding, and at one part a small boat is kept for the purpose. The average depth from the floors to the upper surface of the mountain is about 650 ft. The strata abound in marine fossil remains. The Eldon hole, 3 m. W. of Castleton, is of a similar character, and also that approached by the level of the Sheedwell mine, near the Winnets. This mine has been given up; but the Odin mine, in the vicinity, which was worked in the Saxon period, is still productive. Mam Torr, or the Shivering Mountain, rises 1,300 ft. above the vale, and is composed of alternating strata of shale and micaceous grit. There is an ancient encampment on its summit, and British and other ancient remains are frequent in the district, which is one of the most remarkable in the kingdom for its picturesque character, and the abundance of natural objects and phenomena interesting to science. On the attainder of the grandson of William Peverell of the Peak (for poisoning the Earl of Chester), the castle was granted by Henry II. to his son, afterwards King John: subsequently Edward III. gave it to John of Gaunt; since which it has formed part of the duchy of Lancaster, and is at present leased by the Duke of Devonshire.

CASTRES, a town of France, dép. Tarn, cap. arrond., in an agreeable and fertile valley, on the Agout, 23 m. SSE. Alby, on the railway from Alby to Narbonne. Pop. 21,538 in 1861. This, though not the capital, is the principal town of the dép., and is thriving and industrious. It is divided into two parts by the river, over which it has two bridges. It is but indifferently built, and the streets are narrow and winding. The principal building is the old episcopal palace, now the *sous-préfecture*; it has also barracks, workhouses, an exchange, a theatre, and a fine promenade. It is the seat of a court of primary jurisdiction; and has a model school, a diocesan seminary, with 113 pupils, a Protestant consistorial church, a class of linear design, and a public library with 6,500 volumes. There are here extensive manufactures of cloth and woollen stuffs, with establishments for the spinning of cotton, linen fabrics, paper fabrics, dye-works, bleach-fields, and tanneries. It has also copper forges and foundries.

Castres espoused, in the 16th century, the Protestant party, and Henry IV. resided in it for a lengthened period. Its ramparts were demolished by Louis XIII., and the bishopric was suppressed at the Revolution. It is the birthplace of Dacier the critic, of Rapin the historian of England, and of the Abbé Sabatier.

CASTRO, a seaport town of Southern Italy, prov. Lecce, on the Adriatic, 28 m. SSE. Lecce, with which it is connected by railway. Pop. 5,300 in 1862. The town has an old castle and a cathedral, and is the seat of a bishopric. It was sacked by the Turks in the 16th century; and since then has suffered much from the inroads of Barbary cruizers. Its harbour admits only small vessels. The environs are productive of corn, wine, cotton, and fruits.

CASTRO DEL RIO EL LEAL (an. *Castra Julia*), a town of Spain, prov. Cordova, on the Guadajos, 16 m. SE. Cordova. Pop. 8,945 in 1857. The town has two churches, two hospitals, a foundling hospital, two seminaries for the education of boys and girls, and a castle; with manufactures of wool and hemp.

CASTROGIOVANNI (an. *Enna*), a town of Sicily, prov. Catania, cap. cant., almost in the centre of the island, 65 m. ESE. Palermo, in a plain about 5 m. in circ., being the summit of a lofty and almost inaccessible mountain, more than 4,000 ft. above the level of the sea. Pop. 13,747 in 1862. This city, celebrated in antiquity as the birthplace of Ceres, and the site of her most sacred temple, is now one of the poorest towns in the island. It still, however, commands an extensive and delightful prospect, is well supplied with excellent water, and has a clear salubrious atmosphere. The surrounding country, which is very fertile, was, in antiquity, ornamented with innumerable groves and temples, appropriated to the worship of Ceres and Proserpine. Livy has correctly described the city as built in *excelso loco ac præcupto*; and Cicero has given an eloquent description of the town, temple, and statue of Ceres, carried off by the wholesale plunderer, Verres: '*Simulacrum Cereris Ennæ ex suâ sede ac domo sustulit, quod erat tale, ut homines, quum viderent, aut ipsam videre se Cererem, aut effigiem Cereris, non humanâ manu factam, sed cœlo delapsam, arbitrarentur.*' But all traces of the temple, as well as of the worship of the goddess, have disappeared. The castle in the modern town, which is going fast to ruin, is evidently of Saracen or Norman origin.

About 5 m. from the town, at the foot of the mountain, is the famous lake, on the borders of which

> 'Proserpine gathering flowers,
> Herself a fairer flow'r, by gloomy Dis
> Was gathered.'

The orators and poets of antiquity have exhausted their powers in describing the beauty and sublimity of this famous lake. (See, among others, Cicero in Verrem, iv. § 48; Ovid, Met. lib. v., lin. 385.) But it no longer wears the livery of perpetual spring; its groves have been cut down, and its temples levelled with the dust! All is desolate and deserted:—

> 'Pro molli viola, pro purpureo narcisso,
> Carduus, et spinis surgit paliurus acutis.'

Its naked borders are fœtid and loathsome, and in the summer months exhale a pestilential air.

> 'Tantum ævi longinqua valet mutare vetustas.'

Enna was the head-quarters of the revolted slaves under Eunus, during the first servile war in Sicily. Here they defied for several years the power of Rome, and defeated three Prætorian armies. At last they were entirely defeated under the walls of Messina, by the consul Piso; and Enna was subsequently taken by the consul Rupilius, and the slaves put to the sword or crucified.

CATALONIA (Span. *Cataluna*), an old prov. of

Spain, occupying the NE. portion of the kingdom, between lat. 40° 30′ and 42° 51′ N., and long. 0° 15′ and 3° 21′ E. It is of a triangular shape, and has the E. Pyrenees, which separate it from France on the N.; the Mediterranean on the E.; and Aragon, and a small part of Valencia on the W. Greatest length and breadth, 190 and 130 m.; area about 12,150 sq. m., including Andorre. Offsets from the Pyrenees spread themselves through the whole prov. from N. to S., forming valleys of larger or smaller extent, like those of Ampuridan, Urgel, Aran, and Lerida. Towards the middle of the prov., 29 m. NW. from Barcelona, is the celebrated Montserrat, 4,500 ft. in height; and farther S., on the Ebro, is the Sierra de la Llena. The Pyrenees are not so rugged on this as on the French side, and descend gradually towards the Mediterranean. They are mostly granitic. The other mountains of Catalonia are in many respects similar. The mountain of Cardona, 17 m. NW. Montserrat, almost in the centre of the prov., is a solid mass of pure rock-salt, without the least crevice or fissure, between 400 and 500 ft. high, and 3 m. in circ. This prodigious mass of salt is unparalleled in Europe, and perhaps in the world. In almost any other country it would be turned to great account, and be made the means of an extensive trade; but here, owing to the badness of the roads and the difficulty of access, this inexhaustible source of wealth is but little known, and comparatively neglected. (Dillon's Travels in Spain, p. 390.) Near Olot, in this prov., about 55 m. N. Barcelona, is a remarkable district of extinct volcanos, that has been visited and described by Mr. Lyell. It contains about 14 distinct cones, with craters. The greatest number of perfect cones are close to Olot; and the level plain on which the town stands has clearly, according to Mr. Lyell, been produced by the flowing down of lava from the adjoining hills. Most of these volcanos are as entire as those near Naples, or on the flanks of Etna. Some of them contain caverns called *bufadors*, from which a current of cold air blows during summer. There is no record of any eruption here; but the town of Olot was nearly destroyed by an earthquake in 1421. (Principles of Geology, ii. 38, 3d. ed.) The mountains in the S. of the prov., near the coast, are limestone. On the E. of Cervera gypsum only is met with; but more to the W. it gives place to chalk. The coast is mostly bold and rugged. In the N. is Cape Creus, the most E. point of Spain, being the extremity of a rocky peninsula stretching out into the sea, and separating the Gulf of Lyons from that of Rosas, lat. 42° 19′ 53″ N., long. 3° 20′ 16″ E. The prov. is well watered. One of the affluents of the Ebro, the Naguera, forms for nearly 60 m. the line of demarcation between it and Aragon. The Ebro itself enters the prov. at Mequinenza, and flowing through its most S. portion by Tortosa and Amporta, falls into the Mediterranean 15 m. E. from the latter. The Segre, with its affluents, unites with the Ebro at Mequinenza. The principal rivers, unconnected with the Ebro, are the Llobegrat and Ter, the one flowing SE., and the other E., to the Mediterranean.

The Pyrenees furnish iron, copper, zinc, and manganese. There are lead mines in various districts. Coal is abundant, but much difficulty has always been encountered in working it, from the want of capital and of improved means of communication. Townsend says, that copper and silver abound in the valley of Aran, and that coal, silver, and gold, have all been found in the vicinity of Lerida. There is abundance of alum in the valley of Aran; nitre is produced spontaneously in the plains of Urgel, and cathartic salts at Cervera. The mountain of rock-salt at Cardona has been already noticed. There are marbles, jasper, and other stones useful in architecture and sculpture; alabaster, amethysts, topazes, and coloured rock crystal; quartz, barytic spa, fluor spa, limestone, chalk, and gypsum, in all varieties; amianthus, talc, serpentine, and chalcedony. There are many mineral waters and hot springs.

The air is dry and unusually bright and clear in the interior; but on the coast it is variable and moist; and in summer pestilential diseases not unfrequently prevail. The mountains are everywhere covered with snow during the winter, and in the Pyrenees frequently even in June.

Soil and Produce.—About half the surface is susceptible of cultivation, the rest consisting of rocks, naked barren hills, and woodland. The mountain land is stony, and full of fragments of granite; but the valleys are mostly fertile. All sorts of grain are grown, viz. wheat, rye, maize, barley, oats, and millet. The plains of Ampuridan are suitable for rice; but its cultivation is prohibited, as prejudicial to health. (Miñano.) Pulse is produced in all parts. Hemp, flax, saffron, madder, woad, anise, liquorice, and barilla are also produced. The E. districts yield good strong wines, which are frequently employed to give body to the wines of other provs., and are sometimes exported for that purpose to Cette, and thence to Bordeaux. Oranges, lemons, and citrons, are found on the coast; figs and almonds are grown in the plain of Tarragona; and apples, pears, cherries, quinces, medlars, apricots, peaches, walnuts, chestnuts, and filberts, in all the plains. Oil, though not of the best quality, is produced in all the warmer parts of the coast district. Silk, honey, and wax are also produced in considerable quantities. Timber is plentiful, especially the roble-oak, beech, fir, elm, evergreen poplar, cork-tree, &c. Nuts and cork constitute important articles of export from the prov., being in this respect second only to linen and cotton goods and brandy. Bears and wolves are sometimes seen in the Pyrenees. Laborde estimated the produce of wool at 30,000 quintals.

Catalonia is the best cultivated, and the people the most industrious, of any of the Spanish provs. This is owing to a variety of causes, but principally, perhaps, to its exemption from the *alcavala* and other oppressive imposts (See SPAIN), and to the mode in which lands are occupied. Generally, throughout Spain, the land is divided into vast estates, held under a system of strict entail, and administered by stewards on account of the proprietors. The disastrous influence of this system is apparent in the low state of agriculture, and the wretchedness of the peasantry, in most parts of the monarchy. But in Catalonia its influence is materially modified by the landlords having power, by what is called the *emphyteutic* contract, to lease a portion of their estates. This they may do for a term of years, either absolute or conditional, for lives or in perpetuity; always reserving a quit-rent, as in the English copyhold, with a relief on every succession, a fine on the alienation of the land, and other seignioral rights dependent on the custom of the district. The reserved rent is commonly paid in money; but the agreement is often for wine, oil, corn, or poultry. If the tenant quits before the end of his term (which he may do), he loses all claim for improvements, for which he must otherwise be paid. Persons occupying land under this tenure have an obvious interest in its profitable cultivation; and wherever it prevails the country is in a comparatively flourishing state.

Irrigation is the leading feature in the husbandry of the prov., and is carried to a great extent by means of canals and trenches cut from every available source; the maintenance of which, together with the distribution of the water, is committed to the care of a particular junta. Great numbers of farms are also watered by means of the *noria*, a machine introduced by the Saracens for raising water from wells. The soil is in parts so very light that it is ploughed with a couple of oxen, and sometimes with one horse, or even mule; but with the help of the water it is rendered fertile, and produces on the same spot corn, wine, oranges, and olives.

The silk and woollen manufactures of Catalonia were formerly carried on to a great extent, and are still of considerable value and importance. In the latter part of last century the cotton manufacture was introduced; but it has not succeeded. Exclusive of silks, cottons, and woollens, a good deal of linen is made, with paper, hats, and cordage. All kinds of weaving are carried on upon the slopes of the Pyrenees, where wages are lowest, the webs being brought to Barcelona to be bleached and printed. Leather is largely manufactured, and shoe-making used to be one of the principal employments. In 1786, the export of shoes from Barcelona only was estimated at 700,000 pairs, mostly for the colonies. Since the emancipation of the latter, this trade has greatly declined. Distillation is extensively carried on; the exports of brandy amounting, on the average, to 35,000 pipes a year. Cannon and small arms, soap, glass, sheet-iron, and copper utensils, are also produced. Women, in the agricultural districts, are employed in the making of blond and other laces. The shipbuilding, formerly carried on at Barcelona, Mataro, and other places on the coast, where timber was cheap, has nearly ceased. Tarragona is the chief place in the prov. for the export of nuts, almonds, wines, brandy, cork wood, and cork bark. (See TARRAGONA.)

The pop. of Catalonia was estimated in 1788 at 814,412. According to the census of 1857, it contained 1,652,291 inhabitants. Catalonia is now divided into the four provinces of Barcelona, Tarragona, Lerida, and Gerona. The principal towns are Barcelona, Tarragona, Gerona, Lerida, Reus, Manresa, and Tortosa.

The language of the Catalans is a dialect of the Romance or Provençal, at one time the common language in the S. of France, and in some other parts. But it is now a good deal intermixed with Castilian and other words. Letters were successfully cultivated at the court of Barcelona; and some of the counts attained to distinction as troubadours.

Catalonia had for a lengthened period its states, composed of the clergy, nobility, and commons, who shared the legislative power with the sovereign. It had, also, particular and very extensive privileges, and a peculiar form of jurisdiction in the hands of magistrates, called *viguieros*, whose districts are named *viguieries*. The highest court of appeal was the royal council established in Catalonia. Their contributions to the king were not considered as imposts, but as voluntary gifts; the Catalans were to be tried by the laws of Catalonia only, and by native judges; and their estates were never to be confiscated, unless for treason. But these privileges were suppressed by Philip V. when he subdued the province; and the laws of Catalonia were then assimilated to those of Castile. They have always been exempted from the *alcavala*, *cientos*, and *millones*, in lieu of which they paid 10 per cent. on all rents, whether belonging to individuals or communities, and on the supposed gains of merchants and mechanics.

The Catalans are hardy, active, and industrious; and used to be distinguished by their attachment to their privileges, and their opposition to arbitrary power. But in this respect they seem to have undergone a material change, being now distinguished by their veneration for the apostolical party in church and state—a consequence probably of their ignorance and subservience to the priesthood. There seems, indeed, to be little or no provision made for education. Philip V. suppressed the universities of Barcelona, Lerida, and Gerona, and established in their stead only that of Cervera. There are academies in the principal towns; but the great bulk of the people appear to be without the means of instruction. Their improved condition is not therefore in any degree owing to their superior intelligence, but to the comparatively favourable circumstances under which they have, in other respects, been placed.

The difference between the cottages of Catalonia and those of the other provinces of Spain is very visible. The houses and cottages here have an air of convenience and comfort; there is glass in the windows, and the insides display the articles of furniture in common use. No beggars, and few ragged people, are seen; industry is everywhere active; stones are removed from the ground and collected in heaps; fences are more general and more neatly constructed; nobody is seen basking in the sun; even the women and girls who attend the cattle do not sit idle, wrapped up in their plaids, but every one has her spindle in her hand.

Catalonia anciently made a part of the *Hispania Taraconensis* of the Romans. The Goths were its next masters, who spread themselves from it over the rest of Spain. On the fall of the Gothic empire, the Catalans submitted to the Moors, but the dominion of the latter was not of long duration. In the 8th and 9th centuries, Catalonia, with the adjoining country of Roussillon, became an independent state, subject to the counts or earls of Barcelona. Under their government, liberal institutions were established in the prov.; it was distinguished by its naval power, commerce, and proficiency in the arts; and its fleets and armies frequently interfered with decisive effect in the contests of the time. In 1137, Catalonia was united with Aragon by the marriage of one of its counts with the heiress of the latter; but the Catalonians retained their separate legislature, and distinct privileges. In 1640 the prov. revolted against Philip IV., and was not recovered till 1659. In the war of the succession, the Catalonians were the most zealous adherents of the Archduke Charles; and even after England and Austria had withdrawn from the contest, they refused to submit, and defended Barcelona with an obstinacy of which there are but few examples. On its capture, their ancient cortes, and most of their peculiar privileges, were suppressed.

CATANIA, an ancient and celebrated city and sea-port of Sicily, cap. prov. same name, on the E. coast of the island, at the foot of Mount Ætna, at the extremity of a vast plain, 31 m. NNW. Syracuse, on the railway from Messina to Syracuse. Pop. 64,396 in 1862. The city, though it has suffered much from earthquakes, by one of which, in 1693, it was all but totally destroyed, has always risen from its ruins finer and more magnificent than ever. Catania has a noble appearance from the sea; and what is rare in an Italian town, the effect is not diminished on landing; for the streets are regular, spacious, and handsome; and the numerous churches, convents, palaces, and public

establishments, principally constructed of lava, faced with magnesian limestone from Malta and Syracuse, and enriched with marbles from the ruins, are magnificent. The city is nobly situated, on the roots of Ætna, its despoiler and its benefactor. Overwhelmed, as it has often been, by torrents of liquid fire, it has risen, like the phœnix, more splendid from its ashes. The very substance which once ravaged its plains has, by its own decomposition, covered them with soil fertile as the fabled garden of the Hesperides; and on all sides the material of destruction is turned to the purposes of ornament and utility. The streets are paved with lava; houses, palaces, and churches, are built of lava; of lava they form ornamental chimney-pieces, tables, and a variety of toys; whilst a natural mole of lava defends the shipping from the fury of the tempest. The cathedral, founded in 1094, was rebuilt on a simple and grand scale, after the earthquake of 1693; the senate-house, *monte di pietà*, theatre, and most of the municipal establishments, are also fine, appropriate buildings. Near the cathedral is a fine square, ornamented with an antique statue of an elephant bearing on its back an obelisk. It has 49 churches, of which that of St. Maria dell' Ajuto, and several others, are magnificent structures; it has also 19 convents for men, and 11 for women. The Benedictine convent of San Nicolò d'Arena has long been justly celebrated for its vast extent, superb church, excellent organ, large museum, ancient mosaics, and great riches. Among the charitable establishments, exclusive of the *monte di pietà*, are several hospitals, a workhouse, a foundling hospital, a lying-in hospital, and a Magdalen asylum. The university, founded in 1445 by Alphonso of Aragon, is an extensive foundation with an annual revenue of above 2,000*l*. It has able professors, and is well attended: its library and museums are open on holydays to the public. The heirs of Prince Biscari and others have also fine museums. Catania is the seat of a bishopric, of a court of appeal, a criminal court, a civil court, and of the provincial authorities; and enjoys extensive privileges. The humanity, hospitality, and good-breeding of the inhabitants have been eulogised by all travellers. On many occasions they have shown a singular unanimity in public affairs; they had the courage to practise inoculation so early as 1742, and to introduce the potato while an ignorant prejudice existed against it among their neighbours. The principal manufacture is that of silk, which is largely carried on. The working of the yellow amber found on the S. coast of the island affords employment to some thousands of the population. The snow of Mount Ætna is also a great source of wealth. The harbour is not equal to the importance of the city; but it is generally full of small craft that resort thither for corn, macaroni, potatoes, olives, figs, silk, wine, almonds, cheese, oil, soda, manna, cantharides, amber, snow, and lava. The environs are fruitful, and well cultivated.

Catania is very ancient. It is believed to have been founded by the Chalcidians, and had Charondas for its early legislator. Under the Romans, it was the residence of a prætor, and was adorned with many noble buildings. Owing, however, to the repeated occurrence of earthquakes, and the irruption of lava from Ætna, its ancient monuments have been mostly destroyed; but the remains of its amphitheatre, the circumference of which exceeds even that of the colosseum, as well as of its theatre, odeum, hippodrome, temples, aqueducts, baths, &c., attest its former extent and magnificence.

CATANZARO, a town of Southern Italy, prov. Cosenza, in a healthy and agreeable situation, on a mountain near the Gulf of Squilace, 29 m. SSE. Cosenza. Pop. 11,464 in 1862. The town suffered very severely from the dreadful earthquake of 1783, which overthrew several of its principal buildings; it still, however, has a cathedral, several churches and convents, a seminary, a royal academy of science, a lyceum, a foundling hospital, a *monte di pietà*, and two hospitals; and is defended by a castle. It is the seat of a bishopric, of one of the four great civil courts of the kingdom, of a criminal court, and of an ordinary civil tribunal. There are considerable manufactures of silk, velvet, and cloth, and a good deal of trade is carried on in silk, corn, cattle, wine, and oil. The inhabitants are affable and industrious, and the women are reckoned the handsomest in the three Calabrias.

CATEAU-CAMBRESIS, a town of France, dép. du Nord, cap. cant., on the Sallè, 15 m. ESE. Cambray, on the Northern railway. Pop. 9,212 in 1861. The town was formerly fortified; and has manufactures of starch, soap, and tobacco, with tanneries, and some trade in lace. It is celebrated in diplomatic history for the treaty concluded in it, in 1559, between France and Spain.

CATHERINA (SANTA), or NOSSA SENHORA DO DESTERRO, a marit. city of Brazil, cap. prov. St. Catherine, on the W. side of the island of same name, on the narrow strait separating it from the mainland, 520 m. SW. Rio Janeiro; lat. 27° 36′ S., long. 48° 40′ W. Pop. probably from 5,000 to 6,000. From the landing place in the harbour, which is at the bottom of a verdant slope of about 500 yards, the town has a most beautiful appearance, and the perspective is nobly crowned by its fine cathedral. The green is interspersed with orange trees, and forms an agreeable parade. The houses are well built, have two or three stories with boarded floors, and are provided with neat gardens well stocked with excellent vegetables and flowers. Besides the church of Nossa Senhora do Desterro, which gives name to the place, there were some years ago two chapels, a convent, an hospicio, and good barracks. Notwithstanding its excellent port and convenient situation, the trade of the town is not very considerable; but it is frequently visited by ships passing to and from the Pacific, and by those in the S. Sea whale-fishery. Sperm-whales used to be frequent on this coast, and even in the bay of St. Catherine, but they are now comparatively rare. There are some manufactures of coarse cotton and linen stuffs, and earthenware.

The island of St. Catherine may be entirely circumnavigated, and many good anchorages are found between its W. coast and the continent; but the N. part of the channel is the only one suitable for large vessels. Here they anchor in 5 fathoms on a mud bottom which holds well, and are protected from all winds, except from the NE., which are rarely dangerous. Opposite to the town the channel narrows, and the depth of water decreases to 2 fathoms. The roadstead is defended by two forts. This is one of the very best places at which to refit: excellent water may be had in any quantity for nothing, and provisions of all kinds are cheap and abundant.

The island of St. Catherine is about 35 m. in length, N. to S., and from 4 to 8 m. in width. Its shores rise abruptly from the sea to such a height, that in fair weather it is visible 45 m. off. Its most N. extremity, Point Rupa, is in lat. 2° 22′ 31″ N., long. 48° 32′ 7″ W. The surface of the island is singularly varied, presenting granite mountains, fertile plains, swamps fit for the growth of rice, lakes stocked with fish, and several

small streams. Mandioc and flax are the chief articles of culture; but wheat, maize, pulse, onions, rice, sugar, cotton, indigo, and an abundance of fruit are also grown. The climate is rather humid, but temperate and salubrious.

CATMANDOO, or KHATMANDU, an inland city of N. Hindostan, cap. of the Nepaul dom., built in a mountainous region, 154 m. NNW. Patna, and 4,784 ft. above the level of the plains of Bengal. Estimated pop. 20,000. It extends for about 1 m. along the bank of a river; and contains many wooden and brick temples, with the palace of the Nepaul rajah. The houses are mostly mean brick or tile buildings, often three or four stories high; streets narrow and dirty.

CATRINE, a manufacturing town of Scotland, co. Ayr, parish Sorn, on the N. bank of the Ayr, 32 m. S. Glasgow. Pop. 2,484 in 1861. Cotton-works were erected here by a company as early as 1786, and a bleaching-work in 1824. Both works are carried on by means of water-power, but in case of a deficient supply of water, steam-engines make good the deficiency. The bleaching establishment, in addition to what is manufactured at Catrine, bleaches all the cotton produced at the other mills belonging to the same company, the quantity varying from 15,000 to 25,000 yards per day. Every part of the process is carried on within doors, and without interruption, at all seasons of the year. There are seven schools, six of which are supported by the school fees, and one maintained by a fixed salary paid by the company; four libraries, one of which is attached to a Sunday-school; and several places of worship connected with the established church, or belonging to Presbyterian dissenters.

CATTARO, a town of the Austrian states, cap. circ. of same name, at the SE. extremity of the Gulf or *Bocca di Catarro*, 210 m. SE. Zara; lat. 42° 25′ 26″ N., long. 18° 46′ 16″ E. Pop. 3,970 in 1857. The town is walled, and is farther defended by a fort built on an adjoining eminence. Streets narrow, dark, and gloomy. Notwithstanding its small size, it has a cathedral, a collegiate church, seventeen other Roman Catholic churches and chapels, a Greek church, six convents, and a hospital. It is the seat of the administration of the circle and of a bishop, and has a government high-school. The harbour is one of the best in the Adriatic. At its mouth there are two rocks dividing the entrance into three separate channels, two of which admit the largest ships. Internally the gulf is spacious and secure, though little frequented by shipping. The trade of Cattaro is chiefly with the Turkish district of Montenegro. The vicinity is very picturesque; but from being surrounded on three sides by mountains, Cattaro has this disadvantage, that the sun rises an hour later and is lost an hour earlier than in other places under the same latitude. The district of Cattaro was the seat of a Roman colony; but the town itself only dates from the 6th century. It has suffered much from earthquakes, especially in 1563 and 1667. It was long the cap. of a small republic, which, falling into debt, placed itself under the government of Venice on the single condition of having its debts paid. Previously to the treaty of Tilsit this town was for some time in the occupation of the Russians.

CATTEGAT, or KATTEGAT, a portion of the N. Sea, or of the Baltic, between Jutland and Sweden. (See BALTIC.)

CAUBUL, or CABUL (an. *Aria* and *Arachosia*), an extensive region of Central Asia, formerly the centre of a powerful kingdom reaching from Meshed to Cashmere, and from the Oxus to the ocean, but now comprising only the country between lat. 28° and 37° N., and long. 59° 30′ and 72° E.; and divided into four chiefships, independent of each other, viz. those of its principal cities, Caubul, Peshawur, Candahar, and Herat. Caubul, in its extended sense, includes the greater portion of Affghanistan, Seistan (an. *Drangiana*), and Sewestan, with parts of Khorassan, Caufiristan (the Kohistan), and Lahore: length and breadth each about 600 m. The pop. was estimated by Mr. Elphinstone, in 1809, at about 14,000,000, but this estimate is believed to have been too high when it was framed; and since that period civil wars and foreign conquests have deprived Caubul of the provs. of Beloochistan, Sinde, Moultan, Damaun, Cashmere, Balkh, &c., and have diminished the pop. to little more than 5,000,000. At present, besides the cities already named, the chief towns are, Ghiznee, Dooshak, and Furrah.

The N. and E. portion of Caubul is a lofty table-land, its mountains belonging to the Hindoo Koosh (or Indian Caucasus), and two of its offsets, viz. the Solimaun and Paropamisan ranges. The Koosh mountain, about long. 69° E., gives its name to the range which extends from it both W. and E., and beyond the Indus is continuous with the Himalaya, running generally SW. to NE., and in the Kohistan forming the N. boundary of Caubul. Between long. 70° and 72° it makes a remarkable curve to the S., opposite to which the Bolor-Tagh (or cloudy mountains) unites with or approaches it, from Budukhshan on the N. The highest, as well as the most S. point of this curve, is apparently a mountain, called Coond, or Kooner, near long. 71°, where the Affghans believe the ark to have rested after the deluge; a tradition current, however, respecting the Tukhte Solimaun also. The Koosh is covered with perpetual snow; its peaks are visible from Bactria, India, and even Tartary, and one of them, measured by Sir A. Burnes, was found to be 20,493 ft. high. Mr. Elphinstone observed at Peshawur three inferior mountain ranges, progressively decreasing in height beneath the former; the description of which will serve, he says, to give an idea of the rest of the Koosh chain; the lowest range was destitute of snow, and its sides were clothed with forests of pine, oak, and wild olive, European fruits and flowers, fern, and elegant shrubs. The tops of the second range are covered with snow, and the third are so to half their height. On the high central range Mr. Elphinstone observed that 'no diminution in the snow could be perceived in any part in the month of June, when the thermometer in the plain of Peshawur was at 113° Fahr.' The Koh-i-Baba range, between Caubul and Baumian, is the continuation W. of the Koosh; but its peaks are not so lofty, probably not more than 18,000 ft. (Burnes, iii. 203), although 'covered with eternal snow for a considerable distance beneath their summits.' The passes of Hajeeguk and Kaloo on this range are respectively 12,400 and 13,000 ft. above the sea; the other passes are none more than 9,000 ft. in height, and all, without exception, are free from snow by the end of June. In the defiles the road often winds at the base of a mural precipice, rising to 2,000 or 3,000 ft. perpendicularly, and in one part, called Dura-i-zundan, or the 'Valley of the Dungeon,' the height is such as to exclude the sun at noonday: at the height of 10,000 ft., however, the ground in some parts is ploughed when the snow disappears, the grain sown in May being reaped in October. The ranges N. of the Koh-i-Baba are much inferior in height, and often free from snow, but rise from the plains of Balkh in a bold and

precipitous line, 2,500 ft. high. The valley of the Caubul river separates the Koosh from the Teera mountains, which run in a parallel direction, decreasing in size to the E.; but in their higher parts are covered with perpetual snow, and are certainly as much as 15,000 ft. high. (Burnes, ii. 105.) The Solimaun range commences with the Sufued-Koh, S. of the Caubul valley; across which it may be considered as connecting itself with the Koosh, by means of cross ranges, causing many cascades and acclivities in the bed of the river. This range stretches from nearly 34° to 29° N. lat., where it becomes connected with the high table-land of Kelat (Beloochistan). It is not so high as the Koosh: its principal points are the Sufued-Koh, or 'White Mountain,' and the Tukhte Solimaun, or 'Throne of Solomon,' the last near lat. 31° 30′ N.: the former is always covered with snow, and the latter so for three months in the year. Between these two points this range decreases considerably in height, especially where it is intersected by the Gomul river. The Solimaun chain has several parallel ridges, and gives off many lateral and other ranges, especially a remarkable one to the SW., including the Khojeh Amram hills; a broad range, though of no great altitude, which appears to join the table-land of Kelat. On the E. a high and broad range, abounding in salt, passes off near the Teera mountains, across the Indus, into the Punjab, with a SE. direction. The Paropamisan mountains (for which as a whole there is no modern name) occupy a large space of country, extending 350 m. E. to W., and 200 m. N. to S.; W. of the Koosh, and between the Helmund river and Toorkistan. They are a maze of mountains, difficult of access, and little frequented; their E. portion is cold, rugged, and barren, although nowhere covered with perpetual snow: in the W. they contain rather wider valleys, and are somewhat better cultivated. Their greatest declivity is on the N. side, from which they send off several ranges towards Balkh; the slope of the whole tract is towards the W.

The Koosh, collectively called the Caubul Kohistan, or 'Land of Mountains,' contains, in its higher ranges, a number of narrow valleys; in its lower portions the valleys are of some size; Mr. Elphinstone calling them 'plains.' Many open laterally into the valley of Caubul, which occupies the space between the Indian Caucasus and the Solimaun and Teera mountains, and which in some places is 25 m. wide. The narrow plain, or valley of the Swaut river, is well watered; yields two harvests of most sorts of grain; and abounds in orchards, mulberry-gardens, and plane-trees: others are by no means so wide or productive, and are often bounded by a number of narrow glens. There are many fertile and well-watered valleys on both sides the Solimaun range.

Besides those of the desert, which extend over the S. and W. parts of Caubul, there are many extensive and productive plains: that of Peshawur, about 35 m. in diam., is well watered; its streams fringed with willows and tamarisks; and has numerous gardens and orchards scattered over it: the latter contain a profusion of apple, plum, peach, pear, quince, and pomegranate trees. The greater part of this plain is highly cultivated and irrigated by canals, and the uncultivated parts covered with a thick elastic sod, scarcely equalled, except in England: its villages are generally large, very clean and neat, and surrounded with groves of date, peepul, and tamarisk. The valley of Caubul encloses some small plains, of which that of Jellalabad is the principal. Most of the cities and large towns are in fertile plains; one of great luxuriance surrounds Herat; and the site of Furrah, and other places in the W., as well as the banks of the Helmund, seem 'rich oases in the midst of a waste.' The desert in Seistan, Gurmseer, and Shorawuk, has an ill-defined boundary, and often encroaches on the habitable country.

The Indus forms, for a short distance, the E. boundary, and excepting it, there is no river which is not fordable throughout its course for the greater part of the year. The principal of the minor rivers are the Caubul, Helmund, Furrah-Rood and Lora. The only lake of any importance is that of Seistan, or Zurrah (*Aria Palus*), which receives the waters of the Helmund (*Etymander*).

The *Climate* varies with the elevation; the temperature is much higher at Peshawur and Candahar than at Caubul and Ghiznee; but, generally speaking, the average heat of the year does not equal that of India, nor the cold that of England. At Caubul the snow lies on the ground for five months, and Burnes found the thermometer stood no higher than 64° Fahr. during the hottest period of the day in the month of May. The prevailing winds throughout Caubul are westerly. The rains brought by the SW. monsoons are much diminished in power by the time they reach the NE. part of the country, where the rainy season is limited to a month of cloudy weather, and occasional showers. At Candahar the influence of this monsoon is not felt in the least degree: at Caubul there is no regular wet season; but showers are frequent at all times of the year, as in England. At Peshawur, by the first week in March, peach and plum trees begin to blossom, and by the end of that month are in full foliage: from July to Septr. the weather is cloudy; the winter lasts from the latter month till Feb. Caubul generally is healthy; the most prevalent diseases are fevers, small-pox, and ophthalmia. Sir A. Burnes found the inhabitants of the Koosh, at 10,000 ft. above the sea, quite free from *goitre*, so common in the lower rangés of the Himalaya.

Geology and Minerals.—A core of granite, and resting on it a deep bed of slate, are the prominent geological features of the Koosh: the slate formation includes gneiss, mica, and clay-slate, chlorite, carbonate of lime, and quartz; gneiss generally occupying the lower portion. The Solimaun chain is composed of a hard black stone; its accompanying ranges on the E. of an equally hard red stone, and a friable grey sandstone: the hills between Herat and Dooshak consist partly of a mixed reddish and black rock, streaked with ore, and partly of greywacke slate. Iron, lead, copper, antimony, tin, and zinc are found in various parts of the mountain region, and 10 or 12 lead mines near Baumian, and elsewhere, are worked; gold is washed down by the rivers that come from the Hindoo Koosh; there are extensive deposits of sulphur in Seistan, at Cohut, &c.; coal, naphtha, and petroleum are met with in the latter district; salt in the E. part of the country, both in springs and beds; and saltpetre is procured from the soil in many places.

Many of the forest trees, and most of the finer fruits of Europe grow wild. The timber in the mountain region consists chiefly of pine, oak, cedar, gigantic cypress, and wild olive: the Hindoo Koosh is destitute of wood, and in many places of verdure. Some of the hills produce the birch, holly, hazel, and mastic, the wild vine, berberry, blackberry, and many other bushes bearing edible berries; the valleys abound with extensive orchards, particularly of apricot-trees; the other trees most common on the plains are the mulberry, tamarisk, plane, willow, and poplar. The assa-fœtida plant grows luxuriantly at an elevation of

7,000 ft.; hemlock, fennel, peppermint, nettles, and other such plants common in Europe, are equally common in the higher parts of Caubul, with a profusion of roses, poppies, hyacinths, and jessamines. The vegetation of the lowlands approximates more to that of India; and, on descending into them, the contrast with the country just passed is so striking that it is thus adverted to by the Emperor Baber in his commentaries:—'I saw another world. The grass, the birds, the trees, the animals, and the tribes of men: all was new! I was astonished.'

Lions of a small species are said to have been found in the hilly country about Caubul; tigers are met with in most of the wooded tracts; wolves, hyenas, jackals, wild dogs, the elk, and various other kinds of deer, wild sheep, and goats, on the E. hills; the wild ass in the desert; foxes, hares, porcupines, ichneumons, and ferrets are also found. Birds are very numerous, and include several kinds of eagles, hawks, and other birds of prey; herons, cranes, wild fowl, and game, in plenty; doves, magpies, thrushes, and nightingales: parrots and birds of rich plumage are found only in the E. Turtles and tortoises are numerous; there are no crocodiles in the rivers; the snakes are mostly harmless. Large scorpions infest Peshawur; mosquitoes, except in Seistan, are less troublesome than in India; large flights of locusts are rare, but occasionally cause a famine in Khorassan.

Races of Men.—The Affghans, who call themselves Pooshtoon, bear a considerable resemblance to the Jews; and, though they consider it a reproach to be called Jews, they claim descent from a son of Saul. Sir W. Jones and Sir A. Burnes contend for their Jewish origin; Mr. Elphinstone discredits it. They are divided into a number of tribes, often at war with each other, especially those in the E. of Caubul, and each under the authority of a chief, who, however, is usually assisted by a council (*jeerga*), consisting of the heads of the tribe. Mr. Elphinstone conceives their political condition to bear a strong analogy to that of the Scottish clans, in former times; but the genius of the Affghans is more decidedly republican; they resist every encroachment of their rulers, and have a boldness and elevation of character unknown to most other Asiatic nations. They are Mohammedans of the Soonite sect, but use the Persian alphabet: their literature bears a similarity to that of the Persians; but it has a superior dignity and refinement, and in many respects is not unlike that of Europe. The Affghans are hospitable, and tolerant in religion; but extremely superstitious and addicted to astrology, divination and alchemy. They are plunderers by profession; in the W. they live in tents, in the E. in fixed habitations; only a few of them reside in the large towns. Their chief amusements are the chase, feasting, songs and recitations: they have slaves, but traffic very little in them. (See AFFGHANISTAN.)

The Eimauks and Hazaurehs, two races of Tartar origin, although using dialects of the Persian tongue, inhabit the Paropamisan mountains. The Eimauks, who are divided into four principal tribes, subdivided into numerous clans, each governed by its chief, occupy the lower parts of the country, between Caubul city and Herat; Mr. Elphinstone estimated their number at about 450,000. In war they are ferocious and cruel: they retain many Mogul customs, mixed with others of Persian origin; they live almost entirely in camps, and use the same kind of food as the Affghans, with the addition of horse-flesh and bread of an oily kind of nut. They cultivate wheat, barley, and millet; keep many sheep, and rear a small but active breed of horses: they are Mohammedans of the Soonite sect. The Hazaurehs have been estimated at about 350,000; they inhabit a higher region than the Eimauks, a cold and sterile country, where little corn can be grown: their sheep, oxen, horses, and the produce of the chase, furnish them with their principal articles of food; sugar and salt are the foreign commodities most in demand amongst them. They live in villages of thatched houses, and are divided into different clans, constantly at war with each other, and each governed by an absolute chief. The Hazaurehs have strong Tartar features, and many similarities in customs and dress with the Uzbeks; the women, who are frequently good-looking, possess an unexampled license and ascendancy over their husbands. These people are passionate, fickle, and capricious; but conversable, hospitable, and very fond of music, recitation, visiting, and other sociable kinds of amusement. Many of them are performers on a guitar, poets, and *improvisatori*. They belong to the sect of Ali. The Tadjiks, or Taujiks (see BOKHARA), are probably descendants of the original Persian inhab. of the country, and of the Arabs who conquered it in the first century after the Hegira. They live mostly in and round the larger towns, and everywhere reside in fixed habitations, having settled employments. They are zealous Soonees, mild, sober, peaceable, and industrious; and assimilate much more with the Affghans than their brethren of Bokhara do with the Uzbeks. The Tadjiks are most numerous towards the W. of Caubul; as the Hindkees (Hindoos, Juts, Sindians) are towards the E. The Hindoos are, however, to be met with all over the country, chiefly as money-changers and tradesmen; they are mostly of the Kshastriya or military caste. The Kuzzilbashes, or Persian Toorks, inhabit the towns; the Beloochees are generally almost confined to the S.: there are about 2,000 Arab families, besides Armenians, Abyssinians, European Turks, Jews, and Caufirs amongst the population.

Agriculture.—There are five classes of cultivators—1st, proprietors, who cultivate their own land; 2nd, tenants, who pay a fixed rent in money, or a proportion of the produce; 3rd, *buzgurs*, or metayers; 4th, hired labourers; 5th, *villeins*, who cultivate their lords' lands without wages. The lands are more equally divided in Caubul than in most countries, and the first class, or that of small proprietors, is very large, as by the Mohammedan law every man's estate is at his death divided equally amongst his sons. The class of tenants is not numerous. Leases are generally from 1 to 5 years, and the rent varies from 1-10th part to half the produce; the landlord generally providing the seed, cattle, and farm implements. Labourers are principally employed by the *buzgurs*; they are fed and clothed by their employers, and paid for 9 months' work about 30 rupees. The *villeins* are many of them of foreign descent, and always attached to the service of some master; they are subject to taxation, and even death-punishment from their lord, but have the privilege of removing from the service of one master to another: they are most numerous amongst the Eusofzyes and other Affghan tribes in the NE. There are two harvests in the year; one crop, consisting of rice, millet, *jowaree*, and maize, is sown in the spring, and reaped in autumn; the other, which consists of wheat, barley, and legumes, is sown at the end of autumn, and reaped in summer. Rice is grown in most parts of the country, but wheat is the common food of the people: barley is usually given to horses. The vegetables and pot-herbs of Europe and India are cultivated largely, especially turnips

and carrots; melons and cucumbers are abundantly grown in the neighbourhood of the towns; and ginger, turmeric, and the sugar-cane in the E.; but the latter plant is confined to rich plains, and most of the sugar, as well as the cotton, used in Caubul is brought from India. The palma Christi, sesamum, and mustard, are grown for the sake of their oil; tobacco is cultivated in most parts; madder abounds in the W.; and Caubul furnishes to India its chief supply of that article: lucerne and other artificial grasses are sown for the cattle. Much of the land fit for culture has been brought into that state by irrigations undertaken by individuals singly, or associated for the purpose. Cultivable land in Caubul is generally valued at from nine to twelve years' purchase. Irrigation is effected by means of canals and subterranean conduits, beneath the slopes of hills, termed *cauraiz*, which are common in Persia. The plough is heavier and makes deeper furrows than that of India, but still only employs one pair of oxen. All grain is sown broadcast; and drill husbandry is unknown. The place of a harrow is supplied by a plank dragged over the field, on which a man stands. The sickle is the only instrument used for reaping. The flail is unknown; and the corn is trodden out by oxen, or forced out by a frame of wood filled with branches, on which a man sits, and is dragged over the straw by cattle. It is winnowed by being thrown against the wind, and, when cleaned, is kept in hampers plastered with mud, unbaked earthen pots, and coarse hair-cloth bags.

For grinding the corn, windmills are used in the W., but these are very different from ours, for the sails are inside, and there is an opening in the erection to admit the wind. Water-mills are not unknown, but handmills are most generally used. The manure employed is composed of dung, straw, and ashes, but the dung of camels is carefully avoided. Horses are employed in ploughing only by the Eimauks; in Seistan camels perform this work. There are no carts. The horses of Herat are very fine, and somewhat similar to the Arabian breed; and there is a strong and useful breed of ponies, especially about Baumeean. Mules preferable to those of India; but asses, camels, and dromedaries mostly are used for carriage. The ox resembles that of India; sheep chiefly of the broad-tailed kind; and the goats, which are numerous, have often long and tortuous horns. The greyhounds and pointers are excellent. A great number of horses are annually sold in the N. and W. of India, under the name of Caubul and Candahar breeds; but no horses are bred in large numbers in Caubul, nor are those of Candahar exported in any quantity.

Trade.—Exports.—The principal foreign trade is with India, Persia, and Toorkistan: the exports to the first-named country are principally horses and ponies; furs, shawls, chintz; madder, assafœtida, tobacco, and fruits: those to Toorkistan are shawls, turbans, chintz, white cloth, indigo, and other Indian produce: to Persia the same articles, with the carpets of Herat. The latter-named article, with woollens, furs, madder, cheese, and some piece-goods, are sent from the W. to the E. provs.; and Bhawupoor and Mooltan cloths, silk, cotton, and indigo, are sent back in return. Iron, salt, alum, sulphur, and the other natural produce, are also exported.

Imports.—From India are coarse cotton cloths, worn by the mass of the people; muslins, silks, and brocade; indigo, in great quantities; ivory, chalk, bamboos, wax, tin, sandal-wood, sugar, and spices: from Toorkistan, horses, gold, and silver; cochineal, broad cloth, and tinsel: cast-iron pots, cutlery, hardware, and other European articles, from Russia, *viâ* Bokhara. Silks, cottons, embroidery, and Indian chintz come from Persia; slaves from Arabia and Abyssinia; silks, satins, tea, porcelain, dyes, and the precious metals, from the Chinese dominions; and dates and cocoa-nuts from Beloochistan. The merchants are chiefly Tadjiks, Persians, or Affghans, and Hindkees in the E.; but no Affghan ever keeps a shop, or exercises any handicraft trade. Caubul is the great mart for the trade with Toorkistan; Peshawur for that with the Punjab; and Candahar and Herat for that with Persia. The demand for British manufactures has increased so much latterly, that Russia, which before 1816 supplied a great many articles, now only sends nankeen and broad chintz, of a description not manufactured in Britain, into the market. The greater part of the trade between India, Caubul, and Bokhara is conducted by the Lohanees, a pastoral tribe of Affghans, often of considerable wealth. About 1,000 camel-loads of Indian goods are annually consumed in Caubul. The Caubul merchants have latterly begun to frequent the annual fairs on the borders of the Russian dominions, and most of the Russian trade with Bokhara has fallen into their hands. Sir A. Burnes remarks, that were such fairs to be established on our NW. frontier, and encouragement given to the Lohanee merchants, who are every way deserving of it, a large export of British manufactures would take place.

Roads.—In an inland country, without navigable rivers, and not suited to wheeled carriages, traffic must be carried on by means of beasts of burden; camels are the principal of these in Caubul, and constitute great part of the wealth of many individuals, as they are let out to merchants by those who cannot afford to trade themselves. The merchants commonly travel in bodies, called *caravans*, and place themselves generally under the conduct of some chief whom they elect as a *canfila baushee*, or an officer with absolute command over all the arrangements of the journey. There are but two great routes through the country; one from Balkh across the mountains at Baumeean, through Caubul to Peshawur, and thence into the Punjab; and the other from Herat to Candahar: on this line there are few obstacles to oppose a European army, and the latter city could furnish abundant supplies. From Candahar there are two routes; the former through Ghiznee to Caubul, not difficult for nine months in the year, but next to impassable in the winter, from the snow and intense cold; the second through the valley of Pisheen and Quetta to Shikarpore in Sinde; a country furnishing supplies of food, but deficient in wood and water. There is another road across the Solimaun range from Candahar to Dera Ghazee Khan, in Damaun; but it is said to be hardly practicable for a European army, and is not travelled by merchants. The Khyber Pass from Peshawur to Caubul has, in consequence of enormous exactions on merchandise at the former place, been deserted by traders, and is unsafe. Camels, horses, mules, &c., are cheap enough throughout Caubul; but fuel is very scarce and dear, and water is not generally to be had in abundance: two great drawbacks in travelling. (Conolly, ii. 323.)

The Public Revenue, in settled times, amounts, according to Mr. Elphinstone, to nearly 3,000,000*l.*; but, before the revolution which dethroned Shah Shoojah, 1-3rd part was remitted to different tributary princes, who consented to hold their dominions as grants from the khan of Caubul: of the rest, half was assigned for military services to the chiefs, and the remainder for the maintenance of moollahs and dervises. The chief sources of

the revenue under the present khan are, the land, the tribute of certain tribes, the town duties and customs, certain fines and forfeitures, and the profits of the mint. The land revenue is collected by the head man of each village, and paid either through the head of the tribe, or the *hakim* or governor of the province: great peculation is often practised by the *hakim*, as the current expenses are paid before the balance is sent to the treasury.

Government.—Under the monarchy, the crown was hereditary in the family of the Suddozyes, who belonged to the tribe of the Dooraunees, said by Mr. Elphinstone to be the greatest, bravest, and most civilised of all the Affghan tribes. The right of succession was not always vested in the eldest son; but the future heir was determined either by the reigning sovereign or a council of the great officers of state.

Justice is administered in the cities by the *cauzy* (or *cadi*), assisted by muftis and other officers; but where the khan happens to reside, criminal complaints are made to him. The cauzies have deputies over the whole country. The police of towns is managed under one head, in three departments, viz. watchmen, inspectors of public morals, and superintendents of weights and measures. In the country the people to whom the land belongs are answerable for the police. In cases of robbery and theft, if the chief of the village or of the division of a tribe in whose lands a crime was committed, fail to produce the thief, he pays the value of the property stolen, and levies it on the people under him. The police is very bad, and does not interfere in murders for retaliation, except in towns and their vicinity.

Religious Establishment.—Moollahs or priests always fill the duties of inspectors of public morals: under the police established in the country, they have grants of land from the head-man of the tribe, and a tax similar to tithes, but by no means equivalent to them in amount: in the towns they are maintained by fees on marriages and burials, and the gifts of their congregations. A superintendent priest and a registrar are established in each city; several are connected with the royal household; and at the visit of Mr. Elphinstone, there was a professor and a body of students in theology at the king's palace, each of whom received a daily allowance for his support.

Armed force is chiefly cavalry, 3-4ths of whom are Kuzzilbashes. They are collected in bodies, varying in number from 6 to 300, under their several chiefs, and tolerably mounted. Their dress is a *loongee* or turban, one end of which is tied under the throat in the field; a *kummerbund* or garment, which serves for a coverlid at night; a *koorla* or shirt, *ulkaliq* (low trowsers), and boots to the knees, and over all a *caftan* or cloak: their arms are a sabre, a gun, with a good flint lock, and long bayonet; a powder and ball pouch round the waist, and always a shield: their saddles are high both behind and before, and they all carry a rope with a twisted chain attached, by which they can secure their horses at any place or time. There are about 12,000 infantry, all Affghans, armed with a sword, shield, and match-lock, which carries twice as far as a musket; but being too heavy to be brought up to the shoulder, is furnished with a prong or rest, which is fixed in the ground. These troops are but skirmishers, and fight generally in ambush: there are besides two regiments raised seven years ago in Bombay, one of 800, and the other of 300 men, dressed in European uniform, but ill paid and disciplined; and wretched artillery of about fifty field-pieces of different sizes, only half of which are used.

History.—Caubul was amongst the countries invaded by Alexander, and several spots may be almost confidently identified with those mentioned by the historians of that conqueror. A remarkable rock near Bajour is probably the celebrated Aornus; Jellalabad is supposed to be in the neighbourhood of the spot where Alexander revelled in imitation of Bacchus; many topes or artificial mounds are situated along the skirt of the mountain ridges, and on the banks of the Caubul river, some of which having been opened, have been found to contain Grecian coins, gems, bones, cups, lamps, &c. A. D. 997 Caubul was conquered by the Tartars under Sebuctaghi, whose successors extended their empire over great part of India, Khorassan, Balkh, and Budukshan. In 1737 Nadir Shah possessed himself of the country; and in 1747 Ahmed Shah Abdalli, the founder of the Dooraunee dynasty, was crowned at Candahar. His successor Timour Shah died in 1793 without naming an heir, and, in consequence of the uncertainty of the succession, a protracted civil war broke out among his three sons. One of them, Shah Shoojah-ul-Moolk, having succeeded in placing himself on the throne, was defeated and deposed, in 1809, by Futteh Khan, chief of the Baurickzye family, who espoused the cause of Mahmoud, brother of Shah Shoojah. But notwithstanding his great services, Futteh Khan was treacherously murdered, in 1818, by Mahmoud. On this event taking place, the brothers of Futteh Khan, who had been made governors of provinces, revolted; and one of them, Dost Mohamed Khan, established himself on the throne of Caubul. Runjeet Singh seized about the same time on Cashmere and Peshawur; and Herat and its dependencies were the only part of the old monarchy that continued in the possession of the Dooraunee dynasty. Dost Mohamed having assisted the Persians in their attempts on Herat; and having, it is alleged, on various occasions evinced his hostility to British interests, the Indian government determined upon dethroning him, and on placing Shah Shoojah on the *musnud*. For this purpose a powerful army crossed the Indus, and advanced as far as Ghiznee without meeting any opposition, other than that arising from the nature of the country, and the deficiency of supplies. The latter having been taken by storm, after a short but sharp contest, on the 23rd June 1839, a panic seized the troops of Dost Mohamed, who immediately disbanded themselves; and Shah Shoojah was shortly after enthroned at Caubul, whence he had been driven thirty years before. But he was unable to maintain himself on his slippery elevation even with the assistance of the strong British force left in Caubul. We have elsewhere noticed the singularly disastrous retreat of that force from that city early in 1842; with the subsequent invasion of the country by the British, and their final withdrawal from it. (See AFFGHANISTAN in this Dict.; Elphinstone's Caubul, *passim*; Conolly's Journey to India; Burnes' Trav. into Bokhara, 1835.)

CAUBUL, the ancient cap. of the above country, under the Douraunee dynasty, situated in the plain, and on both banks the river of same name, 6,600 ft. above the level of the sea; 56 m. NNE. Ghiznee, 140 m. WNW. Peshawur: lat. 34° 22′ N., long. 69° 15′ E. Pop. about 60,000. The city is compactly built: on three sides it is enclosed by a semicircle of low hills, along the top of which runs a weak wall, with an opening surrounded by a rampart towards the E., by which the principal road enters through a gate, after passing a bridge over the river. The Balla Hissaur, or 'palace of the kings,' which stands on the

part of the hill N. of this entrance, is a kind of citadel, and contains several halls, distinguished with the royal ornament of a gilded cupola: there is an upper citadel, formerly used as a state prison for princes of the blood; but as fortresses both are contemptible. In the centre of the city is an open square, whence issue four bazaars, with shops about two stories high; the houses are constructed of sun-dried bricks and wood, but few of them have any pretensions to elegance. Caubul is, however, a bustling place; the chief mart of trade in the country; and its bazaars are superior to most in the E.: the great bazaar is a handsome roofed arcade 600 ft. long by 30 ft. broad. Each different trade has its separate quarter. Provisions in summer are moderate, but both wood and grain are dear in winter. Its climate, and the scenery around it, are both very fine; the banks of its river are beautifully adorned with poplar, willow, and mulberry; but the most pleasing spot in its vicinity is the tomb of the Emperor Baber, who made Caubul his capital. His grave is marked by two erect slabs of white marble, situated in a small garden at the summit of a hill overlooking the city: outside Caubul also stands the tomb of Timour Shah, an unfinished octagonal brick building 50 ft. high.

In the 7th century of our æra, the Arabian writers mention Caubul as the residence of a Hindoo prince; it was, as already stated, the capital of the empire of Baber, and taken by Nadir Shah in 1739. At his death it was taken by Ahmed Shah Abdalli, and remained the capital of Affghanistan till the destruction of the monarchy.

The chiefship of Caubul extends N. to the Hindoo Koosh and Baumeeân; E. to Neemla half way to Peshawur; S. to Ghiznee, which city it includes; and W. to the country of the Hazaurehs. Much of the country is mountainous, and of great natural strength but small resources; there is plenty of fruit, and forage for cattle, but grain grows scantily. The revenues of Caubul amount to 18 lacs rupees a year: those derived from the city customs are 2 lacs annually, which amount they have reached in consequence of the encouragement given to trade by the lately deposed khan.

CAUCASUS, a great mountain-range, extending in a NW. and SE. direction, between the Black and Caspian Seas. Its extreme points are those of the main ridge or back bone of the system, which, commencing at Anape, on the Black Sea, in lat. 44° 50′ N., runs first SE. as far as the parallel of 42° 50′, and meridian of 40° 45′; then almost due E. to the long. of 46°, and finally, again SE. to Baku, on the Caspian Sea, in lat. 40° 20′, where it terminates. The direct distance between Anape and Baku is 690 m., but, following its windings, the ridge of the Caucasus measures 800 m. The extent of the mountains towards the N. is very well marked by the courses of the rivers Kuban and Terek; the one flowing W., along the basis to the Black Sea, the other E. to the Caspian. The natural S. limit is the Araxes; so that the breadth of this range, in its widest part, is about 5°, or nearly 350 m.; and in its narrowest, along the shores of the Caspian, not much short of 250 m. The area enclosed by these two seas and three rivers, taken as the boundaries of the Caucasian system, is not less than 100,000 sq. m., but it must be remarked, that within these limits there is, though not much, some level land; and that the least elevation is found, not in the bed of the Araxes, but in that of the Kur. (Klaproth's Trav. in Cauc. and Georg., p. 158, *et seq.*; Mignan's Winter Journey through Russia, i. 27, *et seq.*; Col. Monteith's Geog. Journ., iii. 21–57.)

The highest peak of the Caucasus attains an altitude of 17,785 ft., which is more than 2,000 ft. higher than Monte Blanc. (Bontzkoffskoi's Lettres sur le Caucasse, p. 23.) This peak, or rather mountain-knot, is found nearly at the intersection of the 43rd parallel with the 42nd meridian. Among European geographers it has been called, improperly enough, ELBOURS, ELBURZ, or ELBROUZ; a name which, in the spread of information concerning E. countries, is likely to be productive of no little confusion. It is already applied to a peak of the Caucasus, and a range on the S. of the Caspian Sea, and may, unless care be taken, be multiplied indefinitely, since it is not a proper name, but a common designation for any mountain *which reaches the snow line.* (Klaproth, p. 170.) From this point, as from a centre, the mountains descend in all directions, but much more rapidly towards the N. and W. than towards the E. and S. (Klaproth, p. 276.) The Mquinvari peak, to which the Russians have improperly given the name of Kasbek, is said by Klaproth to attain an elevation of 4,419 metres, or of 14,500 ft. (Lettres sur la Caucasse, p. 40.) Farther E., the ridge declines towards the Caspian; and where it approaches that sea, as in the Cape of Absharon, or at the town of Derbend, the eminences do not probably exceed 1,500 or 2,000 ft. The ridge W. from Elbours is very considerably lower, and presents fewer peaks; it appears to descend gradually, till at Anape, on the Black Sea, its elevation is only about 180 feet above the *water;* but this height rises perpendicularly, and the face of the rock is continued downwards for several hundred fathoms; such being the depth of the sea at this point. The N. ranges run nearly parallel to the main ridge, and extend about 100 m., when they suddenly and abruptly terminate in the low steppe of the Don and Wolga. This frontier, as it may be termed, of the Caucasus, is called the Black Mountains (Schernye Gory). The Bechtag, the highest point, is probably not less than 6,000 ft. in height, and there are several summits which appear to have a nearly equal elevation; extreme ruggedness is, however, a stronger characteristic of these hills than altitude. The Elbours (Osha Makhua) appeared to Pallas to rise in the horizon to more than double the height of the Bechtag, when viewed from a station very near the base of the latter. S. of the main chain, the country spreads into table-lands, terraces, and slopes, broken and intersected by transverse ranges and peaks, of which last the highest is Ali Guz, in 40½° N., 44¼° E., its elevation being about 15,000 ft. About 50 m. S. of this, but on the other side of the Araxes, is Mount Ararat; but it cannot with any propriety be reckoned as part of the Caucasus. Towards the SE., between the Kur and Araxes, the mountains spread into a level but considerably elevated plain, 24 m. in width, and terminated by a strong defile towards Erivan. The various plains, valleys, and defiles of this part of the mountains seem to vary between 4,000 and 6,000 ft. in height. On the N. the Caucasus is absolutely unconnected with any other mountain-range, unless the chain of the Crimea may be regarded as an exception; but on the S. it mingles with the high land of Azerbijan; on the SW. it combines with the mountains of Armenia, and through them with the Taurus; and on the SE. its offshoots appear to be continued by the mountains of Ghilan and Mazunderan, to the Elbours (Persian), Paropamisan, Hindoo Koosh, and Himalayas. (Guldenstadt, Reise durch Russland,

i. 433, *et seq.*, ii. 23, *et seq.*; Gmelin, Reise durch Russland, iii. 84, *et seq.*; Annales des Voy., xii. 5, et seq., 167, *et seq.*; Pallas, i. 339, *et seq.*; Klaproth, 158, *et seq.*; Monteith's Geog. Journ., iii. 31, *et seq.*).

The above results as to the extent and elevation of the Caucasus are deduced from a very full comparison of the authorities cited, and of others not named. It is right, however, to state that they cannot be wholly depended upon. There is the most extraordinary discrepancy among authorities as to the extent of the mountain-system, its elevation, &c.; but the above results seem to be those on which most reliance may be placed.

The ancients mention two principal passes of the Caucasus, the Caucasian Gates and the Albanian Gates; of which the former is at present the great, indeed almost the only frequented pass. It runs close by the base of the Kasbek mountain, in lat. 42½° N., long. 44½ E., and is, in fact, a deep ravine, through which the Terek seems to have cut its way in a channel, sometimes scarcely wide enough to allow of its passage. The commencement of this cleft on the S. is 4,000 ft., and it continues to rise, till, at the neck of the pass, it is full 8,000 ft. above the sea. Precipitous walls of porphyry and schist, 3,000 ft. in height, press upon its sides; and awful abysses open beneath it, sometimes, it is said, to the depth of 10,000 ft. Avalanches are frequent in this pass, carrying with them not only any unfortunate travellers who may be in the defile, but very often the *road* itself, and even when the snow does not descend in masses, its meltings in the spring and summer cause occasional floods, which carry every thing before them. The direct length of this defile may be about 120 m., from Mosdok to Gory; and some idea may be formed of its difficulty from the fact that Strabo (xi. 500) describes it as occupying four days in the passage. This must be understood also of summer travelling, since in winter the pass was wholly unapproachable. The Russians have, however, made it passable even for carriages; and in January, 1830, it was crossed by the Persian embassy, but this winter transit employed *six days*. (Mignan, i. 46.) About midway stands the old castle of Dariel, in the narrowest and highest part of the gorge, where the statement of Pliny (vi. 2), that an iron gate would be sufficient to close the opening, seems to be any thing but an exaggeration. This castle is therefore, in all probability, the fortress which, according to the Roman naturalist, was called, though improperly, the *Pylæ Caspiæ*. (Klaproth, p. 311; Monteith, G. J., iii. 39.) The Albanian Gates appear to answer to a pass between Georgia and Daghestan, in lat. 42° N., long. 47° E. (Ptolemy, v. 9; Lapie's Map; An. Voy., xii. 1.) This is, however, very little known; it is almost wholly in the possession of the native tribes, and probably is not passable except for hunters, and in the summer. Ptolemy's E. Sarmatian Gates (Geog. v. 9) appear to be the pass of Derbend, on the Caspian Sea: this is always available; its narrowness makes it a strong military position, and the swampy nature of the shore renders travelling along it often difficult. A similar remark applies still more forcibly to the pass between the W. termination of the Caucasus and the Black Sea. Along this road Prince Gortschakoff, in the last war, succeeded in marching an army, with incredible difficulty, from Anape to Sokhumkulla (about 150 m.); but here he found it equally impossible to advance or retreat, and was compelled to return by sea. (Monteith, G. J., iii. 37.) The impediments to the coast roads appear, however, to consist only in the number and power of the mountain torrents, which, without bridge or boat, are quite impassable; and as a very wide bank of hard sand stretches along the whole shore, it may be practicable to throw bridges over all the streams; but very considerable height and strength will be necessary to secure them from the effects of sudden floods. These are all the passes over the main ridge, and the transverse ranges do not seem to be better provided; one only appears to exist between Imeritia and Georgia, and that has been rendered available only within modern times, and is still encumbered with great difficulties.

Geology.—The bases of the Caucasus on the N. seem to be covered with sand or a sandy marl, from which the first eminences rise in low but abrupt hills of sandstone, tufa, and iron-stone. These are rapidly succeeded by higher and more mountainous elevations of white calcareous limestone, many of which exhibit unquestionable evidence of decay, the rivers that flow through and round them depositing thick layers of a yellow and grey sandy consistence. Occasionally the limestone rises into great rocky peaks and ridges, between which marshy plains of sandy mud are not unfrequent, apparently formed by the débris of the mountains themselves. This limestone, of which the Bechtag, the Metshuka, and nearly all the frontier line of the Caucasus is formed, is very ancient, and exhibits scarcely any petrifactions; behind this rises a ridge of slate, from the appearance of which the term *Black Mountain* is given to the range. The higher ranges, which rise to the snow line, consist of basalt, schistus, porphyry, granite, and other old formations, so that whether its actual material, or the absence of organic remains, be considered, it is probable that the Caucasus is one of the oldest mountain systems in the world. The S. slope exhibits the same succession of formations, as far as regards the three principal strata, but much less rapidly. Sandstone is far less abundant in the S. than in the N., but, on the other hand, calcareous spar, milk-quartz, and other fossils, are frequently met with, indicating a much greater degree of wealth in mineral ores. Lava and other volcanic matter is common enough among the formations; but, though *mud* volcanos exist in various parts of the Caucasus, igneous eruptions are unknown; and neither Klaproth nor Pallas could come to any satisfactory conclusion as to their former existence. Monteith is of opinion that the volcanic rocks are rather to be ascribed to the sudden rise of a great extent of country, than to emissions from particular mountains. (Guldenstadt, i. 434–441, ii. 23–29; Pallas, i. 337, 347, 358, 365, &c.; Klaproth, pp. 386–390; Monteith, G. J., iii. 49.)

Hydrography.—The Caucasus, like the Alps, does not form the dividing line between rivers flowing in opposite directions; other ranges rise immediately on its S., which shut it out from communication with the Persian Gulf and the Mediterranean; while, on the N., the great plain of the Wolga and Don, after rising from the beds of those rivers for some distance S., subsides again, leaving a positive, though scarcely perceptible, ridge between the sources of Mantyeh and Sarpa and the bases of the Caucasus, with a positive though very gentle slope towards the latter. In consequence of this formation, every drop of water from the Caucasus falls into the Black or Caspian Sea. The principal streams, besides the Kuban, Terek, and Araxes, already mentioned, are the Kur (an. *Cyrus*), and the Phasis, rising on opposite sides of the transverse range which divides Imeritia from Georgia, and running, the first SE. to the Araxes, the other W. to the Black Sea. The

Shorak or Jorak (an. *Apsarus*) is another tolerably large river, running to the Black Sea, and the Koisu (an. *Cassius*), a still larger, falling into the Caspian. The torrents that run short courses to these seas from the flanks of the mountains in their neighbourhood are quite innumerable, as are the affluents of the principal streams which pour from the mountain sides in every direction, sometimes with respectable length of course, and always in immense volume. It may, indeed, be reasonably concluded that the store of moisture in the Caucasus cannot possibly be exceeded by that of any other country of like extent; and since, from the causes before named, it is prevented from spreading beyond the bounds of the mountains, it follows necessarily that no land can be more abundantly watered. Most of the streams are flooded by the melting of the winter snows; and their action on the substance of the mountains is at all times very violent, especially on the slate and limestone. The former is brought down in the form of a black glistening sand, the latter, in that of a soft white substance, so fine and so abundant, that it is used by the natives, in its natural state, for whitening their houses. (Klaproth, p. 386; Pallas, i. 365.)

There is, perhaps, no other mountain region in the world so destitute of lakes as Caucasus. The lake of Sevan or Goukcha, between the Kur and Araxes, is the only one of any size in the whole region, and it can hardly be regarded as belonging to the Caucasus. It is a salt lake, of the kind so common in Central Asia, without any outlet, and occupying nearly the whole extent of a small elevated plain about 48 m. long, by 12 m. in width, 5,300 ft. above the sea. (Pallas, i. 337, &c.; Klaproth, pp. 159, 241–407, &c.; Monteith, G. J., iii. 43, *et seq.*; Spencer, *pass.*)

Climate.—This, of course, varies with the elevation; but perhaps still more with the degree of shelter afforded by the neighbouring ranges from the different winds. Some of the N. valleys, notwithstanding their exposure to the bleak gusts from the Snowy Mountains, are so perfectly protected from the N. wind, that their winter is as mild as in the S. parts of the Crimea. (Pallas, i. 339.) They are subject, however, to sudden and fierce, though brief, vicissitudes; and the very shelter which they possess, by confining the air, makes them unhealthy. With the sharp ascent of the land, the temperature rapidly decreases, and a few hours serves to convey the traveller from the climate of the temperate zone to that of everlasting winter. The cold in the upper ranges is intense; but observations are wanting on which to found any conclusion as to its average; Mignan, at a comparatively low part of the range, found it, in Jan. 1830, a very cold winter, at 4° Fahr., or 28° below the freezing point. (i. 35.) A better idea may, perhaps, be formed on this point, from the quantity of snow deposited in the defiles: 1,400 men were employed a fortnight in cutting a road for the Persian embassy, which, after all, was scarcely passable. (Mignan, i. 40.) Notwithstanding this intensity of cold, the plague is very common on the mountains.

On the S., the countries on the Black Sea and Caspian may be described as warm; those of Imeritia and Georgia as rather cold; but this, again, must be taken with considerable limitation, the N. parts of the two seas being subject to winter frosts. The melting of the ice in them frequently causes chilly summers on their shores, while, on the other hand, some of the higher valleys are among the ottest spots in the Caucasus. The abundance of running water, and the neighbourhood of the two bounding seas, cause a great accumulation of vapour; indeed, so extensive is the exhalation constantly going on, that it may be said every wind, if long continued, brings with it a mist, which nothing can disperse except a storm. These last are, consequently, frequent and terrible. Luckily, however, the cause that produces them gives warning of their approach; the vapours, when grown too heavy for the atmosphere, collect themselves in dense masses round the sides and tops of the mountains; and the Caucasians, warned by this clothing of their Alps, prepare for the explosion, which they know, by long experience, will speedily follow. They wrap themselves in their *tchaoukas* (large cloaks made of wool and goat's hair, and perfectly waterproof), and under a low tent made of felt, expressly for such emergencies, or under the lee of a rock or tree, await, generally in safety, the passing of the tempest. (Spencer's W. Cauc., p. 129.) Sometimes, however, the falling of the cliff or tree destroys those who have sought its shelter; but these accidents are of rare occurrence, as it is not often that the natives are compelled, for want of their felt tents, to run such risks; but to strangers unprovided with the means of combating these storms, the effect is sure to be ultimately fatal. One or, at most, two years' exposure to the varying influence of a Caucasian climate, sends the Russian soldier either to his grave or to the hospital, with a constitution irreceverably broken. The uncertain temperature and the humidity of the atmosphere appear indeed to make it very unhealthy to strangers, especially on the slopes and flats towards the sea. Intermittent and bilious fevers of a very grave kind are endemic, and exceedingly obstinate; and the plague, as before observed, is also very common. (For a singular statement connected with the climate of the Caucasus, see Herodotus, Clio, p. 105; Klaproth, p. 160.) The varying humidity, or some other cause, seems likewise to impress the air with very peculiar qualities; observations of altitude by the barometer, or the boiling point of water, give very inconsistent results at different times (see CASPIAN SEA), and the extent of horizontal vision is frequently quite startling. The Caspian Sea is sometimes seen from the summit of the Bechtag, 164 m. distant; and the Snowy Mountains from Sarepta, on the Wolga, a length of 322 m. (Pallas, i. 370; Klaproth, p. 158.) The distance of the visible horizon, exclusive of refraction, would be in the first case about 94½ m., in the second about 163½ m.; the amount of refraction is, therefore, equal to more than 1°, and nearly 2½° respectively; but, in ordinary states of the atmosphere, the maximum being only 33′, the excess of 27′ and 1° 57′ indicates a variable density in the medium which is truly surprising. Some of the larger clefts are said, in the traditions of the natives, to have been caused by earthquakes; but there are no authenticated records of these phenomena. (Guldenstadt, i. 217–432; Pallas, i. 340, 358, 447, *et pass.*; Gmelin, iii. *pass.*; Klaproth, pp. 163, 165, 309, 333, &c.; Chardin, p. 165; Spencer, W. Cauc., p. 125, *et seq.*, 320, &c.; Circass., i. 286, &c.; Monteith, G. J., iii. 31, &c.)

Productions.—1. *Minerals.*—Except in its deficiency of lakes, the Caucasus has many points of resemblance to the Alps; among others, an apparent poverty of mineral treasures. It is true that this, in the case of the Caucasus, may be apparent only. The ancients unquestionably believed these mountains to be rich in the precious metals, but this they also believed of most other districts that were but slightly known to them; and the limited observations of scientific men in modern times tend to the opposite conclusion. A yellow mineral, called cat gold, is indeed found, which may,

perhaps, have occasioned the stories as to the gold mines of the Caucasus; but it is perfectly worthless. Iron, copper, saltpetre, sulphur, and lead, are found, the last in tolerably large quantities. Salt is almost wholly wanting, and of gems there does not appear to be any vestige. Indications of coal have lately been discovered; and, from the enormous quantity of lime deposits, it is likely that marbles may be found. (Pallas, i. 429; Guldenstadt, i. 441, 456; Klaproth, p. 391; Spencer, W. Cauc., i. 331.)

2. *Vegetables.*—In amount and variety of vegetation, the Caucasian regions seem to be unrivalled. Chardin, writing in 1692, says, 'Mount Caucasus, till ye come *to the very top of it*, is extremely fruitful;' and Spencer, in 1838, says, 'However high the ascent, we see luxurious vegetation, mingling even with the *snow of centuries.*' Nearly every tree, shrub, fruit, grain, and flower, found from the limit of the temperate zone to the pole, is native to or may be raised in the Caucasus. The N. bases consist of arable land of an excellent quality, meadows of the finest grass, and dwarf wood in great abundance. At a very little distance the increase of wood indicates a higher and colder country, but the plants which delight in a warm situation still continue to be very numerous. From the more rapid rise of the ground, bare rocks are more numerous on the N. than on the S., but every shelf, however limited, is marked by a rich vegetation to a height almost inconceivable. The S. slopes and table-lands are still more abundant and varied in their productions than those on the N.; to say nothing of the swampy shores of the Euxine and Caspian, which are, in most cases, nearly impenetrable jungles of the rankest and most varied vegetation. The rising country consists of a succession of small flats, each covered with a most productive earth. The mountain sides and higher plains are clothed with dense forests, and the rivers are frequently unapproachable for a great distance. The forest trees consist of oaks of every species, cedars, cypresses, beeches, savins, junipers, hazels, firs, boxes, pines, alders, and a host of others. Among the standard fruits are found the date palm, the jujube, quince, cherry, olive, wild apricot, and willow-leaved pear. Pomegranates, figs, and mulberries grow wild in all the warmer valleys; and vines twine round the standard trees to a very great elevation up the mountains. A hard-wood tree, called by the natives *outchelia*, is apparently peculiar; it is of a deep rose colour, very closely grained, and susceptible of an extremely high polish. In addition to the vine, the other climbing plants are innumerable, which mixing with the standards, the bramble fruits, such as raspberries and blackberries, and other dwarf woods, form a density of vegetation which it is impossible to penetrate, unless a passage be hewn with the hatchet. Rye, barley, oats, wheat, and millet are abundantly raised, even as high as 7,500 ft. above the sea; and besides these grains, the warmer plains and valleys produce flowers of every scent and dye, cotton, rice, flax, hemp, tobacco, and indigo, with every variety of cucumber and melon. This list is of necessity very imperfect, as will be evident when it is stated that Guldenstadt has filled eighteen quarto pages with the mere names of the various plants seen by him on the banks of the Terek and in Georgia. (i. 188–197, 418–430.) It may serve, however, to exhibit the vegetable riches of a region which seems to produce everything necessary for the existence, and, with the exception of salt, even for the luxurious accommodation of man. (Guldenstadt, as above, *et pass.*; Gmelin, iii. 22–58, *et pass.*; Pallas, i. 340, 357, 364, 368, 379, &c.; Klaproth, pp. 167, 309, 391, &c.; Spencer, Circassia, i. 317, 330, ii. 233, 318, 357, &c.; W. Cauc., i. 29, 188–195, 216, &c.; Monteith, G. J., iii. 31–35.)

3. *Animals.*—Animal life in the Caucasus is on a scale of magnitude and variety equal to its vegetation. Wolves, bears, lynxes, jackals, foxes, wild cats, a peculiar beast of prey called *chaus*, together with many varieties of deer, wander in the forests and on the sides of the mountains. The smaller fur-bearing tribes are also common, as weasels, polecats, ermines, and moles of many varieties. Hares and every other species of game abound, with chamois and goats, of which the Caucasian goat (*Capra Caucassica*) seems peculiar. Sheep with peculiarly long wool are numerous; and it is even doubtful if, among the mountains, this creature be not yet living in a state of nature. This also is one of the homes of wild cattle; the largest species (the aurochs) being found in its forests; while of the domesticated kinds the varieties are numerous and serviceable. The horses of the Caucasus have been famous from a very high antiquity, the Bechtag Mountain having formerly been called Hippicon (Ἱππίκων), from the number of these animals which were grazed upon its sides. (Ptolemy, v. 9.) They are not less numerous in the present day, and are among the very finest varieties of the species. Of birds there are pheasants, partridges, grouse, and the whole tribe of mountain game, a great variety of the crow kind, nearly every species of birds of prey and passage, and some of the best specimens of the domestic varieties. Among insects, the bee and silkworm claim pre-eminence: they are both numerous, and their productions, particularly the honey, formed a considerable branch of trade with Turkey, till the power of Russia sealed the ports of the Black Sea. Other insects are equally numerous, as are also the reptile tribes, among which are some fine species of tortoises and snakes, both harmless and venomous. (Guldenstadt, i. 418, *et passim*; Gmelin, iii. 58, *et passim*; Pallas, i. 341, 410, &c.; Klaproth, p. 344, &c.; Spencer, *passim*.)

Inhabitants.—There is probably no other part of the world, except Africa, S. of the Sahara, where so many nations and languages are collected within so small a space as in the Caucasus. Guldenstadt gives a list of seven different nations, besides Tartars, who speak languages radically different, and who are again subdivided into almost innumerable tribes, among whom the varieties of dialects are nearly infinite. The principal nations he thus enumerates:—1. Georgians; 2. Basians; 3. Abchasians; 4. Tcherkessians; 5. Okesians; 6. Kistiens; 7. Lesghians; 8. Tartars. (Reise, i. 458–495.) Of these the most numerous and important are the Georgians and Circassians or Tcherkessians; but the Abchasians and Okesians, called by Pallas and Klaproth Abassians and Osetians, are also powerful tribes. In habits and manners a strong resemblance is observed among them all; they are usually wandering hunters and warriors, for which occupations their country is peculiarly fitted, and only in an inferior degree shepherds or agriculturists. A partial exception must, however, be made to this general character in favour of the Georgians, who reside in towns, and have long possessed a fixed form of government and internal polity; but, for the rest, they appear to possess the erratic disposition, reckless courage, boundless hospitality, and much of the predatory habits which mark the Arab and other half barbarous people. (See Circassia, Georgia, &c.) It is well known that Blumenbach looked here for the origin of his first and most intellectual

race of men (the Caucasian); but for this, as has been proved, there is not a particle of evidence, historical or philological. The Caucasians, though surrounded by the means of improvement, and occupying a country more favourably situated than that of Switzerland, have made no progress either in arts or arms; and continue to this day the same unlettered barbarians as in the days of Herodotus. (Clio, 203.) They have fine physical forms, but their mental endowments are of the most inferior description.

Name.—This has in all ages been the same among neighbouring nations, though, according to Strabo (xi. 500), the range was called by the natives Κάσπιον ὄρος (Caspian Mountains). The names Caspian and Caucasus have, in the opinion of Klaproth (p. 169), a similar etymology, namely, *Koh-Chaf* or *Chasp*, the mountain of *Chasp*, so called from the Caspii, a powerful people on its sides. (See CASPIAN SEA.) Pliny (vi. 2) derives the name, but with no great appearance of probability, from *Graucasus*, which, he says, in the Scythian tongue, means *nive candidus*. At present the term Caucasus is but little used by the Asiatics, the name for the mountains among the Tartars being *Jal-bus*; among the Turks, *Chaf-daghi* (Mount Ckaf); and among the Armenians, *Jalbusi-ssar*, a modification of the Tartar term; but Caucasus is still in use among them.

CAUDEBEC, a sea-port town of France, dép. Seine Inférieure, cap. cant., on the Seine, at the mouth of the Caudebec, 6 m. S. Yvetot. Pop. 2,164 in 1861. The parish church, built in the 15th century, is remarkable for the boldness and delicacy of its architecture. It has some manufactures of cotton goods. Previously to the revocation of the edict of Nantes, it was comparatively flourishing; but that disastrous measure gave a blow to its manufactures and commerce, from which it has not recovered. Its port, though safe, commodious, and advantageously situated between Havre and Rouen, is but little frequented.

CAUDETE (an. *Biggera*), a town of Spain, prov. Murcia, 8 m. NNW. Villena, 12 m. NE. Yecla. Pop. 6,572 in 1857. The town was formerly fortified; and has a church, 2 convents, a hospital, several distilleries, and a palace of the bishop of Orihuela. On the heights in the vicinity a battle was fought in 1706, the day after the great victory gained by the Duke of Berwick at Almanza, between a detachment of the combined French and Spanish forces and those of the Archduke Charles, which ended in the defeat of the latter.

CAUFIRISTAN, or CAFFRISTAN, a region of Central Asia, occupying a great part of the Hindoo Koosh and a portion of the Bolor Tagh mountains, chiefly between lat. 35° and 36° N., and long. 70° E. and the W. limits of Cashmere; having N. Budukshan, E. Little Thibet, S. the dem. of the Punjab and Caubul, and W. those of Caubul and Koondooz. The hills N. of Bajour and Kooner form its S. limit; its other boundaries have been very imperfectly defined. The whole of this country is a lofty Alpine tract of snow-capped mountains, deep pine forests, interspersed with small but fertile and often populous valleys, and table-lands sometimes 10 or 15 m. across. Torrents and rivers are numerous, and are crossed by stationary wooden bridges or hanging bridges of rope and osiers. The cold of the winter is severe, but the valleys afford an abundance of grapes and other fruits, and the hills good pasture for sheep and goats. The Caufirs (infidels) who inhabit this region are an independent nation, said by Baber and Abul Fazel, and believed by themselves, to be descended from the troops of Alexander the Great. They are supposed by some to have been driven thither from the valley of the Oxus, on its being overrun by the Mohammedans; but Sir A. Burnes and Mr. Elphinstone suppose they had emigrated, through a similar cause, from the neighbourhood of Candahar. They are remarkable for the fairness and beauty of their complexions; are liberal, social, and extremely hospitable: they never combine in war against their neighbours, but retaliate invasions fiercely, and fight with great bravery and determination. They indulge an unceasing hatred against Mohammedans, and a Caufir adds an additional ornament to his dress, or another trophy to a high pole before his door, for each Mussulman he has slain. All wear tight clothes; those of some tribes made of black goat skins, and of others of white cotton: all suffer their hair to hang over their shoulders, and each looks upon every one else as a brother who wears ringlets and drinks wine: to the latter they are much addicted, and grape juice is given to children at the breast. They eat the flesh of all kinds of animals, except the dog and jackal, and use both tables and chairs of a rude construction: the women perform the business of tillage, as well as all laborious domestic occupations. Fine rice, wheat, and barley are the principal grains cultivated; honey, vinegar, cheese, butter, milk, bread and fruit, constitute the rest of their food. Both sexes drink wine to excess. Their dwelling-houses are usually built of wood upon hill-slopes, the roof of one row of houses forming the street to those above it: the only roads in the country are footpaths. Their weapons are spears, scimitars, and bows and arrows. After battle the victors are crowned with chaplets of mulberry-leaves. Both sexes wear ornaments of gold, silver, and other metals; and drinking-cups of the precious metals are often used, and much prized by them. Their language is unintelligible to Hindoos, Usbecks, or Affghans; it contains a mixture of words from the Hindoo, Affghan, and Persian tongues; but the major part of its roots are different from either: they have no books, and neither understand reading nor writing. They adore a supreme being, whom they call Dogan, and to whom they sacrifice both cows and goats; but address themselves to surbordinate deities, represented by idols of wood or stone, who, they say, intercede with the chief deity in their behalf: fire is a requisite in every religious ceremony, although no veneration is paid to that element itself. They neither burn nor bury their dead, but expose the corpse in an open coffin, in a forest jungle or on a mountain, and after a certain time collect as many of the bones as possible, and deposit them in a cave: these ceremonies are solemnized with triumph, dances, and sacrifices. Music, dancing, which is eagerly practised by all classes, conversation, and carousals, form their chief amusements. They have priests, but they do not possess an extensive influence: they live under different chiefs, but little farther is known respecting their government. The slavery of such as have lost their relations is universal: some of the Caufirs possess many slaves and cattle, and much land. By old writers this region is often named Kuttore: it was invaded by Timour, and in 1780, unsuccessfully, by a confederacy of the surrounding Mohammedan nations. (Elphinstone's Caubul, ii. 373–377; Burnes's Trav., iii. 183–185.)

CAUNES (LES), a town of France, dép. Aude, on the Argent-Double, 11 m. NE. Carcassone. Pop. 2,347 in 1861. The town has a fine parish church, formerly belonging to the Benedictine abbey suppressed at the revolution; with distilleries, tanneries, dye-works, marble-works for

working the marble found in the neighbouring mountains.

CAUSSADE, a town of France, dép. Tarn-et-Garonne, cap. cant., in a fertile country, near the Caude, 12 m. NE. Montauban, on the railway from Montauban to Viviers. Pop. 4,033 in 1861. The town is handsome, well-built, and has broad and straight streets; has numerous flour-mills, with manufactures of woollen and linen stuffs, and carries on some trade in corn, saffron, and truffles.

CAVA, a town of Southern Italy, prov. Salerno, cap. cant., in the middle of the agreeable valley of Fenestra, 26 m. ESE. Naples. Pop. 24,378 in 1862. The town has a cathedral, three other churches, a convent for noble ladies, a charity workhouse, a hospital, and a seminary. Silk, cotton, and woollen stuffs are manufactured in the town and the adjacent villages. The territory is not very fruitful, but the inhabitants have become rich by their industry and commerce. About a mile from the town is the magnificent Benedictine convent of La Trinità, with a fine library.

CAVAILLON (anc. *Cabellio*), a town of France, dép. Vaucluse, cap. cant., on the Durance, near where it is joined by the Coulon, at the foot of a mountain, 13 m. SE. Avignon. Pop. 7,797 in 1861. The town is mostly ill-built, with narrow and dirty streets. The fortifications by which it was formerly surrounded were destroyed during the revolution; the bishopric of which it was the seat has been also abolished. It has a considerable trade in dried fruits and preserves, shoes, and nuts.

Cavaillon is a very ancient town. The Romans are believed to have planted a colony in it, and, at all events, they embellished it with several magnificent edifices. But having been since repeatedly overrun and pillaged by barbarians, and having suffered much from an earthquake in 1731, comparatively few remains of antiquity are to be found either in the town or its vicinity. The best preserved, though even that is much dilapidated, is a fragment of a triumphal arch supposed to belong to the age of Augustus.

CAVAN, an inl. co. of Ireland, prov. Ulster, having N. Fermanagh, E. Monaghan, S. Longford, Meath, and Westmeath, and W. Leitrim and Longford. Area, 473,749 imperial acres, of which 30,000 are unimproved mountain and bog, and 21,987 water, consisting principally of loughs Shillin, Ramor, and Oughter. The Shannon has its principal source in the NW. part of this co., and it is traversed by the Erne, Annalee, &c. Surface hilly, and soil generally poor. There are some large estates, but the greater number are of moderate size. About 4-5ths of the land under tillage. Agriculture in the most depressed state; holdings generally small, and the competition for them excessive. Spade cultivation is very general, so much so that in some parishes there is hardly a plough. Oats and potatoes principal crops, but some wheat is raised, and flax. Cottiers have generally pigs and goats; the former being sold to pay the rent, and the latter kept for their milk. Linen manufacture widely diffused, having not a little contributed to the subdivision of the co. It is affirmed that the condition of the peasantry has been materially deteriorated during the last 20 years. Minerals little known. Cavan is divided into 7 baronies and 30 parishes, and sends 2 mems. to the H. of C. for the co. Registered electors 5,989 in 1865. Principal town Cavan. The co. had a population of 243,262 in 1841; of 174,260 in 1851; and of 153,906 in 1861. These statistics of population tell, more than words can do, a sad history of decline.

CAVAN, an inland town of Ireland, co. Cavan, prov. Ulster, 60 m. NW. Dublin, on the railway from Dublin to Enniskillen. Pop. 3,209 in 1861. Cavan, though the assize town, is with few exceptions meanly built, long lines of suburbs being formed of thatched mud cabins. The public buildings are a large parish church and Rom. Cath. chapel; an endowed school of royal foundation, having accommodation for 100 resident students; a fine court-house, a co. prison on the radiating plan, and an infirmary. A garden of Lord Farnham's, near the town, has been thrown open as a promenade for the inhabitants. The corporation, under a charter of James I., in 1610, consisted of a sovereign, 2 portreeves, 2 burgesses, and an unlimited commonalty; but having been deprived at the Union of the right of sending mem. to the H. of C., it has fallen into desuetude. The assizes for the co., general sessions at Hilary and Midsummer, and petty sessions every week, are held here. Trade inconsiderable, and chiefly in oats and butter. Markets are held on Tuesdays; fairs on Feb. 1, April 4, May 14, June 30, Aug. 14, Sept. 25, and Nov. 12.

CAVERY, a river of S. Hindostan, the most considerable and useful S. of the Krishna; both Mysore and the Carnatic owing much of their agricultural wealth to the water it distributes. It rises in Coorg, bounds Coimbatoor NE., and after a winding course of 450 m., chiefly in a E. direction, falls into the sea by various mouths in the district of Tanjore, where it is industriously made use of for irrigation. It is filled by both monsoons, but is not navigable for large vessels.

CAVERYPAUK, a town of Hindostan, prov. Carnatic, 57 m. WSW. Madras, in the neighbourhood of which is an immense tank 8 m. long by 3 m. broad, faced with large stones, and supported by a mound of earth 30 ft. high. This is one of the finest works constructed for the purpose of irrigation throughout the S. of India.

CAVITE', a town of Luzon, one of the Philippine Islands, in the Bay of Manilla, 3 m. SW. that city, of which it is the port; lat. 14° 34′ N., long. 120° 48′ E. Estimated pop. 5,000. It is the naval depôt of all the Spanish possessions in the East, and is built on the E. extremity of a low bifurcated peninsula, stretching into the sea for about 3 m., having between its two extremities the outer harbour, while the inner harbour is situated to the S. of the town: neither has more than four fathoms water, though very large ships moor in the inner harbour. The houses of Cavité, which are two stories high, are built chiefly of wood, their windows being furnished with a semi-transparent shell instead of glass. It has an arsenal, a marine hospital, some well-built churches, and several convents; but has of late years greatly decreased in size and importance.

CAWNPORE, or CAUNPOOR (*Khanpura*), a district or collectorate of Hindostan, prov. Allahabad, presid. Bengal, composed of cessions from the nabob of Oude, between lat. 26° and 27° N., and long. 79° 30′ and 80° 30′ E., having NW. the distrs. of Etawah, Belah, and Furruckabad, NE. the Oude reserved territories, SE. the Fultehpoor and Kalpee distrs., and SW. Bundlecund. Area 2,650 sq. m. Pop. probably nearly a million. This distr. is bounded NE. by the Ganges, and intersected in its entire length by the Jumna: it is therefore almost wholly comprised within the Doab. Surface flat; soil highly productive, and upon the whole tolerably well cultivated, though in some parts there are extensive wastes. Maize, barley, and wheat, turnips, cabbages, and other European vegetables; grapes, peaches, &c., are grown, and the sugar-cane flourishes in great luxuriance. Agriculture prospers in the neighbourhood of the cap., owing to the presence of a Euro-

pean market, and consequent high prices. The assessment on the land is high, and the prov. was on its first coming into British possession very much over-assessed, and suffered greatly in consequence. There are about 2,000 villages in this distr., which possess lands; but the perpetual settlement is also established. Nearly all the pop. are Hindoos, the heads of the villages being mostly of the Rajpoot caste. Offences are frequent, but yearly diminishing as the efficiency of the police increases; *dacoity*, or gang-robbery, was formerly frequent, but was committed only by gangs out of the Oude reserved territory. *Thuggee*, or murder by professional murderers, also prevailed greatly in this distr.; and from 1830 to 1840 the average was about 10 *thuggees* yearly. The principal towns are Cawnpore, the cap., Resoulabad, Jaugemow, and Acberpoor.

CAWNPORE, the cap. town of the above distr., and chief British military station in the ceded provinces, on the W. bank of the Ganges, 38 m. SW. Lucknow, and 100 m. NW. Allahabad; lat. 26° 30′ N., long. 80° 13′ E. The town extends irregularly for 6 m. along the bank of the river, which is here a mile broad, and lined by the bungalows of European officers. It is built in a very straggling manner, with the exception of a tolerable main street nearly parallel with the military lines, composed of well-built brick houses two or three stories high, with wooden balconies in front. Excepting its size, few circumstances about Cawnpore attract much notice; the European public buildings are of simple architecture, and confined to works of absolute necessity; the chief are the military hospital, gaol, assembly-room, and custom-house. A Protestant church has been erected by public subscription within the last few years: most of the other religious edifices are mosques, some of which are handsome. Shops large and tolerably well supplied, provisions being about half the price they bring in Calcutta. The European private houses are roomy, one story high, with sloping roofs, first thatched and then tiled. The officers' bungalows along the banks of the Ganges are encircled by gardens surrounded by mud walls. At the NW. extremity of the town are the public magazines protected by a slight entrenchment; and farther on, in the same direction, is the old town of Cawnpore, a place of no consequence, and containing no interesting relics of antiquity. A free-school was established here in 1823, which is attended by Europeans, Mohammedans, and Hindoos, who receive instruction together, and the progress of which is most satisfactory. It is supported partly by a government grant of 4,800 rupees a year. Cawnpore is not a pleasant place of residence for Europeans. Its great heat and the clouds of dust to which it is subject are represented as most distressing.

Cawnpore derived a sad notoriety during the Indian mutiny of 1857. The small British force stationed in this town having surrendered, by capitulation, to Nana Sahib, they were allowed to leave; but had no sooner embarked in their boats, on the 17th of June, when they were fired upon, and nearly all cruelly murdered. A number of women and children escaped the slaughter only to be killed, soon after, with unexampled brutality. The tale of these horrors is perpetuated by a monument erected at Cawnpore.

CAXAMARCA, a city of Peru, cap. prov. of same name, in a fertile and well-cultivated valley in the Andes, 370 m. NNW. Lima; lat. 7° 8′ 38″ S., long. 78° 36′ 15″ W. Pop. about 7,000, chiefly Indians and Mestizoes. Its name is equivalent to 'place of frost,' and has been probably derived from its being sometimes visited by frosty winds from the E.; but, in general, the climate is excellent. Most of the houses are tiled and whitewashed. The churches, which are numerous and handsome, are built of stone richly cut, and are ornamented with spires and domes. They were formerly celebrated for the quantity of gold and silver decorations they contained. There are also some convents and nunneries. The inhab. are industrious, and considered the best silver and iron workers in Peru. 'I have,' says Mr. Stephenson, 'seen many very handsome sword-blades and daggers made here; pocket-steels and bridle-bits most curiously wrought, besides several well-finished pistol and gun locks. Literature would prosper here, were it properly cultivated; the natives are fond of instruction, and scholars are not rare; many of the richer inhab. send their children to Truxillo and Lima to be educated.' (Stevenson's Peru, ii. 132.) The inhab. of the interior resort thither to sell their own produce and manufactures, and to purchase such other as they may require. Hence a considerable trade is carried on with Lambayeque, and other places on the coast, to which Caxamarca furnishes manufactured goods, such as baizes, coarse cloth, blankets, and flannels; and receives in return European manufactures, soap, sugar, cocoa, brandy, wine, indigo, Paraguay tea, salt-fish, iron, and steel. Some of the shops are well stored with European goods. The markets are well supplied with fresh meat, poultry, bread, vegetables, fruit, butter, and cheese, at very low prices. About a league E. from the city are some hot and cold springs, which were used by the incas for baths, and are still employed for the same purpose.

Caxamarca is a place of considerable celebrity in the history of Peru, and of Spanish atrocity. The incas had a palace here; and it was here that Friar Vincente Valverde delivered his famous harangue to the Inca Atahualpa, which was immediately followed by the butchery of the Peruvians, and by the imprisonment, accusation, and murder of the inca.

CAYENNE, a sea-port town of French Guyana, cap. of that colony, at the NW. extremity of the isl. of same name, at the mouth of the Oyaque; lat. 4° 50′ 15″ N., long. 52° 14′ 45″ W. Pop. 6,230 in 1861. The town covers a surface of about 70 hectares, and contains about 600 houses, mostly of wood. It is divided into the old and new towns: the former, which is ill-built, contains the government house and the ancient Jesuits' college: it is separated from the new town by the Place d'Armes, a large open space planted with orange-trees. The new town is larger than the old, and was laid out at the end of the last century; its streets are wide, straight, mostly paved, and clean; it has a handsome church, with some large warehouses and good private residences. The old town is commanded by a fort, which, with some low batteries, protects the entrance of the harbour. The latter is shallow, but otherwise good, and well adapted for merchant-vessels of moderate size. There are two quays for loading and unloading. The roadstead at the mouth of the Oyaque, though small, is the best on the coast. Its holding-ground is good, and it has everywhere from 12 to 13 ft. water; trading vessels lie in it within 1 m. of the land, and 2 m. of the town. Ships drawing more than 15 ft. water anchor about 6 m. from Cayenne, near a rocky islet called 'L'Enfant Perdu.' Cayenne is the centre of the whole trade of the colony. (See GUAYANA, FRENCH.) It is the seat of a royal court, a court of assizes and of tribunals of the peace and original jurisdiction. The town was founded about 1635. The Emperor Napoleon III., on establishing himself on the throne of France,

sent a number of political prisoners here, many of whom perished on account of the unhealthiness of the climate.

CAYENNE. See GUYANA (FRENCH).

CAYLUS, a town of France, dép. Tarn-et-Garonne, near the right bank of the Bonnette river, and the high road between Montauban and Rhodez, 24 m. NE. the former city. Pop. 4,973 in 1861. It has a considerable trade in corn, and eleven fairs annually.

CAZALLA, a town of Spain, prov. Seville, on the crest of the Sierra Morena, 13 m. SE. Guadalcanal. Pop. 6,852 in 1857. The town has a church, five monasteries, and two hospitals. Its environs have many Roman and Arabic antiquities, and ruins of country residences of more modern date; with mines of silver, iron, sulphur, amianthus, and copper; and quarries of beautifully variegated marbles. The mountains are the resort of wild boars and wolves, which make much havoc among the cattle.

CAZÈRES, a town of France, dép. Haute Garonne, cap. cant., on the Garonne, 31 m. SW. Toulouse. Pop. 2,633 in 1861. A handsome promenade separates the town from the suburbs. There are fabrics of hats, with dye-works and tanneries.

CEFALU, a sea-port town of Sicily, prov. Palermo, on the Tyrrhenean Sea, at the foot of a rock, 40 m. ESE. Palermo; lat. 38° N., long. 14° 13′ 57″ E. Pop. 11,183 in 1861. The town is surrounded by a bastioned line wall, but the works are old and weak. The streets are tolerably regular, and there is a good cathedral and some other churches, with a school of navigation. The port is small, and the trade of the place but inconsiderable. On the summit of the hill above the town are the ruins of a Saracenic castle.

CEHEJIN (*Segisa*), a town of Spain, prov. Murcia, on the river Caravaca, 3 m. E. Caravaca town, and 40 m. WNW. Murcia. Pop. 8,710 in 1857. The town is situated in a well cultivated and fertile district. The principal streets are well paved, and the houses good—some of them magnificent, marble being abundant in the neighbourhood. It has a church, a convent, and an ancient castle, with several distilleries, and manufactures of coarse paper, linen, and sandals.

CELANO, a town of Southern Italy, prov. Aquila, cap. cant., near the lake Fucino or Celano, 20 m. SSE. Aquila. Pop. 6,525 in 1861. The town has one collegiate and some other churches, and a manufactory of paper. For an account of the Lake of Celano see FUCINO (LAKE OF).

CELEBES, a large island of the E. Archipelago, forming the centre of its 2nd division; stretching from lat. 2° N. to nearly 6° S., and from long. 119° to 125° E.; having N. the Sea of Celebes, W. the Straits of Macassar, E. the Molucca and Pitt's Passages, and S. the Flores Sea. Area estimated at 75,000 sq. m. Pop. supposed to be between 1,500,000 and 2,000,000. Its shape is singularly irregular; it is deeply indented by three great bays, separated by four peninsulas, diverging N., E., and S.

Celebes, unlike most of the other great islands of this archipelago, abounds in extensive grassy plains, free from forests, which are looked upon as the common property of the tribes who live upon them, by whom they are carefully guarded from the intrusion of aliens. There are only three rivers of any consequence; the Chiurana, which rises near the centre of the island, and running S. through the state of Boni, falls by several mouths into the bay of the same name; a second stream, having a N. direction; and a third, which discharges itself on the W. coast, S. of Macassar. The Chiurana is navigable for ships to some distance; and native boats pass up it considerably farther into a fresh-water lake. Volcanos are said to exist in the N. division of the island. Gold is found in Celebes; but in a less quantity than in Borneo, and chiefly in the sands of the streams. Timber is not very plentiful; teak-trees are generally few; but a large forest of them exists in one part of the island, which the natives report to have been raised from imported seed. The vast plains afford abundant pasture and cover for a variety of the best game, deer, wild hogs, &c. The tiger and leopard, though common in the W. parts of the archipelago, are here unknown. The horses of Celebes, though seldom exceeding 13 hands high, are larger built, and unite a greater share of blood and strength than any other breed of the E. islands; they are regularly trained for hunting, and are noted for fleetness and perseverance. Rice, maize, and cassava, with cotton and tobacco, are the chief articles grown. The S. peninsula being the most healthy, is by far the most extensively peopled, and contains the two principal states of the island, those of Boni and Macassar. The centre of the island is said to be inhabited by Horaforas (see E. ARCHIPELAGO), supposed to be aborigines: the brown race consists of a number of tribes, agreeing remarkably in person, but divided into four or five different nations, of which that of the Bugis is by far the most considerable. They are usually squat, robust, and somewhat heavily formed, though not ill built; their medium height is a little above 5 ft.; faces round; cheek-bones high; nose small, and neither very prominent nor flattened; mouth wide, and teeth fine, when not discoloured by art. They are more distinguished for a revengeful disposition than any of the other natives of this archipelago. Notwithstanding most of the tribes have long passed that stage of society in which the chase is pursued for subsistence, they follow it with great ardour; and no sooner is the rice seed cast into the ground, than the chiefs and their retainers turn with enthusiasm to the sports of the field, in parties of frequently not less than 200 horsemen.

The Wadju, or Tuwadju tribe, inhabiting the body of the island, are distinguished as a commercial and enterprising people. The natives of Celebes and Bali are the most celebrated in the archipelago for their manufactures of cloth, their fabrics ranking before all others for fineness and durability: they are, however, ignorant of the art of printing cloths, or of giving them the brilliant colours of the fabrics of the Asiatic continent. The inhabitants import cotton, birds' nests, tripang, sharks' fins, tortoise shell, agar-wood, &c.; and, together with gold in small quantities, and hides, re-export these articles to China, by the junks which annually trade to Celebes. The several chiefs have often a monopoly of some article of produce, as brass, betel-nut, opium, and salt.

The various independent nations of Celebes have each their peculiar form of government; but these are for the most part limited monarchies, the sovereign being controlled by the subordinate chieftains, and these again frequently by the mass of the people. The federal state of Boni consists of eight petty states, each governed by its own hereditary despot; while the general government is vested in one of the number elected from among the rest, but who can do nothing without the assent of the others.

In the state of the Goa Macassars, the king is chosen by ten electors, who also choose an officer invested with powers similar to those of the mayors of the palace of France, or the ancient justiza of Aragon, and who can, of his own authority,

remove the king himself or any one of the council, and direct the electors to proceed to a new election.

In the Bugis state of Wadju, forty chiefs constitute the great council of the nation, which is divided into three chambers, from each of which two members are nominated, who, in their turn, elect the chief of the confederacy. The 'Council of Forty' decide on all questions of peace and war. Women or infants of the privileged families in Celebes are commonly eligible to the throne; and women very frequently actually exercise the powers of sovereignty; they are throughout the island associated on terms of equality with the men, taking active concern in all the business of life. They appear in public without scandal, and are often consulted on public affairs. Though the husband invariably pays a price for his wife, she is never treated with contempt or disdain.

Notwithstanding the symptoms of a considerable advance in civilisation now enumerated, a great deal of rudeness and barbarity exhibit themselves among the inhabitants. Crimes are frequent; thefts and robberies extremely so: a total disregard of human life seems to prevail, and murder and assassination for hire are by no means rare. Mohammedanism is the predominant religion, especially in the S. part of the island; it was introduced by the Malays; but the inhab. generally are by no means strict as to its injunctions. The languages spoken belong to the great Polynesian family, but differ from those common in the W. of the archipelago, in being more soft and vocalic, and having less intermixture of Sanscrit: the two dialects of the Bugis and Macassars are the principal, and amongst the most improved tongues of the archipelago: the Bugis have a literature by no means contemptible. In their costume, the people of Celebes avoid showing the knee; they wear a long coloured cloth, the end of which they throw over the shoulder. They blacken the teeth, and use unctuous cosmetics: their ornaments are flowers, gold trinkets, and diamonds, krisses, betel-boxes, &c. They appear to have no scientific treatises; but are not wholly ignorant of some of the constellations, by the observation of which they navigate their prows.

Celebes was first visited by the Portuguese in 1512, who were expelled by the Dutch in 1660. In 1811 the territories belonging to that nation fell under the British dominion; but in 1816 were restored. The principal Dutch settlement is Macassar, which contains Fort Rotterdam, the residence of the governor. The Dutch have other settlements on the bays of Tolo and Tominie; and most of the native states are subordinate to them. (Crawfurd, Hist. of the Indian Archipelago, 3 vols.)

CEPHALONIA (an. *Cephallenia*), an isl. in the Mediterranean, and the largest of those composing the former Ionian republic, now forming part of the kingdom of Greece, near the W. coast of Greece, opposite the Gulf of Patras: between lat. 38° 3′ and 38° 29′ N., and long. 20° 21′ and 20° 49′ E.; 8 m. N. Zante, 5 m. S. Santa Maura, and 64 m. SSE. Corfu. Length, NNW. to SSE., 32 m.; breadth, very unequal. Area 348 sq. m. Pop. 70,120 in 1860. Its aspect is generally mountainous and barren, and though some spots are rich and fertile, the soil is, for the most part, only scantily spread over the limestone rock, of which the country consists. The shores are indented by numerous bays, of which that of Argostoli in the SW. is the principal. It extends for 7 or 8 m. inland, and has, in most parts, deep water and good anchorage. In the interior of the island an elevated range, called the Black Mountain, runs NW. to SE., the highest point of which (an. *Mt. Œnos*), is 5,000 ft. above the level of the sea. Surface generally uneven; the only plain is in the SW. near Argostoli, which is also the most densely inhabited part of the island. Climate mild; but storms and heavy rains, sudden changes of temperature, and earthquakes are frequent. The island contains about 40,000 acres of cultivated, and 180,000 acres of uncultivated land. Wheat, Indian and other corn, pulse, currants, olive oil, wine, cotton, flax, and salt, constitute the chief products. The principal article of export is currants; and next to it, wine and oil. The annual produce of currants is estimated at from 5,000,000 to 6,000,000 lbs. The Valonea oak abounds. Tenures of land are mostly annual, on the *metayer* system. Property is much divided, few proprietors having a revenue of 1,000*l.* a year. Cephalonia is represented by ten deputies in the parliament of the kingdom of Greece. Argostoli and Lixuri are the chief towns; they are situated on either side the Bay of Argostoli. At the mouth of this inlet there is a lighthouse; and at Lixuri, a mole for the security of trading vessels has been constructed. Near Argostoli, a curious undershot water-mill was built by an English merchant in 1835. The roads were formerly very bad, but have been greatly improved during the time that the island was under British protection. Most of the pop. belong to the Greek church; the remainder are chiefly Roman Cath. Lixuri is the seat of a Roman Cath. bishop. The inhabitants of this island are active, enterprising, and noted for their industry and commercial spirit. A great number of them are physicians; and, like many other of their countrymen, emigrate and settle elsewhere. The island was anciently known by several names: Thucydides calls it Tetrapolis, from its four principal cities, Samos, Pali, Krani, and Pronos, remains of which still exist. The site of Samos exhibits very extensive ruins, amongst which many medals, vases, statues, &c. have been found, and Dr. Holland traced the Cyclopean walls of Krani, at the head of the Gulf of Argostoli, in almost their entire extent. Cephalonia belonged successively to the Byzantine empire, Normans, Venetians, Turks, and Venetians again; from whom it was taken by the French in 1799. In 1815 it was, with the rest of the Ionian Islands, placed under the protectorate of Great Britain, but ceded to the kingdom of Greece in 1864.

CERAM, a considerable island of the E. Archipelago (third division), chiefly between lat. 3° and 4° S., and long. 128° and 131° E.; length, E. and W., about 185 m. by 30 m. average breadth; area 5,500 sq. m. A mountain chain runs E. and W. through the centre of the island, the highest peak of which is apparently about 7,000 ft. above the level of the sea. Ceram is chiefly distinguished for its large forests of sago-palm and its fine woods for cabinet-work; in one portion of it great quantities of nutmegs and cloves were formerly produced; but the trees were extirpated by the Dutch about 1657. The shores of Ceram abound with rare and beautiful shells; its interior is peopled by tribes of Horaforas. (See ARCHIPELAGO, EASTERN.) A cluster of small islands, called Ceram Lant, lies off the E. end of Ceram.

CERET, a town of France, dép. Pyrenées Orientales, cap. arrond., near the Tech, 15 m. SSW. Perpignan, and 5 m. from the frontier of Spain. Pop. 3,585 in 1861. The town is the seat of a departmental college and of a court of primary jurisdiction. It was here that the plenipotentiaries met to fix the limits between France and Spain, in 1660.

CERIGNOLA, a town of Southern Italy, prov. Foggia, cap. cant., 23 m. SE. Foggia. Pop. 18,517

in 1861. It is a well-built town, with a college, several convents, and a hospital. In the neighbourhood of this town, in 1503, Gonsalvo de Cordova gained a decisive victory over the French forces commanded by the Duc de Nemours, who was killed in the action.

CERIGO (an. *Cythera*), the most southerly of the seven principal Ionian Islands, which formerly constituted the Ionian republic, situated at a considerable distance from the others, near the S. extremity of the Morea, between lat. 36° 7′ and 36° 23′ N., and long. 22° 52′ 30″ and 23° 7′ 30″ E. Length, N. to S., 20 m.; greatest breadth, 12 m. Area 116 sq. m. Pop. 14,100 in 1860. The surface is mountainous, rocky, and mostly uncultivated; but some parts of it produce wheat, maize, pulse, cotton, flax, wine, and olive oil; the latter of which is highly esteemed. The honey of Cerigo is also of very good quality. It has a greater number of horned cattle than any of the other islands. The shores are abrupt; the sea round Cerigo is much disturbed by currents; and gales dangerous to shipping are frequent. The best anchorage is at St. Nicolo, on the E. coast. The principal town is Kapsali, at the S. extremity, with a pop. of about 5,000; houses mostly of wood and ill-built. Though now comparatively insignificant, Cythera was formerly a place of considerable importance, and probably of wealth, if we may judge from the ruins still extant in various parts of the island. It was the birthplace of Helen, and sacred to Venus, in honour of whom a temple, said to have been founded by Æneas, was erected. (Larcher, Mémoire sur Venus, 144.) Cythera was originally called *Porphyris*, from the nature of its rocks. It was long a naval station of the Lacedæmonians; and belonged successively to Macedon, Egypt, Rome, and Venice. The little island of Cerigotto, (an. *Ogilia*), 4 m. long, and inhabited by about thirty families, lies midway between Cerigo and Crete, about 20 m. from either.

CERRETO, a town of Southern Italy, prov. Benevento, cap. cant., on the declivity of Mont Matera, near the Cusano, 10 m. ESE. Piedimonte. Pop. 6,981 in 1862. It is well built, and is one of the most agreeable towns in the province: it has a fine cathedral ornamented with superb pictures, a collegiate church, three convents, a seminary, and considerable manufactures of coarse cloth. In 1656 it was wasted by the plague, and in 1688 an earthquake destroyed great part of the town.

CERVERA, a city of Spain, prov. Catalonia, on an eminence, 57 m. NW. Barcelona, 102 m. E. Saragossa. Pop. 4,499 in 1857. The town stands on a considerable eminence, is surrounded by walls, and has an ancient decayed castle. It has a church, five convents, a hospital, and five colleges. Some of its streets are well paved. The church is a Gothic building, with three naves; and the university, established in this city by Philip V., is a large, magnificent structure. The vicinity produces wine, oil, almonds, grain, pulse, cattle, and plenty of game.

CERVIA, a town of Central Italy, prov. Ravenna, near the Adriatic, with which it communicates by a canal, 11½ m. SE. Ravenna. Pop. 5,733 in 1862. The town is a seat of a bishopric; is regularly built; has a cathedral and several churches and convents. To the W. of the town is a vast marsh, called the *Valle di Cervia*.

CESENA, a town of Central Italy, prov. Ferrara, on the Sario, at the foot of a mountain, 10 m. SE. Forli. Pop. 33,752 in 1862. The town is the seat of a bishopric; is well built; has a cathedral, a handsome town-house, fourteen convents for men, and seven for women, a seminary, a society of agriculture and of arts, with silk filatures, and a considerable trade in wine and hemp, produced in its territory.

CETTE, a fortified sea-port town of France, dép Herault, cap. cant., on the narrow tongue of land separating the lagoon of Thau from the sea, and on the declivity and at the foot of a calcareous hill, which advances into the Mediterranean in the form of a peninsula, 15 m. SW. Montpellier, on the railway from Montpellier to Narbonne. Pop. 22,438 in 1861. The town is well built, but it derives its chief importance from its harbour, and from its being the port, on the Mediterranean side, of the Canal du Midi. The harbour is formed by two lateral moles, with a breakwater across the entrance. There are forts on both these moles, and on the principal is a lighthouse, the lantern being elevated 84 ft. above the level of the sea. The harbour is perfectly safe in all weathers; has from 16 to 19 ft. water; and can accommodate about 400 sail of large and small ships. A broad and deep canal, bordered with quays, establishes a communication between the port and the lagoon of Thau; and, consequently, with the Canal du Midi on the one hand, and with the canals leading to the Rhone on the other. Cette is the centre of a great deal of traffic, particularly of the coasting description; and from about the middle of November to the end of March freights are generally to be met with. There is regular steamboat communication with Algiers and the chief ports on the eastern coast of Spain; but the principal articles of export and import are those conveyed by the canal. About 36,000 tons of wine, and 4,000 tons of brandy, are annually exported. A good deal of Benicarlo wine from Spain, for mixing with claret, is imported. It has a court of summary jurisdiction, a school of navigation, an exchange, barracks, and a theatre. Ships are built here, and there are glass, soap, and tobacco-works, with distilleries, and a manufactory of highly esteemed liqueurs. The fishery of sardines is successfully carried on along the coast; and the salt-works on the adjoining lagoon are extensive, and furnish employment to many individuals. Cette is of modern date, having been founded in 1666, to serve as a port for the great canal.

CEUTA (an. *Septum* or *Septa*), a sea-port town of N. Africa, in the possession of Spain, coast of Morocco, directly opposite Gibraltar, and at the SE. extremity of the straits, on a narrow peninsula stretching about 3 m. ENE. into the Mediterranean, and having a capacious bay on its S., and a smaller one on its N. side. Pop. 7,144 in 1857. The E. part of the peninsula is occupied by the mountain of Almina, on the highest point of which is the castle of Ceuta, 14 m. S. by E. from Europa Point; lat. 35° 54′ 4″ N., long. 5° 17′ W. This mountain, which, towards the sea, is fenced round by inaccessible rocks, is the *Abyla* Proper of the ancients, and is famous as one of the pillars of Hercules; the rock of Gibraltar (*Mons Calpe*) being the other. The citadel, a very strong fort, is built across the narrowest and lowest part of the peninsula, at its junction with the mainland. The town, immediately to the E. of the citadel, is situated at the foot and on the declivity of the mountain. Ceuta has many points of resemblance with Gibraltar, and, like it, if properly garrisoned, would be all but impregnable. It is well supplied with water; is the seat of a bishopric; has a cathedral, two convents, a hospital, and a *bagne* or prison for criminals employed on the public works. It is also used as a place for the confinement of state prisoners. It is the most important of all the Spanish *presidios* or settlements in Africa, and is the seat of a military governor, a royal tribunal, and a financial intendant. Most

of the provisions and other necessaries required for the supply of the town and garrison are brought from Spain. Ceuta was taken from the Moors by John, king of Portugal, in 1415. Since 1640 it has belonged to Spain. It has been several times besieged by the Africans, especially in 1697.

CEVA (an. *Ceba*), an inl. town of Northern Italy, prov. Cuneo, cap. mand., at the confluence of the Cevetta with the Tanaro, 10 m. E. by N. Mondovi. Pop. 4,520 in 1862. It is built, at the foot of a rock, formerly surmounted by a castle, which was used as a state prison previously to its destruction by the French revolutionary forces. The town was formerly surrounded with walls; but these were in great part destroyed by an inundation of the Tanaro, in 1584. It contains a church, and several convents; some forges, and silk factories; and, in both ancient and modern times, has been celebrated for its cheeses.

CEYLON (an. *Taprobana*), a large island belonging to Great Britain, near the S. extremity of Hindostan, bearing the like relation to the Indian that Sicily does to the Italian peninsula. It lies between lat. 5° 56′ and 9° 50′ N., and almost entirely between long. 80° and 82° E.; having NW. the Gulf of Manaar and Palk's Straits, which separate it from Hindostan; S. and SW. the Indian Ocean, and E. the Bay of Bengal. It tapers to a point towards the N., and is shaped like the section of a pear cut lengthwise through the middle. Length N. to S., 270 m.; average breadth nearly 100 m.; area 24,500 sq. m. Pop. 2,075,234 in 1862, of whom only 7,102 whites.

The Coasts, on the N. and NW., are low and flat; those on the S. and E. bold and rocky, and in some places fenced with reefs: in many parts they are deeply indented by the sea, and present some large and many small harbours. Trincomalee harbour, on the NE. coast, is one of the finest anywhere met with. Point de Galle, in the S., is the next in importance; the inferior harbours are Batticaloa, Matura, and Caltura, on the S. and E., and Negumbo, Chilaw, Calpenteen, Manaar, and Point Pedro, on the W. coasts. The deep water along the E. shores admits the safe approach of large vessels, but the harbours on the N. and NW. are full of sands and shallows, whose position varies with the monsoons. Columbo, the marit. cap., has merely a roadstead, which is practicable for large ships only from the beginning of Dec. to the latter end of March. So large a number of inlets causes a corresponding proportion of small islands, promontories, and peninsulas; of the latter the principal are the peninsulas of Jaffnapatam, on the NW. and that of Calpenteen, on the W. coast. At its N. extremity especially, the shores of Ceylon are studded with numerous small rocky and verdant islets. The ridge of sandbanks called Adam's Bridge, which crosses the Gulf of Manaar from Ceylon to the island of Ramisseram, near the opposite coast of India, is connected by the natives with a variety of curious traditions, and forms a great obstacle to the more speedy communication with the continent, by its hinderance to navigation. It consists of loose sand, resting on firm foundations, but constantly varying in form from the action of the monsoons. There are three principal openings or channels through this ridge; one near the island of Manaar, another 8 m. farther to the W., and a third about 11 m. from the island of Ramisseram; but all of them are impracticable except for small native boats in fine weather, and even then the navigation is attended with some danger. Near these openings the bank rises above the water for some miles, broken occasionally by smaller channels, but towards the centre it is mostly covered by water, the depth of which does not in any part exceed a few feet. By the late accounts (see Asiat. Journ., April, 1839), attempts at enlarging the passage between Ramisseram and the continent are now in progress.

Interior — Mountains. — The belt of country along the shore surrounding the interior, or old kingdom of Candy, is, for the most part, flat, varying in width from 8 to 30 m., and, in the N., to nearly 80 m.; its extensive green plains giving to the shores of Ceylon an advantageous appearance when contrasted with the barren and sandy shores of the opposite continent. The interior consists of three distinct natural divisions—the low country, the hills, and the mountains. The centre of the island S. of lat. 80° N. is occupied by an extensive tableland, 67 m. in length, by about 50 m. in width, and estimated at from 2,000 to 3,000 ft. above the sea. The interior of the N. and central divisions consists of ranges of mountains running mostly NE. and SW., and varying from 1,000 to 4000 ft. above the sea, clothed to the summits with magnificent forests, and intersected by numerous ravines, cataracts, and cascades. From these regions various conical-shaped hills rise up at intervals to an additional height of from 2,000 to 3,000 ft. The most conspicuous summit is that which is known by the name of Adam's Peak (the Samenella of the Singalese), in lat. 70° N., and long. 80° 40′ E., 46 m. ESE. Columbo, rising to 6,152 ft. above the sea. Namany-Cooli-Kandy, the next in elevation, is about 5,548 ft. above the sea.

The mountains are generally in continuous ranges, and are seldom or never found isolated. This region is skirted by a hilly country, from 10 to 20 m. wide, and varying in elevation from 100 to 500 ft., with occasional summits of more than twice that height. This tract is destitute of the ravines and other bold features of the mountainous country.

Rivers and Lakes—Ceylon has numerous small rivers and perennial streams; but few of them are navigable, even by a canoe, to many miles from their mouths. The principal is the Mahavilly Ganga: it rises near the highest part of the central table-land, about 30 m. S. Candy; and, having received many tributaries, falls into the sea, a little S. of Trincomalee, after a course of about 200 m. It is the only river navigable for any considerable distance. The next most important river is the Kalani-Ganga, which has its source in the country at the foot of Adam's Peak, and empties itself into the ocean by several mouths in the neighbourhood of Columbo: it is made considerable use of for internal traffic.

There are no lakes of any consequence in the interior, the largest being no more than 4 m. across; but along the E. coast, from Batticaloa northward, there are several extensive lagoons, which, by means of artificial channels, are made serviceable to traffic: other lagoons exist in the neighbourhood of Negumbo and Columbo. (Davy's Account of the Interior of Ceylon, pp. 1–5; Percival's Account, pp. 55–60.)

Geology and Minerals.—The rocks met with in Ceylon are mostly primitive, and consist, with little exception, of granite or gneiss, with large veins of quartz, hornblende, and a snow-white dolomite: limestone occurs only in Jaffnapatam, and the N. districts. A belt of grey or black sandstone, together with coral formations, nearly encompass the whole island. The upper soil is in general sandy, with but a small mixture of clay, and chiefly derived from the disintegration of primitive rocks: the cinnamon soil near Co-

lumbo is perfectly white, and consists of pure quartz. Ceylon is rich in valuable minerals; its metallic products are, however, comparatively unknown: ores of iron, lead, tin, and manganese are found in the interior, but are made little use of: plumbago is the only article amongst these which has become of any commercial importance. Mines of quicksilver were formerly worked by the Dutch. It has numerous gems; and common salt-beds are found in various places. No volcanos exist in Ceylon, nor are mineral waters very abundant; but they are met with near Trincomalee.

Climate.—The mountain ranges which separate Ceylon almost completely into two parts, by arresting the course of the monsoons, occasion a radical difference at the same moment in the climate of the E. and W. parts, whole floods of rain deluging the island on one side, while on the other the natives are carefully hoarding all the water left from previous inundations. In the S. and SW. the climate is moist, temperate, and similar to that of Malabar; in the E. and SE. it is hot and dry, and more like that prevalent on the Coromandel coast. The SW. monsoon lasts from April to Sept.; the NE. from Nov. to Feb.: in the intervening months the winds are variable. The SW. monsoons are usually accompanied by violent storms of thunder and lightning, and torrents of rain, which sometimes extend themselves to the central table-land, especially in March and April; but this high region is generally out of the influence of either monsoon, and both its winds and temperature are greatly modified by its own physical character, and the directions of its principal ridges. The quantity of rain which falls during the year is about three times as great as in England; the rains being, though not more frequent, far heavier, so much so that a fall of two or even three inches in twenty-four hours is not uncommon: 84 inches is the annual estimate in the alpine region, and 100 inches at Columbo. The seasons depend more on the monsoons than on the course of the sun; and the coolest season is during the summer solstice, while the SW. monsoon prevails. The heat is, however, nearly the same throughout the year, and much less oppressive than on the continent of India. Along the coast, the annual mean temperature is about 80° Fahr.; at Candy, 1,467 ft. above the sea, it is 78°; at Columbo the annual variation is from 76° to 86°; at Galle, 70° to 90°; at Trincomalee, 74° to 91°. For a tropical country, Ceylon has a comparatively salubrious climate; but some of the less inhabited parts, and the low wooded hilly country between the mountains and the sea, are highly insalubrious. Near Columbo and Trincomalee, where the jungle has been cleared away, and the land drained, the country has been rendered perfectly healthy. The prevalent diseases are those affecting the liver and intestines, often accompanied by fever: diseases of the lungs, urinary organs, and nervous system, are very rare: gout is unknown. Elephantiasis, *Lichen tropicus*, and other cutaneous complaints, are common. The small-pox was formerly very destructive, but is now guarded against by vaccination, to which the natives raise no objection; measles and hooping-cough both occur in a mild form. The beri-beri (*Hydrops asthmaticus*) is a disease nearly peculiar to Ceylon.

Vegetable products are numerous and valuable. The most important, next to rice and other grain, is the cinnamon (*Laurus Cinnamomum*), called by the Singalese *corundoo*, which here arrives at its greatest perfection, and has always been a chief article of export. It delights in a poor sandy soil, with a moist atmosphere, and is almost exclusively confined to the SE. part of the island, between Negombo and Matura. In the N., where the climate is dry and sultry, it is totally unknown, and the endeavours to propagate it at Batavia, in the W. Indies, and on the opposite coast of Tinnevelly, have not been so successful as was anticipated. In its wild state it grows to the height of 20 or 30 ft., and bears a white blossom in January: while in bloom, the cinnamon forests have a very beautiful appearance; but the aroma of the plant resides wholly in the bark, and the fragrance of the groves is not nearly so great as strangers have been led to believe. The soil is peculiarly suitable for the growth of coffee; and its culture has of late years been so much extended that it is now the principal article of export. The cocoa-nut tree flourishes with singular vigour, and is of great importance to the native population, almost every part of the tree being converted into articles of food or domestic use: the best trees produce from 50 to 100 nuts annually, and grow so close to the sea, that the roots are even washed by its surge. The Palmyra palm grows principally in the N. part of the island, and is scarcely of less importance than the cocoa-nut tree. The talipot palm, the leaves of which are large enough to shelter many individuals, grows luxuriantly here, though rare on the continent of India. The bread-fruit-tree attains an immense size; cotton is not equal to that of India; indigo is found wild, but its culture is neglected; the areca and betel nut, as well as tobacco, all of which are of excellent quality, grow abundantly; the cardamom seeds are inferior to those of Malabar. Gum-lac and gamboge are also produced in this island. The Flora of Ceylon is not so extensive as beautiful and various: the rose, pink, mignonette, &c. are as fragrant as in England, and the jessamine much more so; the *gloriosa superba* and amaryllis grow in profusion, and the jamba, or rose-apple, strews the ground with its scarlet blossoms. (Heber's Narrative, iii. 143–145, &c.; Percival, pp. 319–337.)

Animals.—Ceylon has been from an early period celebrated for its breed of elephants, which, though inferior in size to those of other countries, are more valued for their greater strength and docility. The chase of these animals has always been with the Singalese an object of great importance; but the avidity with which they have been pursued has greatly diminished their numbers, and they are now chiefly confined to the N. and NE. districts. The royal tiger is not met with, but bears, leopards, the cheta (a small species of leopard), hyænas, jackals, and tiger-cats are numerous: besides elks, deer, gazelles, buffaloes, wild hogs, and monkeys. Near Jaffna a large baboon is very abundant, and fearless: a large variety of the monkey tribe, porcupines, racoons, armadilloes, squirrels, and mungooses, are met with. There are no foxes; but the flying fox and rats are very common and troublesome. Pheasants, snipes, red-legged partridges, pigeons, peacocks, and a great variety of birds; with serpents, alligators, and reptiles of all sorts, are abundantly plentiful. The fishing of the pearl oyster is an important branch of industry.

People.—The pop. of Ceylon, exclusive of the various colonists who have at different times possessed themselves of the coasts, may be divided into four classes:—1st, the native Singalese or Ceylonese, who may be again subdivided into those occupying the Candian territories, and those of the coasts; 2nd, the Moors, who are found in all parts of the island, and form the chief population of the district of Pultam; 3rd, the Veddahs, a savage race, who are supposed to

be the aborigines, and inhabit the mountainous regions and unexplored fastnesses, almost in a state of nature; 4th, the Malabar and other Hindoos, who are chiefly confined to the N. and E. coasts. The Singalese of the coasts, whose complexion, features, language, and manners closely resemble those of the Maldivians, are about 5 ft. 8 in. in height, of a slim figure and fair complexion, especially the women; they are represented as remarkably mild, bashful, and timid, and rather deficient in intellect. The Candian Ceylonese are in all respects superior to those of the coasts, and differ from Europeans less in feature than in colour; they are taller, better made, and more robust, than the Singalese; and for Indians are stout, with large chests and broad shoulders. They have small bones, rather short but muscular legs and thighs, and small hands and feet; heads well formed, and, like those of other Asiatics, longer than those of Europeans; features often handsome. The colour of their skin, eyes, and hair varies from brown to black; they have a profusion of hair, which is allowed to grow to a considerable length. The Candian character differs essentially from that of the Singalese, having none of the effeminacy and timidity which distinguish the latter, and there is a certain haughtiness and independence in their whole bearing and demeanour. They will not generally, however, attack an enemy in the open field; but resort to ambush, in the same manner as the Singalese. Indolence, hypocrisy, and revenge may be regarded as national vices. Some traits may be recognised as common to the natives of Ceylon with the Bengalese, but they are still more closely allied, both in physical and moral characteristics, as well as language, religion, and traditions, with the Indo-Chinese nations, and especially the Birmese. The Malabars of Ceylon differ but little in any respect from those of the continent, though varying somewhat in their manners and customs. They retain, in great measure, the religion and manners of their congeners of S. India, and are much less numerous than formerly. The Moors have a tradition that they are the descendants of a tribe of the posterity of Hashem, expelled by Mohammed from Arabia. They retain many customs similar to those of the ancient Jews.

Of the Veddahs little more is known than that they chiefly inhabit the great forests which extend from the S. to the E. and N., and also the most inaccessible parts of the central table-land, having neither clothing nor habitations, subsisting upon wild fruits and animals, and having the branches of large trees for their resting-places. They are conjectured by some to be a portion of the original inhabitants, who, upon the invasion of the island, retreated to the inaccessible haunts in which they are now found. They are divided into two tribes, —the Village and the Forest Veddahs; the former, who are the more civilised, occasionally go down into the lower districts to exchange their game and cattle for rice, cloth, and iron. They live in huts and cultivate the ground; though, in common with their more savage brethren, they seek their chief subsistence in the forests. They are peaceable and inoffensive, never commencing, although easily persuaded to join in any insurrection; and in times of disturbance they have occasionally been employed as mercenaries.

The other inhabitants of the coast consist of Dutch, Portuguese, and English colonists: some Caffres and Javanese; a few Chinese and Parsee traders; and a various pop., sprung from the intermixture of these with each other and with the native races. The burghers, many of whom fill public offices and subordinate situations under government, are the descendants of Europeans and half-castes. The distinctions of caste are recognised, and in some instances scrupulously preserved, by the Ceylonese; but they respect them only in their civil, rejecting their religious, influences.

Till latterly, the pop. had been diminishing for four or five centuries. But a considerable increase has taken place in the pop. of the maritime provinces during the last thirty or forty years. Several parts of the interior are, however, very thinly peopled, there being, in some districts, not more than four, five, or six persons to a square mile. In the central prov. the pop. is dense in certain parts; but with the exception of the country round Candy, and the districts of Ouva and Mattele, seven-eighths of the ground is covered with wood and jungle, and nearly unpeopled.

Ceylon is now divided into six provinces, the area and population of which, according to a census taken in the year 1862, is shown in the following table:—

Provinces	Area in Square Miles	Population
Western . .	3,820	725,812
North-Western .	3,362	204,924
Southern . .	2,147	334,759
Eastern . .	4,753	83,738
Northern . .	5,427	419,062
Central . .	5,191	306,939
Total . .	24,700	2,075,234

Not included in these population returns are 4,647 military persons, which added make the total population 2,079,881.

It will be seen, from the preceding table, that the pop. of Ceylon is very unequally distributed, the western province being the densest populated part—190 inhabitants per square mile—and the eastern province the least dense—only seventeen inhabitants on the square mile. This inequality is only partly explained by differences of soil and climate.

Agriculture.—The tract of country near the Coromandel coast is only in some parts fit for tillage, the ground for many miles exposing only a barren and naked surface. The soil of the central parts is capable of producing luxuriant crops were it properly cultivated. All products requiring a moist soil and climate flourish most in the SW., and rice is grown chiefly in the level lands there, or in the valleys of the hill region, but often also on the slopes, on account of the facilities they present for irrigation. Around the fields, on the level lands intended for its reception, small embankments, about three feet in height, are raised, and water let in upon them; they are afterwards trodden over by buffaloes or turned up with a sort of light plough. On the hill slopes the rice-fields are dammed up, and form a succession of terraces, for irrigating which the water is conveyed sometimes for a mile or two along the mountain sides, and let off from one terrace to another, as the state of the grain requires it. There are two rice harvests during the year; the first crop is sown from July to October, and reaped from January to March; the second is sown from March to May, and reaped from August to October. What is called a plough consists of a piece of crooked timber shod with iron, which tears rather than ploughs up the ground. After the first ploughing, the fields are flooded; then ploughed again, and carefully weeded. Rice is industriously cultivated by the Malabars of the N. and NE. districts; but the produce is insufficient for the consumption of the island, and large quantities are annually

imported from both the Malabar and Coromandel coasts. Hemp is raised in abundance, the sandy soil of the maritime districts being well adapted for it. Cotton of different sorts grows with the greatest facility, the buds ripening within four months after being sown. Each village or hut has its sugar and tobacco plantation: coffee is raised of a very superior quality.

As cinnamon forms a chief article of export and revenue in Ceylon, its cultivation is one of great interest, and is conducted with much care. The neighbourhood of Colombo is particularly favourable for its growth, being well sheltered, and having a high and equable temperature. About 2,000 acres of land, chiefly near that town, are laid out in cinnamon plantations, furnishing employment to 30,000 individuals, and yielding annually about 500,000 lbs. of bark, worth 138,000*l.* sterling. In its wild state the plant grows to the size of a large apple-tree; but when cultivated, is not allowed to attain to more than 10 or 12 ft. in height, after seven or eight years' growth. May and June are the months for stripping the bark from the plant, which is done by two methods. In the first, the rough bark is removed with knives, and the inner rinds stripped off by a peculiarly shaped instrument; by the other method, the outer bark is not artificially removed, but the process of fermentation which the strips undergo when tied together in large quantities spontaneously removes it. The bark, in drying, gradually contracts, and rolls itself into a quill-like form; and, after being subsequently dried in the sun, the smaller are inserted in the larger pieces, and the whole are made up into bundles of about 30 lbs. weight. Layers, shoots, and transplanted stumps are the best means of extending the growth of the *cinnamon plant*.

Wages are considerably higher, and provisions proportionally dearer, in Ceylon than in Bengal. Those of the poorer classes, who possess small portions of land, rarely derive their support from it exclusively, but employ themselves in fisheries, trades, manufactures, and the petty traffic of the country; the wages of mechanics and artisans are proportionally higher than those of the labouring population, but still very moderate. A very minute subdivision of property often exists, and the inheritance of one person will sometimes consist of 9-10ths of a seer of rice land, 5-12ths of the produce of a cocoa-nut-tree, or 2-3rds of that of a jack-tree. Notwithstanding this, the peasantry of Ceylon are generally in better circumstances than those of the adjoining continent. They are not under either a zemindary or ryotwarry settlement, and the demands of the government on the land rarely exceed 1-10th part of the produce, and are sometimes less. Under the Candyan government, the tenures of land were of three kinds. Some lands belonged wholly to the sovereign; others were cultivated by individuals at a government rent, of some fixed proportion of the produce; and others, again, were granted as payment for the performance of specific services to the headmen of different districts, chiefs, and reverted again to the crown on the death of such individuals. The latter could neither be mortgaged nor alienated; the second class of lands might be transferred in any way as long as the permanent rent continued to be paid. The lands belonging to the sovereign himself were cultivated on his account, or let out to the highest bidder, and sometimes brought a rent of 1-3rd or half the produce. The plan of redeeming the whole rent, above 1-10th part of the produce, has been adopted by the British government with much success, and in those districts where the practice has prevailed the revenue has increased rather than diminished: for more lands having been brought into cultivation, 1-10th part of the crops now yields as much as 1-3rd or 1-4th part formerly did. Domestic animals are not numerous. The horse is a degenerate breed, and not aboriginal; oxen, though small, are well tasted, and the chief food of the British troops, though eaten by none else: poultry of all kinds are abundant.

Pearl Fishery.—The pearl fishery in the Bay of Condatchy, which was formerly a government monopoly, is now free; but, whether from the banks having been over-fished, or otherwise, the produce is now of comparatively little importance. The pearl banks are formed by coral ridges from 6 to 10 m. off shore, and of a variable depth, but commonly from five to seven fathoms below the surface. The oysters are attached by fibrous bands to these ridges, from within a short time of their bursting from the egg, to about 6½ years old, when they loose their hold, and drop to the sandy bottom, where they lie in heaps. Soon after attaining the age of seven years, the animals are said to perish. As many as sixty pearls have been found in one oyster; but such instances are rare, as is, indeed, the presence of pearls generally. The season commences in Feb. and finishes in April: six weeks or two months at the utmost, is the time allowed for its continuance. Each of the boats carries a *tindal*, or master, and twenty-three men, ten of whom are divers, and relieve each other, five divers being constantly at work during the hours of fishing. After they are taken out of the boats, the oysters are left to open spontaneously, die, and rot, the stench of their putrefaction filling the air for many miles round Condatchy, till it is swept off by the SW. monsoons. The Ceylon pearls are whiter than those of Ormuz, or the Arabian coast; and the natives are extremely expert in cutting and drilling them. The usual Ceylonese boats are like the catamarans of Madras and other parts of the peninsula. A great number of chank shells are found, and exported to India from the N. shores of Ceylon. (Raschenberger, Dr., in Martin's Statistics, p. 400; Percival, pp. 86–100; Sturt, in Phil. Transac., iii. 3.)

Salt is a government monopoly, and its manufacture, in leeways and pits on the sea-shore, is carried on to a great extent in the N. and E., where it is of fine quality, and may be procured in greater abundance than the government requires, or has been able to collect. Before the Dutch monopoly existed, this coast supplied Bengal with salt; and, indeed, the Ceylon salt may be imported at Calcutta for two-thirds the price of the salt produced in India. There are no other manufactures of any extent or importance, except that of arrack, which is distilled from the blossoms of the cocoa-nut-tree, as toddy and jaghery are from the juice; while ropes, brushes, baskets, brooms, matting, rafters, and thatch for cottages are obtained from the various parts of the tree, in addition to the valuable oil now in extensive use in England. Saltpetre is made from the chipping of rocks, in which nitrate of lime is prevalent, mixed with wood ashes; the mixture washed, and the liquor evaporated to a concentrated solution, and suffered to crystallise. Lime of excellent quality, and possessing a power of adhesion much greater than that procured from shells, is made by burning the coral found upon the shores. Gunpowder is made by a rude process; the native pottery is coarse and unglazed. Little progress has been made in weaving; the loom is somewhat similar to the primitive loom of Ireland; all the

cloths used are of domestic manufacture; no muslins are woven, nor indeed anything but coarse cottons, and some silks. Rude images and implements of husbandry are made of the native metals, and the Singalese can work with dexterity and taste in gold and silver. They are generally more capable of setting gems than cutting them; and excel in the manufacture of lacquered ware.

Trade.—Since the Dutch monopoly system has been abandoned, both the internal traffic and foreign trade have greatly increased. Subjoined is a table of the imports and exports of Ceylon, in the two years 1862 and 1863:—

Ceylon—Imports		1862	1863
PRINCIPAL ARTICLES.			
Coals and Coke	Tons	35,229	51,104

Both the imports and exports of Ceylon have enormously increased since the year 1850. In this year, the imports were 1,488,678*l.*, and the exports 1,246,956*l.* The rise took place very gradually, but in imports was chiefly visible in grain, and in exports in coffee.

There is a canal between Calpenteen and Columbo, by which cargoes are conveyed during the SW. monsoon. A fine road has been constructed from Columbo to Candy, on which a mail-coach runs; carriage-roads also extend from Columbo N. to Chilaw, and S. to Matura. Many rapid and unfordable streams have had iron and wooden bridges thrown across them, amongst which is that of Paradeinia, across the Mahavilly Ganga, which consists of a single arch, with a span of 205 ft., principally composed of satin-wood.

English weights, measures, and moneys are becoming universal in Ceylon.

The public revenue of Ceylon consists chiefly of import duties on merchandise and indirect taxes. It amounted to 767,101*l.* in 1860; to 751,997*l.* in 1861; and 759,136*l.* in 1862. The public expenditure is principally for costs of administration, and was 705,440*l.* in 1860; 635,230*l.* in 1861; and 626,654*l.* in 1862. The cost of governor and principal officers amounted to 57,865*l.* in 1862; while there were expended in the same year for works and buildings 23,896*l.*, and for roads, streets, and bridges 94,167*l.*

The administration of the colony is vested in the hands of a British governor, assisted by a council of European civil servants, selected either by the governor himself or the secretary of state for the colonies; but the power of the council is limited, and subservient to the authority of the governor. The governor has complete control over the financial department in the interior, while in the maritime provinces he is restricted to a certain sum for contingent expenditure, unless authorised in exceeding it by his council, to whom, except on this point, he refers, or not, at pleasure, being empowered to carry into effect any law without their concurrence. All laws, before being acted upon, are published in the official gazette, for the purpose of their general diffusion, with translations into the Singalese and Malabar languages.

The active business of the government is conducted by individuals of three different classes. Offices of the first and second classes are usually filled by Europeans; the subordinate situations by natives; but, by recent regulations, any person judged to possess sufficient qualifications may fill the most important offices without reference to nation or faith; a knowledge of the English language being, however, considered indispensable. Each village and caste has its elected headman, who is recognised by the government, which commonly selects native servants from amongst this class of people; the *modeliars* of *corles*, or lieutenants of districts, are appointed from this body.

Armed Force.—Exclusive of native troops there are in Ceylon, on the average, some 3,000 British troops. The cost of these is chiefly borne by the home government, and amounted to 110,268*l.* in 1862. The contribution of the colony towards this military expenditure was only 24,000*l.* in this year 1862.

Justice.—A supreme court of justice is established at Columbo, with powers equivalent to those of the Court of Queen's Bench and Court of Chancery. It is presided over by three English judges, aided by two other functionaries, all of whom are appointed from England. Trial by jury was introduced into Ceylon by Sir A. Johnston, and is now established in every district. Exclusive of Colombo, the whole island is divided into three circuits, viz. the N., S., and E.; the last of which comprises the old kingdom of Candy, with all the country to the E. of it. The circuits are subdivided into many districts, each of which has its own court, with a judge and three assessors,

and with jurisdiction in all cases not punishable with more than a fine of 10*l.*, one year's imprisonment, or 100 lashes. The supreme court in Columbo is the sole court of appeal. Excepting in the maritime provinces, where arrack drinking is prevalent, atrocious crimes are in general rare; so that the courts are more occupied with petty litigations than serious offences.

The Religion of the Singalese is Buddhism; but the upper classes profess Christianity, and many of the others have been converted to Mohammedanism. There are 16 Protestant churches in the island, subordinate to the archdeacon of Colombo, and 32 dissenting places of worship. Roman Catholic chapels are very numerous, and 10 years ago it was believed that half the Ceylonese population were Christians, following the ritual mostly of the Romish and Dutch churches. There is a tradition amongst the natives that Buddh himself visited this island, which, before his advent, had been inhabited by demons. There are numerous temples to that deity in the island, especially in the central parts, where the Buddhic sect is most prevalent; and the British government, having succeeded to the temple patronage and other privileges belonging to the old kingdom of Candy, has the appointment of the Buddhic priests. When the palace of Candy was taken by the British, a celebrated relic, believed by the natives to be a genuine tooth of Buddh, was captured; the possession of which is considered to insure its possessors the sovereignty of the whole island. This relic is annually exposed with great state and ceremony, and is worshipped by multitudes flocking from all parts of the country, and bringing offerings of various kinds to the priests, who thereby realise considerable sums. (Journal of the Asiat. Soc., iii. 101.)

Public Education.—Education is making great progress in Ceylon. There were, in 1862, above 800 schools in the colony, attended by 25,408 pupils. Of these, 5,518 were in 'public;' 49 in 'orphan;' 822 in 'regimental;' 13,511 in 'free;' and 5,508 in 'private' schools. Unfortunately, the benefit of this education did not include the female sex. In 1862 there were but 876 females in the 'public;' 24 in the 'orphan;' 35 in the 'regimental;' and 148 in the 'private' schools. The free schools, which had 13,511 male pupils, were not attended by a single female. The public schools are supported by government. The others have been established by the Church Missionary and Dissenters' Missionary societies. Free elementary education in the English language, arithmetic, and geography is given in these schools. The government schools are chiefly in the Singalese maritime districts. At Columbo there is a superior academy, where the usual branches of a classical and mathematical education are taught.

Civilisation and Arts.—In civilisation the Singalese appear to be nearly, if not quite, on a par with the Hindoos; in courtesy and polish of manners they are inferior to none, but in intellectual acquirements, and proficiency in the arts and sciences, they have made little advancement. Many of the male Singalese read and write in their own tongue, but this is no part of female education. They write with a sharp iron style, on talipot leaves, and colour the traces afterwards with lamp-black. They excel more in lacquered painting than in any other art. Their statuary is better than their pictures, though the figures of Buddh have been subject to no innovation of style, and are always in the same posture, of whatever material they may be formed. The Singalese colour the statues of their gods, and give a pupil to the eye, which last ceremony is supposed to confer all the holiness belonging to the figure, and is done with much mystery and solemnity. There seems to be no peculiar national style of architecture; the Buddhic temples are like Tartar structures. The Ceylonese rise at dawn, and retire at nine or ten o'clock at night; they sleep either on mats on the floor, or on couches. Their meals are short and unsocial, the men and women not often eating together; there are two principal meals, one taken at noon, and the other at seven or eight o'clock in the evening. The standing dish consists of rice with curry; some eat eggs and poultry; but beef is never eaten excepting by a very low class, who are in consequence held in great abhorrence: milk, ghee, oil, and fruits are the other important articles of diet. The best of their houses are commonly of mud, with tiled roofs, and a single story in height; built on a low terrace, presenting outwardly dead walls, and having in the interior an open space, into which the rooms open by doors, which, as well as the windows, are very narrow. The floors are composed of clay, plastered with manure, to keep off the insects, and the walls are covered with the same material, or a coat of white clay: lime is used for the walls of temples only. The furniture of the houses consist of two or three stools, a few mats, and porcelain dishes, a stone hand-mill, a pestle and mortar for rice, a rattan bag for compressing seeds to procure their oil, and a few other indispensable articles. The dress of the men is a handkerchief wrapped like a turban round the head, leaving the top exposed, and a long cloth, called *topetty*, reaching from the loins to the ankles. That of the women is very similar; they leave the head uncovered, but the end of their dress is thrown across the left shoulder. On occasions of ceremony, both sexes wear a small jacket. Rings, and silver and crystal bugles, and other ornaments, are commonly worn, and certain privileged persons are permitted to wear gold and silver chains and trinkets; but the Ceylonese look with extreme jealousy on every assumption of dress which is not strictly in conformity with the caste of its wearer. Like the Hindoos, they admit of the four chief subdivisions of castes, viz. the religious and military orders; *Toiessea*, cultivators, merchants, &c.; and *Rshoodras*, artisans: the first two ranks have, however, scarcely any actual existence in Ceylon, and all the honours and hereditary rank in the island are monopolised by the cultivators, at the head of the third class, with whom all Europeans are ranked, while the Moors are classed with the fishermen at the head of the fourth order. The male Singalese marry generally at the age of eighteen or twenty, the females earlier. Matches are determined on and concluded by the parents of the parties to be affianced: the dowry of the women generally consists of household goods, or cattle; seldom of land: the husband always pays a price for his wife. The women seldom have more than four or five children; but sometimes suckle them for as many years: the latter are in consequence very backward, and often neither speak nor walk till upwards of two years old. Infidelity is little regarded, provided it be not an intrigue with a person of inferior caste: concubinage and polygamy are indulged in by the men, but plurality of husbands is more common than that of wives, one woman belonging equally to several brothers of the same family. This, as well as other usages, is, however, fast disappearing before new habits, acquired by the extending intercourse with Europeans. The Ceylonese appear to be sincere and warm in their attachments. Dr. Davy disbelieves the report of the practice of exposing female infants, excepting in the wildest parts of the country, and then

never from choice, but necessity, and when the parents are on the brink of starving.' The sick and dying, though not openly exposed, are certainly removed to temporary buildings. Every respectable family burns its dead; low castes are not allowed to do so, but bury them with the head towards the west. Immediately after a decease, the relations, with their hair dishevelled, and beating their breasts, cry and embrace each other, giving utterance to lamentations of a highly poetical nature. (See Journal of Asiatic Society, ii. 63, 64.) A common exhortation is, 'When I die, pay me due honours.' The common language of the Singalese is a dialect of the Sanscrit; the sacred language, like that of the Birmans, is the Pali. (For further details of Ceylon, see the works of Sir G. Emerson Tennent:—'Christianity in Ceylon,' 1850; 'Sketches of the Natural History of Ceylon,' 1861; and the admirable and most exhaustive 'Ceylon, an Account of the Island, Physical, Historical, and Topographical, 6th edit. 1864.)

Antiquities and History.—The proper name of this island is Singhala; but there is considerable uncertainty whence the people originated who gave it that name, and who are called Singalese. They have a tradition that their ancestors came hither from the eastward nearly 2,400 years ago; some modern authors think, on the other hand, that they were a colony of *Singhs*, or Rajpoots, who arrived here about 500 years B.C. Toijeya (perhaps of the royal house of *Sakya Singh*, of Magadha, the native country of Buddh, but evidently the same as the Sanscrit Vijaya) is the first king of Ceylon mentioned in history. The numerous ruins of cities, tanks, aqueducts, extensive canals, bridges, temples, &c., show that Ceylon had been, at a remote period, a rich, populous, and comparatively civilised country. In 1505 the Portuguese formed settlements on the W. and S. coasts, and received a tribute of cinnamon from the king of Candy, on condition of defending Ceylon against the Arabian pirates. They, as well as the Dutch who expelled them, after a long and sanguinary struggle in the next century, and the English, who superseded the latter, became, soon after the conquest of their first enemies, involved in hostilities with their native allies. In 1815 the Candyans entreated the interference of the British, to drive a tyrannical sovereign from the throne. This was soon effected, and Candy has since become a part of the British dominions.

CHABLIS, a town of France, dép. Yonne, cap. cant., on the Seray, 10 m. E. Auxerre. Pop. 2,335 in 1861. The town is principally distinguished by its excellent white wines, which the French epicures take with oysters.

CHAIBAR, or KHEIBAR, a town of Arabia, in El-Hedjaz. Lat. 25° N., long. 39° 30′ E., 150 m. NE. Medina. Pop. said to be 50,000. It is the cap. of, and gives name to, an independent sovereignty of *Jews*, the descendants, according to their own assertion, of the Trans-Jordanic tribes, Reuben, Gad, and Manasseh. They have a character for bravery and learning; but the term Beni-Chaibar is so odious among Mohammedans that its application is regarded as an insult. In manners and appearance the Jews of Chaibar do not differ from other Arabs: their state has existed upwards of 1,100 years; and though the town was captured by Mohammed in the 7th Hejira, A.D. 628, it is still said to be flourishing and powerful. It was here that Mohammed received from a Jewess a poisoned egg, professedly to test his prophetic powers, which laid the seeds of the disorder under which he finally sank, about four years afterwards.

CHALONS-SUR-MARNE, or CHALONS, a city of France, cap. dép. Marne, on the Marne, in the middle of extensive meadows, 27 m. SE. Rheims, on the railway from Paris to Strasbourg. Pop. 16,575 in 1861. The Marne formerly traversed the town, but since 1788 it has skirted it in a new channel dug for the purpose, and crossed by a magnificent stone bridge. Two small affluents of the Marne run through the town. It is surrounded by old walls in pretty good preservation. With the exception of that which leads from the bridge to the Hôtel de Ville the streets are narrow and crooked; houses generally mean, not a few being of wood. The cathedral, consecrated in 1147, and rebuilt in 1672, is a large fabric, partly of Greek and partly of Gothic architecture. The Hôtel de Ville and the Hôtel de Préfecture are both fine buildings: the Porte St. Croix has a good effect, and there is a splendid promenade, called the *Jard.* It is the seat of a bishopric, and has a court of primary jurisdiction, a commercial tribunal, a departmental college, a primary normal school, a diocesan seminary, a school of practical geometry, a botanical garden, a society of agriculture, commerce, and a public library, with 20,000 vols. But the most important establishment belonging to the town is the public school of arts and trades, at which 450 pupils are maintained, at the expense of government, exclusive of those who pay. It has also a theatre. Different branches of the woollen, linen, and cotton manufactures are carried on in the town; there are also extensive tanneries, and a good deal of trade is carried on with Paris in wine, corn, wool, hemp, and rape-oil. La Caille, the astronomer, and D'Ablancourt, the translator, were natives of Chalons.

This is a very ancient town: it has been repeatedly taken and pillaged, and was once much more considerable than at present. Attila was defeated under its walls in 451. In 1591 and 1592 it burned the bulls of Pope Gregory XIV. and Clement VIII. against Henry IV. In 1814 it was for a while the central point of the operations of Napoleon.

CHALONS-SUR-SAONE, or CHALLON, a town of France, dép. Saône-et-Loire, cap. arrond., in a fertile plain, on the right bank of the Saône, which here forms an island, in which is situated the suburb St. Laurent, 34 m. N. Macon on the railway from Paris to Lyon. Pop. 19,709 in 1861. The town is pretty well built, but the streets are narrow and ill paved: it has a fine quay on the Saône, and is connected with its suburb by a stone bridge of five arches. There is a cathedral, and a hôtel de ville; but the objects most worthy of attention are the Hospice St. Laurent, in the suburb of that name, and the Hôpital St. Louis, both large establishments, and exceedingly well managed. The latter is an asylum for indigent old persons and orphans. There are some fine promenades, one of which, at the head of the Canal du Centre, is ornamented with an obelisk in honour of Napoleon. The bishopric has been suppressed; but it has a court of primary jurisdiction, a tribunal of commerce, a dep. college, a school of design, a public library with 10,000 volumes, and a theatre.

Chalons is very favourably situated for a commercial entrepôt, communicating with the Mediterranean by the great line of railway from Paris to Marseilles, which has a station here, as well as by the Rhone and Saône, and the canals connected with them, and with the North Sea by the canal of the centre, constructed in 1792.

The town is very ancient, and was for some time the capital of the kingdom of Burgundy. It suffered severely during the civil wars of the 16th century, and not a little from the invasion of the allies in 1814. It was formerly very unhealthy; but in this respect it has been materially im-

proved, by the better drainage of the surrounding country, and the greater attention paid to cleanliness in the town, though in both these respects it might still be very considerably improved. The famous Abelard died here in 1142.

CHAMAS (ST.), a town of France, dép. Bouches-du-Rhône, on the N. bank of the lagoon de Berre, 23 m. NW. Marseilles. Pop. 2,692 in 1861. The town is well built, has a handsome church, and is celebrated for its oils and olives, which it ships from its port on the lagoon. It is divided into two portions by a hill, through which a large tunnel has been cut for a channel of communication. It has an important powder magazine, which supplies Toulon and the fortresses dependent upon it. In the vicinity is a Roman bridge, of a single arch, having a triumphal arch at each extremity.

CHAMBERTIN, a famous vineyard of France, dép. Côte d'Or, a few miles NE. Beaune. It occupies about twenty-five hectares, and produces at an average from 130 to 150 pipes of burgundy. Chambertin was the favourite wine of Louis XIV. and of Napoleon.

CHAMBERY, a city of France, dép. Savoie, cap. of dép., on the left bank of the Aysse, in an elevated and fertile valley, 110 m. WNW. Turin, and 43 m. SSW. Geneva, on the railway from Paris to Mont Cenis, which is to be prolonged, by means of a gigantic tunnel under the Alps, to Turin. Pop. 19,950 in 1861. The city presents little worthy of notice; it has one good street, but most of the others are crooked, dark, and sombre. There are several squares adorned with fountains; and most of the houses are three stories in height. Chief public buildings, the cathedral, the Hôtel Dieu or principal hospital, the barracks constructed by the French, and the manufactory of silk-gauzes, for which Chambery has long been celebrated. The palace is an old castle, in no way remarkable. The churches exhibit gaudy decorations; in one, however, there is some good painted glass. The city was formerly fortified; but the walls have been removed, and the space they occupied is laid out as public walks.

Chambery is the seat of the superior judicial tribunal, and of an archbishop. It has societies of agriculture and commerce, a public library, theatre, public baths, and many charitable institutions. Besides gauze, other silk fabrics, lace, hats, leather, and soap are manufactured; and there is some trade in liqueurs, wines, lead, copper, and various other articles. The environs abound in vineyards, woods, and picturesque scenery. Near Chambery is the country house of Les Charmettes, once the residence of Mad. de Warens and Rousseau. The city is supposed to stand near, though not upon, the site of the ancient *Lemincum*. It was taken by the French in 1792, who made it the cap. of the dép. of Mont Blanc, and retained it till the second treaty of Paris, in November, 1815, when it was made over to the king of Sardinia, who, however, gave it up, together with the whole province of Savoy, to France, in 1861.

CHAMBORD, a village and famous castle of France, dép. Loire-et-Cher, on the Cosson, 10 m. E. Blois. The village—pop. 327 in 1861—is inconsiderable, and the place derives its entire importance from its castle, one of the most magnificent and best preserved in France. This noble edifice was commenced by Francis I., after his return from Spain. He is said to have employed 1,800 workmen for twelve years upon it; and here, in 1540, he entertained his illustrious rival Charles V. The building was still further enlarged by Henry II., and finished by Louis XIV., who frequently inhabited it during the early part of his reign. The *Bourgeois Gentilhomme* of Molière was acted, for the first time, at a fête given here by Louis, in October, 1670. Stanislaus Leczinsky, king of Poland, occupied this castle for nine years previously to his being put in possession of the duchy of Lorraine. In 1748 it was assigned by Louis XV. to Marshal Saxe, who spent in it the evening of his days in almost regal splendour. After many vicissitudes, it was given by Napoleon to Marshal Berthier; and having been sold by his widow, in 1820, it was bought by subscription for the Duc de Bordeaux, to whom its possession has since been confirmed by a decision of the courts. Since the expulsion of the elder line of the Bourbons from France, the head of the family has taken his name from this property.

The castle is buried in deep woods, and its situation is rather low and damp. It is of vast extent, in the Gothic style, and has a profusion of towers, turrets, and minarets. Being built of black stone, it has a heavy appearance. The interior is very magnificent. The grand staircase is so contrived that persons ascending and descending do not see each other; it has two fine chapels, and many spacious apartments and splendid ceilings. Its gorgeous furniture was sold by auction during the Revolution; and the beautiful tapestry that adorned the apartments of Francis I., Louis XIV., and Marshal Saxe, was burned, as the surest way of getting at the gold and silver with which it was embroidered; but the castle itself was not injured. The park is of great extent, comprising above 12,000 arpents.

CHAMOND (ST.), a town of France, dép. Loire, cap. cant., in a fine valley at the confluence of the Gier and the Ban, 8 m. NE. St. Etienne. Pop. 11,620 in 1861. It is a thriving, industrious town, is well built, has a handsome promenade, a departmental college, a fine parish church, and public baths. On a hill above the town are the ruins of the ancient castle, destroyed during the revolution. The manufacture of ribbons and *lacets* (laces) is very extensively carried on. It has, also, considerable cast-iron and nail-works.

CHAMOUNY, or CHAMOUNIX, a celebrated valley of the Alps, dép. Haute-Savoie, France, immediately NW. of Mont Blanc, by which, and others of the Pennine Alps, it is bounded on its S. and E. sides, and on the W. and N. by Mont Breven and the *Aiguilles Rouges*. Its length, NE. to SW., from the base of the mountains, is about 12 m., and its breadth at the bottom in most parts exceeds a mile; but including the mountain slopes and sides, it is as much as 9 m. in breadth, and may be reckoned 22 m. in length from its head at the Col-de-Balme to its outlet at the torrent of the Dioza, near Servoz. The average height of this valley above the sea is about 3,400 ft.; the Arve rises at its upper end, and intersects it in its entire length, escaping into the valley of Servoz through a ridge of granitic rock. The pines and larches which clothe the lower parts of the mountains give a sombre appearance to the W. end of the valley; and this effect is increased by the unvaried snows of Mont Blanc, which hang over it. But after passing the priory of Chamounix, the scene changes, and to this dreary magnificence succeeds a series of majestic pyramids, called *Aiguilles*, or needles, of astonishing height, and too steep to admit of the snows resting on them at any season. The valley, which becomes narrower, is richly ornamented with trees; and the Arve, rushing between finely-clothed rocks and precipices, adds life and beauty to the scene. The little village of Argentière, with its church and

glittering spire, and the two *Aiguilles* above it, together with the cheerful appearance of cultivation, form a landscape sublimely picturesque. The average height of the mountain-range on the S. side of Chamounix is about 5,000 ft.; but the principal *Aiguilles* on this side, viz. those of Charmos; the A. Verte, de Dru, d'Argentiere, and de la Tour, rise from 11,000 to 13,000 ft. above the level of the sea. Between these *Aiguilles* are situated the numerous glaciers which constitute the chief interest of the valley, to the very bottom of which they descend. Nowhere else in the Alps are the glaciers of equal magnitude.

These mountains of ice are formed by the consolidation of the snow lodged in the high Alpine valleys. As the surface of the snow thaws and percolates through the mass, it is again frozen, and acts as a cement; and by a repetition of this process; the whole mass is converted into solid ice; not so compact, however, as that of rivers or lakes; for it is full of air-bubbles, owing to the mode of its formation. Entering the valley from the SW., the first glaciers met with are those of Taconay and de Boissons, succeeding which are the more considerable ones of Montanvert, de Bois, d'Argentiere, and de la Tour. The glacier de Bois, at the foot of the Aiguille de Dru, and about a league E. of the village of Chamounix, is the largest of all: it is upwards of 7 m. in length, and in some places more than a mile broad; it is, in fact, the terminus of the Mer de Glace. (See MONT BLANC.) Near its foot, the Arveiron, a tributary of the Arve has its source in an ice cavern, which varies in size at different periods of the year; but is sometimes as much as 100 ft. in height. On the W. side of the valley, Mont Breven, and the *Aiguilles Rouges* (so called from their reddish colour) form an unbroken ridge, but of a much less elevation than that on the opposite side of Chamouny. The Col-de-Balme, at the NE. end of the valley, and 3,000 ft. above it, affords a full and magnificent view of the gigantic group. Across this mountain one of the roads from Chamouny into the Valais passes. The climate is rigorous: the winter in the valley of Chamounix lasts from October to May, during which season the snow usually lies to the depth of 3 ft., while at the village of Tour, the highest in the valley, it often attains the depth of 12 or 13 ft. In summer, the thermometer at noon commonly stands no higher than from 57° to 63°; it rarely reaches 68° Fahr. Barley and other kinds of corn, pulse, hemp, and some fruits, are grown, and a good many cattle are reared. The honey of Chamounix is of a very fine quality. The total pop. of the valley was about 4,000 in 1861. There are several small villages: that of Prieurè, or Chamounix, *par excellence*, on the right bank of the Arve, towards the centre of the valley, has a pop. of about 1,700, and several good inns. It originated in a Benedictine convent, founded here at the end of the 11th century by Count Aymon of Geneva. The other chief villages are Onches, Argentiere, Le Boissons, and Tour.

CHAMPAGNE, the name of an old prov. of France, in the E. part of the k. adjacent to Franche Comté and Lorraine, now distributed among the depts. of the Ardennes, Marne, Haute Maine, Aube, Gonne, and Seine-et Marne. Champagne is also the name of several small towns in different parts of France.

CHAMPLAIN (LAKE OF), a long and narrow lake, principally in the U. States of N. America, between New York and Vermont, and having its N. extremity in Lower Canada. This lake occupies a considerable part of what has been called the Great Glen of N. America; that is, the remarkable hollow or chasm, stretching N. from New York to the St. Laurence, a distance of about 390 m. The glen is occupied from New York to Glen's Falls, 190 m., by the Hudson; thence for 21 or 22 m. to Lake Champlain, by a table-land which, in its highest part, is only 140 ft. above the level of the tides in the Hudson. The lake extends N. and S. 110 m., with a breadth varying from ½ to 14 m.; but it is, in general, very narrow: the distance, 67 or 70 m. from the lake to the St. Laurence, is traversed by the river Richelieu, or Chambly, the outlet of the lake, which is partly navigable by vessels of 150 tons, and throughout by river barges. A canal has been constructed uniting Lake Champlain and the navigable portion of the Hudson; so that there is now a direct inland navigation, which, by a little outlay on the Richelieu, might be made suitable for steamers, from New York to the St. Laurence, between Montreal and Quebec. (Darby; Gordon's Gaz. of New York.)

CHAMPON, or CHOOMPHOON, an inl. town of Lower Siam, on the road between Ligor and Bankok, on the E. bank of a river about 7 m. W. the Gulf of Siam; lat. 10° 51′ N., long. 99° 23′ E. Estimated pop. 8,000. In 1826 it was stockaded, and considered by the Siamese an important military post. Tin, good timber for ship-building, and excellent rattans, are found in its vicinity.

CHANDA, an inl. town of Hindostan, prov. Gundwanah, cap. distr. of same name, between two small rivers, 62 m. S. Nagpoor; lat. 20° 4′ N., long. 79° 22′ E. Its walls are 6 m. in circuit, and from 15 to 20 ft. in height, built of freestone well cemented and flanked by round towers. Its interior consists of straggling streets, detached houses, gardens, and plantations. In 1803 it contained 5,000 houses; in 1822 only 2,800. In its centre there is a fort called Bala Killa. Chanda was taken by the British in 1818, when it was found to contain a good deal of treasure and valuable property, brought thither for security.

CHANDERNAGORE, a marit. town of Hindostan, prov. Bengal, belonging to the French, built on the W. bank of the Hooghly river, 16 m. NNW. Calcutta, and in point of situation, in every respect superior to that city; lat. 22° 49′ N., long. 88° 26′ E. "In 1814 it had a pop. of 41,000, but which has been reduced now to less than half that number." The streets are straight and well-paved, but present a scene of solitude and desertion; and the trade, formerly so flourishing, is almost annihilated. There are some manufactures of cotton cloths; the commerce is chiefly in opium. The territory originally attached to this town extended to 2 m. along the river, and 1 m. inland: about 2 m. below Chandernagore are the ruins of a superb house, the country residence of its former governors. The French, in 1676, obtained permission to establish this settlement, which they subsequeutly appropriated and fortified. In 1757 it was taken by the British, who destroyed the fortifications.

CHANDORE, a considerable inl. town of Hindostan, prov. Candeish, presid. Bombay, 68 m. WNW. Aurungabad, lat. 20° 19′ N., long. 74° 19′ E. It has a most formidable position on a rock, commanding one of the best passes on the range of hills on which it is situated, and is quite inaccessible everywhere but at the gateway, where it is strongly fortified. It however surrendered without much resistance to the British arms, both in 1804 and 1818.

CHANTIBUN, a large inl. town of Siam, cap. of the rich distr. of the same name, at the foot of the mountain chain separating it from Camboja, on the S. bank of a river 18 m. E. the Gulf of Siam, and 150 m. SE. Bankok; lat. 12° 35′ N., long.

102° 18′ E. It is a place of considerable trade; its chief export is pepper, to the amount of 30,000 or 40,000 piculs yearly. Cardamoms, rosewood, dye-woods, ship timber, hides, horns, ivory, lac, and benzoin, are products of the Chantibun distr. Near the town are mines of precious stones.

CHANTILLY, a neat town of France, dép. Oise, on the Nouette, and on the road from Paris to Amiens. 24 m. N. of the former, on the Northern railway. Pop. 2,930 in 1861. It has a fine hospital, endowed by the last prince of Condé. This town is distinguished by its industry and manufactures of cotton and porcelain; but it owes its celebrity to its having been, since 1632, the seat of the family of Condé, and to the vast sums they expended on the formation and embellishment of its castle, park, and gardens. The castle was one of the largest and finest structures of the kind in France; the 'grand Condé' lived here in regal magnificence; and the entertainments given by him to Louis XIV. were so splendid as to excite the jealousy of the monarch. But the glories of Chantilly have disappeared, and cotton-mills occupy the sites where Racine, Molière, and Boileau used to recite their *chefs d'œuvres* amid the applauses of all that was beautiful and chivalrous in France.

The *Grand Château*, rebuilt in 1779, was destroyed during the revolution, and all that now remains is the *Petit Château*, the *Château d'Enghien*, and the stables; the latter, constructed between 1719 and 1735, are unequalled in Europe. The remains of the Admiral de Coligni, butchered at the massacre of St. Bartholomew, are interred in the parish church of Chantilly. The forest of Chantilly occupies a space of about 3,806 hectares.

CHAPEL-EN-LE-FRITH, a market town and par., England, co. Derby, hund. High Peak, on the declivity of a hill rising from an extensive and fertile vale, surrounded by lofty eminences, 11 m. NW. by W. Derby, 167 m. NW. by N. London. Pop. of par. 4,264 in 1861. The town is only partially paved. There is one cotton mill, employing about 120 hands, and many of the lower classes are employed in weaving for the Manchester houses. At White Hall Mill is a considerable manufactory of paper. There is a brewery in the town, and nails are also made. Here is an establishment for warehousing goods, the place being a medium of communication between Manchester and Sheffield, and having in consequence a large carrying trade. The town is one of the polling places for the election of mems. for the N. div. of the co. Besides the par. church, a neat edifice with a square tower, there is a chapel for Wesleyan Methodists. There is also an endowed school at Chapel-en-le-Frith, and another at Bowden's Edge. Lead and coal mines and quarries are worked in the vicinity. The Peak Forest lime-works lie 3 m. E. of this town, and communicate by railway with the Peak Forest canal. The par. includes the townships of Bowden's Edge, Bradshaw's Edge, and Combe's Edge.

CHARD, a town and bor. of England, co. Somerset, hund. Kingsbury East, in an elevated situation, near the S. border of the co., 11 m. N. Lyme Regis, and 170 m. WSW. London, by London and South-Western railway. Pop. of bor. 2,276, and of par. 5,316 in 1861. The old municipal bor., which is a parish of itself, comprised an area of fifty-two acres; but the area of the new municipal bor. has been increased. It has an old town-hall, an extensive market-place, a church with a tower and bells, a well-endowed hospital for the maintenance of old and infirm persons belonging to the parish, and is well supplied with water. Fairs, 1st Wednesday in May, August, and November. Market-day, Monday. Chard was made a bor. by Edward I., and elected mems. to nine parliaments, when it lost the privilege.

CHARENTE, an inland dép. of France, distr. of the W., formed principally out of the ancient prov. of Angoumois: it takes its name from the Charente, by which it is traversed; and has N. the Deux Sévres and Vienne, E. Haute Vienne, S. Dordogne, and W. the Charente Inférieure. Area 594,238 hectares, or 3,270 Eng. sq. m.; pop. 379,081 in 1861. Surface diversified by a great number of little hills. Soil various, being mostly thin or clayey, and encumbered with moisture; the latter prevails in the arrond. of Confolens, where there are no fewer than sixty-two shallow lakes, or *étangs*, some of them of considerable extent; there is also in the latter arrond., and in that of Barbezieux, a large extent of heath and waste land. Principal corn crops, wheat, maslin (a mixture of wheat and rye), maize and millet, rye, barley, and oats; but, owing to the inferiority of the soil, the returns are among the poorest in France, and the produce is insufficient for the consumption. The principal wealth of the dép. consists in its vineyards, which cover about 100,000 hectares. Their produce is mostly converted into *eau-de-vie*, the superiority of that made at Cognac being universally acknowledged. Hemp, flax, and potatoes are extensively cultivated. The woods cover about 74,000 hectares; and the produce of chestnuts averages 200,000 hectolitres. Truffles are abundant, the value of those sold being estimated at about 300,000 fr. a year. There are, comparatively, few horses; but cattle, sheep, and hogs are abundant: wolves, foxes, and otters are pretty common, but wild boars have become rare. The minerals are antimony, lead, iron, and gypsum; the last two being wrought to a considerable extent. Besides the iron-works, there are very extensive distilleries, with paper-works (see ANGOULÊME), tanneries, and manufactures of linen, canvas, cordage, cloth, hats, and earthenware. The dép. is divided into five arrondissements. The principal towns are Angoulême, Cognac, Ruffec, and Confolens.

CHARENTE INFÉRIEURE, a maritime dép. of France, on the W. coast, deriving, like the foregoing, its name from the Charente, by which it is intersected; having N. Vendée, NE. Deux Sévres, E. Charente, S. the Gironde, and W. the Atlantic Ocean. Area, including that of the islands of Oleron, Ré, and Aix, 682,569 hectares, or 3,763 sq. m.; pop. 481,060 in 1861. Surface flat, and in part marshy; soil partly light, calcareous, and gravelly, and partly heavy and clayey. Principal crops, wheat, maslin, rye, barley, maize, millet, and oats. The rotation is, 1st year, wheat; 2nd rye, or some other grain; during the 3rd year the ground remains untilled, serving as a kind of pasture for sheep; in the 4th year the old routine recommences. Rent of arable and pasture land varies from 8s. to 36s. an acre. About half the dép. is cultivated by proprietors, who possess from 50 to 100 and 150 acres; the other half is occupied by farmers, whose farms may vary from 300 to 700 acres, and who are said to be prosperous. About 112,000 hectares are occupied by vineyards, whose product, like those of the Charente, is mostly converted into *eau-de-vie* or brandy. The forests cover above 70,000 hectares. Pastures extensive and excellent, furnishing food for a great number of cattle, excellent horses, and sheep. Minerals not of much importance; but there are in the dép. very extensive salt marshes, particularly in the neighbourhood of Marennes, which furnish large quantities of salt. In summer, the marshes are unhealthy, but otherwise the climate is mild and

salubrious. This dép. has great facilities for commerce. It has several deep bays and excellent ports, and, exclusive of the Charente, which has Rochefort near its mouth, it is watered by the navigable rivers Seudre and Sévre, from the latter of which there is a canal to La Rochelle, and is skirted on the S. by the Gironde. The fishery of sardines and oysters is extensively carried on, and vessels are also fitted out for the cod fishery. La Rochelle, Rochefort, and the other ports have also a considerable share of the colonial and coasting trade of France. With the exception of the salt manufacture and distillation, manufacturing industry is not prosecuted on a large scale; but coarse woollen stuffs, soap, fine earthenware, and glass are produced; and there are also tanneries and sugar refineries. The dép. is divided into six arrond. Principal towns, La Rochelle, Rochefort, Saintes, and St. Jean d'Angely.

CHARENTON-LE-PONT, a town of France, dép. Seine, cap. cant., agreeably situated on the Marne, near its confluence with the Seine, 4 m. SE. Paris, on the railway from Paris to Troyes. Pop. 5,531 in 1861. The town has several country houses, among which is the one occupied by the famous Gabrielle d'Estrées. The Marne is here crossed by a bridge, the possession of which has always been regarded as of material importance to the defence or attack of Paris; and it has frequently been the scene of obstinate conflicts, the last of which took place in 1814, when it was forced by the allies. The bridge unites the town with the village of Charenton St. Maurice. There is here an excellent lunatic asylum, founded in 1741, and capable of accommodating 400 patients. The Protestants had formerly a large church in this village, in which synods were held in 1623, 1631, and 1644; but it was demolished in 1655, after the revocation of the edict of Nantes.

CHARITE' (LA), a town of France, dep. Nièvre, cap. cant., at the foot of a hill planted with vines. The Southern railway has a station here. Pop. 5,297 in 1861. The town is situated on the right bank of the Loire, over which there are two bridges. It was formerly fortified, and much more considerable than at present. It is celebrated for its manufactures of coarse jewellery, buttons, glass, earthenware and woollen stuffs.

CHARKOFF. See KHARKOFF.

CHARLEROY, or CHARLEROI, a fortified and important manufacturing town of the prov. of Hainault, in Belgium, on the navigable river Sambre, 33 m. S. of Brussels, on the railway from Brussels to Paris. Pop. 10,800 in 1856. The town is built on the side of a steep hill, and the inhab. are occupied chiefly in working the extensive coal mines of the district, and in numerous iron foundries and glass works. The town is in the centre of the great coal-basin of Charleroy. Adjacent quarries of slate and marble are also important sources of industry and wealth; and the neighbourhood contains numerous mills for sawing marbles. The manufactures of glass comprise all kinds of vessels and sheet glass, of various qualities; and the iron works include the manufacture of fire-arms, cutlery, tools, and utensils. There are, besides these principal establishments, several factories for spinning wool and weaving woollen cloths; dye-houses, tanneries, snuff mills, rope walks, soap-houses, salt and sugar refineries, breweries, distilleries, and brickyards. The communication with Brussels by means of the railway, as well as the Charleroy canal, affords great facilities for commerce. Between 200 and 300 capacious barges are constantly employed in exporting from Charleroy to Brussels coal, iron, merchandise is held during 10 days, commencing on the 5th of Aug.

The fortress of Charleroy was built in 1666, by Rodrigo, Spanish gov. of the Netherlands, and named after Charles II. king of Spain. The lower and middle town were added by Louis XIV. in 1676. Charleroy has sustained several memorable sieges; and by various treaties has been transferred from Spain to France, from France to Spain, from Spain to Austria, and from Austria to France. The fortifications were materially improved under the direction of the Duke of Wellington, after the campaign of 1815. Near Charleroy are the ruins of the magnificent abbey of Alne, in a beautifully romantic solitude, about 9 m. from the town. The cloisters of this superb establishment were supported by 300 columns of coloured marble, and its revenue amounted to 250,000*l*.

CHARLESTON, a city and sea-port of the U. States, one of the principal in the S. part of the Union, and the largest town of S. Carolina, on a low point of land at the confluence of the Cooper and Ashley rivers, 6 m. W. by N. the nearest point of the Atlantic, 118 m. NE. Savannah, and 590 m. SSW. Baltimore; lat. 32° 46′ N., long. 79° 49′ W. Pop. 51,200 in 1860. Charleston was, till 1787, the seat of the state government. This city was visited, in 1838, by a most destructive fire, which raged with great fury in its most populous part, destroying several streets and an immense amount of property. Previously to this disaster, the streets, which were rather narrow, crossed each other at right angles, and were often planted with pride-of-India trees (*Melia azederacha*): the houses were mostly of brick, and generally furnished with verandahs. Charleston was partly destroyed a second time in 1864, when it was taken possession of by the troops of the United States, after having been for four years in the hands of the Confederate government, serving as the chief port of entry for foreign vessels into the Southern States, and the principal refuge of 'blockade runners.' The town has a college, town-hall, exchange, custom-house, guard-house, theatre, circus, orphan asylum, hospital, two markets, two arsenals, and numerous churches. The college, established in 1785, was reorganised in 1824: it possesses a commodious edifice, with a library and philosophical apparatus. There are two medical schools, and various learned and charitable societies. The harbour is large and convenient, but rather difficult of access, in consequence of its entrance being obstructed by a range of sand-banks. Through these there are but two channels suitable for ships of large burden. In the principal or S. channel the depth of water in the shallowest part, 8 m. SE. from the town, at ebb tide, is only about 12 ft., and at flood tide from 17 to 18 ft. A lighthouse, 80 ft. high, with a revolving light, has been erected on a small island bearing 2½ m. NW. from the bar, at the entrance to the S. channel. After crossing the bar, there is deep water up to the city, where vessels lie moored alongside wharfs or quays. Charleston is a place of very extensive trade, it being the port whence more than three-fourths of the whole foreign trade of S. Carolina is carried on. Its exports consist chiefly of cotton and rice. Most of the imports are from the N. and middle states, and consist of wheat and flour, fish, shoes, and all kinds of manufactured goods. The foreign imports are mostly brought at second hand from New York, and consist of cottons, woollens, linens, hardware, iron and steel, coffee, sugar, tea, wine, and spices. Like most other cities in the S. part of the United States, Charleston formerly had a large slave pop., and

to those who lived in countries free from this moral contamination. Happily all this has ceased by the emancipation of the slaves in 1865, in consequence of the great civil war in the United States. The yellow fever occasionally commits great ravages here; but it is more fatal to foreigners than to the native pop. The fever is supposed to be owing, in a considerable degree, to the marshy nature of the soil on which a part of the town has been built; but the swampy ravines by which it was formerly intersected have been gradually filled up and drained, and the city has, in consequence, become much more healthy. The town is badly supplied with water, having mostly to depend on the rain water collected in cisterns. Charleston was founded in 1680, and was the seat of government till the building of Columbia, in 1787.

CHARLEVILLE, an inland town of Ireland, prov. Munster, N. extremity co. Cork, 22 m. S. Limerick, on the railway from Limerick to Cork. Pop. 4,766 in 1831, and 2,468 in 1861. The town consists of four main streets crossing each other at right angles. In it are the par. church, a large R. Cath. chapel, a building for public meetings, a national school, and an endowed grammar school. The corporation, under a charter of Charles II., in 1671, consists of a sovereign, two bailiffs, twelve burgesses, and an indefinite commonalty. It returned two members to the Irish H. of C. till the Union, when it was disfranchised. A manor court has jurisdiction in pleas to the amount of 20*l*., and as a civil bill court. Petty sessions are held on alternate Mondays. The court and market house are in the same building. Tanning and blanket making are carried on to some extent, and there are two large flour mills. Markets on Saturdays; fairs on 10th Jan., 16th March, 12th May, 15th Aug., 10th Oct., and 12th Nov. The town is a constabulary station.

CHARLEVILLE, a town of France, dép. Ardennes, on the Meuse, at a short distance from Meziers, on the railway from Chalons to Namur. Pop. 9,907 in 1861. The town is extremely well built; streets straight and broad, intersecting each other at right angles; houses nearly all of the same height, and slated, having a comfortable, gay appearance. In the centre of the town is a fine square, surrounded by arcades, and ornamented with a superb fountain. The river is crossed by a suspension bridge. It is the seat of a court of primary jurisdiction, and of a commercial tribunal; and has a departmental college, a primary normal school, a secondary ecclesiastical school, a course of geometry and mechanics applied to the arts, a public library, with 24,000 vols., a cabinet of natural history and antiquities, and a theatre. The royal manufactory of arms, formerly established here, has been transferred to Tulle and Châtellerault; but arms are still largely manufactured on account of individuals. The nail-works produce about 3,500,000 kilog. of nails a year; and there are, besides, copper foundries, where large quantities of copper-wire, and plates, are produced, with soap-works and tanneries. It has a commodious port on the Meuse, and a considerable trade in wine, spirits, coal, iron, slates, marble, and manufactured goods. Through the canal of Ardennes, as well as the railway, it has also an easy communication with Paris.

The foundations of Charleville were laid in 1605, by Charles of Gonzaga, duke of Mantua Nevers, who gave it his name. Having passed from his heirs to the house of Bourbon, the fortifications were razed, in 1686, by order of Louis XIV.

CHARLOTTENBURG, a town of Prussia, 5 m. W. Berlin, with which it is connected by railway. Pop. 12,431 in 1861. The town consists chiefly of villas and taverns, the summer residence of the rich, and the resort of the humbler classes from Berlin; is well built, and has handsome straight streets, ornamented with rows of trees. There is a magnificent palace, built by Frederick the Great, and furnished with a collection of antiquities. The gardens, which are finely laid out, are always open to the public, and are much visited by Sunday parties and strollers from the capital. Within the gardens is the mausoleum, erected by King Frederick William III., over the remains of his beautiful and unfortunate queen, Louisa of Mecklenburg. It contains the celebrated recumbent marble statue of Louisa, by Rauch, admitted to be not only the masterpiece of that eminent sculptor, but one of the finest modern works of art.

CHAROLLES, a town of France, dép. Saône-et-Loire, cap. arrond., at the confluence of the Semence and the Reconce, 28 m. WNW. Mâcon. Pop. 3,284 in 1861. The town is agreeably situated, neat, and well built; has a communal college, tribunals of primary jurisdiction and commerce, an agricultural society, iron forges, and fabrics of earthenware, and crucibles. A hill above the town is crowned with the picturesque ruins of the old castle of the counts of Charolais. One of these, a prince of the blood royal, who lived during the reign of Louis XV., achieved an infamous notoriety.

CHARTRES, a city of France, dép. Eure-et-Loire, of which it is the capital, on the Eure, 48 m. SW. Paris, on the railway from Paris to Nantes. Pop. 19,531 in 1861. The town is surrounded by walls and ditches, and is situated partly on a hill, and partly on low ground. The Eure, which here divides into two branches, runs through and encircles the lower town. Streets narrow and crooked; those forming the communication between the upper and lower towns being so very steep as to be inaccessible to carriages. The cathedral is reckoned one of the finest Gothic edifices in France. Here are, also, two fine steeples, a monument to General Marceau, barracks, a theatre, and some fine promenades. It is the seat of a bishopric; has a court of assizes, tribunals of primary jurisdiction and commerce, a departmental college, a public library, with 30,000 vols., a school of design, and a botanical garden. The manufactures consist principally of hosiery and hats, and there are also tanneries and dye-works. Chartres is the centre of the corn trade of the dep., its corn-markets being among the most important in France, and providing in a great measure for the supply of Paris. It is the native country of Regnier the poet, of Brissot, and Petion, members of the convention, and of General Marceau.

This is a very ancient city, being reckoned before the Roman conquest, as the capital of Celtic Gaul. It was for a considerable time in the possession of the English. Henry IV. was crowned here in 1594.

CHARTREUSE (LA GRANDE), a famous monastery of France, dép. Isère, 14 m. N. Grenoble, among rugged mountains, at an elevation of 3,281 ft. (1,000 metres) above the level of the sea. The access to it is very difficult. This monastery was founded in 1084; but having been several times pillaged and burnt down, the present building has been erected since 1676. It is of vast extent, and has cost an immense sum. During the revolution, the monks were driven out, and their property, including their valuable library, confiscated and sold. But, in 1826, the building, which had escaped the

destination. Some of the old monks, accompanied by several neophytes, returned to the building; and the Chartreuse existed once more, but shorn of its old lustre, importance, and wealth.

CHARYBDIS. See SCYLLA and CHARYBDIS.

CHATEAUBRIANT, a town of France, dép. Loire Inférieure, cap. cant., on the Chere, near the pond or lake of Grand Lieu, 26 m. WNW. Ancenis. Pop. 4,636 in 1861. The town is old and meanly built, round the ruins of the old castle, founded in 1015, whence it derives its name. Francoise de Foix, celebrated for her beauty and gallantries with Francis I., died here in 1537, and was buried in the church of the Trinity, with an epitaph on her tomb written by Clement Marot. The town has a court of primary jurisdiction, an agricultural society, and manufactures of coarse woollen stuffs, and its pastry and *confitures* are held in high estimation. It has some trade in iron, coal, and wood, and a considerable corn-market.

CHATEAU-CHINON, or CHINONVILLE, a town of France, dép. Nièvre, cap. arrond., near the Yonne, in the middle of mountains, at an elevation of 1,968 ft. (600 métres) above the level of the sea, 20 m. WNW. Autun. Pop. 2,960 in 1861. The town was formerly surrounded by fortifications, and was defended by a vast castle, of which there exist considerable ruins. It has a court of primary jurisdiction, an agricultural society, and some fabrics of coarse woollens and linens. Having been taken by the royalists in 1591, after an obstinate resistance, the garrison and the greater part of the inhabitants were put to the sword.

CHATEAUDUN, a town of France, dép. Eure-et-Loire, cap. arrond., near the left bank of the Loire, 25 m. SSW. Chartres. Pop. 6,719 in 1861. Having been almost wholly burnt down in 1723, it has been rebuilt on a regular plan, with broad straight streets, and uniform houses. The principal square, the Hôtel de Ville, and the buildings of the communal college, are worthy of notice. Besides the college, it has a court of primary jurisdiction, a public library, with 6,000 vols., and some manufactures of woollens, and tanneries. On a rock, commanding the town, are the remains of the old castle of the Counts of Dunois, the chapel attached to which has the tomb of the famous general of Charles VII., and some other tombs of less distinguished members of the family.

CHATEAU-GONTIER, a town of France, dép. Mayenne, cap. arrond., on the Mayenne, 18 m. S. Laval. Pop. 7,214 in 1861. The town is badly laid out, but well built; has a stone bridge over the river, by which it is united to its principal suburb, a fine Gothic church, a communal college, 3 hospitals, public baths, an agricultural society, &c.; and is the seat of a court of original jurisdiction. It has considerable manufactures of fine linen and linen thread, with extensive bleachfields; is the entrepôt of a great proportion of the wines, slate, coal, and tufa of the dep.; and the centre of the trade in fine thread. The town was formerly surrounded by walls, and had a castle, whence it took its name. It suffered a good deal during the wars of Vendée.

CHATEAULIN, a town of France, dép. Finistère, cap. arrond., in an agreeable valley, on the Aulne, which there takes the name of Châteaulin, 22 m. SE. Brest, on the railway from Brest to Quimper. Pop. 2,892 in 1861. The town is ill-built; has a court of primary jurisdiction, and an agricultural society. Vessels of from 60 to 80 tons come up to the town, which has a good deal of trade in slates, procured from quarries in the neighbourhood, cattle, and butter.

CHATEAUNEUF-DE-RANDON, an inconsiderable town of France, dép. Lozère, cap. cant., on a mountain, 12 m. NE. Mende. Pop. 1,465 in 1861. The town was formerly fortified; and an English garrison was besieged in it, in 1380, by a French force under the famous constable Dugueselin; the constable having died during the course of the siege, the English governor laid on his coffin the keys of the town, which he had engaged to deliver up to him if not relieved within fifteen days. A monument was erected here in 1820 to the memory of Dugueselin.

CHATEAUNEUF-SUR-CHARENTE, a town of France, dép. Charente, cap. cant., on the Charente, 12 m. WSW. Angoulême. Pop. 3,565 in 1861. The town has a considerable trade in wine, brandy, and salt. It was anciently called Berdeville, and was defended by a castle burnt down in 1081. A new castle having been built to replace the former, the town took from it the name of Châteauneuf.

CHATEAUROUX, a town of France, dép. Indre, of which it is the cap., in an extensive plain on the left bank of the Indre and on the railway from Paris to Bordeaux. Pop. 16,176 in 1861. Though materially improved Châteauroux continues to be one of the worst built towns in France. Streets narrow, crooked, and ill-paved; houses small, irregularly built, and gloomy. It has, however, some finely shaded agreeable promenades, and some good buildings. It is the seat of a court of assizes, of tribunals of primary jurisdiction and commerce; and has a theatre, a public library, a public garden, a society of agriculture, science and arts, and an annual exhibition of the products of the industry of the dep. The cloth manufacture is very extensively carried on; cotton hosiery and hats are also produced, and there are establishments for the spinning of wool, with tan-works, and tile-works.

Châteauroux was founded in 950; was burned down in 1088, and rebuilt shortly after. Louis XIII. erected it into a duchy; and it was given by Louis XV. to one of his mistresses, Madame de Mailly, better known by the name of the Duchess de Châteauroux.

CHATEAU-THIERRY, a town of France, dép. Aisne, cap. arrond., on the Marne, 25 m. S. Soissons, on the railway from Paris to Soissons. Pop. 5,925 in 1861. The town is built on the declivity of a hill, the summit of which is surmounted by its ancient castle, a vast mass of thick walls, towers, and turrets. It has a considerable suburb on the left bank of the Marne, the communication between them being kept up by a handsome stone bridge of three arches. It has a court of primary jurisdiction, a communal college, an establishment for the spinning of cotton, and tanneries. The famous poet La Fontaine, not less original by his character and conduct than by his talent and genius, was born here on the 8th of July, 1661. The house which he inhabited is still preserved; and a marble statue was erected to his memory on the end of the bridge in 1824. Château-Thierry suffered considerably during the campaign of 1814.

CHATELLERAULT, a town of France, dép. Vienne, cap. arrond., on the Vienne, 20 m. NNE. Poitiers on the railway from Paris to Poitiers and Bordeaux. Pop. 14,210 in 1861. The town is situated in a fertile, agreeable country, but is ill built. It is joined to its suburb on the opposite side of the river by a stone bridge, built by the Duc de Sully. Besides several churches, it has a communal college, a theatre, an exchange, a hospital, and a royal manufacture of arms, the buildings of which are among the finest in the town; and some fine promenades. This town has been long famous for its cutlery, and has

clocks and watches, and lace. It serves as a kind of entrepôt for the towns of the S. and the N. of France; particularly for wines, spirits, salt, slates, iron, corn, hemp, and timber. The Scotch Earl of Arran, ancestor of the Dukes of Hamilton, was created Duc de Châtellerault in 1548.

CHATHAM, a par., town, parl. bor., naval arsenal, and sea-port of England, co. Kent, lathe Aylesford, on the Medway, 28 m. E. by S. London, by road, and 34¼ m. by London, Chatham and Dover railway. Pop. of parl. bor. 36,177 in 1861. Chatham is separated from the city of Rochester by a merely artificial line; and the latter being connected with Stroud by a bridge, the three towns form a continuous street of upwards of 3 m. along the old Dover road from London. For about ½ m. below Rochester, the town extends along the bank of the river, which there bends NNE. and E. by N. till it falls into the æstuary of the Thames at Sheerness. Notwithstanding the shortness of its course, the Medway has very deep water. At Chatham the tide rises 18 ft. at springs, and 12 ft. at neaps; and from Sheerness to Chatham there is water to float the largest ships; and the ground being soft, and the reaches short, it forms an admirable harbour for men-of-war; and it is to its facilities in this respect that Chatham and the contiguous towns are mainly indebted for their rise.

The principal church, a plain brick structure, was rebuilt in 1788; and a more modern one was erected in 1821, by the parliamentary commissioners. Several more churches have since been built, as also a number of dissenting chapels, a national school, a proprietary classical school, a philosophical and literary institution, to which a museum is attached, and two public subscription libraries. Here is also a chapel, on the site of one attached to a monastery, founded in 1078, the endowment of which supports four brothers, two of them in orders. Sir J. Hawkins' hospital for decayed seamen and shipwrights, chartered in 1594, supports 10 individuals. There are three or four minor charities. 'Chatham chest,' which originated with Sir F. Drake and Sir J. Hawkins, after the Spanish Armada, and at first consisted of voluntary contributions from seamen, soon became compulsory, and was ultimately removed, in 1803, to Greenwich. Down to the 4th Wm. IV. it was supported by deductions from the monthly wages of seamen, but an act of that session made it chargeable on the consolidated fund. The town was considerably improved under an act passed in 1772, but many parts of it still remain narrow and irregular. It is in the jurisdiction of the co. magistrates, with the exception of a small part, comprised within the municipal limits of Rochester. The Reform Act, which made it a borough, conferred on it the privilege of returning one member to the H. of C. The limits of the parliamentary borough include a considerable area S. and E. of the town. Registered electors 1,741 in 1865. Market-day, Saturday; annual fairs, May 15, September 19, each lasting three days: annual races in August.

The town is almost wholly dependent on the great naval and military establishments at Brompton, in its immediate neighbourhood, but separated from it by a line of fortifications. The dockyard, which lies along the E. side of the river, is, including the arsenal, above 1 m. in length; and is defended by Gillingham Fort, Upnor Castle, and several bastions. Fort Pitt, on the S. or land side of the town, was erected in 1803. The dockyard contains between 500 and 600 houses for the artificers employed in the different works, and is abundantly supplied with every accommodation required for the building and fitting out of the largest ships. It has five large tide docks, capable of receiving first rate men-of-war, and six building-slips for vessels of the largest dimensions; a mast-house, attached to which are saw-mills worked by steam, and two large floating basins, for the reception of the timber for the masts; a smithery, where anchors of the largest size are forged; a rope-house, where cables above 100 fathoms in length, and 25 inches diameter, are twisted by powerful machinery; a sail-house, and numerous warehouses, containing every article required for the building and equipment of ships of war. Here also is a spare set of Brunel's block machinery, in the event of that at Portsmouth getting out of order; dwellings for the civil officers of the establishment, and a handsome chapel. Near the entrance (which is a spacious gateway flanked by two towers) is a general marine hospital, built in 1828, and capable of receiving 340 patients. Four hulks moored off the dockyard, one for juvenile, two for adult offenders, and one as a hospital, form the convict establishment, usually containing from 900 to 1,000 individuals, employed in the common drudgery of the arsenal. The ordnance wharf, to the W. of the dockyard (on the slip of land between the church and river, quarter of a m. from the high street of Chatham), contains the guns belonging to each vessel respectively, in separate tiers, piles of shot and shells, a well-arranged armoury, and a large building in which lead is rolled and paint ground by steam machinery. The military establishments, comprised within the lines, consist of large infantry, marine, engineer, and artillery barracks, with a park of artillery. There is also a school, established in 1812, where young engineering officers and recruits are trained to a practical acquaintance with their duties. The naval arsenal was first formed a short time previously to the Spanish Armada, on the site of the present ordnance wharf: Upnor Castle was also built about the same time. The dockyard was removed to its present site by James I., and was subsequently enlarged and improved, by the formation of floating docks, by Charles I., at which period Gillingham Fort was built; but the present establishments were principally formed subsequently to 1758, when an act was passed for their construction. Previously to this, the security of the arsenal depended mainly on the river forts, especially that of Sheerness; and on the guard ships stationed in the river. These, however, were not adequate for its protection. A memorable instance of their insufficiency occurred in 1667, when a powerful Dutch fleet, under De Ruyter, having suddenly appeared in the Thames, took Sheerness, broke a strong chain that had been drawn across the Medway, and, sailing up the river as far as Chatham, destroyed several sail of the line and a great quantity of stores. The Dutch accomplished this brilliant and daring achievement without incurring any material loss; but the fortifications were soon after very materially strengthened, and are now such as to render any *coup de main* of this sort quite out of the question

To shorten the distance by water, and facilitate the communication between London and Chatham, an open canal and tunnel was made, at the beginning of the present century, from the Thames, opposite Tilbury Fort, to Chatham, a distance of about 9 m., of which about 2 m. are tunnelled. But notwithstanding the obvious importance of this channel of communication as a means of saving distance, the too great height of the rates prevented it from being much used, and it was ultimately sold to the North Kent railway

company, who used the tunnel for the railroad. Cetcham, or the Village of Cottages, is the name of Chatham in Domesday, and many British and Roman remains have been found in its vicinity; but the greater part of the modern town has been built since the reign of Elizabeth. Chatham has given the title of earl to the Pitt family.

CHATILLON-SUR-LOING, a town of France, dép. Loiret, cap. cant., on the Loing, 14 m. SSE. Montargis. Pop. 2,594 in 1861. This town belonged to the family of Coligny; and in its old castle, on the 16th of February, 1517, was born the famous Admiral de Coligni, the most illustrious victim of the massacre of St. Bartholomew. The mangled remains of the admiral having been deposited, by the care of some of his servants, in the chapel of the castle of Chatillon, were transferred, in 1786, to Maupertuis, where a monument was erected to his memory.

CHATILLON-SUR-SEINE, a town of France, dep. Côte d'Or, cap. arrond., on the Seine, 28 m. NNE. Semur-en-Auxois, on the railway from Paris to Mulhouse. Pop. 4,836 in 1861. The town is neat, well built, and well laid out; it has a fine castle, a communal college, a small public library, a hospital, and a school of design, a society of agriculture. It has also fabrics of coarse cloth, hats, jewellery, iron-plates, glass, beet-root sugar, and casks. There was formerly, within the park belonging to Marshal Marmont, a very perfect agricultural establishment, and an establishment for the preparation of iron and hardware articles: but since the death of the marshal, the establishments in question have been dismantled and the articles sold. Chatillon was, in 1814, the seat of the unsuccessful negociations between Napoleon and the Allies.

CHATRE (LA), a town of France, dép. Indre, cap. arrond., on the left bank of the Indre, 22 m. SE. Châteauroux. Pop. 5,038 in 1861. The town is agreeably situated on the side of a hill, and was formerly defended by an immense castle, now in ruins, and of which one of the towers serves for a prison. It has a handsome church, and a fine promenade; with a court of primary jurisdiction, a communal college, very extensive tanneries and leather manufactures, and fabrics of serge and other coarse woollen stuffs. Chestnuts are very plentiful in its vicinity; and it has a considerable trade in them, and in cattle, wool, and hides.

CHATSK, a town of Russia in Europe, gov. Tambof, cap. distr., on the Chatcha, 95 m. N. Tambof. Estim. pop. 8,000. The town was founded in 1553, and peopled with Strelitz, Pouchgars, and Cossacks, and was formerly fortified; and has a good deal of trade in corn, cattle, tallow, honey, hemp, and iron.

CHATSWORTH, a famous seat belonging to the Duke of Devonshire. See BAKEWELL.

CHATTERPOOR, a town of Hindostan, province Allahabad, about 140 miles WSW. that city, formerly a flourishing place, and still possessing extensive manufactures of coarse cotton wrapper.

CHAUDES-AIGUES, a town of France, dép. Cantal, cap. cant., in a narrow, deep gorge, on one of the affluents of the Truyère, 14 m. SSW. St. Flour. Pop. 1,950 in 1861. This town is indebted for whatever importance it may possess to its hot springs, which were known to the Romans, by whom they were called *Aquæ Calentes*, of which its modern name is a translation. Their temperature varies from 30° to 80° Reaumur. In winter, the houses are warmed with the hot water conveyed through the streets and into the houses in wooden pipes. It is also successfully employed in the incubation of various species of eggs. It has some trade in isinglass, and carries on some branches of the woollen manufacture.

CHAUMONT (formerly *Chaumont-en-Bassigny*), a town of France, dép. Haute Marne, of which it is the cap., on a height between the Marne and the Suize, about 1½ m. from the confluence of these rivers, 18 m. NNW. Langres. Pop. 7,140 in 1861. The town is indifferently built; streets straight and clean, but some of them steep and of difficult access. It formerly laboured under a deficiency of water; but now it possesses several fine fountains, supplied by means of a hydraulic machine. It has several good public buildings; and in the upper part of the town are some fine promenades. Louis XII., Francis I., and Henry II., surrounded it with walls and ditches; but these are in a state of disrepair, and in most places, indeed, are thrown down and filled up. It has tribunals of primary jurisdiction and of commerce; a departmental college, a society of agriculture, commerce, and arts; a public library, with 35,000 volumes; a theatre, a hospital, and a house of correction; manufactures of coarse woollens and druggets, with important fabrics of hosiery and gloves; and a considerable trade in iron and cutlery. The emperors of Austria and Russia, and the king of Prussia, signed here, in 1814, a treaty against Napoleon.

CHAUNY, a town of France, dép. Aisne, cap. cant., at the point where the Oise is joined by the canal of St. Quentin, half the town being built on an island in the river, 18 m. W. Laon, on the railway from Paris to Mons. Pop. 8,163 in 1861. A good deal of cider is made in the town, which has also a considerable amount of trade, being favourably situated for commerce.

CHAVES, a fortified frontier town of Portugal, prov. Tras os Montes, on the right bank of the Tamega, over which it has a Roman bridge of eighteen arches, 40 m. W. Braganza. Pop. 6,720 in 1858. The town has mineral baths, which were formerly much frequented. It was taken by the French, under Marshal Soult, on his entry into Portugal in 1808, but was recaptured by the Spaniards in the following year.

CHAYENPOOR, a town and distr. of Nepaul, N. Hindostan; the former is fortified, and is 130 m. E. by S. Catmandoo. The distr. is altogether mountainous; it exports to Thibet rice, wheat, oil, butter, iron, copper, cotton and woollen cloth, planks, spices, indigo, tobacco, sugar, furs, and pearls; and imports thence, salt, gold, silver, musk, musk deer skins, chowries, blankets, Chinese silks, borax, and medicinal herbs.

CHEADLE, a market town and par. of England, co. Stafford, S. div., hund. Totmonslow, 180¼ m. NW. London, by London and North-Western railway. Pop. of town 3,191, and of par. 4,803 in 1861. The town is pleasantly seated in the most fertile part of the Moorland, in a vale surrounded by hills, planted with forest trees, and in a district abounding with coal. It consists of one principal and four small streets, and is intersected by the roads from Newcastle to Ashbourn, and from Leek to Uttoxeter. The church is an ancient structure, in the decorated style of English church architecture. The chapel of ease, a neat building, was erected by subscription in 1832. The town is governed by a constable and headborough, nominated annually at the court-leet, held by the lord of the manor. It is also a station for receiving votes at the election of mems. of the H. of C. for the N. div. of the co. The living is a rectory, in the archdeaconry of Stafford, and diocese of Lichfield and Coventry. Patron, master and fellows of Trinity College, Cambridge. There are various chapels for dissenters and R. Catholics. It has a free school, endowed in 1685; a national school,

and sundry bequests for the poor of the par. In the vicinage are very extensive copper, tin, and brass works, and a considerable tape manufactory. There are also in the town numerous blacksmiths, braziers, and tin-plate workers; iron merchants, nail-makers, curriers, and tanners; rope-makers, flax-dressers, saddlers, and maltsters. Copper ore has been found in the neighbourhood, but not in sufficient abundance to make its working advantageous. The Caldon branch of the Trent and Mersey canal passes within 4 m. of Cheadle. Market-day, Friday; and fairs are held in January, March, Holy Thursday, 16th August, and 4th October, for cattle and horses.

CHEDDER, a par. and village of England, co. Somerset, hund. Winterstoke. Area 6,690 acres. Pop. 2,032 in 1861. The village, 15 m. S. by W. Bristol, at the base of the Chedder cliff, a part of the Mendip hills, has three irregular streets branching from a centre. The church is a spacious structure, with a lofty pinnacled tower; there is a charity school for 35 boys and 13 girls, supported by a portion of a bequest left in 1751, the remainder being appropriated to the apprenticing of poor children, and the relief of the poor generally. There are fairs for sheep and cattle, May 4 and Oct. 29. The inhabitants are chiefly employed in agriculture; but a paper-mill in the immediate vicinity employs several hands, and many females are engaged in knitting stockings. The Chedder rocks, close to the town, form a huge chasm or gorge, apparently torn apart by some convulsion of nature, presenting irregular precipices and extensive caverns, characteristic of calcareous strata. The extensive downs comprised within the par. are clothed with fine pasture; and the dairies of the district have long been famous for the production of an excellent species of cheese, known by the name of Chedder.

CHEDUBA, an island in the Bay of Bengal, about 10 m. SW. Ramree, Aracan, to which prov. it belongs, constituting one of its four chief divisions. It lies between lat. 18° 36′ and 18° 46′ N., and long. 93° 28′ and 93° 44′ E.: shape, nearly round; length and breadth, about 20 m. each; area, 400 sq. m. Pop. between 5,000 and 6,000. Nearly the whole of its surface consists of a rich productive soil; the interior is much more free from jungle than that of any other island upon this coast. The sugar cane, tobacco, hemp, cotton, and rice grow most luxuriantly, and the cattle are the finest in the whole prov.

CHELMSFORD, a town and par. of England, co. Essex, hund. Chelmsford, at the confluence of the Widd, or Cann, and Chelmer, 28 m. NE. by E. London by road, and 29¼ m. by Great Eastern railway. Pop. of town 5,513, and of parish 8,407 in 1861. The town, which is almost in the centre of the co., consists of one principal street and three others branching from it: houses mostly well built, many of them having gardens extending to the rivers. It is lighted, and well supplied with water from a spring distant ½ m., conveyed to a handsome reservoir in the town. The church, a stately fabric of the early part of the 15th century, has been repaired within the last few years, but the original pointed style has been carefully preserved. It has a chapel of ease, several dissenting chapels, four sets of almshouses (the oldest founded in 1625); a public dispensary, and many minor charities and benevolent societies; a grammar school, founded by Edward VI., which participates alternately with those of Malton and Brentwood in an exhibition to Caius College, Cambridge; 2 charity schools (one founded in 1713, one in 1714), which respectively clothe and educate 50 boys and school; a neat theatre; public baths, with a reading-room attached; and a handsome hall, in which the courts of assize and of quarter sessions for the county are held, and which also contains a spacious assembly-room. The present co. gaol, on a hill about 1 m. from Chelmsford, in the par. of Springfield, where it occupies an area of 8 or 9 acres, was built in 1828 on the radiating plan. The former gaol, in the same par., is now only used for prisoners previously to conviction, and debtors: attached to it is a house of correction for females. During the last war, two sets of barracks, capable of containing 4,000 men, were erected near the town; but they have since been taken down. A line of embankments defended by star batteries may still be traced, erected during the threatened invasion in 1805, to protect the approaches to the metropolis from the E. coast. The Chelmer is crossed by a handsome iron bridge. Below the town, the river has been formed into a navigable canal, 12 m. in length, for barges, by means of locks and artificial cuts, to Maldon, at the head of the estuary of the Blackwater. A handsome stone bridge of one arch has been thrown over the Cann, to replace an older bridge of three arches built in the reign of Henry I. Chelmsford is on the line of the Great Eastern railway, and has long been the main thoroughfare to the E. parts of Essex, and to those of Norfolk and Suffolk. This and the general co. business of assizes are the chief support of the place, for there is no manufacture, and the principal part of the labouring pop. are employed in agriculture, or as carriers and drovers to the metropolis. There are well-frequented annual races in July, held on Galley Common, 2 m. from the town. Chelmsford is near the *Cæsaromagus* of the Roman period.

CHELSEA, a town and par., forming part of the W. suburbs of the metropolis of England, co. Middlesex, hund. Ossulston, Kensington div. Pop. of par. 32,371 in 1831; 40,179 in 1841; and 63,439 in 1861. Chelsea is situated on the N. bank of the Thames, along the widest of its reaches above London Bridge, and is connected with Battersea by a modern suspension, and an old wooden bridge. The lower, or old town, is irregularly built, and on the whole of mean appearance: its best houses are those of Cheyne Walk, along the side of the river above the hospital, anciently a fashionable resort, where many distinguished individuals resided. The upper and more modern town, which extends towards Hyde Park, and comprises Sloane Street and Square, Cadogan Place, and part of Knightsbridge, consists of handsome and regularly built houses. The original parish church near the river (the oldest part of which is of the 14th century) contains many interesting monuments; amongst others, one to Sir Thomas More, and in its churchyard is one to Sir Hans Sloane, who resided here, and was lord of the manor. This original church has now become a chapel of ease to a splendid church, built in 1824, in the decorated and later Gothic style, of which it is a very fine specimen: it has 927 free sittings, in consequence of the parliamentary commissioners having contributed several thousand pounds towards its erection. There are numerous other religious edifices, among them an episcopal chapel in Park Street, built in 1718; another in Sloane Street, in the later pointed style, in which there are 650 free sittings; several dissenting chapels, a charity school founded in 1694, in which 40 scholars are educated, and 30 of the number clothed; a national school behind the church, and others connected with the Park and Sloane Street chapels; besides several minor charities. The most important public estab., how-

1690, on a plan of Sir C. Wren, at an expense of 150,000*l.*: it is of brick, with stone quoins, columns, and cornices, and forms three quadrangles in the centre of extensive grounds; those at the back of the structure being planted with avenues, those in front, occupied by gardens which extend to the river, to which the central quadrangle opens, forming the S. front, with wings on either side, ornamented with porticos and piazzas. The estab. has a governor and lieutenant-governor, and usually about 550 in-pensioners, consisting of veteran soldiers, who, besides food and clothing, receive weekly pay, varying according to rank and service. The affairs of the hospital are managed by a board of commissioners. Sir Stephen Fox, the chief promoter of this noble institution, contributed 13,000*l.* towards its formation. York Hospital is connected with the Royal Hospital, having been built for the reception of wounded soldiers from foreign stations, who are taken into the other as vacancies occur. A military asylum was established by the Duke of York in 1801, for soldiers' orphans, and the children of those on foreign stations. It is a handsome building, not far from the Royal Hospital: 700 boys and 300 girls being maintained, clothed, and educated in it on Bell's plan: the boys, on leaving, enter the army; the girls are apprenticed. Between Chelsea Hospital and Cheyne's Walk are the botanical gardens of the Apothecaries' Company, occupying four acres on the bank of the river, granted by Sir H. Sloane, whose statue by Rysbrach is placed there: a hot-house green-houses, and library are connected with them, and annual lectures are given. There are similar gardens near Sloane Street, estab. in 1807, comprising six acres, in which lectures are also given in May and June: the plants are arranged in compartments on the Linnæan system.

Chelsea continued, through the 17th and 18th centuries, a favourite and fashionable resort, and was noted for its taverns and public gardens: the Ranelagh Gardens, adjoining those of the Royal Hospital, were closed in 1805.

CHELTENHAM, a town, parl. bor. and fashionable watering-place of England, co. Gloucester, hund. Cheltenham, in a fertile vale opening to the S. and W., at the base of the Cotswold Hills, on the Chelt, a small stream, whence it derives its name; 9 m. NE. Gloucester, 97 m. WNW. London by road, and 121½ m. by Great Western railway. Pop. of parl. bor., which is identical with the parish, 39,693 in 1861. The increase of the town since the commencement of the present century, occasioned by the great influx of wealthy invalids and others, attracted by the celebrity of its spas, the mild and equable temperature of the site, and the beauty of the surrounding neighbourhood, has been quite extraordinary. In 1801 the pop. amounted to only 3,076; in 1811 it had increased to 8,325; in 1821, to 13,396; in 1831, to 22,492; and in 1841, to 31,411. The High Street, running NW. and SE., is upwards of 1½ m. in length; several others branch from it at right angles, on each side, leading to the various squares, terraces, detached villas, and spas; each of the latter being surrounded by extensive pleasure-grounds. On the N. side of the town, amongst other fine ranges, are Columbia Place, St. Margaret's Terrace, and Pitville Lawn; on the S. the Upper and Lower Promenades (on the plan of the Louvre), and the Crescent; and up the ascent in that direction, Lansdown Place, Crescent, and Terrace, commanding fine views of the Malvern Hills. The spas, to which the town is indebted for its rapid growth and celebrity in the fashionable world, originate in a considerable number of

and having their source in the new red sandstone formation, which appears at the surface at the base of Coombe Hill, NW. of the town, whence it dips gradually, and is about 700 ft. beneath the surface of the chief streets and squares. In all the springs, chloride of sodium is the predominating ingredient, and prevails the most where the red sandstone is approached the nearest. The other mineral components consist chiefly of the sulphates of soda, magnesia, and lime, oxide of iron, and chloride of manganese—the three last in smaller proportions. Iodine and bromine have also been detected in several of the springs. Though the ground has been bored to the depth of 260 ft., none of the present wells exceed 130 ft. in depth. The waters, not only of different springs, but those of the same spring, at different times, probably vary much in their analysis, as several eminent chemists have arrived at different results. The various ingredients, except chloride of sodium, are supposed to be derived from the lias incumbent on the red sand, the waters becoming impregnated in their ascent through the different marls and clays of that formation. They are chiefly efficacious in bilious and dyspeptic cases; and are taken as aperients, usually to the extent of 2 or 3 half-pint glasses before breakfast, at intervals of a quarter of an hour between each. The alkaline form the most numerous class; the magnesian occurs in 2 or 3 wells of recent origin; and at the old wells and Montpellier are sulphurous springs used in cases of scrofula. The earliest of these saline springs first attracted attention in 1716, and was subsequently enclosed and resorted to by a few invalids. It was not, however, till the visit of George III. in 1778, that the waters obtained any extensive repute; since which period, or a little later, Cheltenham has increased, with singular rapidity, and with every prospect of its still continuing a favourite resort of the fashionable world, and of wealthy invalids from the E. Indies, and other hot climates. The Original Establishment, or Old Well, has been greatly extended and improved; it is approached by a fine avenue, and has the crest of a pigeon on various parts of the structure, in allusion to the discovery of the first spring, from its being resorted to by flocks of those birds. The Montpellier Spa (about ½ m. S. of the town) was first opened in 1809; this has also been greatly augmented, and is at present the most fashionable resort during the season, which, at all the spas, begins May 1 and ends Oct. 31. During this period they are opened at 6 in the morning; and at Montpellier there is a numerous band in attendance from 8 to 10 o'clock, the usual time for drinking the waters and promenading, The evening musical promenades at the same spa are also amongst the principal attractions of Cheltenham; and, during the season, the weekly assemblies take place in the rotunda of this spa. In winter they are held at a splendid suite of rooms in the High Street. The Montpellier baths comprise every variety of warm, cold, vapour, air, and shampooing, and adjoining them is an extensive laboratory for manufacturing the various kinds of 'Cheltenham Salts.' They form altogether an extensive range of buildings, and are supplied with the mineral water of 80 different wells, conducted by one main pipe to the establishment. The monthly exhibitions of the Horticultural and Floral Society are held at the Montpellier and Pittville Spas. The latter is in the Grecian style, and is a splendid structure, on an eminence N. of the town, commanding fine prospects, with extensive walks and drives round it. A few public breakfasts are given at this spa during the season, but hitherto the

the most frequented and fashionable. The Pittville establishment was opened in 1830, having cost in all about 60,000*l.* The Cambray Spa is a small Gothic structure, built over a chalybeate spring. The whole of these spas are more or less frequented throughout the year: there are also good public baths in the High Street. The parish church is an ancient Gothic building, with a lofty spire, in the midst of an extensive churchyard, planted with noble avenues. There are also 6 modern churches; built partly by private subscription, and partly by grant from the commissioners; a Catholic, and various dissenting chapels. A free grammar school was founded in 1586, for at least 50 boys; but grammar being held to mean Latin, though the scholars are instructed gratuitously in that language, they have to pay for instruction in English. Various efforts have been made to obviate this anomaly and get the school placed on an improved footing. It has 2 exhibitions at Pembroke College, Oxford, worth 60*l.* each; and 4 church livings are exclusively open to the scholars of this school who have obtained exhibitions. A charity school was founded in 1682, for boys of this and several other pars., who, on leaving, have an apprentice fee allowed them; a national school, established in 1817, has between 500 and 600 children daily, and 200 on Sundays; a female orphan asylum, founded in 1806 by Queen Charlotte, maintains and educates about 27 children.

But the principal educational establishment connected with the town is the Proprietary College. It was set on foot by a large body of subscribers, with the view of furnishing a complete course of classical instruction to the sons of the upper classes. The building, a magnificent fabric in the Tudor style, opened in 1843, has a front 240 ft. in length, with a tower rising to the height of about 80 ft. Inside it has a school-room 90 ft. by 45 do., a gymnasium of the same dimensions, and lecture-rooms.

The principal charitable institutions are, the general hospital, accommodating 100 patients from all parts; the dispensary and casualty hospital, established 1813; the benevolent and anti-mendicity society, established in 1827, and affording relief in kind, by means of tickets; the Cobourg (for women in child-birth), Dorcas, and numerous others; alms-houses, founded 1574, for six old people; and several minor charities. There are public libraries and reading-rooms at each of the spas, and five or six others in the town; a literary and philosophical institution, established 1833, at which lectures are frequently given, with a good library and museum; and zoological gardens. The General Association for Scientific and Literary Instruction has weekly meetings and courses of lectures—it is on the plan of a Mechanics' Institute. There is a neat theatre, usually open in summer, but enjoying no great share of patronage. The assembly rooms in Regent Street, opened in 1816, cost 60,000*l.* The ball-room is 87 ft. by 40, and 40 ft. high. The market-place is an extensive structure, built in 1823, with an entrance, through an arcade, from the High Street. Market, Thurs. and Sat.; there is usually an abundant supply, at moderate prices. Annual fairs for cattle and cheese are held the 2nd Thursday in April, August 5, 2nd Tuesday in Sept., and 3rd Thursday in Dec.; there are also two statute fairs, on Thursday before and after Old Michaelmas Day. Malting is carried on to some extent, but the chief trade of the place is caused by the great influx of visitors to the spas, and by its being a considerable thoroughfare. Cheltenham is connected by railways with all parts of the country, and has profited much by the consequent facility of communication. Coals and other articles of general consumption are brought, by a railway, from the Gloucester and Berkeley Ship Canal to the W. side of the town (9 m.), where there are convenient wharfs and warehouses. Water, for domestic use, is conducted from sources in the Cotswold Hills to a large reservoir, and thence, by pipes, to the upper stories of most of the houses: this and the gas (with which the whole of the town and suburbs are well lighted) are supplied by private companies. The Reform Act conferred on Cheltenham, for the first time, the privilege of returning 1 mem. to the H. of C. The limits of the parl. bor. coincide, as already mentioned, with those of the par. Registered electors, 2,664 in 1862. Gross annual value of real property, 201,098*l.* in 1857, and 216,169*l.* in 1862. The government of the town is vested in commissioners. The scenery in every direction is very beautiful, and nightingales abound in the vicinity. Bennal's Wood, about 1 m. from the town, has been named, from the numbers that frequent it, Nightingale Grove. From some of the neighbouring summits extensive prospects are commanded, especially froom Cleeve Cloud, Birdlip, Charlton Deer Park, and 'the Castles,' so named from the remains of some ancient encampments. Sudeley Castle, a splendid old ruin; Southam, a curious specimen of domestic architecture of the Tudor period; Witcombe, where the remains of a Roman villa were discovered in 1818 (Archæolog., vol. ii.), and Toddington, a splendid modern seat, are in the vicinity.

CHELVA, a town of Spain, prov. Valencia, on a river of the same name, 39 m. NW. Valencia. Pop. 4,499 in 1857. There are vestiges of an ancient Roman aqueduct, on the NE. of this town, that served to convey water to Liria. The neighbourhood is planted with mulberries and vines, and produces wheat, barley, rye, oats, maize, wine, and oil.

CHEMNITZ, a town of the k. of Saxony, circ. Zwickau, cap. distr. of same name, on the Chemnitz river, 20 m. ENE. Zwickau, and 37 m. WSW. Dresden, on the railway from Dresden to Nuremberg. Pop. 45,432 in 1861. The town was formerly walled, but its fortifications have been levelled, and their site is now laid out in public walks. It has some good streets and squares, a castle, five churches, four hospitals, a town hall, cloth hall, lyceum, and school of design, and has handsome and thriving suburbs. Chemnitz is the principal manufacturing town of the kingdom. It has extensive cotton manufactures, and that of cotton hosiery, mitts, &c., to which it is mainly indebted for its rapid growth, is said to employ from 15,000 to 20,000 looms in Chemnitz and the neighbouring villages. The stockings and mitts manufactured here are now very widely diffused over the states comprised within the German Customs League; and considerable quantities are also shipped for the U. States. In 1862, there were in the town 51 factories of woollen stuffs; 18 factories for stockings and mitts; and 16 for cotton. There were also, at the same date, 4 iron foundries, and 20 establishments for the manufacture of spinning machinery, with which it supplies a considerable part of the Continent. The town has besides manufactures of linens, and dyeing and bleaching establishments. The district of Chemnitz contains fourteen villages, and had, in 1861, a pop. of above 80,000 inhab., most of whom are employed in the above branches of industry. Chemnitz was for 400 years a free imperial city. It was the birthplace of Puffendorf.

CHENONCEAUX (CASTLE OF). See BLERE.

CHEPSTOW, a sea-port town and par. of England, co. Monmouth, hund. Caldecot; on the Wye, 2½ m. from its embouchure in the Severn, 110 m.

W. Lond. by road, and 141½ m. by Great Western railway. Pop. 3,364 in 1861. The town stands on a gradual slope betwixt bold cliffs rising from the W. bank of the river, and is surrounded by some of the finest scenery in England. Streets broad, well paved, and lighted with gas, but badly supplied with water. There are many good houses, and the town looks neat and cheerful. The church has a fine Norman entrance, and many curious specimens of the early pointed style. It has also a Cath. and several diss. chapels; an endowed charity school for thirteen children; a national school, two ancient hospitals, in which twenty-five aged persons are supported; and several minor charities. Market, Wed. and Sat. Fairs, Frid. and Sat. in Whitsun-week; Sat. before June 20, Aug. 1, and Frid. before Oct. 29. It has no manufactures; but a considerable trade, being the chief port of most of the places on the Wye and Lug, including Herefordshire and the E. part of Monmouth. Ship-building is carried on to some extent; and about 70 vessels, of the aggregate tonnage of 4,600 tons, belong to the port. The tide runs with great rapidity in the river, making its navigation a little dangerous; and it rises at ordinary springs between 40 and 50 ft., and at high springs it sometimes reaches between 50 and 60 ft.; hence very large ships may come up to the town, and barges of 30 tons burden ascend the river to Hereford. A handsome iron bridge was thrown over the river in 1816 at the joint expense of the two cos. separated by the Wye. The castle, on a steep cliff overhanging the Wye, dates from the 11th century, though most of the existing remains, which occupy a considerable space, appear to be of more recent origin: it was alternately in the hands of both parties during the last civil war; and after the restoration, Henry Martyn, the regicide, was imprisoned for life in one of its towers, where he died after thirty years' confinement. The co. magistrates hold petty sessions in the town, and a small theatre is occasionally opened.

CHER, an inl. dép. of France, reg. Centre, formed of part of Berri and Bourbonnais, having N. the dép. Loiret, E. Nivêre, S. Allier and Creuse, and W. Indre and Loire-et-Cher. Area, 720,880 hectares, or 2,853 Eng. sq. m. Pop. 323,393 in 1861. It derives its name from the Cher, by which it is intersected, and is included in the basin of the Loire, which, with the Allier, forms its E. boundary. Surface generally flat. Soil various: in the E., and along the Loire, it is very fertile; S. it is of a medium quality, while in the N. it is sandy, and covered in great part with heath. Agriculture backward. Principal crops, wheat, maslin, rye, barley, and oats. Hemp is largely cultivated, the crop being estimated at about 750,000 kilog. a year. The natural meadows, which are extensive and valuable, are principally depastured by sheep and cattle. The stock of sheep is estimated at about 500,000 head, producing annually 570,000 kilog. of wool. The stock of black cattle is estimated at 85,000 head. In the reign of Henry IV., the horses of Berri enjoyed a high reputation; but the breed is now greatly deteriorated. Hogs and goats numerous. The forests occupy about 120,000 hectares; and furnish timber for the navy. The vineyards cover nearly 13,000 hectares; those in the arrond. of Sancerre furnish the best wines. Iron is abundant, and is pretty extensively wrought. The cloth manufacture, once the staple of the dep., has greatly fallen off; and the glass works that were formerly to be met with have ceased to exist. The cutlery of Bourges is much esteemed; and there are fabrics of coarse cloth and linen, with earthenware manufactures, breweries, and tanneries.

The dep. is divided into three arrondissements. Principal towns, Bourges, St. Amand, Vierzon, and Sancerre.

CHERASCO, an inl. town of N. Italy, prov. Cuneo, advantageously situated on a point of land between the Stura and Tanaro, near their confluence, 31 m. SSE. Turin. Pop. 8,852 in 1861. The town was formerly an important military post, and is still surrounded with walls; but its citadel was dismantled in 1796. It is well built and laid out, and supplied with water by a canal cut from the Stura, which also turns several silk mills. Trade chiefly in wine and silk.

CHERBOURG, a principal sea-port and fortified town of France, dép. Manche, on its N. shore, nearly opposite the W. extremity of the Isle of Wight, at the bottom of a bay formed by Cape Levi on the E., and Cape La Hogue on its extreme W., at the mouth of the Divette, 41 m. NW. St. Lo, and 185 m. WNW. Paris, at the terminus of the Paris-Cherbourg railway. Pop. 41,812 in 1861. The streets are narrow and dirty, notwithstanding there are many public fountains. Houses mostly of stone and slated. Chief public buildings: the military and marine arsenals; a spacious marine and several other hospitals; the parish church, a singular edifice; the town hall and prison, both new and handsome buildings; a theatre; public baths and barracks. From its advanced position in the English Channel, it has long been a favourite object with the French government to render Cherbourg a great naval arsenal, and a secure asylum for ships of war; and, to accomplish this, vast sums have been expended upon it. The harbours for merchantmen and ships of war are quite distinct from each other. The last, which was constructed by the Emperor Napoleon I., is a magnificent work. It is mostly excavated out of the solid rock, is 328 yards long by 250 wide, and is capable of accommodating 50 ships of the line, which may enter it at all times, there being 25 ft. water at low ebb. It has four fine covered granite docks, 85 ft. deep, for the building of ships, and a basin for those undergoing repair. Near the naval port is the dockyard of Chantereyne for the building of frigates, containing a large timber yard, and a rope walk 546 yds. in length. The commercial port, formed by the mouth of the Divette, and easy of access, consists of an outer harbour and a basin, the former 262 yds. long, by 218 wide; the latter 446 yds. long, by 138 wide. Between the two divisions is a sluice: the outer harbour communicates with the sea by a canal 656 yds. long, and 54 wide, bordered in its whole length by a granite jetty, within which a depth of 19 ft. water is always retained. The roadstead of Cherbourg is one of the best in the Channel, and capable of containing 400 sail. It is defended on all sides by batteries, and is protected from the northerly winds, which would otherwise throw in a heavy sea, and in a great measure also from the Channel currents, by a vast artificial *digue*, or breakwater, similar to that in Plymouth Sound, constructed in the centre of the bay, opposite to, and about 2½ m. from, the mouth of the river. This great work, formed for the most part of granite and sandstone, was commenced under Louis XVI., in 1784, and continued till 1791; it was re-commenced by Napoleon I. in 1802, again discontinued in 1813, and finally completed by the Emperor Napoleon III. in 1864. Its foundation was laid by sinking many massive wooden frames, which were afterwards filled with blocks of stone. The length of the *digue* is 3,768 metres (4,120 yards); breadth at its base, 262 ft., at its summit, 101 ft. On its central part, which is 9½ ft. above the water at the highest spring

tides, a battery has been erected. The E. channel between it and the shore is 1,060 yards in width, that on the W. side 2,550 yards.

Cherbourg is the seat of a tribunal of original jurisdiction, of a marit. tribunal and prefecture, and is the cap. of the 1st naval arrondissement. It has a departmental college, a royal academical society, a public library with 3,500 vols., a naval library, and several museums. Cherbourg, which is very ancient, was in the 10th century called *Carusbur*. It was long in the possession of the English, and was the last place they retained in Normandy.

CHERIBON, a sea-port town of Java, cap. div. and prov., at the head of a wide bay on the N. coast of the isl., 128 m. SE. by E. Batavia; lat. 6° 48′ S., long. 108° 37′ E. In the early part of the present century it suffered from a pestilence, which destroyed more than a third of its inhab.: and, from this and other causes, it is said to have declined of late; but it still continues to be the residence of a Dutch governor, and enjoys considerable trade. The town and harbour are protected by a fort. The district of Cheribon is remarkable for its fertility, and the excellence of its coffee, indigo, teak and timber.

CHERSO and OSERO (an. *Crepsa* and *Absorus*, together called *Absyrtides*), two contiguous, long and narrow isls. of the Adriatic, belonging to Illyria, gov. Trieste; between lat. 44° 30′ and 45° 20′ N., and long. 14° 15′ and 14° 30′ E., separated from Istria by the Gulf of Quarnero; united length nearly 50 m., breadth varying from 1 to 8 m. Area 95 sq. m. Pop. of Cherso, 17,200; of Osero, 3,535 in 1857. Surface generally mountainous, stony, and barren; but in some parts the olive, vine, fig, and various other fruits, and a little corn, are grown, and in several parts there are good pasture lands for sheep. Oil is the most valuable product of Cherso, wine of Osero. In the N. part of the former island there are some fine woods; and shrubs and plants for dyeing are very abundant. The breed of sheep is very indifferent, and the wool bad. Other domestic animals are few. Many of the pop. subsist by the tunny and anchovy fisheries. There are a few manufactures, chiefly of coarse woollen cloth and liqueurs; and vessels are built at the principal towns:—these are Cherso, Osero, Lossin Grande, and Lossin Piccolo. Cherso, the cap., on the W. side of the island of same name, has a good though small harbour, and 3,000 inhab. It contains a cathedral and numerous other churches; its streets are narrow and dirty; but its inhab. clean and industrious. Osero, also on the W. side of the island of Cherso, in an unhealthy situation, has only 1,500 inhab.; but it has a cathedral with a fine steeple, and was formerly the seat of a bishopric. It was sacked by the Saracens in 840. Its inhab. have some trade in timber. Lossin Grande and Piccolo are two insignificant towns on the island of Osero. The two islands are connected by a bridge.

CHERSON. See KHERSON.

CHERTSEY, a town and par. of England, co. Surrey, hund. Godley, 22¼ m. SW. London, by the London and South Western railway. Pop. of town 2,910, and of par. 6,589 in 1861. The town, situated on the S. bank of the Thames, is neatly built of brick, partially paved, and well supplied with spring water, but not lighted. It is connected with the Middlesex side of the river by a stone bridge of 7 arches, built in 1785, at the joint expense of the two counties. The church, a handsome structure, erected in 1808, in the later pointed style, contains a tablet to the memory of the celebrated statesman C. J. Fox, who resided for a lengthened period at St. Ann's Hill, near the town. There are also several dissenting chapels, and a school, founded in 1725, for 50 children of this and three adjoining parishes; its present revenue is above 400*l.* a year, and it has been arranged on Bell's plan, and now educates 230 boys and 130 girls, of whom 30 of either sex belonging to Chertsey are clothed. Market day, Wednesday. Fairs, First Monday and Tuesday in Lent, for cattle; May 14, for sheep; Aug. 6 and Sept. 25, for pleasure and pedlery. The chief business of Chertsey consists in the manufacture of malt, flour, iron hoops, and brooms: great quantities of bricks are also made in the neighbourhood; and vegetables are largely cultivated for the London markets. Cæsar is supposed to have crossed the Thames near this place to attack Cassibelaunus; the stakes then driven into the bed of the river by the Britons to obstruct the passage of the Romans are noticed by Bede as remaining in the 8th century; and vestiges of them are still traceable ¼ m. below the bridge. During the Heptarchy, Chertsey was the residence of the S. Saxon kings: at Hardwick Court, in the par. (now a farm), Henry VI. resided when a child; and in an ancient monastery (founded by Edgar, and existing till Henry VIII.) he was privately interred, though his remains were subsequently removed to Windsor. Cowley the poet died in this town, where his study is still preserved.

CHESAPEAKE BAY, a noble bay on the Atlantic side of the U. S. of N. America, having its embouchure on the coast of Virginia, between Cape Charles, lat. 37° 7′ N., long. 76° 2′ W., and Cape Henry, lat. 36° 56′ N., long 76° 4′ W., about 13 m. apart. It stretches nearly due N. from Cape Henry to the mouth of the Susquehannah river, in 39° 35′ N., a distance in a direct line of above 180 m. Its average breadth N. of the Potomac river, in lat. 38°, is about 10 m.; but S. of that point it is about 25 m. Its coast line is very irregular, inasmuch as it branches out on both sides into an immense number of bays; but including these, and its numerous islands, its area is estimated at 3,600 sq. m. (Darby.) It is wholly within the states of Virginia and Maryland. Chesapeake Bay differs from the other sounds on the Atlantic slope of the U. States in having only one outlet, as well as in its greater depth of water, which is generally about nine fathoms, affording many commodious harbours, and a safe and easy navigation for ships of the largest burden. At its head it receives the Susquehannah; and on its W. site the Potomac, Rappahannock, York, and James rivers. On the same side are Baltimore, Annapolis, Norfolk, Hampton, &c.; and on its E. shore, Chester and Cambridge. Dismal Swamp canal connects Chesapeake Bay with Albemarle Sound; the Chesapeake and Ohio canal, from the tide water of the Potomac to Pittsburg, was commenced in 1828.

CHESHAM, a town and par. of England, co. Bucks, hund. Burnham, in a fertile vale, through which a small brook flows to join the Coln. Area of par., 11,880 acres. Pop. of town 2,208, and of par. 5,985 in 1861. The town, 26 m. NW. London, consists of three streets. The church, an ancient cruciform structure, has an embattled tower and spire; there are also four dissenting chapels, an almshouse for four old people, and a national school. Market on Wednesday for corn, Saturday for general provisions. Fairs, April 21 and July 22, for cattle; a statute fair Sept. 28. Chesham was formerly noted for the manufacture of wooden turneryware, which, though still carried on, has greatly declined. The lace manufacture is wholly discontinued. Shoemaking, for the supply of the

metropolis, is the chief business; but the making of straw plait employs many females: there are also several paper-mills, and a small silk-mill in the vicinity.

CHESHIRE, a marit. co. of England, having N. the Irish Sea, the æstuary of the Mersey, Lancashire, and a small part of Yorkshire; E. the cos. Derby and Stafford; S. Salop, and a portion of Flint; and W. Denbigh, Flint, and the æstuary of the Dee. Area, 673,280 acres, of which about 600,000 are supposed to be arable, meadow, and pasture. Pop. 470,174 in 1861. The surface is generally low and flat, with some considerable hills along its E. border, and a broken ridge on its W. side extending from Malpas to Frodsham; in this ridge, near Tarporley, is the insulated rock of Buston. It is watered by the Dee, Weaver, and other streams, and the Mersey forms the line of demarcation between it and Lancashire: it is also intersected by several canals. It has mines of coal, copper, lead, and cobalt; but its most valuable mineral consists of an inexhaustible supply of rock-salt, vast quantities of which are annually dug up, and used partly for home consumption and partly for exportation; a great quantity of salt is also procured from the brine springs contiguous to Northwich, Middlewich, &c. The soil consists, for the most part, of a red, rich, sandy or clayey loam, much improved by marling, and generally very fertile. The climate is mild and humid; and the country being low and well sheltered, and divided by hedges and hedge-row trees, is remarkable for its verdure and the luxuriance of its pastures. Hence Cheshire is one of the finest grazing districts in England, and has been long celebrated for its dairies. Cheese is the principal product; and is not only highly esteemed throughout England, where it is consumed in immense quantities, but also in many parts of the Continent and of America. Arable husbandry is a secondary object, and is less suited to the climate; but potatoes are grown in large quantities. Estates for the most part large; this is one of the cos. in which the least change has taken place, for a lengthened period, in the ownership of land: farms mostly small, a great many under 10 acres; but, excluding these, the average is probably about 70 acres. Though there are but few extensive woods, Cheshire has, owing to the prevalence of hedge-row trees, a very woody appearance, and a large supply of available timber. Manufactures of cotton and silk are carried on with great spirit and success at Macclesfield, Congleton, Stockport, and other places. Cheshire has 7 hund. and 90 par., exclusive of the city of Chester. It sends ten members to the H. of C., viz. four for the co., and two each for the city of Chester, and the bors. of Macclesfield and Stockport. Regist. electors for the co. 13,184 in 1865, of whom 6,303 for the northern and 6,881 for the southern division. Gross annual value of real property—in the northern division, 838,416*l.* in 1857, and 932,777*l.* in 1862; in the southern division 1,144,023*l.* in 1857; and 1,067,523*l.* in 1862.

Cheshire is called a co. palatine, from the sovereign power in it being formerly exercised by the Earl of Chester as fully as by the king. But it has been long held by the crown. It had, however, separate courts and law officers till the passing of the Welsh Jurisdiction Act of Geo. IV., when they were abolished, and its courts assimilated to those of the rest of the kingdom.

CHESTER, a city, co., parl. bor., and seaport of England, locally in the co. of Chester, hund. Broxton, on a rocky elevation on the N. bank of the Dee, by which it is half encircled, on the S. border of the co., about 6 m. above the confluence of the Dee with its æstuary, 27 m. S. by E. Liverpool, 164 m. NW. London, by road, and 178½ m. by London and North Western railway. Pop. 31,110 in 1861. The city is enclosed within an oblong quadrangle by walls of great antiquity, and which are most probably built on the site of those constructed by the Romans. They make in all a circuit of 2,670 yards, and are of great thickness, and kept in a complete state of repair. The ancient gateways having been removed and replaced by modern arches, a continuous walk on the top of the walls, 6 ft. wide, defended on one side by a parapet, and on the other by a railing, extends all round the city, and affords a great variety of fine prospects. 'The form of the city,' says Mr. Pennant, 'evinces its Roman origin, being in the figure of their camps; with four gates, four principal streets, and a variety of lesser, crossing the other at right angles, so as to divide the whole into lesser squares. The structure of the four principal streets is without parallel; they run direct from E. to W. and N. to S.; and have been excavated out of the earth, and sunk several feet below the surface. The carriages drive far below the level of the kitchens, on a line with ranges of shops; over which, on each side of the streets, passengers walk from end to end, secure from wet or heat, in galleries (or *rows*, as they are called) purloined from the floor of each house, open in front, and balustraded. The back courts of all these houses are level with the rows; but to go into any one of these four streets it is necessary to descend a flight of several steps.' (Tour in Wales, i. 147, 8vo. ed.) The city has of late years been much modernised and improved, and a handsome new street has been formed from near the centre of the town to Grosvenor Bridge,—a noble stone structure of a single arch, 200 ft. in span, with a roadway 33 ft. in width. Previously to the erection of this bridge, the communication across the river was by an old, narrow, and inconvenient bridge of seven arches. The suburbs have also been considerably extended. The whole is paved, lighted by gas, and supplied with water, raised by a steam-engine, from the Dee, and conducted by pipes to a large reservoir. The cathedral is a large Gothic pile, with a low massive tower; the interior is fine, with several lateral chapels in the earlier, and a cleristory in the later pointed style: the bishop's throne, and several ancient monuments, are highly interesting. Contiguous to the cathedral are the remains of St. Werburgh's Abbey, which for nearly seven centuries was one of the wealthiest in the kingdom. The bishop's palace (rebuilt 1752), the prebendal, and other good modern houses (forming the Abbey Square), occupy the rest of the precinct. There are nine parish churches, and two others not parochial. St. John's church is a magnificent specimen of Saxon architecture; in Trinity Church are monuments to Parnell, the poet, and Matthew Henry, the celebrated commentator, interred within its walls. It has also a Catholic and several dissenting chapels; a grammar-school, founded in 36 Hen. VIII. for 24 boys, from whom the cathedral choristers are selected: its annual revenue is 108*l.*, and it has one exhibition to either university; two charity schools founded in 1717, on the site of the ancient hospital of St. John, one for 38 boys, of whom 28 are also maintained; the other for a like number of girls; the Marquis of Westminster's school, established in 1811, and wholly supported by him, educating between 400 and 500 children; a diocesan school, on Bell's plan, for 150 boys; three infant schools and several large dissenting and Sunday schools.

The co. infirmary, and the co. lunatic asylum, each have accommodation for 100 patients; and it has a lying-in hospital, a house of industry, several sets of alms-houses, and various charitable bequests,—the chief of which (called Jones's) produces about 400*l.* a year, which is shared by the members of the ancient city guilds. The old Norman castle (with the exception of one tower) was removed in 1790, and a magnificent co. hall and gaol, together with government barracks, and an armoury, subsequently built on the site. These structures are in the Grecian style, and have great architectural merit; they form three sides of a large quadrangle, the entrance to the area being by a splendid Doric portico. The city courts of justice are held, and corporation business transacted in the Exchange, a plain brick edifice on pillars. There are three commercial halls; one built by the Irish Linen Company, in 1780, for their trade, but at present used for the cheese fairs,—that of linen, once so considerable, having wholly ceased; a second hall, built in 1809 by the Manchester manufacturers for their business; and a third, in 1815, for general purposes, as a private speculation: they are all on the same plan, forming a quadrangle, round which are pillared arcades and shops. There are also commercial rooms, comprising a good public library, news-room, a small theatre, and a good modern market-place. Market, Wednesday and Saturday. Fairs, last Thursday in Feb. for horses and cattle; July 10 and Oct. 10 for general merchandise: these last are of great antiquity, and continue several days: there are also eight annual cheese fairs of recent origin; and the city being situated in the principal cheese-making district of the empire, these fairs have become of considerable importance. Annual races are held in the first clear week of May on 'the Rood-Dee,' a level pasture tract of about 80 acres at the base of the city walls. Manufactures inconsiderable: skins and gloves once formed the staples; but these have greatly diminished: there are a few small fabrics of tobacco-pipes, large flour-mills by the old bridge, and a shot-tower beside the canal, on the N. side of the city, where also are several wharfs and warehouses, chiefly for the convenience of the traffic between the city and Liverpool; articles of general consumption being now chiefly supplied from the latter.

At the æra of the Conquest, and for long after, Chester was a place of very considerable importance as a commercial and shipping port; but the gradual filling up of the channel of the river, and latterly the superior facilities enjoyed by Liverpool, have proved destructive to its trade. In 1737, in order to obviate the difficulties of the river navigation, an artificial channel was excavated, on a plan suggested long previously by the celebrated Andrew Yarranton, from Chester to the sea. It has since been improved, and vessels of 300 tons may now ascend to the city; but it has not recovered any portion of its former importance as a maritime town.

Chester is a bor. by prescription; its three earliest charters are without date, but were probably granted in the early part of the 13th century. There are many others, the latest of which dates in 44 Geo. III.; the governing charter (previously to the Municipal Reform Act), in 21 Hen. VII., considerably extended the former privileges, and made Chester a distinct co.: under it were a mayor, deputy mayor, 24 aldermen, and 40 common councillors. The governing body were self-elective, despite the provisions of the charter, and of much litigation, which in the twenty years preceding 1832, cost upwards of 20,000*l.* Chester has returned two mem. to the H. of C. since 1541. Previously to the Reform Act, the elective franchise vested in the governing body and in the resident freemen. The limits of the parl. bor. include the greater part of the township of Broughton and some other patches, the registered constituency numbering 2,395 in 1862, of whom 1,086 old freemen. The limits of the municipal have since been made to coincide with those of the parl. bor.; and it is now divided into five wards, and governed by a mayor, 10 aldermen, and 30 councillors. The gross annual value of real property assessed to income tax, in the city, amounted to 253,156*l.* in 1857, and to 174,664*l.* in 1862. There are 24 ancient guilds or trades still subsisting, though at present possessing scarcely any property or importance, except that of the goldsmiths, who have an assay master and office, and claim the examination of all plate manufactured for sale in Cheshire, Chester, Lancashire, and N. Wales. The crown mote is the criminal court, with jurisdiction over the highest offences; the port-mote is the chief civil court where actions to any amount are tried; the pentice and passage courts are subordinate to the latter, the sheriff presiding in them. There are three general sessions a year, held in the superior courts, attended by barristers, and presided over by the recorder and mayor; petty sessions for the city are held twice a week.

The city is most probably of Roman origin. Originally it had the name of Deva, from its situation on the Dee, and subsequently of Cestria, from its being a *castrum*, or camp. It was the head-quarters of the 20th legion, which came into Britain previously to A.D. 61; and not only does the figure and construction of the town attest its Roman origin, but fragments of Roman arches and other buildings existed down to a recent period, and probably some still remain; and pavements, many coins, and an altar dedicated to Jupiter Tanarus by the *primipilus* (principal centurion) of the 20th legion, have been dug up. William the Conqueror bestowed the title of Earl of Chester, with sovereign power over the whole of Cheshire, on his nephew Hugh d'Avranches, or Lupus; and his successors to the reign of Henry III. continued in the exercise of like authority. In the last civil war Chester sustained a memorable siege under Lord Byron, by whom it was ultimately surrendered on honourable terms. In 1745 it was garrisoned against the Pretender, which is the last event of any importance in its history.

Eaton Hall, the magnificent seat of the Marquis of Westminster, is about 3 m. S. of Chester; its chief approach being by a triple avenue of limes extending from the end of the new Grosvenor Bridge (where there is a Gothic lodge) to the principal front, through a park abounding in fine forest trees. The structure is an adaptation of the pointed ecclesiastical style to modern domestic purposes; that of Edward III., as seen in York Minster, is chiefly followed, and emblazoned shields are profusely dispersed; in the compartments of some of the windows are several fine portraits executed from cartoons by Singleton: among others those of the six first earls of Chester, who held sovereign power previously to the title being bestowed by Hen. III. on his eldest son; since which period it has uniformly been conferred on the eldest sons of his successors.

CHESTER-LE-STREET, a township of England, co. Durham, near the Wear, 5 m. N. Durham. Pop. of tn. 3,013, and of par. 23,076 in 1861. It stands in a valley, on the line of the Roman way called Ermine Street, leading to Newcastle. The Saxons called it *Cunceastre*, or Cuneagester, and

under that name it was the seat of the episcopal see of Durham for 113 years, till its removal to Durham in 995. The town is nearly 2 m. in length, and has a bridge over the Wear, opened in 1821. The church, formerly collegiate, and dedicated to St. Mary and St. Cuthbert, has a tower surmounted by a very fine spire 160 ft. high, and contains monuments with effigies of members of the Lumley family from the Conquest to the time of Elizabeth. The Independents and Primitive and Wesleyan Methodists have places of worship. An endowed school educates twelve children. A mechanics' institute is held in a handsome building erected for the purpose. Copyhold courts are held in April and Nov., in which debts under 40s. are recoverable; and petty sessions are held on alternate Thursdays. The place is a station for receiving votes at elections for the S. div. of the co. The manufacture of nails, ropes, and tiles is carried on here; but the inhab. are mostly employed in the surrounding collieries and other works.

CHESTERFIELD, a bor. and market town of England, co. Derby, hund. Scarsdale, 20 m. N. Derby, 130 m. NW. by W. London by road, and 151¼ m. by the Midland railway. Pop. of bor. 9,836, and of par. 18,970 in 1861. The town, which is irregularly built, covers a considerable extent of ground, and is pleasantly situated between the rivers Rother and Hyper, in the vale of Scarsdale. The church, a beautiful and spacious edifice of the 13th century, is remarkable for its crooked spire, 230 ft. high. There is also an elegant assembly-room, and near the town is a race-course, on which races are annually run in the autumn. There are two or three manufactories of silk and cotton, but they are not considerable. Just out of the bor. there are some large iron-works. The chief source of support for the town is the weekly market for agricultural produce, which is well attended. It is governed by four aldermen and twelve councillors, but is not divided into wards. The lord of the manor holds a court leet in Oct., when a constable is chosen; and a court of record for the recovery of debts not exceeding 20*l*. The petty sessions for the division are held here in the town-hall, on the ground-floor of which there is a prison for debtors. Chesterfield is one of the polling places at the election of M.P. for the N. division of the co. The town is lighted under an act passed in 1825. There are various places of worship for dissenters, a free grammar-school, founded 2 Eliz., and formerly well attended, was closed in 1832. It has still, however, infant, Sunday, and national schools; several well-endowed alms-houses, a dispensary, a savings' bank, a mechanics' institute, and a literary and philosophical institution. The N. Midland railway between Derby and Leeds passes by Chesterfield. It gives the title of earl to a branch of the Stanhope family. Market-day, Saturday. Fairs, Jan. 27, Feb. 28, first Sat. in April, May 4, July 4, Sept. 25, Nov. 28. The par. of Chesterfield includes an area of 13,160 acres.

CHEVIOT HILLS, a ridge of hills in Great Britain, on the confines of England and Scotland, partly in Northumberland and partly in Roxburghshire. They extend from Kirknewton N. to Carter Fell on the S., where they unite with the hills that stretch across Dumfriesshire and Galloway. The hill to which the name Cheviot is especially given, is in Northumberland, on the borders of Roxburghshire, 8 m. SSW. Wooler, and is 2,658 ft. in height. The Cheviot hills are mostly pointed, the sides smooth and rapidly sloping, and their bases separated by deep narrow glens. They are mostly covered with a close green sward; but in a few instances, as in that of the Cheviot itself, there are considerable tracts of heath. These hills are depastured by the valuable and peculiar breed of sheep called the Cheviots, now widely diffused over England and Scotland.

CHIAPA DOS INDIOS, a considerable inl. town of Mexico, state of Chiapas, advantageously placed in a valley near the Tabasco, 30 m. WNW. Ciudad de Las Casas. It is chiefly inhabited by Indians, whence its name, of whom there are said to be as many as 4,000 families. It is the largest town in the state, the chief trade of which it engrosses. Its principal export is logwood, which is sent down the river to Tabasco, on the Gulf of Mexico; but a good deal of sugar is also grown in its neighbourhood. Its inhab. are said to be rich. Chiapa enjoys many privileges: it was founded in 1827.

CHIARAMONTE, a town of Sicily, prov. Syracuse, cap. cant., on a hill, 11½ m. NNW. Modica. Pop. 8,995 in 1861. The town is regularly built, with broad and straight streets. From the Capuchin convent there is one of the finest and most extensive views in Sicily. The environs produce good wine, and the town is thriving.

CHIARI, a town of Northern Italy, prov. Brescia, cap. distr., near the left bank of the Oglio, 15 m. W. by S. Brescia. Pop. 9,430 in 1861. The inhabitants are chiefly occupied in spinning silk and tanning leather. The town preserves some remains of its ancient fortifications, and has a handsome collegiate and many other churches, a hospital, and a public library.

CHIAROMONTE, a town of Southern Italy, prov. Potenza, cap. cant., on a high mountain. Pop. 2,921 in 1861. It has two parish churches, a convent, and a seminary. Its environs produce wine and silk, and there is a fine chartreuse about 3 m. off.

CHIAVARI, a marit. town of N. Italy, prov. Genoa, cap. prov., at the head of the Bay of Rapallo, 22 m. ESE. Genoa. Pop. 10,501 in 1861. It is a handsome and flourishing place, surrounded by hills, the rich produce of which supplies a profitable commerce. The Genoese, from the earliest times, appreciating its natural advantages, surrounded it with a strong wall, and gave it many privileges to encourage the resort of merchants. It has a hospital and many fine edifices, and several lace and silk twist factories. Marble and slate are quarried in its neighbourhood, and it has a productive anchovy fishery.

CHICAGO, a town of the U. States, Illinois, at the embouchure of the Chicago river, in the SW. corner of Lake Michigan; lat. 42° N., long. 87° 37′ W. Pop. 4,853 in 1840; 29,963 in 1850; and 109,260 in 1860. The river, which is formed of two branches that unite about ¾ m. from the lake, divides the town into three portions, the principal seat of business being on the S. side of the main stream. The growth of Chicago has been quite extraordinary, as will be seen from the preceding statistics of population, and there is every probability that it will continue rapidly to increase for many years to come. It is indebted for this wonderful development to its situation and the enterprise of its inhabitants. It is the natural entrepôt for the trade between the flourishing state of Illinois and the vast regions watered by the great lakes; its importance in this respect having been very greatly increased by its having been united by a canal, of the largest class, with the navigable waters of the Illinois river, an affluent of the Mississippi; so that it communicates, on the one hand, with New Orleans and the Mexican Gulf, and, on the other, with Quebec and the St. Lawrence. Hence the value of its exports and imports, which, in 1840, were respectively 228,636

and 562,106 dollars, had risen, in 1860, to 3,576,450 and 4,139,761 dollars. The harbour, which is partly artificial, is formed by means of piers, at the extremity of one of which is a lighthouse, projecting from the river into the lake. The trade of the port employs a great number of steamers and sailing vessels, many of which belong to the town. The situation, though low, is above the level of the inundations, and is said to be healthy. The streets cross each other at right angles, and the wooden buildings of the first settlers have given way to substantial brick edifices. It has some handsome churches, a medical college, various elementary and superior schools, a merchants' academy, banks and insurance offices. Five different lines of railway centre at Chicago. The most important of them are the Chicago and Alton line, 220 m. long; the Chicago and Rock-Island line, connecting Lake Michigan with the Mississippi river; and the Chicago and North-Western, 213 m. long, extending from Chicago to Appleton, Wisconsin. Fort Dearborn, which acquired some celebrity in the last war between this country and the United States, is in the immediate vicinity of Chicago.

CHICHESTER, a city, co., and parl. bor. of England, co. Sussex, 55 m. SW. by S. London by road, and 79 m. by London, Brighton, and South-Coast railway. Pop. 8,059 in 1861. The city is about 1½ m. E. from the extreme NE. angle of the bay or arm of the sea called Chichester Harbour. It is situated on a gentle eminence, sloping in every direction, amidst the widest part of the plain named from it. The Lavant (a small rivulet usually dry in summer) bounds it on the E. and S. Its walls, forming a circuit of about 1½ m., are still in tolerable preservation, within which a mound extends all round in the Roman fashion, planted in parts with fine elms. Chichester is well built, lighted, watered, and drained. It consists chiefly of four principal streets, diverging at right angles from a common centre, occupied by an octagonal cross, erected towards the close of the 15th century, and said to be the most beautiful of this class of structures in the kingdom. The present cathedral was built in the 13th century, on the site of an older one founded in 1108. It is an inferior building of its class, partly in the Norman, and partly in the earlier pointed style; the old tower and spire of the 14th century fell in Feb. 1861, and a new spire was completed in 1865. The cathedral contains many ancient and several well-executed modern monuments; among the latter is one to the memory of the poet Collins, a native of the town. The collegiate establishment was, from the first, for secular canons, and so left unaltered at the Reformation; it consists of a dean, thirty prebendaries, and other ecclesiastical officers. The see comprises the entire co. of Sussex, with the exception of twenty-two parishes, which are peculiars: the episcopal palace is within the city walls, and has fine gardens attached to it. Except that of St. Paul, which is a handsome modern structure in the pointed style, the other churches are small, mean buildings. There is a grammar school, founded in 1497, and a blue-coat school, founded in 1702. There are several charitable institutions, the most ancient of which is that of St. Mary's Hospital, with a chapel attached to it. The other public buildings are the guildhall, town-hall, market-house, and corn exchange; the buildings of the mechanics' institute, of the Literary and Philosophical Society, and a small theatre.

There are no manufactures, the town principally depending on the surrounding agricultural district. Market-days, Wednesday and Saturday; the former for corn, the latter for general provisions: an important cattle-market is held every second Wednesday; and four large cattle and horse fairs, May 4, Whit-Monday, Oct. 10 and 20. The transit of corn through the town to the metropolis and to the W. of England is also considerable. The harbour is rather difficult of access; but at spring-tides vessels of 170 or 180 tons reach the quay, about 1½ m. below the town; but its communication with the sea is kept up by the Arundel and Portsmouth Canal, a branch from which is carried to the city. It is divided into two wards, and governed by a mayor, six aldermen, and eighteen councillors. Chichester has returned two mem. to the H. of C. from the 23rd of Edw. I. Previously to the Reform Act the franchise was vested in the corporation and freemen and scot-and-lot payers within the bor. The Boundary Act extended the limits of the parl. bor., which is identical with the municipal bor., so as to embrace the suburbs. Registered electors, 585 in 1865. Annual value of real property, 42,734*l.* in 1857, and 37,409*l.* in 1862. Chichester is supposed to occupy the site of the *Regnum* of the Roman period. It was destroyed by Ella in the 5th century, and restored by his son Cissa, whence the name. Some additional importance was given to it by the removal of the see from Selsea thither, after the Conquest. It gives the title of earl to the Pelham family.

CHICACOLE, or CICACOLE, an inl. town of Hindostan, formerly the cap. of the N. Circar of same name, on the high N. bank of the river Chicacole, 4 m. NW. the bay of Bengal, and 50 m. NE. Vizagapatam. It is of considerable size, but irregularly built, being a collection of all sorts of houses and huts. It contains some neat European barracks, several large bazars, and numerous mosques and other Mohammedan buildings,

CHICLANA, a town of Spain, Andalusia, prov. Cadiz, 12 m. SE. Cadiz. Pop. 9,097 in 1857. The town is situated between two hills, on one of which are the ruins of an ancient Moorish castle; has two churches, two convents, a hospital, a workhouse belonging to Cadiz, a theatre, and some good private houses. It is much resorted to by the wealthy classes of Cadiz, who have here country residences and pleasure grounds. The adjoining heights command a fine view of Cadiz and its bay, the isle of Leon, &c. on one side; and, on the other, the ancient city of Medina Sidonia, and plains of Andalusia, towards Algesiras and Gibraltar. The battle of Barossa, in which, after an obstinate engagement, the Anglo-Spanish army under Sir Thomas Graham (Lord Lynedoch) defeated a French force under Marshal Victor, was fought, a few m. S. from Chiclana, on the 5th of March, 1811.

CHIERI (an. *Carrera Potentia*), an inl. town of N. Italy, prov. Turin, cap. mand., on the declivity of a vine-clad hill, 8 m. SE. Turin, on the railway from Turin to Alessandria. Pop. 15,033 in 1861. The town is well built, has four handsome squares, and a collegiate church, said to have been originally a temple of Minerva. Its fortress, La Rochetta, was destroyed in the 16th century. It has some cotton and linen thread and woollen-cloth factories.

CHIETI, a city of Southern Italy, prov. Chieti, of which it is the cap., on the narrow crest of a range of hills, on the right bank of the Pescara, about 10 m. from the Adriatic, on the railway from Ancona to Naples. Pop. 20,192 in 1861. The streets of the town are generally narrow and crooked, and in many parts dark and dirty; but the houses and shops are good, and approach nearer to the standard of the metropolis than those of most provincial towns. It has a large cathedral, and four other churches; a lyceum, or college; a large seminary;

numerous convents; a society of agriculture, arts, and commerce; a hospital; a workhouse; and a handsome theatre. It is the seat of an archbishopric, of the civil and criminal tribunals of the prov.; and has manufactures of woollens and silks. The surrounding country is well cultivated and fertile, and the population have an appearance of ease, cheerfulness, and activity. The Abbé Galiani was a native of Chieti, having been born here in 1728.

Chieti is very ancient, being built on the site of *Teate*, the capital of the small but not unimportant tribe of the *Maruccini*. Silius Italicus calls it *Magnum et Clarum*. The remains of a theatre of considerable dimensions, a large public edifice, two temples, a gateway and Mosaic pavement, with numerous coins and inscriptions, evince its ancient magnitude and importance.

CHIHUAHUA, a city of Mexico, state of Chihuahua, of which it is the cap.; 740 m. NNW. Mexico, 490 m. E. Guaymas, and 500 m. from the mouth of the Rio Grande del Norte: lat. 28° 47′ N., long. 107° 30′ W. It is situated in an arid plain, on a rivulet which falls into an affluent of the Rio Grande. Pop. at one period said to have been 70,000; in 1803, 11,600; at present estimated at 10,000. Streets regular; houses well built and well supplied with water, conveyed to it by an aqueduct 3 m. long. The cathedral, a very large and highly ornamented structure, was erected at an expense of 1,500,000 doll., raised by a duty on the produce of the adjoining mines. The town is chiefly maintained by supplying necessaries to the surrounding mining districts; and from being a depôt for goods to and from Guaymas. Charcoal is conveyed thither for the mines and domestic purposes from a distance of 30 leagues. There are several large monasteries in the town; but they are much diminished in their income and in the splendour of their buildings and establishments since the revolution. The country surrounding the city is occupied by extensive haciendas, or farms, in which large herds of mules, horned cattle, and sheep, are pastured. But, notwithstanding the great capabilities of the soil, agriculture is in a very depressed state, the mines being the great objects of attention. Of these the most celebrated for the quantity of the precious metals drawn from it is El Parral, in the SE. part of the state; but it is now in so dilapidated a condition, that the amount of capital required to re-establish it is too great to justify a well-grounded expectation of its returns being sufficient to repay the outlay. Batopilas, 80 leagues W. of Parras, once one of the most productive of the Mexican mines—a single mass of pure silver weighing 425 lbs. having been found in it—is but feebly worked. One of its veins was discovered by an Indian, who, on swimming across a branch of the Rio del Fuerte after a flood, perceived the crest of a rich lode laid bare by the force of the current, the greatest part pure silver, sparkling in the sun. Santa Eulalia in the E. has long been abandoned. The pop. of the plain country is almost wholly of European descent, the natives having retired before them into the mountainous recesses of the Bolson de Mapimi. Their principal tribes are the Apaches, Comanches, and Chichimeques.

CHILI, or CHILE, a republic of S. America, in the SW. part of that continent, consisting of a long and narrow strip of country between the Andes and the ocean, extending from lat. 25° 20′ to 42° S., and between long. 70° and 74° W.; having N. the southern extremity of Bolivia, E. the territ. of La Plata, SE. and S. Patagonia and the Gulf of Ancud, and Strait of Chacao (which separate it from the Archipelago of Chiloë), and W. the Pacific. Length, N. to S., 1,150 m.; average breadth between 110 and 120 m. Estimated area 249,952 sq. m. Pop. 1,439,120, according to the census of April 19, 1854; and 1,648,894 according to official returns of the year 1861. The country is divided into fifteen provinces, the pop. of which, by the census of 1854, was as follows:—

Provinces	Population
Atacama . . .	50,690
Coquimbo . . .	110,589
Aconcagua . . .	111,504
Valparaiso . . .	116,043
Santiago . . .	272,499
Colcagua . . .	192,704
Talca	79,439
Maule	156,245
Nuble	100,792
Concepcion . . .	110,291
Arauco	43,466
Valdivia . . .	29,293
Chiloe	61,586
Llanguihue . .	8,826
Magallanes . . .	153
Total . . .	1,439,120

Besides these territories, the islands of Juan-Fernandez, Mocha, and some others in the Pacific belong to Chile.

Topography.—The country rises successively from the coast to the Great Cordillera of the Andes; but not by a number of successive terraces running parallel to each other and to the sea, except in the N. 'Elsewhere, the surface,' as Mr. Miers says, 'is not formed by a series of table heights, reaching from the sea to the foot of the Cordillera; but it is a broad expansion of the mountainous Andes, which spreads forth its ramifications from the central longitudinal ridge towards the sea, diminishing continually, but irregularly, till they reach the ocean. . . . . These mountain branches are of considerable height, being seldom less than 1,000 ft., and more generally 2,000 ft. above the bottom of the valleys which intersect them: it may, therefore, be readily conceived that there is but little level country between the smaller branches of these chains; the more valuable portions were formed by the beds of the rivers now comparatively small, although there is evidence of their having been once the courses of greater streams. Some of those valleys present broad expansions of surface, such, by way of illustration, as that portion of the country called the Valley of Aconcagua. These are the patches which constitute the finest and boasted portions of the middle portion of Chile.' (Miers' Trav. in Chile, i. 378, 379.)

The Great Cordillera of the Andes has in S. Chile a mean elevation of 13,000 or 14,000 ft. above the level of the ocean; but it presents many peaks which rise to a considerably greater height. These peaks, most of which are volcanic, begin to be numerous beyond lat. 30°, and increase in number as we proceed farther S. The principal one is that of Aconcagua, about lat. 32° 10′, which has been proved to be at least 23,200 ft. in height (Capt. Fitzroy's Paper in Geog. Journ., vii. 143), and therefore ranks first among the mountains of S. America. At intervals it is an active volcano. N. of 33° 30′ the Cordillera is divided into two separate ranges, enclosing the immense valley of Uspallata, so celebrated for its mineral riches, and other valleys. The principal road across the Andes—from Santiago and the Vale of Aconcagua to Mendoza—crosses Uspallata; several other passes from Chili into the La Plata territories exist farther S. (See ANDES.) Between the ramifications of the mountain chains and the sea some small plains line the coast. The shores are mostly high,

steep, and rocky, as is general along the whole of the W. coast of S. America. They have almost everywhere, however, deep water near them, and there are many tolerable harbours, the best being those of Valdivia, Concepcion, Valparaiso, and Coquimbo, though some are safe only during certain seasons of the year. The rivers of the middle and S. provs. are sufficiently numerous, but they are all small. The N. part of the country is scarcely watered by any; and 'from Maypo to Atacama, a distance of 1,000 geog. m., all the rivers and streams together would not form so considerable a body of water as that with which the Rhône enters the Lake of Geneva, or as that of the Thames at Staines.' (Schmidtmeyer's Trav., p. 28.) The rivers retain pretty much the same quantity of water throughout the year: they are not augmented much at any particular season by the melting of the snows, since, while in the summer the snow on the upper mountain ranges melts, that on the lower heights liquefies even in the winter. They are generally unfit for the purposes of trade. In the N. there is no stream navigable for laden boats for more than 6 m. inland: in the middle provs. the Maule is the only one which brigs of 150 tons burden can enter at high tide, and these cannot ascend far; and in the S. the Callacalla, or river of Valdivia, is the only one capable of being entered with safety by ships carrying 60 guns. Some lakes, or rather lagunes, are scattered over the country; they are most numerous in the S., and in the prov. of Valdivia and in Araucania are of some size. A few are 60 or 70 m. in circumference.

Climate is equable and healthy: epidemic diseases are rare. The interior is hotter than the coast: in the former, during Jan. and Feb., the thermometer often rises to 90° and 95° Fahr. in the shade; on the latter, at the same season, it rises to about 85° in the day, and sinks to 70° or 75° in the night. At Santiago the mean summer heat from December to March at midday is about 84½°, and at night 58°. A cool and pleasant breeze arises at sunset. Winter begins in June. No snow falls on the coast, and frost is rare; on the Andes the snows remain from June to November. About April the rains set in, and fall at intervals till Aug.; but this is only in the S. provs. N. of Santiago the rainy season is limited to a few occasional showers, and in the arid prov. of Coquimbo no rain whatever falls, the want of it being occasionally supplied by heavy night dews. The N. provs. being at a distance from the volcanoes of the Cordillera, which apparently act as safety-valves, are especially subject to earthquakes. Shocks are felt in some parts almost daily, and the country is continually desolated by them. In 1819 the town of Copiapo was totally destroyed; and in 1835 Concepcion, and other towns on the coast in the middle provs., were nearly ruined by an earthquake. (Miers, i. 378–399; Schmidtmeyer, p. 25, &c.; Campbell's Geog. Journ., vol. vi.; Molina; Voyage of the Adventure and Beagle, &c.)

Geology.—According to Schmidtmeyer, the high chain of the Andes is chiefly composed of argillaceous schist, while the lower chains and mountain groups are principally granite. Sienitic, basaltic, and felspar porphyries, serpentines of various colours, quartz, hornblende and other slates, pudding-stone, gypsum, abound in the Cordillera, and fine statuary marble is said to abound in the department of Copiapo. Chili is extremely rich in metals: silver is found there at a greater elevation than any other metal; it is also met with in the valleys or bowls in the lower ranges, but, generally speaking, its quantity decreases in proportion to its distance from the Andes. Gold is most frequently situated at a much less elevation than silver; it is found chiefly in the 'bowls,' and perhaps few of the lower mountain ranges throughout Chili are without it. Most, or perhaps all the rivers, wash down gold. The copper mines are one of the chief sources of national wealth. Lead and iron are found in abundance, but neither is much sought after. Zinc, antimony, manganese, arsenic, tin, sulphur so pure as not to require refining, alum, salt, and nitre, are plentiful. Coal mines have been opened near Concepcion: the coal improves with the depth of the mine, and has already become a considerable article of trade and consumption at Valparaiso. The soil of the N. provs. is sandy and saline; and in the opinion of Mr. Miers, not 1-50th part of the N. half of Chili can ever be cultivated. Some of the valleys in the central provs., as that of Aconcagua, present broad and fertile expansions of surface, and others, being considerably inclined, admit of irrigation wherever water can be procured; but the hilly parts being dried and parched during the greater part of the year, are incapable of culture. S. of the river Maule, however, the proportion of cultivable land is larger, the soil becoming progressively more stiff and loamy. (Miers; Schmidtmeyer.)

Vegetable Products.—Fertility increases in proportion as we proceed S. Capt. Basil Hall observes: 'At Concepcion, in the S. of Chili, the eye is delighted with the richest and most luxuriant foliage: at Valparaiso, which lies between 100 and 200 m. farther N., the hills are poorly clad with a stunted brushwood, and a faint attempt at grass, the ground looking everywhere starved and naked: at Coquimbo even this brushwood is gone, and nothing is left to supply its place but a wretched sort of prickly pear bush, and a scanty sprinkling of wiry grasses. At Guasco, there is not a trace of vegetation to be seen, all the hills and plains being covered with bare sand, excepting where the little solitary stream of water, caused by the melting of the snow amongst the Andes, gives animation to the channel which conducts it to the sea. The respective latitudes of these places are 37°, 33°, 30°, and 28½°.' (Hall's Extracts from a Journal, in Constable's Misc., iii. 9, 10.) Extensive forests cover Araucania and the S. provs. The flanks of the Andes also exhibit a profuse vegetation. The *Mimosa farnesiana* flourishes over most of the country, and the algarob is nearly as common. The *quillai*, the bark of which produces a natural soap, is brought to the towns as an article of trade; laurels, myrtles, cypresses, and other evergreens, grow to such a size as to be highly useful for their timber. Most European fruits flourish, but tropical plants are few. Schmidtmeyer observes, that the numerous groves of palm and cinnamon trees, spoken of by Molina, have disappeared since his time. Chili produces many hard woods, which, in a great measure, supersede the use of iron in the country; and Mr. Miers says that 'the herbaceous plants and flowers are so rich, various, beautiful, and novel, that to a botanist no treat can be greater than a journey through the Cordillera.'

Animals.—The coguar or puma, the jaguar, llama, guanaco, numerous monkeys, and other wild animals common to this continent, inhabit Chili. A kind of beaver (*Castor huidibrius*) frequents the rivers, and the *chinchilla* abounds in the desert country of the N.; both are hunted for their fur, which is much prized. The great condor, several vultures, pelicans, and many other water fowl, flocks of parrots, parroquets, &c., are among the birds; whales, dolphins, cod, pilchards, &c., are caught around the coasts. The skunk, which, when pursued, emits an intolerable odour, is a native of Chili; but in other respects this country enjoys a singular freedom from annoying or ve-

nomous quadrupeds, noxious insects, and reptiles. (Miers, vol. i.; Schmidtmeyer.)

Agriculture and Cattle Breeding.—The climate and soil of the S. and central parts of Chili are highly suitable for the culture of European grains. S. of lat. 30°, the limit at which they cease to attain perfection varies from 3,700 to 5,200 ft. above the ocean; but at the height of 3,000 ft. the harvests are extremely good. Only the middle provs., however, produce sufficient corn for exportation, after supplying the wants of their inhab. Aconcagua is by far the best cultivated prov., and that which exports most corn. Its produce goes chiefly to the market of Valparaiso. Wheat is the staple, and in the N. almost the only grain cultivated. Barley is grown in the S.; maize, buckwheat, and oats are but little raised, and rye is unknown. Kidney beans are exported to Peru, and occasionally to Brazil; all kinds of pulse are common; and potatoes are extensively cultivated, though they fail in flavour. Culinary vegetables are raised, especially near the towns. Water melons are very fine, and gourds of a good flavour are produced in great abundance; the latter are appendages to every Chilian dish of boiled meat. Hemp of good quality is grown chiefly in Aconcagua. The sugar-cane has been tried, but does not succeed. Rice and cacao are imported. At Quillota there are some good gardens: in Aconcagua prov. the vineyards and olive grounds yield an abundance of good fruit; and in that of Concepcion, which was once celebrated for its wine, the vineyards are still extensive, and the grapes fine-flavoured. Elsewhere, according to Poeppig (Reise in Chili, i. 125–127), both orchard and garden cultivation is in the back-ground. The olive crops are good, but the oil is ruined by a bad mode of treatment, and rendered unfit for European markets. Little care is taken in the culture of corn. The art of agriculture is greatly in arrear. The plough, which is everywhere alike throughout the country, consists of only a part of the trunk of a tree, with a crooked branch which serves as a handle, the forepart of the trunk being wedge-shaped, and having nailed to it 'a somewhat pointed flat plate of iron, which performs the necessary operation of coulter and share, neither of which were ever heard of by the natives.' (Miers.) The yoke is fastened not to the shoulders, but to the horns, of the oxen, according to the approved ancient Spanish method. The substitute for a harrow is a heap of bushes weighed down with stones; the turning up of the soil by spade digging and the use of the English hoe are unknown; and what little weeding is practised is performed by the hand or the *bladebone of a sheep*. Lands are cultivated until worn out, with the interval of a fallow every four or five years: no manure is used. The productiveness of the soil in Chili appears to have been formerly much overrated. Mr. Miers observes, that a piece of ground recently cleared 'may produce *to the extent of* 100 *or even* 200 *fold* during the first year; but such lands are now scarce in the cultivated parts of Chili;' and the average of the wheat fields may be from 8 to 12, or of the best crops, from 12 to 20 fold. (Miers, i. 371.) Reaping is performed by means of a rough sickle; and the corn, in quantities of about 100 or 150 quarters at a time, thrashed out in a hard dry spot of ground, by being galloped over by horses. It is then generally left in the open air for some months, not being housed till the rainy season begins.

Few farms are wholly arable, and such as are so are small and situated in narrow valleys. Cattle breeding is the most important branch of rural industry. In the middle provs. the *haciendas*, or farms, feed often from 10,000 to 15,000 head of cattle, in some cases as many as 20,000; and on the smallest grazing farms from 4,000 to 5,000 head are reared. The black cattle in some parts are strong and bony, but in the N. small: they are dull, and neither the beef nor milk they yield is very good. The horses of Santiago are said to be excellent, well broken, and more docile than those of Buenos Ayres. Those of the country generally are well made, and gallop, though they do not trot, well. Schmidtmeyer says (Trav., p. 93) that they are 'so strong and hardy as to be able to carry their riders above 80 m. a day at a gallop, with very little rest, and no other food than lucerne grass.' The mules and asses are of a good size, hardy and strong: the former are the general beasts of burden, and are especially used in travelling across the Cordillera. Goats are plentiful, being more fitted than sheep for the pastures of Chili. The sheep are said to be very inferior, and both the mutton and wool bad. Hogs are not very good, and very little of their flesh is consumed. In the dry season the cattle are often reduced to great straits for want of food. (Poeppig, i. 121–129.)

After its conquest by the Spaniards, Chili was divided into 360 portions, which were given to as many individuals; and though by the Spanish law of succession these portions have been, and continue to be, subdivided frequently, most estates still remain very large. The proprietors of these large grazing estates usually reside with their families in the towns, and keep on their farms a *major-domo* or steward, under whom are a head and a few subordinate herdsmen, and these are assisted sometimes by a few tenants who hold their dwellings under the proprietor by a kind of feudal tenure, being obliged to give their services in any kind of labour that is required of them, without pay, or for a very small remuneration. Land is never leased out to the agricultural tenants, but from year to year: the latter have neither oxen for ploughing, mares for thrashing, nor capital to get in their crops; and all these, and all other kinds of assistance, come from the proprietor, who is repaid out of the produce of the land, which he besides generally buys up at two-thirds or half what the former might sell it for, could he command the necessary funds to harvest it. The cultivator, in short, is rather worse off than the day-labourer, and is even in the habit of hiring himself out as such at times to recruit his means. He is destitute of most comforts, can seldom read or write, nor has any means within his reach of educating his children. The moment his harvest or the produce of his garden is reaped, the landlord enforces his right to the stubble and pasture for the benefit of his cattle, and large droves are even frequently turned in before the produce is cut, either utterly destroying the crops, or obliging them to be gathered half ripe. The tenant is scarcely ever allowed to build his hut on cultivated grounds, to enclose his rented land with fences, or to possess any cattle; and a multitude of other arbitrary practices tend to keep the peon in that state of servitude in which it is the object of the proprietor to retain him. (See especially Miers, i. 341–376.)

Fisheries.—The coasts present good fishing ground, and with good boats, good nets, and good government regulations, the Chilians might be made tolerable fishermen; but, owing in part to some ill-advised measures adopted by the government, Mr. Miers affirms that in his time the fishers were the most abandoned, lazy, and worthless class in the country. They seldom fish more than a mile from shore, using only canoes of the rudest

possible construction, or rafts supported on large seal-skin air-bags, both urged onward by means of a double-bladed paddle, used first on one side and then on the other.

The country has abundance of minerals, of the richest quality, from which, however, little profit is drawn, owing to the constant civil strife and political disturbances under which the republic is suffering. Nevertheless, several mines of silver, gold, and copper are being worked in the province of Coquimbo, and, since the year 1859, some valuable coal mines are worked at Lota and Coronel, in the prov. of Talca. At Lota the whole of the mines are the property of Messrs. Cousino and Son, natives of Chili, and are wrought by English and native coal miners on the English system, with the assistance of railways, steam engines, and wharves, and are now formed into a very complete establishment, at an expense to the owners of upwards of 1,000,000 dollars. The establishment was commenced in 1852, but only got into proper working order during the year 1859. The produce of the mines is at present from 4,000 to 5,000 tons of clean coal per month, and can be greatly increased when more labourers can be obtained. The coal of these mines is being mined, screened, and embarked by contract, and at current prices leaves a clear profit to the owners of more than three dollars and a-half per English ton. Messrs. Cousino and Son have also furnaces for the purpose of smelting copper ore with the refuse or small coal. The mines of Coronel are being wrought by several individuals to a much greater extent than even the mines of Lota, and the produce is greater. Samples of very rich silver ore, gold quartz, and copper ore have been found in the Araucanian territory; but nothing can be done with either, until the Indians come under the dominion of some civilised government. (Report by Mr. Cunningham, British Vice-Consul at Talcahuano, Chili, in 'Consular Reports,' 1863.)

It is a common saying in Chili, that 'a diligent man who works a copper mine is sure to gain; that he who opens one of silver may either gain or lose; but that if the mine be of gold, he will certainly be ruined.' This is owing in great part to the circumstance of many mines having been opened or wrought by persons without capital, who are very soon obliged to suspend their operations; land carriage being difficult and laborious, and fuel, water, and fodder very scarce in those districts which are the richest in ore. The mines are mostly wrought by two parties, one the proprietor of the mine, who supplies the labour, the other the *habilitador*, who advances the capital. The proprietor, who usually resides on the spot and superintends the works, is seldom wealthy enough to conduct them on his own resources, and it is generally the *habilitador*, or moneyed individual, who resides at the port where the metal is shipped, who alone derives any ultimate benefit from the mine. (Meyen; Hall; Schmidtmeyer.)

Manufactures and Trade.—The Chilinos are good potters, and make light and strong earthenware jars, which ring like metal. Hempen cloths, indifferent hemp, cordage, soap, copper wares made in a very rough manner, leather, brandy, tallow, and charcoal, are amongst the chief articles manufactured. The rest are mostly domestic, and conducted by women.

Chili is supposed to be the only American state, formerly subject to Spain, whose commerce has increased since the separation from the mother country. Most of the foreign trade is with Great Britain, the imports from which, consisting chiefly of cotton and woollen goods, hardware, iron, &c., amounted, in 1835, to 606,176*l.*; in 1838, to 413,647*l.*; in 1859, to 1,510,176*l.*; and, in 1863, to 1,474,040*l.* A portion of the merchandise imported from Great Britain is subsequently sent to other parts of America. Linens, &c., are imported from Germany; silks, paper, perfumery, leather, wines, and brandy, from France; silks, nankeens, tea and sugar from China and the E. Indies; tobacco, spermaceti, candles, oil, sugar, and manufactured goods, from the U. States; dyes, coffee, pearls, sugar, cacao, tobacco, cotton, rice, salt, and spirits, from Peru and Central America; and cotton, Paraguay tea, and European goods, from La Plata and Brazil. The exports are chiefly bullion, copper, hides, tallow, pulse, wheat, fruits, drugs, and European goods re-exported to Peru, Bolivia, and Central America. The exports to the United Kingdom have rapidly increased of late years. They were of the value of 1,969,547*l.* in 1859; of 2,416,895*l.* in 1861; and of 2,288,862*l.* in 1863. Copper was the principal article of these exports, furnishing about three-fourths of the value. Valparaiso is the chief port, and centre of the foreign trade.

But little accommodation exists for internal commerce. The only towns of any importance, except the cap. Santiago, viz. Valparaiso, Coquimbo, Concepcion, and Valdivia, are near the sea, and at a great distance from each other; and, except between Valparaiso and Santiago, the latter city and Talca, there are no good roads. Latterly, however, the want of ordinary roads has to some extent been mitigated by the construction of railways. In the year 1863 there existed nearly 400 miles of railway, among them lines from Valparaiso to Santiago, from Santiago to San Fernando, from Caldera to Pabellon, and from Coquimbo to Las Cardas.

Government.—The public revenue, which, in 1831, amounted to 1,517,537 dollars, has since been progressively increasing in amount, and in 1860 had risen to 7,494,750 dollars, or 1,498,950*l.* The expenditure, in the latter year, amounted to 7,507,025 dollars, or 1,501,405*l.* There was a public debt, at the end of the year 1861, of 15,251,600 dollars, or 3,050,320*l.*

Chili is a republic under a president, elected for a term of years. It has a congress of 56 members elected by the different provs. The executive power is in the hands of the president and a council of ministers.

The national religion is the Roman Catholic. The clergy are not numerous; they are subordinate to the bishop of Santiago. Other religions are tolerated; but the exercise of their public worship is not allowed.

People—are mostly of Spanish and Indian descent, but there are some negroes and mulattoes. 'The Chilians,' says Mr. Miers, 'though they may be said to possess in no degree a single virtue, have the credit of possessing fewer vices than other creoles; there is a passiveness, an evenness about them approaching to the Chinese, whom they strongly resemble in many respects: even in their physiognomy, they have the broad low forehead and contracted eyes; they have the same cunning, the same egotism, and the same disposition to petty theft.' (Travels, ii. 223, 224.) They are moderate in their food, but frequently very dissipated and profligate in their habits, and in the towns very fond of dress and display. Highway robbery is rare, and so are murders in the country, but not in the towns. Education, or any taste for the fine arts, have hitherto made but little progress.

History.—Previously to the Spanish conquest, Chili belonged to the incas of Peru. In 1535 Pizarro sent Almagro to invade the country, and

in 1540, Valdivia; the latter of whom conquered most of the country excepting Araucania. The revolution, which separated the colony from Spain, broke out in 1810; from 1814 to 1817 it was kept under by the royalist forces; but in the latter year the victory of Maypú gained by San Martin, permanently secured the independence of Chili, and opened for it a career, which promises a high state of national prosperity, unless prevented by internal dissensions, which, unfortunately, have been very frequent of late years.

CHILKEAH, an inl. town of Hindostan, prov. Delhi, on the borders of the Kumaon distr., 110 m. NE. Delhi; lat. 29° 24′ N., long. 79° 5′ E. It is a chief mart of trade for the W. provinces, with Kumaon, Thibet, and Tartary, but is abandoned on the approach of the unhealthy season, when dangerous *malaria* prevails.

CHILLAMBARAM, a marit. town of S. Hindostan, prov. Carnatic, 34 m. S. Pondicherry, and a short distance N. the mouth of the Coleroon river; lat. 11° 28′ N., long. 79° 47′ E. In its vicinity there are some celebrated Hindoo temples, of considerable antiquity.

CHILMARRY (*Chalamari*), a town of Hindostan, prov. Bengal, distr. Rungpore, on the Brahmaputra, 35 m. SE. Rungpore. A festival is annually held here, which is usually attended by 60,000, and sometimes by 100,000 Hindoo pilgrims and others.

CHILOE (ISLAND AND ARCHIPELAGO), a province of Chili, consisting of a large island in the S. Pacific, near the S. coast of Chili and the NW. coast of Patagonia, between lat. 40° 48′ and 43° 50′ S., and having on its E. side 63 small islands, 36 of which are inhabited. The group, including the town of Maulin on the main land of the continent, forms the most S. prov. of Chili. Shape of the island of Chiloe, oblong; length, N. to S. 120 m.; average breadth, 40 m. Area, 4,800 sq. m. Pop. 61,586 in 1854. The island is mountainous, and covered with wood, chiefly a bastard cedar, very durable, and exported in great quantities to Peru and Chili. There are several good harbours, in all of which vessels of any size may anchor with the greatest safety; and in those of St. Carlos (the cap. in the NE. part of the island), and Castro, ships ride quite land-locked close to the shore in good holding ground. Climate healthy, but damp; at an average, ten months of the year may be called rainy. Cold, however, is not severe; water seldom freezes, and a fall of snow is unknown. Little ground is cleared; the soil is rich, though never manured; it consists of dark mould and fine loam upon chalk, and produces good crops of wheat, potatoes, fruit trees, especially apples, which yield a large quantity of cider. Wine is prohibited, and spirits are rarely seen. Tobacco, being a government monopoly, is very dear. Domestic animals are largely reared. The sheep are bred solely for their wool, and are never eaten. The island swarms with hogs, and the hams of Chiloe are celebrated in S. America. Poultry and fish are very abundant. Principal exports—planks about 260,900, and hams 7,800 annually; brooms, hides and woollen cloths, to the value of about 25,000 dollars a year. The archipelago possesses about 1,500 coasting vessels. Money is here nearly unknown, and traffic is conducted by barter, or payment in indigo, tea, salt, or Cayenne pepper. All these articles are much valued, especially the first for dyeing woollens, for the weaving of which there is a loom in every house.

The archipelago sends one mem. to the Chilian congress. The public revenue is chiefly derived from a tithe on all produce, paid in kind. There are numerous churches and chapels, but few priests. The chief towns are San Carlos, which is fortified, and has about 2,000 inhab., Castro, and Maulin. A good road, 54 m. long, runs between the two former towns. According to Captain Blanckley, the golden age would seem to be revived in this part of the world. 'Murders,' says he, 'robbery, or persons being in debt, are never heard of: drunkenness is only known or seen when European vessels are in port: not a private dwelling in the towns or country has a lock on the doors,' and the prison is in disuse. (Blanckley, in Geog. Journal, iv. 344–361.) The inhab. are passionately fond of music and dancing. Chiloe was the last possession held by Spain in the Pacific.

CHILTERN HILLS, a ridge of chalk hills in England, traversing the co. of Bucks, and reaching from Tring, in the co. of Hereford, to Goring on the Thames in Oxford. Wendover Hill, in Bucks, the highest part of the range, is 905 ft. above the level of the sea. Camden says that these hills were once thickly covered with trees, which were a receptacle for thieves till they were cleared by the abbot of St. Alban's. (Gibson's Camden, i. 327.) An office, called the stewardship of the Chiltern-hundreds, was established at a remote period. Whatever were formerly its duties, they have long since ceased; and it is now nominal only, being kept up to afford mems. of the H. of C. an opportunity, by accepting it, of vacating their seats.

CHIMBORAZO, one of the highest summits of the Andes, which see.

CHINA, a vast country of SE. Asia, between lat. 20° and 56° N., and long. 70° and 144° E.; in form nearly square, being bounded on the E. and SE. by those arms of the Pacific Ocean known as the Gulf of Tartary, the Sea of Japan, the Yellow Sea, the Strait of Formosa, the Chinese Sea, and the Gulf of Tonquin; on the land sides by Tonquin, Laos, and Birmah; SW. and W. by Independent Tartary; and N. for the immense extent of 3,300 m. by Asiatic Russia. Its extent from the borders of Kokhan and Budukshan to the Sea of Okhotsk is 3,350 m., and its greatest width from the frontiers of Daouria N. to Tonquin S., is 2,100 m.; inclosing altogether a space of about 5,300,000 sq. m. Thus the Chinese empire includes all the table land of Eastern Asia—about a third part of the whole continent—or a little less than a tenth part of the habitable globe; and contains, within its enormous area, the largest amount of population and of wealth united under one government in the world. The coast line has an extent of above 3,350 m., and the total circumference of the empire is about 12,550 m. (More detailed particulars of the surrounding possessions of China must be sought in the articles ASIA, THIBET, MONGOLIA, MANCHOORIA, Islands of HAINAN, FORMOSA, and TCHUSAN.)

The area of China Proper does not exceed a fourth part of the whole empire. It is true that its dimensions have not been satisfactorily determined, and the following estimate of the extent of the empire, as well as of China Proper, differs from the calculations of many geographers, which, in their turn, widely disagree with each other, except where the mistakes of one writer have been copied by another. To determine the extent of the empire, seventeen linear measurements have been made; two upon native maps, which have been carefully compared with European maps, and the result in reference to China Proper stands thus:—for its length, from N. to S., 1,474 m.; breadth, from W. to E., 1,355 m. But these are not the longest straight lines that may be made to intersect its surface; since, from the NE. corner to the frontiers of Birmah the distance is 1,669 m.,

and from the NW. extremity to the Isle of Amoy it is 1,557 m. The entire area contains 1,348,870 sq. m. The coast is upwards of 2,500 m. in length, while the land frontier occupies a space of 4,400 m. Thus China Proper is about eight times the size of France, and eleven times that of Great Britain. (Staunton; Tab. Geog. Chin. Native; Ogilby, i. 7, and Map; Du Hulde's General and Particular Maps; Lord Macartney's do.; Arrowsmith's Atlas, pl. 27, 29, 32, 33; Gutzlaff's China Opened, i. 21–57.)

General Aspect.—The first object that invites attention in the general aspect of China is its *Great Plain*, which, occupying the NE. part of the country, is above 700 m. in length, and varies in width from 150 to near 500 m. The entire area incloses no less than six provinces, and a space of 210,000 sq. m., being seven times greater than the plain of Lombardy. It is extremely populous; and if we might depend upon the census of 1813, no fewer than 170,000,000 'mouths'—the Chinese expression for souls—are fed upon its surface. The N. portion, bounded by the great wall, is dry and sandy, and its E. portion, bordering on the sea, and between the two great rivers the Hoang-ho and the Yang-tse-Kiang, by which it is intersected, is low, swampy, and studded with lakes. But, notwithstanding these deductions, it may be said to be, on the whole, extremely fertile. It has few trees, but is everywhere well watered; is cultivated with the utmost care, and produces vast quantities of rice, with cotton, wheat, &c.

Mountains and Hills.—The mountainous and hilly districts of China comprise about half its area. A portion of the great mountain system of E. Asia entering this country at its NW. and SW. frontiers, subsides previously to its termination near the sea-coast into low hills; so that, tracing their course backwards from E. to W., they gradually ascend in terraces or slopes, and give to the S. and W. districts a mountainous, and to the E. divisions a hilly character. NW., at about 34° N. lat. and 102° E. long., the great Pe-ling range, which has already traversed a portion of Thibet from W. to E., is joined by the Yun-ling chain, which, entering China at about 31° N. lat. and 101° E. long., descends southward nearly to the prov. of Yun-nan. These mountains form the easternmost edge of the high table-lands of E. Asia, are snow-capped, and inaccessible to the natives, being actually left *blank* in the Chinese maps. (Davis, i. 131.) Another ridge, joining the Pe-ling at the same point, takes an opposite or NNE. direction, and entering the empire in the prov. of Shen-se, reaches nearly to 110° of E. long. Another arm of the Pe-ling—the Ta-pa-ling chain—intersects the country from W. to E. to about 115° E. long.; the Pe-ling itself continuing in its former course, gives out various branches, which traverse the central provinces. The other mountain chains join the stupendous Himalaya ridges, and enter the country at its SW. extremity in the province of Yun-nan, from whose high table-lands the most extensive Chinese ranges rise. The Yun-ling, the most southerly of these chains, runs nearly E. into the prov. of Quang-tung. But by far the most important mountain range is the Nan-ling, which, branching off from the northern edge of the Yun-nan highlands, runs eastward to within 150 m. of Canton; it then inclines to the NE. to its termination near the harbour of Ningpo; having given out many branches, some of the mountains belonging to which rise above the snow-line. (Macartney's Embassy, pp. 207, 246, 259; Barrow, ii. 241, iii. 29, 122; Malte Brun, ii. 554, 555; Davis, pp. 130, 131.) Most of the mountains here enumerated end in low hills in the eastern provinces, which consequently comprise the *hilly districts*. These are the most picturesque portions of China; and being covered with noble forests, crowned with pagodas, and with cities along their sides, give to the country a magnificent aspect, without interrupting its culture.

Rivers and Lakes.—It is to her mighty rivers that China is chiefly indebted for that fertility which is at once the source of her riches, and of her vast population. The *Hoang-ho*, or yellow river, and the *Yang-tse-Kiang*, or 'son of the ocean,' rank in the first class of rivers. 'These two great streams, similar both in rise and destination, descend with rapidity from the great table lands of central Asia, and each of them meets a branch of mountains which forces it to describe an immense circuit, the Hoang-ho to the N., and the Yang-tse-Kiang to the S. Separated by an interval of 1,100 m., the one seems inclined to direct itself to the tropical seas, while the other wanders off among the icy deserts of Mongolia. Suddenly recalled, as if by a recollection of their early brotherhood, they approach one another like the Euphrates and Tigris in ancient Mesopotamia; where, being almost conjoined by lakes and canals, they terminate, within a mutual distance of 110 m., their majestic and immense course.' (Malte-Brun, ii. 556.) The waters of the Hoang-ho bring down from its sources large quantities of yellow clay, which not only tinge them with that colour, but supply the banks with alluvial soil. Large deposits of this clay are constantly being made at the mouth of the Hoang-ho; so that the depth of the Yellow Sea has sensibly diminished. The Yang-tse-Kiang is, however, the pride of China. It is the chief artery of the country, and undoubtedly one of the largest rivers of Asia. This stream is also heavily charged with alluvium, for at its exit into the sea—near which it is from 15 to 20 m. broad—continued deposits have formed the I. of Tsung-ming, besides numerous banks. The tributaries received into this river during its course, which is about 2,300 m., are innumerable; and, with the canals, connect it with the whole empire. Both the rivers, especially the Hoang-ho, which has a very rapid course, occasionally overflow their banks, and, in spite of many strong artificial mounds, cause the most destructive inundations. The river next in importance is the Eu-ho or Yun-liang river, which flows NE. till it joins the Pei-ho or Pekin river: the latter rises in the mountains NW. of Pekin, near which city it becomes navigable for boats; and is, during the rest of its course, the most *populous* stream of a country where a large proportion of natives live upon the water in junks; their united waters flow into the sea in the most W. angle of the Pe-che-lee Gulf. The Ta-si-Kiang, Choo Kiang, or Canton river, rising in the prov. of Yun-nan, takes an E. course to the plains of Canton, and having received the Pe-ki-ang, the Ta-ho, and other smaller streams, forms an estuary known as the Bocca Tigris, by which it is finally discharged into the China Sea, after a course of 600 m. There are a vast number of other rivers, some of which fall into the sea, and others into the great lakes. The Brahmaputra, Irawaddy, Thaluen, Menam, &c., have their sources in the SW. parts of China. (Journal Royal Geog. Soc., iii. 305; Lindsay's Voyage in the Lord Amherst, *passim*; Gutzlaff's Voyage, *passim*; China Opened, i. 29 and 61–168; Malte-Brun, ii. 555–557.)

The principal lake in China is the Tunting-hoo, 220 m. in circ. It receives the waters of many considerable rivers, and furnishes an important affluent to the Yang-tse-Kiang, which passes near its N. extremity. After a further course of be-

tween 200 and 300 m., this great river receives the surplus waters of the Po-Yang-hoo lake, which also is of great dimensions, and is the recipient of many considerable streams. This lake is surrounded by picturesque and finely-wooded hills. Indeed, its scenery is so much admired, that its shores are the favourite spot where Chinese poets muse and write their versified prose. It is, however, subject to sudden tempests, which render its navigation dangerous. The environs of the Tai-hoo lake, near the E. coast, lat. 31° N., long. 120° E., are even more picturesque than those of the Po-yang, having gained the name of the 'Chinese Arcadia.' The Houg-tse-hoo, being situated near the junction of the Grand Canal with the Yellow River, is much frequented on account of its advantageous position. All the lakes, in fact, furnish intermedia of communication, and are abundantly stocked with fish. China contains several smaller lakes, but the whole do not occupy any great proportion of her vast surface. (China Opened, i. 31; Barrow, ii. 387, 391, iii. 12.)

Coast.—The coast of China has yet to be described. If our statement be correct, that the sea-coast extends for 2,500 m., there is only one mile of coast to every 539 m. of territory; but internal navigation is carried on so extensively that this deficiency has no ill effect upon Chinese commerce. Commencing at the NE., the coast opposite Corea is bold and rocky, but, on approaching the Gulf of Pe-che-lee, presents a low and sandy shore, scarcely perceptible from the sea. The bar formed in this bay, at the mouth of the Pei-ho, makes its bed inconveniently narrow, and, when the S. winds blow, the whole adjacent country is overflowed to a great extent. The coast of the Shantung peninsula is bold and rocky, so indented as to afford excellent harbours; but, once rounded, the low swampy character of coast is again presented as far as the Tchusan islands. Meantime, the two great rivers have brought down their immense deposits from the interior, which give its name to the Yellow Sea. The mud is so thick as to retard the headway, and affect the steering of ships; and this great gulf will, in process of time, become a vast alluvial district, like Bengal and Egypt. 'The present inclination of the bottom is about a foot in a geographical mile, or somewhat less than 1 in 5,000; and it is probable that the bottom of the Yellow Sea, as it rises, will likewise gradually approximate to a horizontal plain.' (Hall's Voyages, i. 27.) This sea is nearly surrounded with islands. The coast down to the strait of Formosa continues low, and, except where it faces the Tchusan islands, and in the prov. of Fokien, is but little indented. The strait itself abounds with headlands, and is also so thickly studded with islands, which are but imperfectly notified even in the best charts, that navigation is, by Captain Hall's account, 'exceedingly trying to the nerves.' The Quang-tong shore is bold and high, except in the recesses of the numerous bays and harbours. A narrow peninsula is thrust out far into the sea at the W. extremity of Quang-tong, and forms, with the island of Hainan, a narrow channel, which is shoal, full of sand banks and rocks, so that even the native flat-bottomed junks are exposed to great dangers. The rest of the shore is washed by the Tonquin Gulf, which is studded with small islands. (Hall's Voyages, 12mo. edit. i. 29–46; Gutzlaff's Voyage, *passim*; Lindsay's Voyage; Journal Geog. Soc., iii. 297–310.)

Public Works.—Aspect of Cities and Towns.—An amount of human labour, probably unmatched by any other nation in the world, except ancient Egypt, has been expended on the *public works* of China, by which the natural aspect of the country has been materially varied. The first and most stupendous of these is the great wall, built several hundred years before the Christian æra, to protect China from Tartar incursions. It extends along the whole N. frontier, from the Gulf of Leatong, in 120°, to the NW. extremity of the empire, in about 99° E. long., and 40° N. lat., being, including its windings, about 1,250 m. in length: it is carried over the tops of the highest mountains, through the deepest valleys, and continued by bridges over rivers. Its height varies from 15 to 30 ft. It is 15 ft. across at the top; and, at short intervals, square towers are erected, some of them 37 ft. high. The wall is composed of earth faced with masonry, the top or platform being paved with square tiles. It is now in a state of decay, being no longer required, since the union of the Tartar with the Chinese territory, for its original purpose. (Davis, i. 136; Bell's Travels, ii. 88.)

The *Great Canal* commences at Hang-tchou, near the mouth of the Tching-tang-chiang river, in about 30° 22′ N. lat., and 119° 45′ E. long., and, extending N., unites first with the Yang-tse-Kiang, and then with the Hoang-ho, terminating at Lin-tcing, on the Eu-ho river, in about 37° N. lat., and 116° E. long. The direct distance between the extreme limits of the canal is about 512 m., but, including its bends, it is above 650 m. in length; and as the Eu-ho, which is a navigable river, unites with the Pei-ho, also navigable, an internal water communication is thus established between Hang-tchóu and Pekin, across 10° of lat. And by the junction of smaller canals and numerous rivers, the Great Canal not only assists in the irrigation of immense tracts of land, but affords a ready means for conveying its produce to all parts of the empire. But, apart from its utility, the Great Canal does not rank high as a work of art. A vast amount of labour has, however, been expended upon it: for though it mostly passes through a flat country, and winds about to preserve its level, its bed is in parts cut down to a considerable depth, while in other parts it is carried over extensive hollows, lakes, &c., on vast mounds of earth and stone. (Barrow, 511.) The sluices, which keep its waters at the necessary level, are all of very simple construction. In the *public roads*, and where rugged steeps are only accessible by means of laboriously formed *passes*, Chinese industry is fully apparent. Three mountain paths traverse the Nan-ling; one, N. of Canton, is estimated by Sir G. Staunton to rise 8,000 ft. above the sea; yet vast quantities of goods are conveyed over this pass from Canton to the interior by *coolies* or porters. The obstacles to communication presented by the Pe-ling and Ta-pa-ling ranges are greatly diminished by an artificial road sometimes conducted over yawning clefts by arches, in other places deeply cut through high mountains, and extending altogether for 150 m. In short, wherever intercourse is expedient between any two parts of China, no natural impediments are too gigantic, no labour or expense too great, to overcome them.

The following summary of the general appearance of the cities and towns of China is supplied by Gutzlaff:—'The districts on the sea-coast are generally the best inhabited and the richest; the tracts along the Yang-tse-Kiang the most fertile. Large and flourishing cities are found only where already water communication with other parts of the empire can be carried on. The greatest sameness exists in all the cities. In the larger ones are a few well paved streets, lined with shops; but the greater part of the streets are very narrow, extremely filthy, and planted with mere hovels.

The suburbs of many cities are much larger than the cities themselves; and it is by no means extraordinary to see an immense walled space without any houses, where formerly a city stood. Villages and hamlets have a beautiful appearance at a distance; but on entering them one sees nothing but a heap of houses irregularly thrown together, the outside fair to behold, but the inside without furniture or comforts, and more filthy even than a stable. This does not apply to one district only, but it is common to most. Although the fields and gardens are beautifully laid out, there yet appears in them little attention either to elegance or pleasure. The gardens are very few; and a Chinese grandee delights more in artificial landscapes laid out in a small compass, than in an extensive park or a flower-garden. Utility is studied in preference to pleasure. The grandeur of natural scenery is in many parts of China as striking as in many parts of the world. Mountains, crags, rivulets, and valleys, both picturesque and romantic, are found in most provinces. Commanding situations are chosen for temples, the haunts of superstition and idolatry. These serve likewise for taverns, stages, public halls, and gambling-houses. The building of houses is regulated by law; none are allowed to exceed a certain dimension. Public halls have little to recommend them; the Chinese were never great architects; they understood the building of dwelling houses, but not of palaces.' (China Opened, i. 57, 58.)

Climate.—Connected with this subject there are some singular circumstances. Situated between the 20th and 42nd degrees of N. lat., and the most E. long. of any part of the Old World, the temperature of China is very low for its geographical position. Its climate may also be said to be one of *extremes*; and while at Pekin, which is nearly 1° farther S. than Naples, the mean temperature is that of Brittany, the scorching heats of summer are greater than at Cairo, and the winters as rigorous as in the northern provinces of Sweden. But in so extensive a territory there are necessarily many variations. The W. districts are much influenced by the colds diffused by the mountains, while the climate of the maritime provinces is modified by the sea. At Canton, which is under the tropic, the heat during July, August, and September, is excessive: then occur those frightful tornadoes, called typhoons, spreading devastation in their course, which, however, do not extend far beyond Canton. At the breaking up of these hurricanes, the transitions from the heat of day to cold and foggy nights are more violent and sudden than in any other part of the globe. The N. winds set in about November, and bring with them cold as intense as the preceding heats. The mean temperature of Canton is 76° Fahr. The climate of the interior is not however, with few exceptions, so extreme, particularly towards the N. frontier, where the summers are genial; and though the winter be cold, it is dry, and does not check the growth of fruit; but the N. winds bring clouds of white sand, which afflict the natives with ophthalmia. The W. frontier districts of *Yun-nan* and *Sze-chuen* are said to be unhealthy, and are selected as places of banishment for Chinese convicts. The central provinces present a striking contrast to those already named. There the climate exhibits a happy medium between the rigour of the N. regions and the enervating heats and sudden colds of the S. The Kiang-tse is the most favoured in this respect. The fall of rain in China varies considerably in different years. Humboldt states—without naming on what authority—that the average quantity per an. is 70 in.; though it has been known to exceed 90. Many violent earthquakes have been felt in China. (Malte-Brun, art. 'China'; China Opened, i. 31, 60, 90, 162, 163, 185; The Fan-qui in China, by C. T. Downing, Esq., i. 191, 192; Lyell's Geology, ii. 50.)

Population.—China has long been very generally believed to be the most densely peopled country of any considerable extent in the world. The Jesuit Semedo, writing in 1645, remarks that, after living in the country twenty-two years, he was no less surprised on leaving than on his first arrival, at the immense number of persons he met with, not only in the towns and cities, but on the highways, 'where,' says he, 'there is at all times as large a crowd as is usually to be met with on some great festival or public occasion.' The Jesuit Amiot, founding on official documents, estimated the pop. in 1743 at about 143,000,000, which, adding for some classes that he had omitted, may be carried to about 150,000,000; and in 1792, Lord Macartney was informed, by a mandarin, 'a plain, unaffected, honest man,' whose statement is said to have been made on the authority of official documents, that the pop. was 333,000,000, and later accounts carry it up to above 360,000,000.

It must be confessed, however, that, with the exception of that of Amiot, these statements appear altogether incredible, and that, in point of fact, there is no certain information as to the pop. of China. According to the statements in Chinese official works, the pop. of the empire amounted, in 1393, to 60,545,000; and in 1578 to 60,692,000. It is supposed to have continued at or about this amount till the Tartar conquest in 1644, a year before the publication of Semedo's work. But it appears from an imperial proclamation quoted in the 'Chinese Repository,' issued in 1792, and said to be founded on official data, that the pop. had been reduced in 1711 to 28,605,716! (vol. i. p. 356, Canton, 1833.) This extraordinary diminution is attempted to be explained in the work referred to, by the mortality occasioned by the long and bloody wars that accompanied the establishment of the Manchoo dynasty, by the fact of some of the provs. in the S. not having been fully subdued when this census was taken; and by the circumstance of a poll-tax being then imposed, which made it for the interest of individuals to escape being enrolled in the census. But even admitting the force of some of these statements, and allowing that but for the wars occasioned by the Tartar conquest, and the imperfectly subdued state of parts of the country, a correct census taken in 1711 would have given a pop. of sixty or seventy millions, still it can scarcely be credited that the pop. should have increased from even that amount, in 1711, to above 300,000,000 in 1792. Had China been a new country, or had the Tartars, by whom she was overrun in the 17th century, been distinguished by their superior intelligence and industry, an increase of this sort might have been possible. But the reverse of all this is the fact. China has been settled and civilised for many centuries; the great works undertaken and completed by her inhabit. at a very remote period, show that she had then been pretty thickly peopled; and it is admitted, on all hands, that in China the arts have been for ages in a nearly stationary state. The Tartars imparted to her little that was new. They were, in truth, mere roving herdsmen; and though they might have given the Chinese some instruction in predatory warfare, they could communicate to them no useful art, science, or invention. Under these circumstances it must be admitted either that the former official accounts of the pop. were grossly underrated, or that the later ones were grossly ex-

aggerated. (For a further discussion of this subject, see De Guignes, Voyages à Peking, iii. 55–86.)

Subjoined is an account of the area of the different provs. as given by Lord Macartney, and their pop. as given by Amiot in 1743, by Lord Macartney in 1792, and by the official returns in 1813.

Provinces	Area in sq. m.	Pop. 1745 (Amiot)	Pop. 1792 (Macartney)	Pop. 1813 Official
Northern				
Pe-che-lee	58,949	16,702,765	38,000,000	27,990,871

Total . .	1,297,999	150,265,475	333,000,000	360,279,897

The census for 1813 adds an additional 1,413,982 souls as the pop. of Shing-king, Keih-lin, Turfan, Lobnor, and Formosa; and 188,326 families as engaged in the service of the emperor. Supposing the latter to consist of four members each, the total pop., according to the census of that year, will be 362,447,183.

A glance at the above table will show that the account of the pop. furnished to Lord Macartney, in 1792, and the census of 1813, cannot both be accurate. The last shows an excess over the former of 29¼ millions in the aggregate; but it would appear that in the majority of the provinces there has been no increase; but, on the contrary, a diminution. In the evidence adduced before the British parliamentary committees, in 1830, 1831, and 1832, the area of China was computed at 1,372,452 English statute square miles, and the number of inhabitants at 141,470,000, or 103 to the square mile; to which was added 1,182,000 for the standing army, and 12,000,000 for Tartary. But the information was very obscure with regard to the population. Thibet, Korea, the Manchoo, and other Tartar and Mongolian states, were computed to have a population of more than 30,000,000, which would increase the whole population of China and its assumed dependencies to nearly 400,000,000 inhabitants.

Local Divisions.—Though the geography of the world be not much studied in the 'Celestial Empire,' the more minute details of local topography are no where better understood. The survey of the Jesuits, made by order of the emperor Kang-he, is said to be very correct; and every district of any importance has since found a geographer, who describes it, if not so scientifically as the Catholic missionaries, with the utmost minuteness, so that, with little difficulty, a library of 3,000 vols. might be collected treating exclusively of Chinese geography. Nothing can be more systematic than the manner in which the whole empire is divided. Each prov. is portioned off into provincial districts; while the towns and cities are divided into the 1st class (*foo*), 2nd class (*tchoo*), and 3rd class (*heën*). Formerly China Proper consisted of fifteen provs.; but in Keën-Lung's time the largest were bisected, and there are now eighteen.

Northern Provinces.—1. Pe-che-lee (the independent) is subdivided into sixteen districts, the most W. of which are very flat; the central ones somewhat hilly; while those on the sea-coast along the Pe-che-lee Gulf are low and marshy. Pekin, the metropolis of Northern China and residence of the court, is situated in this prov., about 60 m. from the great wall, and 100 m. from the sea, The Pei-ho flows through Pe-che-lee, disemboguing at the small sea-port of Takoo. The chief ports are Tong-choo and Tèin-sing. It is a curious fact, and one which does not square well with the popular notions of absenteeism, that, despite the residence of the court, the bulk of the population are probably more depressed in this than in any other prov. (Barrow, 495.) 2. Shan-se, or Chan-se (west of the mountains,) is divided from Mongolia by the great wall, a branch of which (the inner great wall) separates its E. limit from Pe-che-lee. It is said to have been the most early occupied part of China. Its mountainous portions are not, however, habitable, and many other localities afford but a scanty subsistence. Hence it has no large or remarkable cities. 3. Shen-se, or Chen-se (west of the pass), is also separated from the Mongolian borders by the great wall, which in this place is kept in good repair. The mountains in this prov., which are more rugged than high, contain gold mines, but these are not allowed to be worked, lest the attention of the people should be withdrawn from agriculture. The valleys through which the Hei-ho and the Han-Kiang run are fertile in millet, wheat, and pulse, but are too dry to produce much rice. Swarms of locusts frequently appear in Shen-se, destroying the harvest, and converting smiling valleys into wastes. The chief town is Se-gan-foo, one of the largest in the empire. 4. Kan-suh (voluntary awe) and Shen-se, formerly united, made one large prov., extending over a space of 154,008 sq. m. Kan-suh consists principally of a narrow neck of land thrust out upon the edge of the great Gobi desert; hence the soil is cold and barren. Kan-suh forms the NW. limit of China, the great wall ending at Shwang-lan.

Central Provinces.—5. Ho-nan (south of the river) is one of the most fertile provinces of the great plain, and is called the garden of China. Shen-se, Pe-che-lee, and a part of Shan-tung join its N. boundary, while branches of the Pe-ling enclose it to the W. The Hoang-ho, or Yellow River, runs nearly parallel with the N. boundary, and intersects the finest parts of the prov. 6. Kiang-se (west of the river) has its boundaries well defined by the Nan-ling range and its branches, which surround it on three sides, the W., S., and E. Its N. part contains the great Poo-Yang lake, and its contiguous marshes, said by Mr. Barrow to be the sink of China. It has, however, many well cultivated valleys, in which rice, cotton, indigo, and sugar, are produced. It has also extensive manufactures, amongst which must not be forgotten the China-ware, so highly esteemed all over the world, till European imitators exceeded the original manufacture in beauty and cheapness. Still, however, no fewer than a million persons are said to be exclusively employed in this manufacture, which is chiefly

carried on at the capital King-le-chin. Here 500 furnaces are constantly burning. 7. Hoo-pih (north of the river), and, 8. Hoo-nan (south of the river), form the ancient prov. of Hoo-Kwang, divided into two parts by the Yang-tse-Kiang. The former is divided into eleven and the latter into thirteen districts; the whole covering an area of 144,770 sq. m. Both provs. are extremely fertile, and the capital of Hoo-pih yields to few cities of the empire in extent and prosperity. The tea grown in its neighbourhood is of superior quality, and the bamboo-paper manufactured within its walls is extensively exported. This city is called Woo-chang-foo. Hoo-nan bears a great resemblance to the Ho-nan prov., but is richer in minerals. A very active trade is carried on, on both banks of the Yang-tse-Kiang. Hoo-pih and Hoo-nan are both within the great plain. 9. Kwi-chow has been designated the Switzerland of China, being traversed by the highest portion of the Nan-ling range. To the S. it is peopled by wild and intractable highlanders (*Meaou-tze*), who, though in the centre of the empire, preserve their independence, and frequently make predatory descents on the adjoining provinces. Kwi-chow has no large towns, but several fortresses.

Maritime and Southern Provinces.—10. Shan-tung (east of the mountains) is partly in the great plain and partly consists of a promontory jutting into the Yellow Sea, S. of Pe-che-lee, and NE. of Ho-nan. Its W. part is traversed by the Great Canal, but the country is poor, and the climate, though bracing, bleak. There are, however, some valuable coal mines, which supply the whole empire with that article. The coast is bold, and affords good shelter. The principal port is Tong-cheou-foo. 11 & 12. The Kiang-soo (river Soo) and Gan-hway (fixed excellence) prov. were once united under the name of Kiang-nang. The two great rivers, the Hoang-ho and Yang-tse-Kiang, cross both districts, and fall into the sea 2° apart, forming the Chinese delta. Gan-hway has 13 districts, and the Kiang-soo 11; their united extent being 92,961 sq. m. 'If we consider,' remarks Gutzlaff, 'their agricultural resources, their great manufactures, their various productions, their excellent situation on the banks of the two largest rivers in China, their many canals, and amongst them the Great Canal and tributary rivers, they are doubtless the best territory of China.' Enjoying these blessings, chiefly conferred by their two great rivers, these provinces are also the most liable to the evils they produce, namely, frequent and destructive inundations. The staple products are grain, cotton, green teas, and silk. Rice suits admirably with the black marshy loam of which most of the soil consists. Nanking (capital of the S.) is situated on the S. bank of the Yang-tse-Kiang, but at the distance of a league from the stream (Nankin). The Kiang-soo prov. only faces the ocean. The scene which appeared at the junction of the Yang-tse-Kiang and Great Canal is thus described by Barrow:—'The multitude of ships of war, of burden, and of pleasure; some gliding down the stream, others sailing against it; some moving by oars, and others lying at anchor; the banks on either side covered with towns and houses as far as the eye could reach; presented a prospect more varied and cheerful than any that had hitherto occurred. Nor was the canal on the opposite side less lively. For two whole days we were continually passing among fleets of ships of different construction and dimensions. Cities, towns, and villages were continued along the banks without intermission. The face of the country was beautifully diversified with hill and dale, and every part in a high state of cultivation.' (p. 516.) 13. The Che-Kiang (river Che), or Tche-Kiang, is the smallest Chinese prov. It occupies the SE. corner of the great plain. The Yun-ling chain ends here in innumerable low hills, the most barren of which produce abundance of tea. In fact the whole district is most assiduously laid under contribution by the inhabitants, every inch of ground being tenanted. At the port of Cha-poo, a large trade is carried on with Japan. 14. Fo-Kien (happy establishment), which forms the W. shore of the Formosa channel, is mountainous. Barren hills and sandy plains are, in truth, the natural characteristics of Fo-Kien, but Chinese industry has made the land fruitful. The tea-plant thrives in perfection, and the 'China orange' is chiefly derived from this prov. The maritime commerce of Fo-Kien is extensive, its merchants monopolising most of the Chinese shipping trade. Emigration though discouraged by the government, is here very prevalent. 15. Quan-tong (eastern breadth) joins Fo-Kien to the E.; its shores stretch along the whole S. coast of China, to the borders of Cochin China, the N. boundary being formed by the Nan-ling mountains. Quan-tong has 13 districts, and an equal number of trading emporiums, and to this prov. alone are Europeans allowed to trade. It has many wide valleys, particularly the plain around Canton, which is of great extent, and many valuable products; but, though it be the great entrepôt for tea, that article is not of the number. The capital, Kwang-choo-foo (Canton), is the greatest emporium of the E. 16. Kwang-se (western breadth) joins the W. limits of Quang-tong, the Nan-ling range divides it from Hoo-nan on the N., while its S. border unites it with the Cochin Chinese prov. of Tonkin. The mountainous portions of the prov.—by far the greatest part of it—are said to contain gold and other metals: the lowlands and valleys produce rice, silk, and timber. Both the language and manners of the inhabitants differ from those of their countrymen. 17. Yun-nan (south of the clouds), the most W. of the S. provs.; is conterminous on the S. with Cochin China and the Birman empire; and towards the W. with Thibet. Its mountains, which are remarkably high and bold, furnish the copper that supplies the currency of China. It is in Yun-nan that the Yang-tse-Kiang enters China; and by the aid of a high road, which has been made parallel to its banks for a great distance, communication between it and the rest of the empire is rendered constant and easy. The same road branching off to the S., extends into the heart of the Birman empire.

The western province, Sze-chuen (five rivers), is the largest in China. Plains, mountains (the Yun-ling), and extensive deserts are its principal components. The Yang-tse-Kiang having taken a N. bend at the Yun-nan frontier, traverses its whole extent; and, during this part of its course, receives several tributaries. The capital, *Ching-too*, was once the metropolis of an independent state, which then surrounded it; and its inhab. still boast of greater independence of character than their neighbours; which they evince by frequent rebellions. (China Opened, i. 155–168.)

Natural Productions of China.—The climate of China, exhibiting occasionally such severe cold, forbids the presence of some members of the *animal kingdom* met with in the similar latitudes of India. The universal cultivation of China Proper, and the thickness of its population, have long expelled most of the wild animals which still abound in the surrounding regions. There

are also fewer domestic ones than inhabit most European countries. Beasts of burden are in a great degree superseded by the means of transit so copiously afforded by canals and water-courses, and by that fine race of men the *coolies* or porters; while the canal boats are dragged along by trackers. Add to this, that animal food is considerably less in use among the Chinese than vegetable diet. There are no meadows for feeding cattle; and even if there were, the natives have a singular aversion to butter and milk. Tigers, though they have been seen in the forests of Yun-nan, are scarcely known; and the lion is almost deemed fabulous in China. There are wild cats, which are caught, confined, and fed in cages, and considered a dainty for the table. Monkeys are found in the southern districts. The Chinese horse and ass are small and spiritless, and so is the buffalo, which is sometimes employed in ploughing. Dromedaries are much used between Pekin and Tartary. Pigs are reared with great care; sheep are smaller than those of England, and goats, of various colours, have uniformly straight horns. The dog of China is about the size of a spaniel, and is uniformly met with of the same variety. Rats emigrate occasionally from one place to another in large troops, when they devour crops and harvests: they are very large, and are used by the common people as an article of food. There is a genus of rat peculiar to China, which bears some resemblance to the bamboo rat of Sumatra. The *ornithology* of China presents, in the first place, the eagle, which frequents the mountainous districts; the *haetsin*, a kind of falcon, abounding in the province of Che-keang, is considered imperial property, while the magpie, which is so numerous as to be the farmer's worst nuisance, is considered sacred by the reigning family. Crows and sparrows are also abundant in China. Among others of their manifold stratagems for catching fish, the Chinese have trained the fishing cormorant; but that the bird may not help itself too bountifully, the owner puts an iron ring round its neck, which obliges it to deliver up a portion of its prey. Curlews and quails are found in great quantities in the N.: the latter are esteemed chiefly for their fighting qualities, as cocks used to be in England; and, when tamed, good fighting quails sell at enormous prices. Larks are numerous, and sing admirably. But the greatest boast of Chinese ornithology is its splendid varieties of pheasants. One, the *medallion* pheasant, takes its name from a membrane of brilliantly coloured feathers, which are displayed or contracted at the will of the bird. The gold and silver pheasants have also a most brilliant appearance, and are so plentiful as, in some districts, to furnish the tables of the poor with an excellent dish. Pigeons of different sorts are not rare, but the natives seldom domesticate them. Aquatic birds are naturally invited to a country which has so many lakes and rivers. The most celebrated of these is the mandarin duck, a species of teal, so celebrated for the strong mutual affection between the male and female that it is used by the Chinese as an emblem of conjugal fidelity: their plumage is beautiful. The snow-white *rice-bird* of Siam is of great use in China in extirpating vermin from the marshy rice-fields; which it is enabled to accomplish by means of its long legs and long beak.

From the *fishes* peculiar to China we derive the gold and silver fish, which are kept there, as in Europe, for ornament in glass globes. The edible fish peculiar to China are, first, one of a yellowish colour, caught in the Yang-tse-Kiang, which, while fresh, is insipid; but is considered a great delicacy after having been kept for a time in ice. The *shang-tung*, sea-eel, and a sort of rock cod, called *tsang-yu*, are also much esteemed, and so are sturgeon, mullet, carp, perch, sea-bream, &c. Crab fish of various kinds are plentiful. On parts of the rocky coast, oysters are successfully preserved and fattened in oyster-beds.

Though the larger species of *reptiles* are unknown in China, the smaller lizard tribes are numerous in the hot months; several fresh water tortoises have been discovered, and also two new species of frogs. Venomous serpents are but little known. The *insect* tribes of China furnish its greatest plague and its greatest blessing. The plague of locust-swarms is terribly inflicted upon the N. and W. prov. Nothing can exceed their voracity; and it is not uncommon for them to occasion so much destruction, as to reduce thousands of human beings to starvation; while another insect, the silk-worm, furnishes employment and riches to an immense part of the pop. In rearing these profitable worms, the Chinese excel all other nations. Scorpions and centipedes are plentiful. A spider, peculiar to China, which inhabits trees, devours small birds, after entangling them in its enormous web. Butterflies of gigantic size, and brilliant colours, abound E. of Canton. Multitudes of white ants are very destructive in the S.; and the mosquito is found in most parts of the country during the summer months. There is a singular sort of bee, called the white-wax insect, which furnishes the whole nation with that article, which it deposits upon a particular sort of tree, furnished by the natives with nests to attract the insects.

The *vegetable kingdom* of China is remarkable for not containing any very large trees, and timber is consequently scarce. The oak is seldom seen, fir trees chiefly supplying its place, every ridge of mountain where it is likely to grow being planted with the fir. Palms, laurel, cassia, and caper trees are often met with, especially in the S. provinces, and the cultivator grows together the banana, guava, orange, papaw, cocoa, litchi, peach, apricot, vine, pomegranate, and chestnut. There is also a singular production called the tallow-tree, which resembles the birch, but the bark is white, and the branches slender: the fruit, growing in bunches, is enclosed in a brown capsule, which encloses three kernels, all coated with tallow, themselves containing an oil much used for the lamp, while the tallow is converted into candles. There is also the *tse*, or varnish tree, resembling the ash, which exudes a valuable essential oil, but produces a cutaneous disease if dropped upon the skin. It is the white blossoms of the *le-pih* which attract the wax-fly. The camphor-laurel is extremely productive of that drug in China. The *kwan-lan* contains a pith which, when ground to powder, answers all the purposes of flour. A species of sycamore, the *hoo-shoo*, supplies paper to the Chinese from the rind; thin, ribband-like strips are peeled and made into paper. Mulberry trees, as food for silk-worms, have much pains bestowed on their culture.

We come now to the shrub which has brought China into nearer contact with foreigners than her sages ever desired, or her government seem willing to render closer. The tea-plant, called by the natives *cha*, rises from four to five feet in height, and bears a strong resemblance to the myrtle, but the flower is not unlike small white hedge roses. Although European botanists have only discovered two varieties, black tea and green tea, native writers enumerate as many hundreds; an obvious exaggeration. Though this plant will

grow in the most sterile ground, the quality of the leaves depends upon the soil which nourishes them, and the age of the tree. The best are taken from three year old shrubs. There are three ingatherings of the leaves; the first in early spring, the second at the commencement, and the third at the end of the summer. They are carefully manipulated, dried in various ways, and then packed. The coarsest leaves are beaten into cakes and exported, principally into Tartary, under the name of *kaiel-cha*, or brick tea. But the finer descriptions of tea require a vast deal of labour in their preparation, and could only be produced in a country where the inhabitants are universally industrious, and wages low. That giant of the grass tribe, the bamboo, is most extensively used; besides being an important instrument for enforcing the laws, the Chinese build cottages and fashion all sorts of furniture with it. The tender shoots make an excellent food, and supply the material for a coarse sort of paper. Tobacco, the cotton plant, and sugar-canes, are also profitably cultivated. The growth of garden flowers is not much encouraged, every available inch of ground being used for the production of edible plants. Even the more opulent natives are content with a few flower-pots, with some pretty flower for the sake of ornament. The water-lily not only produces a beautiful flower, but its fruit provides an excellent meal, not unlike gruel, in much request among the Chinese. They have almost unlimited varieties of the camellia. A plant, the name of which has not yet reached this country, furnishes that delicate material for drawing upon, and making into artificial flowers, falsely called rice-paper.

The great pop. of China, and the fondness of the people for vegetables, cause a great number of table-plants to be reared. Turnips, carrots, sweet potatoes, and pot-herbs of every kind, are produced in abundance. A white cabbage, called *pih-tsae*, and not unlike the Roman lettuce, constitutes the principal food of every class, and is really delicious. Of *grain*, the plenitude of water in China causes rice to be so successfully cultivated, that it is brought to greater perfection there than in any other part of the globe. Indeed, there is scarcely any sort of grain but may be found in some part of the country or other. No medical root is in such high favour as the *ginseng*, which is administered as a sort of universal panacea, and is a good tonic. It was formerly found only in Shan-tung, Leao-tung, and Tartary; and brought a very high price. But it has been discovered in different parts of America, and is now extensively imported into Canton by the American traders. The *ti-wang*, a plant very similar to liquorice, is also much used as a restorative. The other roots are *Radix China* (a sort of truffle), galangal, rhubarb, ginger (often exported as a sweetmeat), and poppy, whose juice is made a substitute for opium, and is extensively cultivated in spite of the strictest government regulations to the contrary.

But scanty information is to be obtained of the *mineral kingdom* of China; but the portion of the mountain districts that has been explored is found to possess great mineral riches. The gold mines are worked exclusively by government, but their situation is kept a secret, though that metal is supposed to be derived from the Kwei-choo and Yun-nan mountains. Gold-dust is found in the Yang-tse-Kiang during its course through Sze-chuen. Iron is produced throughout the empire. Several sorts of copper are found in abundance, the most famous of which is the *pe-hing*, or white copper, dug up in Yun-nun. Mercury is also very common, as are arsenic, cobalt, and orpiment. There are coal mines in various parts of China. The beautiful *lapis lazuli* is met with in the W. provinces. Salt, produced from the earth, and by the evaporation of sea-water, is an article of great traffic: it is collected in immense mounds, chiefly on the banks of the Pei-ho. China also furnishes the crystal, ruby, amethyst, sapphire, topaz; but diamonds are little valued. There are stones resembling basalt, which, when struck, give out a sound. Marble, porphyry, and jasper are produced from the quarries of S. China, beside excellent granite and quartz. (Dr. Abel's Narrative of a Journey into the Interior of China, *passim*; Downing's Fan-Qui in China, ii. 140-152; China Opened, i. 33–54; Malte Brun, art. 'China.')

Trade and Commerce—The Chinese are famous for their industry. Of the immense territory they inhabit, there is scarcely a rood of arable ground that is not assiduously cultivated; and such importance do they attach to agriculture, that once a year the sovereign of the Celestial Empire—so seldom seen in public—exhibits himself holding a plough. But it is the misfortune of the Chinese that their patient enduring industry is allowed to usurp the place of ingenuity and science. Their farming instruments are of the most primitive kind, their ploughs being inferior to the very worst of ours. Owing to the smallness of the farms, there is no room for the subdivision of employments; and agriculture, as a science, is but little advanced in China. But they accomplish all that can be effected by the most persevering industry. They spare no pains in the collection and preparation of manure; and they are superior to every other people in the irrigating of land. By the aid of chain-pumps, they draw water from the numerous canals and rivers, while the highest mountains are cut into terraces so constructed as to retain the requisite quantity of water, and to allow what is superfluous to pass off: by these means, and a good system of manuring, they are able, in many parts, to produce two crops a year, without intermission.

But notwithstanding their remarkable industry and economy, the bulk of the population have usually so little to spare, and are so completely without the ability to retrench in periods of distress, or to resort to a less expensive species of food, that the failure of a crop never fails to involve them in the extremity of want; and, despite the supplies brought from other parts of the country, it frequently occasions the death of vast numbers, and the committal of all sorts of outrages. There can, in fact, be no real security for a country at all approaching to the condition of China, unless the food of the people in ordinary circumstances be such as to permit of their retrenching in adverse seasons, and thus countervailing the deficiency of the crops by increased economy.

As a *manufacturing* people, the Chinese are highly distinguished: the fabric of porcelain originated entirely with them; and though the forms of their articles will not bear a comparison with those of the classic ages of antiquity again brought into use in modern Europe, the fabric is excellent, and the colours inimitable. The art of spinning silk was also given to the W. world by the Chinese; and that light cotton stuff we call nankeen derives its name from the ancient capital of China. The lacquered ware, though eclipsed by that of Japan, is very beautiful; but it is in the minute arts of carving and inlaying that the Chinese excel. The articles brought here in mother-of-pearl and ivory are too well known to need description. Gunpowder, though a Chinese invention, is manufac-

tured only on a small scale, and is exceedingly bad; which, indeed, could hardly be otherwise, as it is a part of the soldier's employment to make his own gunpowder. (Barrow, p. 300.) Paper is also a Chinese invention, and seems to have been first manufactured A.D. 95. The materials used in making it are very various. It is thin, silky, and very absorbent of ink. Chinese books are printed only on one side the leaf. The government is jealous of everything new; but the people discover no lack of genius to conceive, or of dexterity to execute. Their talent for imitation is well known. During the course of the present century, a Chinese sailor, who came to England in an Indiaman, frequented a manufactory in Southwark where Prussian blue was prepared; and having made himself master of the process, without exciting the suspicion, or attracting the notice of anyone, he established, on his return home, a similar work; and so well has it succeeded, that the whole empire is now supplied with native Prussian blue, whereas it was formerly wholly imported.

Money in China consists of the *cash*, about the size of an English farthing, made of copper; from 720 to 1,100 of them being, according to their quality, equal to a dollar. Silver is employed rather as an article of traffic than as a circulating medium; that used as money is cast into the shape of a horse's hoof, and called *tael*, being equal to a little over 6*s.* of English money. Gold is also seldom used as currency; but when it is, comes into the market beaten into thin leaves. Credit is little known, except at Canton; consequently paper money has not a very extensive circulation. There are, however, banks in the large commercial towns, which issue paper. The Chinese trade has the peculiarity of being for the most part internal, the country supplying most articles necessary for the subsistence or luxury of its inhabitants, and is carried on by means of canal and river boats. The primitive expedient of barter is still resorted to on account, perhaps, of the inconvenience of the circulating medium. Salt may be almost designated the standard commodity, as being an article of the most extensive commerce.

The foreign trade of China is chiefly in the hands of the English and Americans. The first attempt on the part of Great Britain to open a trade with China was made in 1637, when four merchant vessels arrived at Macao; but through the intrigues of the Portuguese there established, the enterprise failed. Afterwards the East India Company carried on a small traffic at the different maritime ports, and chiefly at Canton. In 1792, Lord Macartney's embassy attempted to put the trade on a more liberal basis, but with little success. In 1816, Lord Amherst's mission for a similar purpose also failed, though the English trade continued for the next twenty years. In 1834 the exclusive trade of the East India Company with China terminated, and the country was thrown open to general traders. However, the government placed many obstacles in the way of trade, and, in 1839, went as far as to confiscate 20,000 chests of opium belonging to English merchants at Canton. This led to war with Great Britain, ending in the Treaty of Nankin—concluded August 29, 1842—which virtually unlocked, for the first time, the gates of the CELESTIAL EMPIRE.

The following is the official return of the declared annual value of British produce and manufactures exported to China and Hongkong, from 1834—the year when the distinction was first made in the Custom-house records between the exports to China and to India—to 1863:—

Years	To China	To Hongkong	To China and Hongkong conjointly
	£	£	£
1834	—	—	845,192
1835	—	—	1,074,709
1836	—	—	1,326,388
1837	—	—	678,375
1838	—	—	1,204,356
1839	—	—	851,969
1840	—	—	524,198
1841	—	—	862,570
1842	—	—	969,381
1843	719,693	736,487	1,456,180
1844	493,356	1,812,261	2,305,617
1845	855,196	1,539,631	2,394,827
1846	565,212	1,226,227	1,791,439
1847	735,089	768,880	1,503,969
1848	795,465	650,494	1,445,959
1849	885,140	651,969	1,537,109
1850	975,954	598,191	1,574,145
1851	1,528,869	632,399	2,161,268
1852	1,918,244	585,355	2,503,599
1853	1,373,689	375,908	1,749,597
1854	532,639	468,077	1,000,716
1855	888,679	389,265	1,277,944
1856	1,415,478	800,645	2,216,123
1857	1,728,885	721,097	2,449,982
1858	1,730,778	1,145,669	2,876,447
1859	2,525,997	1,931,576	4,457,573
1860	2,872,045	2,445,991	5,318,036
1861	3,114,694	1,733,963	4,848,657
1862	2,024,118	1,113,224	3,137,342
1863	2,416,705	1,473,222	3,889,927

There is no separate record of the exports to Hongkong prior to 1843.

By the terms of the commercial treaty signed on August 29, 1842, by the plenipotentiaries of the Queen of Great Britain and the Emperor of China, five ports of the empire were opened to European trade. The five ports are those of Canton, Amoy, Foochowfoo, Ningpo, and Shanghai. Some minor ports were added to these by the treaty of peace of June 26, 1856. The exports from China—including Hongkong—to the United Kingdom are of great value, and consist of two principal articles, namely, tea and silk, to which lately there has been added a third in cotton. The total value of the exports amounted to 9,014,310*l.* in 1859; 9,323,764*l.* in 1860; 9,070,445*l.* in 1861; 12,137,095*l.* in 1862; and 14,186,310*l.* in 1863. The sole article tea figures to the amount of two-thirds in the sum total of these exports. The computed real value of tea exported from China to the United Kingdom amounted to 5,528,660*l.* in 1859; to 6,601,894*l.* in 1860; to 6,449,540*l.* in 1361; to 8,759,763*l.* in 1862; and to 10,051,803*l.* in 1863. Compared with this article, the other exports of China to Great Britain seem insignificant. Of raw silk, the exports amounted to 3,031,280*l.* in 1862, but only to 1,626,539*l.* in 1863. On the other hand, the export of raw cotton was but of the value of 108,995*l.* in 1862, and rose to 2,164,995*l.* in 1863. In return for the vast quantities of tea, silk, and cotton which China sends to the United Kingdom, she accepts little else but a few manufactured cotton goods of about one-third the value. This, the principal article of British imports into China, was of but the value of 1,162,505*l.* in 1863, while the tea exports amounted to 10,051,803*l.*

History, Government, and Laws.—It may be almost said that China has no history, for she has so few revolutions or political changes to record, that her annals rise but in a small degree above the limits of chronology. The antiquity which the Chinese have claimed for their origin, is now, even by the enlightened among themselves, considered fabulous. Almost the first names mentioned in their annals are Shing-noong, 'the divine

husbandman,' who taught their ancestors the arts of agriculture; and Hoang-ty, who partitioned their lands, and contrived a cycle of 60 years, to enable them to register events, and to mark the progress of the seasons. Then comes the period of the 'five kings,' the last two of whom, Yaou and Shun, are held up as patterns for future sovereigns, being the exemplars of royalty down to the present reign. Yu, the successor of Shun, made himself conspicuous by his transcendent merit in draining the country that had suffered from a great deluge. The Chinese have no existing records older than the compilations of Confucius (born 550 B.C.), which must have been made from tradition. From that period the annals of the empire have been carefully noted and preserved, and descend in an unbroken line down to the present day. These, 'the successive labours of twenty-one historians,' consist of 500 vols. Formed into a prosperous and comparatively civilised community, under the Tsin dynasty, the Chinese became objects of envy to their neighbours, of whom the Tartars were the most troublesome; and, to guard against their incursions, the great wall was built. A.D. 184 was the era of the 'three states,' into which the empire was divided; but in 585 it was again united under one ruler. The 9th and 10th centuries were much occupied in civil wars, caused by the contending claims of several aspirants to the throne; but these were finally adjusted A.D. 950, by the consolidation of the Soong dynasty, under Tae-tsoo. This was the first great literary age of Chinese history; and printing having been invented 500 years before it was known to Europeans, authors and books were much multiplied. Under this dynasty the Chinese, unable to resist the Tartars, called in the aid of the Monguls; and they, by a policy of which history affords numerous examples, soon exchanged the character of allies for that of conquerors; and, under the famous Kublai-Khan, founded the Mongul dynasty. This able sovereign established the seat of his government at Pekin, or Kambalu, as it is called by Marco Polo, and constructed the great canal. But his successors rapidly degenerated; and the ninth Mongul monarch surrendered the throne to a Chinese, A.D. 1366. Twelve emperors of this native dynasty of Ming reigned in comparative peace till, in 1618, during the sway of Wan-lie, the 13th in succession, the Manchoos, a race sprung from the expelled Monguls and the Kin or E. Tartars, after a war of twenty-seven years, established themselves firmly in the empire. The seventh in descent from Shunchy, the first of the Ta-thsing dynasty of Tartars, occupies the throne of China at this day. (Davis, i. 157, 188.)

The most conflicting statements have been made with respect to the *government* of China: while some writers have represented the whole empire as trembling under the yoke of a capricious despot, others have represented the government as administered according to the inflexible rules of justice, and with the greatest moderation and humanity. Both these representations seem to be alike inconsistent with the facts. According to the theory of the constitution, the emperor is absolute; his will is law; and he is not responsible to any earthly tribunal for any of his actions. In China, as in ancient Rome, fathers have full power over their families, and, on the same principle, the emperor is held to be the father of the entire Chinese people; and to have the same unlimited power over them that each individual has over his own children. Practically, however, his power is comparatively circumscribed. In China everything is determined by custom, or by immemorial practice, from which it would be highly dangerous for even the emperor to depart. The Chinese is emphatically a government of precedent; and his celestial majesty is, in reality, the creature of custom and etiquette. All employments are bestowed, according to fixed rules, on those who have obtained certificates of proficiency after passing their examinations. The penal laws of the empire are printed in a cheap form, and widely diffused; and one of the sixteen discourses annually read to the public, inculcates the propriety of every man making himself acquainted with them, and with the penalties consequent on their infraction. Although, therefore, the government of China be despotical in its form, and every device be employed to give to the emperor not merely a paternal, but a sacred character, he in fact governs according to long-established rules; and with probably as little admixture of despotism as is to be found in most governments.

The great defect of the Chinese, as of all similarly constituted governments, is the want of any effectual control over the inferior agents. The emperor is not omniscient; and notwithstanding the various devices put in motion to learn the real conduct of the subordinate authorities, and their liability to punishment if they abuse their power, it would seem that these checks are, in many instances, of comparatively little avail; and that much injustice and oppression on the part of persons in power, escape detection and punishment.

The emperor is called 'the son of heaven' (Teën-tsye), and the mandarins and other natives not only prostrate themselves when in his presence, but also before a tablet with the inscription 'the lord of a myriad years' (Wansuy-yay). In his character of patriarch, his imperial majesty is not only looked upon as the father of that multitudinous family, the pop. of his empire, but is also considered the sole dispenser of the blessings of heaven; for the prime canon of belief is, that 'the duty of affording to the people sustenance and instruction is imposed on *The One Man*;' while, on occasions of national calamity, he publicly confesses his errors, and acknowledges his misconduct to be the cause of the divine displeasure. (Quarterly Review, xxv. 416.) The parallel between the relations in which every person stands to his own parents and to the emperor is carried out from the most important functions of the legislature, down to the minutest observances of ceremony, all of which are regularly prescribed by law. (Davis, i. 201.) The union of the avenger with the father, in the emperor, is well illustrated by Davis. A man and his wife had severely ill used the mother of the former, which circumstance was reported to the emperor. The very place where the crime was committed was made accursed. The principal offenders were put to death; the mother of the wife was bambooed, branded, and exiled, for the daughter's crime; the scholars of the district were not permitted to attend the public examinations for three years; and their promotion was thereby stopped. The magistrates were deprived of their office, and banished, 'For,' says the edict published on the occasion, '*I intend to render the empire filial.*' Every device is employed to create the impression of awe. Dressed in a robe of yellow, the colour worn, say the Chinese, by the sun, the emperor is surrounded by all the pageantry of the highest dignity in the world. All ranks must bow the head to a yellow screen of silk; in the great man's presence no one dares speak but in a whisper, though his person is too sacred to be often exhibited in public, and an imperial dispatch is received by the burning of incense and prostration. But with all this he is not allowed to lean back in public; to smoke, to change his dress, or, in fact,

to indulge in the least relaxation from the fatiguing support of his dignity. (Chinese Hist.; Davis; Quarterly Review, lvi. 499; Ellis's Account of Lord Amherst's Embassy, p. 307.)

Next, after the emperor, the court is composed of four principal ministers, two Tartars and two Chinese, who form the great council of state, assisted by certain assessors from the Han-lin or Great College, who have studied the sacred books of Confucius, which form the basis of Chinese law. These may be considered as the cabinet; but the real business of the empire is executed by the Le-poo, or Six Boards. No. 1. Le-poo is the board of official appointments, which has cognisance of the conduct of all civil officers; 2. Hoo-poo, the board of revenue, which regulates all fiscal matters; 3. Le-poo, board of rites and ceremonies, which enforces the customs to be observed by the people; 4. Ping-poo, military board; 5. Hing-poo, or supreme court of criminal jurisdiction; 6. Kung-poo, board of public works. There is also a colonial-office, composed of Manchoos and Monguls, so that the respective tributary princes may have confidence in referring whatever concerns their interests to their own countrymen. To each of the provs. a viceroy is appointed by the chief, or Le-poo board; and every town is presided over by a magistrate, who takes rank according as he is at the head of a *foo*, *tchoo*, or *heën*. Subordinate officers superintend the lesser divisions. All these functionaries are removed every three years; and that no ties of kindred may interfere with the strict discharge of their duties, the viceroys and magistrates are forbidden to form any matrimonial connection with a family within the limits of their rule. It is honourable to the Chinese that, for these and other state offices, merit alone is the qualification; the son of the poorest peasant or artificer may offer himself as a candidate, and, by talent and application, rise to the highest employments. A singular expedient is adopted to ascertain with what fidelity the viceroys and magistrates perform their duties. There is a board, headed by a Tartar and a Chinese, on whom it formerly devolved to watch over the words and actions of the emperor, and freely censure him for any misdemeanour! The duties for which this office was originally established have, for reasons easily understood, long fallen into disuse; and the members are now employed as censors *for* the emperor, being sent as inspectors into the provs. to see how the viceroys and magistrates do their duty, and to report their delinquencies. But these functionaries are less formidable than might be supposed. If they did their duty honestly, they would, no doubt, be of singular advantage; but in China, as elsewhere, it is usually found that inspectors look with an indulgent eye on the faults of those in authority; and it has been doubted whether their visits be not as often the means of stifling the complaints of the public, and of preventing and delaying justice, as of facilitating its course. Nothing can be more lucid and methodical than the code of laws promulgated for the guidance of the boards and their subordinate officers. Each district has a separate code, adapted to the habits and disposition of those for whom it is framed; and offences, with their punishments, are classed under six different heads, corresponding with the six boards, so that each case is referred to the tribunal against whose authority the offence may have been committed, unless it be one admitting of summary punishment.

The Tsing Leu Lee, being the fundamental laws, and a selection from the supplemental statutes of the penal code of China, has been ably translated by Sir George Staunton. 'The most remarkable thing in this code is its great reasonableness, clearness, and consistency; the business-like brevity and directness of the various provisions, and the plainness and moderation of the language in which they are expressed. There is nothing here of the monstrous *verbiage* of most other Asiatic productions; none of the superstitious deliration, the miserable incoherence, the tremendous *non-sequiturs*, and eternal repetitions of those oracular performances: nothing even of the turgid adulation, the accumulated epithets, and fatiguing self-praise of other eastern despotisms; but a clear, concise, and distinct series of enactments, savouring throughout of practical judgment and European good sense; and if not always conformable to our improved notions of expediency in this country, in general approaching to them more nearly than the codes of most other nations. (Edin. Rev., xvi.)

This is high, but not undeserved praise. At the same time, however, the Chinese code is not without very serious defects. There is an elaborate attention to trifles; and a perpetual interference on the part of the legislator to enforce duties and observances of no importance, or that had better be left to the discretion of individuals. But its greatest defect is the vagueness of some of its clauses: so that a person may be punished if his conduct be '*contrary to the* SPIRIT *of the law!*' The frequency of corporal punishment seems extraordinary to Europeans. It is, in fact, the universal penalty: offences the most trivial and the gravest, whether committed by persons in the highest or the lowest walks of life, being visited by so many strokes of the bamboo! These, however, are not always inflicted. Persons under fifteen or above seventy, or maimed, may redeem themselves from all but capital punishments, by a small fine; in other instances the punishment may be commuted by paying a sum of money proportioned to the number of blows. But there are crimes for which even those who are rich enough to escape whipping for ordinary offences are not suffered to make a pecuniary compromise. Indeed the bamboo seems in universal requisition, from the emperor down to the meanest of his subjects; and not only the number of blows, but the length and thickness of the instrument to be used for each offence, are minutely prescribed. The prerogative of mercy is not unfrequently extended, with, however, one exception. In a country which has preserved its institutions unchanged, and its laws unaltered, for 2,000 years, it is not surprising that seditious offences should be severely dealt with. The crime of treason is visited with remorseless severity. In 1803, Mr. Davis states, a single assassin attempted the life of the emperor. He was condemned to a lingering death; and the criminal's sons, being of tender age, were 'mercifully' strangled; for it seems to be the peculiar barbarity of the Chinese criminal code, that it involves the innocent family of an offender in the retribution for his crime. There is much in use a sort of pillory, called the *cangue*; and torture is employed to extort confession. The police of China is said to be vigilant and efficient; but, as a safeguard against oppression, the name of every person in any way connected with the government is published in a sort of Red Book, of which a corrected edition appears four times a year.

Another type of the patriarchal form of the Chinese government is to be found in the mode in which the state *revenue* is produced; it consists principally of tithes: not paid in the nature of taxation, but as rent, the emperor uniting the character of universal landlord with that of king and father: but though the whole pop. be tenants-at-

will, ejectment is seldom resorted to; and it is his own fault if a Chinese be ever deprived of his lands. There are here no great estates; but if any one happen to hold more land than he can conveniently cultivate, he lets it to another, on the *méteyer* principle, or on condition of his receiving half the produce, out of which he pays the whole taxes. A great part of the poorer peasantry hold lands in this way. (Barrow, p. 398; De Guignes, iii. 341.) The revenue is paid partly in money and partly in kind. The greatest possible discrepancy exists amongst the estimates that have been given of its amount. It is believed, however, that the entire revenue remitted to the imperial treasury may amount to about 12,000,000*l.* sterling, that is 10,000,000*l.* in money, and 2,000,000*l.* in produce. But it is essential to bear in mind that this is not the whole amount of Chinese taxation, inasmuch as the expenses of a collection, and many local and provincial charges, are deducted before any remittance be made to the imperial treasury.

The Military service of China is nominally composed of 1,000,000 soldiers, besides the militia and numerous standards of Mongul cavalry; but from this vast number many names must be deducted which are merely entered in the books, and perhaps the whole force does not exceed 700,000. The soldiers are enrolled in the corps quartered in the provinces in which they are born, and which are never quartered any where else; the Chinese government being impressed with the opinion, that soldiers living with their families, and being, in fact, more than half citizens, will exhibit greater bravery in the defence of their country, should any occasion arise for their services, than if they were cooped up in barracks or fortresses, and subjected at all times to strict discipline and martial law. The troops are only embodied at certain seasons, being at other periods their own masters. The Tartar troops, inasmuch as they belong to a standing army at a distance from home, receive higher pay, and are more efficient soldiers than the native Chinese; though they also seem to be enervated by their long residence in this tranquil region. The whole army is divided into standards, distinguished by their different borders and colours. These corps—not unlike our brigades—are subdivided into camps and wings; the right, left, and middle. The officers are all raised from the ranks, and are looked upon by the civilians as little better than police agents; but, like the latter, are obliged to take their regular degrees to obtain promotion, which is rapid. Their grades are precisely similar to ours, from the Le-tuh, commander-in-chief of the forces, down to the Wae-wei, or serjeant. The principal weapons are bows and arrows; but they also use clumsy match-locks and iron guns, without carriages, and, more recently, have imported tolerably good rifles and superior ordnance from Europe. The theory of tactics is well understood; but the practice is very deficient. In so peaceful a country there is but little occasion for military skill; and without intelligent officers, or improved weapons, it is not to be supposed that they should make any effectual opposition to European troops. A standing army, in the European sense of the word, is not in existence. The soldiers do not live in barracks, but in their own houses, pursuing as chief business some civil occupation, frequently that of day-labourers, and meeting only on certain occasions, pursuant to orders from the military chieftains. (Moger, Marquis de, Recollections of Baron Gros's Embassy to China, Lond. 1860.)

The Chinese *Navy* is extensive, but inefficient; it includes, perhaps, 1,000 sail; but the men-of-war are mere junks, which mount a few guns; and there are few large vessels. This imperial navy is commanded by three high admirals and their inferior officers, all of whom are so profoundly ignorant of their business, that the merchant junks are better managed than the imperial cruisers. Gutzlaff draws a deplorable picture of the condition and discipline of the mercantile navy. Few sailors are regularly bred to the service, but are chiefly wretches who have been obliged to flee from their homes. Though there be a nominal commander in every junk, his authority is uniformly disregarded. Every one having the liberty of putting a certain quantity of goods on board, is a sort of shareholder, and does nearly what he pleases. The Chinese make use of a compass, invented by themselves, divided into 24 parts, beginning at the S., the needle moving freely in a box placed upon a bed of sand. Their pilots having been accustomed to the sea from their youth, and always performing the same voyage, have a perfect knowledge of the various localities. In the construction of river craft, the Chinese are more skilful; many of these vessels are indeed floating habitations, and thousands of families live in them during their whole lives. (Sketch of Chinese Hist. by Gutzlaff, i. Introd. 1–40; Sir G. Staunton's Trans. of the Leu-lee, or Criminal Code; Davis's Chinese, i. 204 *et seq.*; Quarterly Review, No. vi.)

Character and Social Condition.—The Chinese are said by Mr. Davis to be a nation of '*incurable conservatives.*' Their rule is to adhere to all that is established, and to reject all that is new. They are the very transcript of the ancient world living in the present day; they wear the same costume, are subject to the same laws, which are administered precisely in the same way, and they exist to all intents and purposes in the same social and intellectual condition as their forefathers did 2,000 years ago. This uniformity may be almost said to have been ordained by nature, for it is a remarkable fact that the Chinese are so much like each other in personal appearance, that it is difficult for a European to distinguish between them. We find no diversity in the colour of their hair, no variety of eye, no prominent and striking feature which indicates the place of their birth. (China Opened, i. 290.) They have black, stiff and strong hair, shaved so as to leave a much cherished tail depending from the crown; a depressed face, wherein the distinguishing features are not strongly marked, a flat nose, small angular eyes, round and prominent cheeks, a pointed chin, thin eyelids, small beards, middle stature, and strong bones. Long ears and plumpness form their *beau ideal* of beauty; consequently, to attain the latter, they exercise but little agility. (Id. p. 293.) The aristocracy of rank and wealth are unknown in China. *Distinction is solely to be obtained by learning*; and dignity is only conferred by office. Even the sons of the emperor and their families merge into the common mass, should they not study, so as to become qualified for some official employment. The mandarins, or literary aristocrats, do not obtain their rank except by passing repeated examinations, as to the fairness of which no doubt has ever been surmised, and establishing their superiority over their competitors to the satisfaction of the Board of Examination. There are nine degrees of mandarins, the highest being viceroys or governors, and the lowest, collectors of the revenue, &c.; promotion can only be obtained by superior proficiency in the study of the law. The different functionaries are distinguished by the number of buttons in their caps, and other variations of costume. As the pay of all persons in office is unreasonably small, they often resort to

extortion to make up this deficiency, and there is scarcely a number of the 'Pekin Gazette,' that does not record some instance of a public officer being degraded for that crime. The natural characteristics of the Chinese are summed up by Davis in these words:—'The advantageous features of their characters, as mildness, docility, industry, peaceableness, subordination, and respect for the aged, are accompanied by the vices of specious insincerity, falsehood, mutual distrust, and jealousy.' The lower orders are passionately addicted to gambling, for which they have their peculiar cards and dice. That honesty is more valued than practised has been inferred from the notification to be frequently seen in shop windows, that 'there is no cheating here,' and from a caution placarded in most public conveyances for travellers, to 'take care of their purses;' but we doubt whether such notices really go for much. The insincerity and falsehood laid to their charge, in so far as they really exist, are the natural consequences of the restraints, under which they are laid from infancy, of the interference of the law with all their actions, and of their being obliged to suppress and conceal those feelings and emotions to which, in other countries, full vent would be given. Their attention to etiquette is a consequence of the same principle. Even when peasants visit each other, complimentary cards—the size of which determines the rank of the sender—and polite answers are exchanged. 'On the arrival of the guest, considerable difficulty is found in arranging who shall make the lowest bow, or first enter the door, or take the highest seat, or assume precedency at table, though the host contrives to place his guest in the most elevated position. When conversation commences, the mutual assent to every proposition, the scrupulous avoidance of all contradiction, and the entire absence of every offensive expression or melancholy allusion, show what a sense these people entertain of politeness.' (Medhurst's China: its State, Prospects, &c., 1838.) The condition of the poor is wretched in the extreme: they are frequently destitute of food, and many are said to perish in the winter season from cold, for want of fuel. (Gutzlaff's Voyages, p. 67.) Begging is common in the large cities, but not more so than in Europe. It is a curious fact, that though the Chinese be remarkable for assisting each other, particularly their own relations, with money or food, they will on no account step out of their way, in case of accident, to save a fellow-creature's life; but this arises from their laws making the person last seen near a corpse answerable for the death. Robbery is not uncommon, but is very seldom accompanied with murder. The people, generally so quiet and submissive, when once roused by the oppression of an intolerant magistrate, will rise *en masse* against him, and subject him to lynch law: in such cases the government of Pekin generally concludes that the magistrate has been in fault; and the outrage is allowed quietly to fall into oblivion. The drowning of infants, particularly of females, has been said to be *customary* in China; but this is a most unfounded statement. That an enormity of this sort is sometimes committed is certainly true; but we believe that it is of exceedingly rare occurrence. Mr. Davis says, that 'the Chinese in general are exceedingly fond of their children, and the attachment seems to be mutual.' (i. 246.)

The whole of the Chinese nation is divided into families, each of which bear the same surname, and consider each other cousins. These clans are bound to assist each other in any way that may be required; and the most powerful of them act as a salutary check upon local despotism. The *women* of China occupy a lower scale in the estimation of their countrymen than those of other nations. A broad face, diminutive waist, pale features, and feet small to deformity, constitute female beauty in the eyes of a Chinese. To insure this last, their feet are confined from tender age in shoes calculated to stop their growth, so that the feet of some ladies only measure 3 in. from toe to heel. Females are universally objects of traffic. When young they are purchased by dealers for the harems of the great, where they remain in splendid seclusion. Marriages depend entirely upon the will of the parents, who *sell* their daughters at from 5,000 to 6,000 dollars a piece, according to the beauty or rank of the female. Early marriages are universal; no man who can afford the expenses of the ceremony deferring it after the age of 20, and parents get rid of their daughters as soon as they can, even at the early age of 14. The Chinese may be said to be an *omnivorous* people. The principal part of their food consists of rice, which is generally eaten dry; but in the S. provinces it is mixed with the sweet potatoe in a sort of soup. Vegetables are the chief provision of all ranks, who do not consume a fifth part of the animal food that Europeans do. Pork is the favourite dish, and the head of the ass is esteemed a great delicacy. To eat every thing which can possibly give nourishment is the comprehensive principle upon which Chinese diet is regulated; so that dogs, cats, and even rats and mice, are not rejected by them. They are the most expert fishermen in the world; no aquatic creature escapes their vigilance, whether it inhabit the sea, lake, canal, or river; even pools and the ridges of fields are searched for fish. Every kind of meat is minced into small pieces, and is eaten with chop-sticks. The Chinese epicure delights in soups made of edible birds' nests of the swallow species (*Hirundo esculenta*), and imported in great quantities from the E. islands. It appears that the birds make use of great quantities of a peculiar sea-weed (*Sphæro-coccus cartilagineus*), and when it is sufficiently softened in their stomachs, it is returned and used as a plaister to cement the dirt and feathers of the nest. These nests, after having been purified in immense manufactories, are eaten with great *goût* by the Chinese. The favourite beverage is tea, drunk out of small cups, which are seldom washed, for that process is thought to diminish the flavour. In this article the Chinese are as great connoisseurs as Europeans are in wines. Distilled liquors are chiefly made from rice: rum is much used, but grape wine has not been met with. Drunkenness prevails, especially in the N. provinces; but the worst species of debauchery is opium smoking, which, when carried to excess, deprives the victim of strength; he becomes a walking shadow; his eyes are vacant and staring; his whole frame is deranged, and he soon sinks into a premature grave. But it should be observed that these are the consequences of the *abuse* of the practice: when used in moderation, it is said to be comparatively innoxious. The fumes of the drug are inhaled through a peculiar pipe, in a recumbent position, and the smoker soon sleeps. When he awakes, he drinks a cup of tea, and smokes again. The Chinese delight in the drama: they will attend a play for a whole night without being wearied, and recount with ecstacy what they have seen. In their pastimes the women are never associated.

The accounts of Chinese architecture are not very satisfactory, a consequence of its being necessary to employ terms in its description that convey to foreigners impressions very different from the reality. According to Mr. Barrow, it is 'as unsightly as unsolid; without elegance or convenience

of design, and without any settled proportion; mean in its appearance, and clumsy in the workmanship.' (p. 330.) Perhaps, however, this opinion is founded too much on preconceived notions of the absolute superiority of the European standard. But without entering on this, it is sufficient to observe that the walls of the houses are of brick, stone, or wood, but principally of the first. The roofs are always supported on columns, that is, on upright pieces of timber, without either capital or base. In the country they are rarely more than one story in height, but in the great towns they are frequently two. Their roofs, which are curved, are usually covered with tiles. Their pagodas are polygonal buildings, of 5, 7, or 9 stories or roofs. Mr. Barrow says, that the pagoda erected by George III. in Kew Gardens is 'not inferior to the very best' he met with in China—a statement which certainly does not tend to exalt our opinions of this species of buildings.

Religion.—There is no religion in China actually supported by the state, and *Yu*, the doctrine of Confucius, is the only one countenanced by it. But there are two other sects; *Fo*, or Buddhism, and *Taou*, or that of the 'rationalists.' The first acknowledges a Supreme Being, and believes the emperor his sole vicegerent on earth. Heaven, earth, the elements, Confucius, gods of various attributes, saints, the emperor, &c., are objects of worship; the rites in performing which are watched over with the most jealous care by the *Le-poo*, or Board of Rites. The doctrine of Confucius fills the world with genii, demons, and the spirits of deceased worthies, who are supposed to have each their separate duties and influences assigned to them. No worship is so strictly observed as that of ancestry, so that filial piety is carried to an excess, even beyond the grave. The religious edifices of the *Yu* sect are said to be very splendid. They chiefly consist of one large hall approached by steps, with the idol placed upon an altar, or table; the walls are adorned with pictures, and the ceiling with gilded griffins and dragons. An apparatus for sacrificing various animals is also provided. There is no congregational worship. Buddhism is a despised creed in China, and is entirely supported by the mendicancy of its priests. The latter practise celibacy, dress in a similar manner to monks, and the devotees use holy water, and a rosary to keep account of their prayers. Mr. Malcolm, the missionary, has given a very favourable view of Buddhism. 'It has no mythology of obscene and ferocious deities; no sanguinary or impure observances; no self-inflicted tortures; no tyrannising priesthood; no confounding of right and wrong, by making certain iniquities laudable in worship. In its moral code, its descriptions of the purity and peace of the first ages, of the shortness of man's life because of his sins, &c., it seems to have followed genuine traditions. In almost every respect it seems to be the best religion man ever invented.' (Travels, i. 322.) The professors of *Taouism* pretend to magic, alchemy, and to be possessed of the elixir of long life; practise glaring impositions, and inculcate the most puerile superstitions. They encourage a belief in ghosts and evil spirits; make use of spells and talismans, lucky and unlucky birds, and a system of tricks called *fung-shuey*, by which they pretend to choose lucky situations for building houses and tombs, and a hundred other fallacies, by which these impostors contrive to fill their purses. Religion, of whatever kind, has always, we believe, been reckoned a matter of secondary importance in China. But this is a subject as to which our information is comparatively little to be relied on. The ancient and modern missionaries, how much soever they may have admired many parts of the Chinese character and institutions, have generally represented their morals and religion in the most unfavourable point of view. That there is much about them that is objectionable is certainly true; but it is so obviously the interest of the missionaries, by depreciating the moral and religious character of those they are labouring amongst, to exalt their own utility and importance, and to justify their claims to the patronage and support of the Christian public, that their statements can hardly be supposed to be free from bias. Many endeavours have been made to introduce *Christianity* into China, but with less success than has attended similar efforts in other nations. It was first introduced by the Nestorians in the 17th century. These were followed by the Jesuits, whose missionaries were more successful than those of any other sect; for at the Tartar invasion there were no fewer than thirty Catholic churches in the province of *Keang-nan* alone; the first of the Tartar princes openly espoused the cause of the missionaries, by taking a German Jesuit, Adam Schaal, for his instructor. The abolition of that order, and the continual wars in Europe, reducing their funds, the Catholic missions declined, and but few native converts at present remain. The late Dr. Morrison was the first Protestant missionary who landed in China; he compiled a dictionary (having been preceded in that arduous task by De Guignes) and grammar; translated the Scriptures into the Chinese language, and established printing-presses at Canton, from which a judicious selection of tracts has issued. These pious efforts have been ably seconded by Mr. Milne and the Rev. Charles Gutzlaff, the latter of whom has published several valuable works on China, of which we have made considerable use. The Mohammedan, Jewish, and many other religions are to be found in China, but in a very languishing condition. A semi-political, semi-religious movement, which broke out in China about the year 1850, and, according to some reports, threatened for a time the destruction of the actual government, was long believed to be owing to the teaching of Christian missionaries. But this belief was scarcely founded on fact. The insurgents, commonly called Taepings, whatever their religious faith, were certainly not Christians, for the many atrocious acts committed by them—acts completely inexcusable even by the direst necessities of warfare, and warfare in its bitterest form, civil strife—showed them entirely unacquainted with the fundamental precepts of the divine Gospel of Christ. This, too, was the conviction of the leading statesmen of Europe, with whose help, and the aid of British and American officers, the Taepings were finally crushed in 1865. The valuable help thus afforded went far to reconcile the Chinese government to European progress, and to enter upon a liberal fulfilment of the treaty of peace concluded with Great Britain, June 26, 1856, by the terms of which Christianity will be tolerated throughout the whole of the Chinese empire.

Language, Education, and Literature.—Distinct as the Chinese are from the rest of mankind in habits, manners, and religion, their total dissimilarity is rendered complete by their language; which, arrested between the hieroglyphic and alphabetic systems, presents a singular phenomenon. The most obvious expedient for expressing substantive ideas otherwise than by speech, would be to figure a representation of the object intended to be expressed; and this was unquestionably the plan first adopted by man to communicate and record what he thought through the medium of

the eye instead of the ear. As civilisation and knowledge advanced, and the necessity for communicating it increased, more concise forms or conventional letters were substituted; but in the case of the Chinese, the primitive mode is still the principle upon which their characters are constructed; so that their system may be called the perfection of the hieroglyphic method of written language. Having pictorial representations of natural objects for their basis, the elementary signs of the Chinese language are few and simple. A horizontal, a perpendicular, two oblique lines drawn in different directions, and an acute angle and dot, are the elements of which the Chinese characters consist. These marks are so combined in the first instance as to form 214 keys or generic characters. Thus, the symbol for 'man' is always present in a word which has direct or indirect reference to him; this character, for example, combined with the symbol for field, signifies a farmer. The Chinese notion of government is well expressed in another example: the verb 'to govern' is represented by the two characters that stand for 'bamboo' and 'stroke.' The keys are divided into 17 classes, and the number of words thus formed, upon a system more complete than that of any of the W. languages, to be found in the most copious Chinese dictionaries, amounts to 40,000, each of which stands as arbitrarily for the thing or idea intended to be conveyed as a figure does in a painting for the object it is meant to represent. Thus the character presents an object to the eye which enters the mind with a striking and vivid certainty; it forms a feature which really is, or by early associations is considered, beautiful and impressive. Chinese writing is also more permanent than the alphabetic system, which is ever varying its spelling with the continually changing pronunciation of the living voice. Perhaps the Chinese written language has contributed in some degree to the unity of the Chinese nation. (Dr. Marsham's Clavis Sinica; Elements of Chinese Grammar, Introduction, p. xi.; De Guignes, Dictionnaire Chinois, Introduction; Quarterly Review, lvi. 506; China Opened, i. 391.) The causes, however, which operate to make the written language in China the most complete and beautiful in the world, render oral communication the most difficult and confined. That systematic regularity which so continually requires the presence of the keys, as parts of words bearing different meanings, and thus precludes a necessary variety of *sounds*, leaves the spoken language as meagre and defective as, when written, it is rich and complete. The sound corresponding with our *e* has at least 2,000 significations, and 'one might write a perfectly intelligible treatise in which only the sound of *e* was employed.' (China Opened, i. 383.) Thus, in conversation between even two of the best educated Chinese, constant misapprehensions occur. 'They understand each other,' says Mr. Davis, 'perfectly on paper, but are mutually unintelligible in speech.' And in the most common-place colloquy it is not unfrequent for the speakers to resort to pen, or rather *brush*, ink, and paper, to make themselves understood; in the absence of these materials, they draw the figure of the root or key in the air with their fingers. So that oratory is entirely unknown in China; and all affairs of importance, such as lawsuits, civil or criminal, are carried on in writing. The deficiencies of the oral language are in a small degree supplied by the different tones in which the same words and their various significations are uttered. But these inflections are so nice as to be only distinguishable by a native ear. The difficulty of free intellectual intercourse must have had a very considerable effect in preventing the Chinese from advancing a step further in civilisation than they had attained so many hundred years ago.

Education in China is more encouraged and favoured even than in Prussia; and such is the estimation in which it is held, that all state employments are given by competition, as school and college prizes to the best scholars. Schools for youth are abundant in every part of the empire; and education is so general, and its cost so reasonable, that reading and writing may be almost said to be universal. Language is taught to very young pupils by means of rude pictures which represent the names of the chief objects in nature and art. Then follows the *San-tse-king*, or summary of infant erudition, conveyed in chiming lines of three words or feet. They soon after proceed to the 'Four Books,' which contain the doctrines of Confucius, and which, with the 'Five Classics,' subsequently added, are, in fact, the Chinese Scriptures. Writing is taught by tracing the characters with a hair-pencil, on transparent paper placed over the copy. This is a most important article in Chinese education, for no man who does not write a good hand can lay claim to literary distinction. The emperor himself, when bestowing a great reward, writes a few characters on a piece of paper, and sends it to his favourite, and this is more valuable than conferring an order. (Davis, i. 290; China Opened, i. 396.) Females of the higher class are allowed to acquire a little reading and writing, and have been known to write poetry; but the great object of their education is to inculcate obedience. The schools established all over the empire are superintended by various officers appointed by government. In every district there is a sort of literary chancellor; but early aspirants are examined by superintendents, who make the circuit of their district twice a year for that purpose. The pupils they approve of repair to the chief, and should they pass that ordeal, and thus obtain the approbation of the officers of their native district, they are eligible for the lowest literary honour of the state. This is called *Tew-tsae* (flowery talent). For this degree the examinations take place twice in every three years in *foos* of every province; the scholars having each a theme given them from the 'Five Classics,' in a large hall, are confined in separate boxes to prevent their receiving assistance from others; and every avenue is strictly guarded by soldiers. The *Tew-tsae* degree having been obtained, the aspirant has to acquire two other honours in the metropolis of his province, and he is placed on the books as eligible for employment corresponding with his advancement. To procure the highest state offices, an examination before the national college, or *Han-lin*, is necessary; but the very pinnacle of fame is only arrived at by being examined by the emperor himself. Every literary honour confers the title of mandarin, and each degree is distinguished by a difference of the dress, which is, in some instances, very splendid. Genius and originality amongst a people so blindly enthusiastic in their admiration of the ancients, are considered rather a blot upon, than as an ornament to, the character of a student. Memory is the chief object of admiration—memory to repeat the greatest number of the wise sayings of the ancient sages.

From what has been already stated, it will be readily conceived that the *literature* of the Chinese is most extensive. 'Books,' says Mr. Medhurst, 'are multiplied at a cheap rate, and to almost an indefinite extent, and every peasant and pedlar has the common depositories of knowledge within his reach. It would not be hazarding too much to say, that in China there are more books and more people to read them than in any other

country in the world. Amongst the 360,000,000 of Chinamen, at least 2,000,000 are literati.' (China Opened, i. 417.) Yet it may appear strange that there is hardly one *original* writer among them: it is generally believed in China, that whatever is to be known has already been discovered and communicated by the ancient sages; and should an author be bold enough to start any thing new, if that should happen to vary in the smallest particular from the orthodox writers, he would be severely punished. It is this which keeps the knowledge and civilisation of China at a standstill. The historical writings are nothing more than elaborate chronologies; and, where real dates have been wanting, the writers are suspected of having supplied them from their own imaginations. The scientific and philosophical works of the Chinese are by the 'ten philosophers,' or Confucius and his disciples and commentators. Chinese literature has, however, been in several respects unjustly depreciated. It has been said, for example, that they are so ignorant and ostentatious as to suppose that China occupies the centre of the world, and that it is surrounded with a few insignificant and petty territories, all its tributaries. But the accounts that have been translated from Chinese writers of several foreign countries, how defective soever in many respects, are sufficient to show that this is a most unfounded statement. It seems highly probable that the vast empire of China will, notwithstanding the extreme conservative character of its inhabitants, be gradually led within the pale of Western civilisation and European modes of thought. Recent events, among them a war with the two greatest nations of Europe, have powerfully contributed to this effect. The boarding, by Chinese soldiers, of a small vessel, the 'Arrow,' Oct. 8, 1856, and other trifling matters, having led to a war between Great Britain and China, in which France was made to join, the government of Pekin was in a short time reduced to such straits as to sue for peace on the most humiliating terms. According to the stipulations of the treaty of peace concluded between Great Britain and China, June 26, 1856, the empire is open to European travellers, especially British subjects, while British men-of-war may visit any Chinese port. More than this, it is stipulated that missionaries shall be allowed freely to preach the Gospel of Christ, and that Christianity shall be tolerated throughout the Chinese empire.

CHINACHIN, a large town of Nepaul, N. Hindostan, 250 m. WNW. Catamandoo. Its houses are of brick and stone, with flat roofs: it has two Hindoo temples, and an export trade in horses, cow tails, sheep, salt, musk, drugs, and woollen cloth; and imports metals, spices, cloth, &c., from other parts of Hindostan.

CHINAUB (an. *Acesines*), the largest river of the Punjab, rising in the Himalaya, in lat. about 32° 10′ N., long. 37° 50′ E.; running at first with a NW. but afterwards with a SW. course between the Ravee (*Hydraotes*), and Ihylum (*Hydaspes*). It unites with the latter river below Ihung with considerable noise and violence, as remarked by the historians both of Alexander and Timour, and with the Sutlege (*Hyphasis*) near Ooch; after which it joins the Indus, in lat. 29°, long. 70° 30′. About 50 m. N. Lahore, it has been found to measure 1½ m. across in the month of July; but, in the dry season, is there only 300 yards wide. It is no where fordable S. of the hills, though in many places easily crossed. Kishtawar, Vizierabad, and Ihung are on its banks.

CHINCHILLA, a city of Spain, prov. Albacete, cap. dist., in an elevated situation, on the high road from Valencia to Madrid, 146 m. SE. Madrid, 72 m. NNW. Murcia. Pop. 6,044 in 1857. The city has a church, convent, a hospital, barracks, and an ancient ruined castle, which was partly restored during the war of independence. There are mines of silver in the neighbourhood; and it produces earthenware and some coarse linen and woollen cloths.

CHINCHOOR, an inl. town of Hindostan; prov. Aurungabad, pres. Bombay, on the road between that city and Poonah, 10 m. NNW. the latter. Estimated pop. 5,000, including 300 Brahmin families. It is chiefly remarkable as the residence of the Chintamun or Narrain Deo, an individual whose honours are hereditary, and who is believed by a large proportion of the Mahratta nation to be an incarnation of their favourite deity Goonputty.

CHINGLEPUT, or '*the Jaghire*,' a distr. of Hindostan; prov. Carnatic; pres. Madras; between 12° and 14° N., and intersected by long. 80° E.; having N. the distr. Nellore; WS. Arcot; and E. the Bay of Bengal. Area, 2,253 sq. m. Pop. estim. at about 350,000. Surface generally low, but with hills interspersed; there are several rivers, the principal of which is the Palaur, which rises among the Nundydroog hills in Mysore, and after a winding course of 210 m., chiefly E., past Vellore, Arcot, Conjeveram, and Chingleput, falls into the sea, near Sadras. There are some lakes and lagoons, or inlets of the sea, the chief of which is that of Pulicat. Granite is the most abundant of the primitive formations, and often projects in detached masses from the surface. Soil sandy and indifferent, and the country often barren, or overrun with low prickly bushes. Owing partly to the scarcity of water, but quite as much to the oppressiveness of the assessment, a large portion of the land does not repay the cost of cultivation; but the rest supplies the Madras market with grain, betel, fruit, oil, vegetables, &c.; the palmyra (*borassus flabelliformis*) thrives without trouble, and is both cheap and abundant. There are no manufactures, excepting some of cloth. The great mass of the people are Hindoos. Chief towns, Chingleput and Conjeveram. This distr. was obtained by the E. I. Comp. in 1763, from the nabob of the Carnatic, who rented it till 1780, when the Madras pres. assumed the entire control over it. It was twice invaded by Hyder Ali, and was afterwards nearly depopulated by famine and emigration. During the present century it has been gradually recovering.

CHINGLEPUT (*Singhalapetta*), an inl. town of Hindostan; presid. Madras, cap. of the above distr.; in a small valley, in great part covered by a beautiful artificial lake; 20 m. W. the Bay of Bengal, and 38 m. SSW. Madras; lat. 24° 46′ N., long. 80° E. Though much reduced in extent, it has a fort of great strength, and in a good state of defence: the latter incloses an inner fort, in which the public functionaries hold their several courts and offices.

CHINON, a town of France, dép. Indre-et-Loire, cap. arrond., on the Vienne, 26 m. SW. Tours. Pop. 6,905 in 1861. The town was formerly fortified; and the ruins of its walls and those of its castle are its most important and interesting objects. It has a court of primary jurisdiction, a commercial college, and some manufactures of linen and woollen stuffs. The celebrated Rabelais was born within a short distance of Chinon, in 1483.

CHINSURAH, an inl. town of Hindostan, prov. Bengal, formerly a Dutch settlement, but latterly transferred to the British government, on the W. side of the Hooghly river, 18 m. N. Calcutta, and about 2 m. NNE. Chandernagore; lat. 22° 52′ N.,

long. 88° 28′ E. In appearance it has quite a Dutch character. There are many small neat houses, with green doors and windows. A pretty little square, with grass-plot and promenades, shaded by trees; a fortified factory; and a gloomy old-fashioned government-house, are the more remarkable features.

CHIO. See SCIO.

CHIOGGIA, or CHIOZZA (perhaps the *Portus Edro* of the ancients), a sea-port town of Austrian Italy, prov. Venice, cap. distr., on an island of the same name, at the S. extremity of the lagoon of Venice, 14 m. S. that city. Pop. 26,800 in 1858. The town is about 2 m. in circuit; well built; contains a wide and handsome street lined with porticos, a cathedral, hospital, orphan asylum, and theatre; and is connected with the mainland by a stone bridge of forty-three arches. It has a harbour with 17 ft. water, protected by two forts: there are other batteries, and Chioggia is deemed one of the most strongly defended points of the Venetian lagoon. It is a bishopric, and has an episcopal palace, a gymnasium, a high seminary, conventual female school, and an evening rudimental school attended by nearly 300 poor children. In its vicinity are some important salt-works, which, together with the manufacture of cordage, the building of vessels, for which there are thirty-six slips, navigation, and fishing, occupy many of the inhab. Trade active in Italian and German produce, and facilitated by canals communicating with the Brenta, Adige, and Po.

CHIPPENHAM, a parl. bor., town, and par. of England, co. Wilts, hund. Chippenham, 87 m. W. London, 20 m. E. Bristol, on the Great Western railway. Pop. of municipal bor. 1,603, and of parl. bor. 7,075 in 1861. The town is situated on the Avon, which is here crossed by a bridge of twenty-two arches. It is well built, paved, lighted with gas, and amply supplied with water. From its situation at the intersection of two great roads, the Malmesbury and the London and Bath lines, many daily coaches formerly used to pass it, and it had a bustling appearance. It is now on the line of the Great Western railway, and a branch of the Berks and Wilts canal terminates in the town. The church is a spacious structure of various dates, some portion being as old as the 12th century: there are also several dissenting chapels, a free school for twelve children, and other charitable and benevolent institutions. The market, which was formerly very extensive, is held on Friday. There are large cattle-fairs, May 17, June 22, Oct. 29, and Dec. 11.

Though one of the oldest towns in the kingdom, Chippenham received no charter till 1554. Under the Municipal Reform Act, it is governed by four aldermen and twelve counsellors, and the limits of the bor. have been extended for municipal purposes, so as to include the whole town and a pop. of about 4,000. The corporation revenue amounts to about 350*l.* a year, derived principally from an estate left for the maintenance of the bridge and of a road to Derryhill in the vicinity. A court of requests for debts under 40*s.* sits successively here and at Calne and Corsham.

Chippenham has sent two members to the H. of C. from the reign of Edward I. Previously to the Reform Act, the right of voting was restricted to the occupiers of 129 burgage tenements within the ancient bor. The extension of the limits of the parl. bor. by the Boundary Act has been noticed above. Registered electors, 375 in 1865.

CHIPPING NORTON, a town and par. of England, co. Oxford, hund. Chadlington, 85 m. NW. London by London and North Western railway. Pop. 3,137 in 1861. The town is built partly on low and partly on high ground. It has a large Gothic church, with a low tower; a free school, founded by Edward VI.; a subscription school, for educating and clothing forty girls; and almshouses founded in 1640. It returned two members to the H. of C. in the 30th of Edward I., and the 32nd and 33rd of Edward III. Its bailiffs were empowered by a charter of James I. to decide actions under 40*s.*

About 3 m. from Chipping Norton is the Rowldrich monument, formed of upright stones, arranged in a nearly circular form. This monument is ascribed by Dr. Stukeley, though probably without any good foundation, to the Druids. (See AVEBURY.)

CHISWICK, a par. and village of England, co. Middlesex, Kensington div. of Ossulston hund., on the N. bank of the Thames, 4½ m. from Hyde Park corner by road, and 8½ m. from Waterloo Bridge by London and South Western railway. Pop. of par. 6,505 in 1861. The church, which has been frequently repaired and altered, has several interesting monuments; and in the churchyard is the tomb of Hogarth. There are many fine villas; but the great ornament of the place is Chiswick House, belonging to the Duke of Devonshire. It was built after the model of a villa by Palladio, by the famous Earl of Burlington, and has a choice collection of paintings. The illustrious statesmen, C. J. Fox and George Canning, breathed their last in this villa.

CHITORE, a city and strong fortress of Hindostan, prov. Rajpootana, and formerly the cap. of the rajahship of Odeypoor, 64 m. ENE. that city. The fortress, situated upon a rock scarped by nature and art to the height of from 80 to 120 ft., is surrounded by a rude wall with semicircular bastions, the circuit of which is said to be 12 m., but which incloses only a narrow, irregular, and disproportionately small area. Its outworks are massive and striking, and its appearance picturesque: its interior contains numerous temples, several palaces, some minarets, one of which is a square tower of white marble, nine stories high, and surmounted by a cupola; and many wells, fountains, and cisterns. All the public buildings are of Hindoo origin, excepting one erected by a son of Aurungzebe. The town, seated below the fortress, is chiefly inhabited by weavers and dealers in grain.

CHITTAGONG (*Chaturgrama*), a dist. of India beyond the Ganges and Brahmaputra, but included in the prov. of Bengal, of which it forms the SE. extremity, lying chiefly between lat. 21° and 23° N., and long. 91° 30′ and 93° E., having N. Tipperah, E. the country of the indep. Khyens, S. Arracan, and W. the Bay of Bengal. Length, N. to S., about 165 m.; breadth uncertain. Pop. estimated at 790,000. The islands of Hattia, Sundeep, and Bameeny, with Mascal and others contiguous to its shores, are under its jurisdiction. Its coast, S. of the mouth of the Karnaphuli or Chittagong river, abounds with openings and harbours; but unfortunately none of them are available for ships of any size, their mouths being choked up with sandbanks and shoals. Surface along the coast low and flat; the interior is hilly; and the E. frontier is formed by the same extensive mountain chain which bounds Sylhet, Tipperah, and Arracan, to the E., and which in this portion of its extent varies from 2,000 to 5,600 ft. in height. In this region many streams arise which disembogue on the Chittagong coast. Climate in many respects similar to that of Bengal; but the rains set in earlier, and last longer: in the hill region the crops often suffer from the inundations of the mountain torrents, as they do on the

coast from invasions of the sea. Chittagong is in many parts particularly healthy, and is, therefore, often frequented by Europeans from Bengal. Many of the valleys and plains possess so fertile a soil that very little labour insures redundant crops. Much of the country is overgrown with jungle, and the whole of the mountain chain is covered with lofty forests. The hilly region, when cleared, is believed to be well adapted for the culture of coffee, pepper, and spices. The low hills are interspersed with many hamlets inhabited by Mughs, who emigrated thither after the conquest of Arracan by the Birmese in 1783, in the neighbourhood of which, on small plots of cleared land, they raise plantains, ginger, betel-leaf, the sugar-cane, cotton, indigo, tobacco, and capsicum. The hills in the N. are inhabited by Tripurah, Joomca, and other tribes, apparently without any dependence on particular chiefs; who cultivate cotton and rice, and rear hogs, goats, and poultry, which they exchange with the Bengalese for salt, iron, earthenware, and fish.

Notwithstanding the fertility of its soil, Chittagong is, upon the whole, but thinly inhabited: towards the end of last century it was estimated that there was twice as much unproductive hilly country as cultivated arable land. Landed property is mostly divided into very small portions, among numerous proprietors. The waste lands, when cleared, become liable to assessment under the decennial land settlement. Except on the sea-coast, towns and villages are very scarce. The Mughs or Arracanese inhabit either temporary hamlets, which they change together with the spots they cultivate, or else permanent dwellings about 40 ft. long by 20 broad, elevated on posts several feet from the ground, after the fashion of some Ultra-Gangetic nations, ascended by a ladder or notched stick, and much more comfortable in their interior than the huts of the Bengalese peasantry. The male Mugh pop. have adopted the dress and habits of Bengal, while the females retain those of Arracan and Ava: all are Buddhists. The Mohammedans in this dist. are to the Hindoos as 3 to 2; but are extremely tolerant, and have adopted many Hindoo habits and customs. The chief exports of Chittagong are timber, planks, canvass, coarse cloths, stockings, umbrellas, &c.; on the sea coast salt, which is a government monopoly, is extensively manufactured. Coal is believed to exist, but no mines have yet been worked. The elephants of Chittagong have been celebrated both for size and excellence. They are admirably adapted for the camp and the chase, and hunting them still forms a chief occupation of some of the forest inhabitants. Many were formerly caught and exported, yielding a considerable profit to the sovereign; the trade in them is now farmed by the government to a contractor.

Chittagong probably once formed part of the extensive kingdom of Tripurah. In the sixteenth century it was successively possessed by the Affghan kings of Bengal and the Arracan rajah; in 1760 it was finally ceded by its nabob to the British.

CHITTELDROOG (*Sitala durga*, the spotted castle), an inland town and fortress of Hindostan, prov. and dom. of Mysore, but occupied by a British garrison; cap. of a dist., on a cluster of rocks at the extremity of a ridge of hills, 110 m. NNE. Seringapatam, 280 m. WNW. Madras; lat. 14° 4′ N., long. 76° 30′ E. The town, which stretches along the base of the droog or fortress at the NE., is surrounded by dilapidated ramparts of granite with round towers at intervals, a spacious ditch excavated from the rock, and a wide-spread glacis: it is neither very large nor populous, but its principal street is remarkably spacious. The fort, enclosed by the town, is probably the most elaborate specimen of a defended rock to be found in S. India; an endless labyrinth of walls of solid masonry winds irregularly up to the summit, guarding every accessible point, and forming enclosure within enclosure; the more exposed points are crowned with batteries, and the ascent is partly by steps, and partly by superficial notches cut in the rock, and scaled with great difficulty. Such is the intricacy of the works, that an enemy might be master of the outer walls and yet not materially advanced towards the reduction of the fort. The lower enclosure contains the former poligar's palace, now occupied by the British commandant, other ancient structures, the officers' bungalows, and a reservoir of good water which supplies all the town: in the other enclosures there are two other tanks, various Hindoo temples, a deep magazine sunk in the rock, and a depôt for ghee. At a short distance W. of Chitteldroog is a curious suite of subterranean chambers, apparently the former habitations of devotee worshippers of Siva. This station is noted above all others in India for the great variety and excellence of its fruits.

CHIUSA, an inl. town of N. Italy, prov. Coni, cap. mand., on the Pesio, 7 m. SE. Coni. Pop. 6,314 in 1861. The inhabitants are chiefly occupied in the manufacture of silk goods and mirrors, and vine cultivation. The town is well built. A continuation of the ancient Emilian way passes through its vicinity.

CHIVASSO, an inl. town of N. Italy, prov. Turin, cap. Mand., on the Po, in a fertile plain, 13 m.NE. Turin. Pop. 8,734 in 1861. The town was formerly one of the strongest places in Piedmont, but is now surrounded by only a simple wall with two gates leading to two suburbs. It has a square, a church, and several convents, and some trade in corn and cattle.

CHOLET, or CHOLLET, a town of France, dép. Maine-et-Loire, cap. cant., on the Maine, 12 m. SSE. Beaupreau, on the railway from Paris to Nantes. Pop. 12,753 in 1861. The town is finely situated, and had formerly several religious houses and a superb castle, destroyed during the revolution. Extensive manufactures of cottons were established here and in the neighbouring communes during the last century; but the town having been the theatre of a battle, in 1793, between the Vendéans and the republicans, the manufactures were all but destroyed, and the workmen either put to death or dispersed. In 1795, however, after the first pacification of Vendée, the expatriated manufacturers returned to Cholet; and, instead of being dispirited by their disasters, entered with fresh vigour on a new career of industry, and have succeeded in carrying the manufactures of the town and its vicinity to a higher pitch of prosperity than ever. At present there are establishments for the spinning of cotton and wool, with extensive bleach-fields and dye-works. A great variety of cotton, linen, and other goods are produced in the town.

CHOLULA, an inl. town of Mexico, state of La Puebla, in a fertile plain S. of the Cordillera of the Malinche, 8 m. WNW. Puebla, and 64 m. SE. Mexico; lat. 19° 2′ 6″ N., long. 98° 13′ 15″ W. Pop., when visited by Humboldt, 16,000; but it has fallen off in the interval. It was compared by Cortez, in the early part of the 16th century, with the most populous cities of Spain; but it declined with the rise of Puebla. It still, however, covers a large space of ground, and the size of its great square indicates its past importance. It contains many churches, and regular and broad streets; the houses are mostly of one story, and flat roofed.

There are some manufactures of cotton cloth. The principal extant relic of its ancient grandeur is a huge pyramid, or *teocalli*, to the E. of the town, now covered with prickly-pear, cypress, and other evergreen shrubs, and looking at a distance like a natural conical-shaped hill. As it is approached, however, it is seen to consist of four distinct pyramidical stories, the whole built with alternate layers of clay and sun-dried bricks, and crowned with a small church. According to Humboldt, each side of its base measures 439 metres (1,440 ft.), being almost double the base of the great pyramid of Cheops (which stands on an area equal to that of Lincoln's Inn Fields); its height, however, is only 50 metres (164 ft.). It appears to have been constructed exactly in the direction of the four cardinal points. The ascent to the platform on the summit is by a flight of 120 steps. This elevated area comprises 4,200 sq. metres (5,023 sq. yds.). The chapel erected on it is in the shape of a cross, about 90 ft. in length, with two towers and a dome. It was dedicated to the Virgin by the Spaniards, and has succeeded to a temple of Quetzalcoatl, the god of the air. This pyramidal pile is, however, conjectured to have served for a cemetery, as well as for the purposes of religion; and Humboldt and other authorities regard it as bearing a remarkable analogy to the temple of Belus, and other ancient structures of the Oriental world. The Indians believe it to be hollow, and have a tradition that during the abode of Cortez at Cholula a number of armed warriors were concealed within it, who were to have fallen suddenly upon the Spanish army. At all events, it is certain that Cortez, having some suspicion or information of such a plot, unexpectedly assaulted the citizens of Cholula, 6,000 of whom were killed. In making the present road from Puebla to Mexico, the first story of this pyramid was cut through, and a square stone chamber discovered, destitute of an outlet, supported by beams of cypress, and built in a remarkable way, every succeeding course of bricks passing beyond the lower, in a manner similar to some rude substitutes for the arch met with in certain Egyptian edifices. In this chamber, two skeletons, some idols in basalt, and some curiously varnished and painted vases, were found. There are some other detached masses of clay and unburnt brick in the immediate vicinity, in one of which, apparently an ancient fortress, many human bones, earthenware, and weapons of the ancient Mexicans, have been found. The view from the great pyramid, embracing the Cordillera, the volcanoes of La Puebla, and the cultivated plain beneath, is both extensive and magnificent. Cholula is surrounded by corn fields, aloe plantations, and neatly cultivated gardens. (Humboldt, Researches, i. 88, Eng. Trans.; Bullock; Six Months in Mexico, pp. 114–116; Ward, Antiq. of Mexico.)

CHOOROO, an inl. town of Hindostan, prov. Rajpootana, in a naked tract of sand hills, 100 m. ENE. Bicanere; lat. 28° 12′ N., long. 74° 35′ E. It is 1½ m. in circ., exclusive of its suburbs, and has a very handsome external appearance. The houses are all terraced, and, as well as the walls of the town, are built of a kind of limestone found in vast quantities in this part of the prov., of a very pure white, but soft, and apt to crumble. In 1817 Chooroo was plundered by one of Meer Khan's sirdars; in 1818 it was visited by a British detachment, and afterwards transferred to the rajah of Bicanere: its chief, however, is rather a dependent than a subject of that prince.

CHORLEY, a par. and market to. of England, co. Lancashire, hund. Leyland, on the Chor, 20 m. NW. Manchester, 8 m. N. Wigan, and 175 m. NWN. London, by London and North Western railway. Pop. 15,013 in 1861. This thriving town, which takes its name from the stream near the source of which it is situated, stands on a rising ground about a mile above the confluence of the Chor and Yarrow. It is well built; streets broad, lighted with gas, and abundantly supplied with water from a reservoir, into which the stream is thrown up by steam machinery. The par. church of St. Laurence is an ancient structure in the Norman style; that of St. George, a handsome edifice, was built by the parl. commissioners in 1835, at an expense of 13,700*l*. The Independents, Unitarians, Methodists, and R. Catholics have places of worship, to some of which Sunday-schools are attached. A free grammar school was founded in 1634, and a national school in 1824. The town is governed by a constable chosen annually at a court leet. The increase of population—from 4,516 in 1801—is a consequence of the still more rapid increase of the cotton trade. As early as 1790, spinning-mills began to be erected in the town. Exclusive of yarn, the fabrics principally produced are muslins, jackonets, and fancy goods. Bleach-greens and print-works are established on the banks of the neighbouring streams. The coal mines in the neighbourhood have contributed greatly to the improvement of the town; there are also valuable quarries of slate, and gritstone for mills, with lead and iron mines. The Liverpool and Leeds canal, which passes within half a mile of the town, and is joined by that from Lancaster and Preston at a short distance from it, affords great facilities for conveying the produce of the factories and mines throughout all the N. counties. Markets are held on Tuesday; fairs on 26th March and 5th May for horned cattle; 21st October for horses; and 4th, 5th, and 6th Sept. for woollens and general purposes.

CHOWBENT, or ATHERTON, a township of England, co. Lancashire, hund. W. Derby, par. Leigh, 10 m. WNW. Manchester, and 6 m. ESE. Wigan. Pop. 5,907 in 1861. This is a thriving place. Previously to the American war, the making of nails was extensively carried on here; and, though the manufacture has declined, considerable quantities are still made for exportation. It is also remarkable for several inventions and improvements in cotton machinery; and it is said that the value of the application of heat in the production of some kinds of cotton fabrics was discovered here. The Bolton and Leigh railway passes within a short distance of the town. Fairs, at which premiums for the best cattle are given, take place on the first Saturday in May, and the last Saturday in October.

CHRISTCHURCH, a parl. bor. and par. of England, co. Hants, New Forest, W. div., hund. Christchurch, 99 m. SW. London by London and South Western railway. Pop. of parl. bor. 9,368, and of par. 7,042, in 1861. It is situated at the confluence of the Avon and Stour, about 1 m. from where their united streams fall into Christchurch Bay, 90 m. SW. London. The town presents no symptoms of activity or industry. No trade nor manufacture is carried on. The church was the collegiate one of the ancient priory, and is a large, fine structure; the older part in the Norman, the rest in the earlier and later pointed styles: the fine tower is of the fifteenth century. It has a very ancient and curiously carved altar, and many beautiful chapels. There are also two episcopal chapels (one of them built by parliamentary grant in 1823, with 462 free sittings), a Roman Catholic chapel, a dissenting ditto, a free school of uncertain foundation, educating ten boys, a national and a Lancastrian school, and several small cha-

rities. Market on Mondays: fairs, Trinity Thursday, and Oct. 17, for horses and cattle. It returned two members to the H. of C. in 35th Edw. I. and in the 2nd Edw. II. No other return appears till the 13th of Eliz.; since which period it regularly returned two members, till the Reform Act deprived it of one of them. The franchise, previously to this act, was vested in the corporation, which consisted of a mayor and an unlimited number of burgesses. The Boundary Act very materially extended the limits of the parl. bor. Registered electors, 351 in 1861. The harbour has a shifting bar, with not more than 5 or 6 ft. water over it, so that it is accessible only at spring tides for the smaller class of coasters. There are several breweries in the town; and the manufacture of watch springs employs a few hands. The name is derived from its ancient priory, of very remote origin. There are traces of many ancient camps and barrows in its vicinity.

CHRISTIANIA, a sea-port town of Norway, of which it is the cap., on the Agger, at the bottom of a very deep gulf or fiord, to which it gives name; 162 m. ESE. Bergen, 242 m. S. by E. Drontheim, and 255 m. W. by N. Stockholm. Pop. 44,212 in 1860. The town is surrounded by an amphitheatre of hills, and its situation is extremely picturesque. It is well laid out; streets spacious and regular, and some of them even handsome. Houses in the town all brick or stone; those of wood having been prohibited, on account of the former frequency of fires. They are airy and well built, though seldom more than two stories high. In the best quarters they are built round an open square court, and are generally occupied by several families. It is the residence of the viceroy, and the seat of the diet; has a cathedral, and three other churches; a military and a lunatic hospital, two orphan asylums, a house of correction, a new town hall and exchange, and two theatres; but none of the public buildings in any wise remarkable. Four suburbs part from the town as a centre, one of which is the old town of Opslo, from which Christiania originated. In these, wooden houses are not prohibited; and, as the suburbs are mostly inhabited by the lower classes, the dwellings are chiefly of wood. A short distance beyond the walls is the royal palace, a plain brick building of modern construction. The whole vicinity of the town is sprinkled with the country houses of citizens. The gulf of Christiania unites with the farthest N. point of the Skagerac: though in parts narrow, and difficult of navigation, it has deep water throughout, there being 6 or 7 fathoms close to the quay. Christiania is the seat of the higher courts of law, and a university. The latter is attended by about 600 students, and has attached to it a public library, with 115,000 volumes, collections of natural history and mineralogy, a museum of northern antiquities, an observatory, and a botanic garden. Here is a military school, with schools of commerce and design, elementary schools, and several learned and philanthropic societies. Manufactures not very extensive; the chief are those of woollens, tobacco, glass, hardware, soap, leather, and cordage. Principal exports, timber, deals, glass, iron and nails, smaltz, bones, oak-bark, and salted and pickled fish, a staple mostly sent to Bergen. The deals of Christiania have always been held in the highest estimation, in consequence of the sap being carefully cut away. Christiania was built by Christian IV., king of Denmark, in 1624.

CHRISTIANSAND, a sea-port and fortified town of Norway, near its S. extremity, cap. diocese of same name, dist. Mandahl, on the Skagerac, at the head of a deep fiord, 160 m. SW. Christiania. Pop. 10,536 in 1860. The town is regularly laid out; streets long and wide, houses generally built of wood, and separated by gardens. Chief public building the cathedral, a Gothic structure, and, next to that of Drontheim, the finest ecclesiastical edifice in Norway. Here is an asylum for the poor, a sail-cloth manufactory, and docks for the construction of vessels, ship building being the principal branch of industry. The harbour is very secure, and sheltered on nearly every side by lofty and rocky heights. It is well supplied with fish; and lobsters are taken in great numbers, and exported to the London markets. Timber is another principal article of export. Christiansand ranks as the fourth town in Norway; it is a bishopric, and the residence of a governor. It was founded in 1641 by Christian IV., king of Denmark, who intended to make it the principal naval port of his dominions.

CHRISTOPHER'S (ST.), or ST. KITT'S, one of the W. India islands belonging to Great Britain, lying about lat. 17° 20′ N., and long. 62° 40′ W., and about 50 m. W. by N. Antigua, of the government of which island it constitutes a part. Length, NW. to SE., about 15 m.; breadth in general about 4 m., but no more than 3 m. towards its SE. extremity, where it is divided by only a narrow channel from the island of Nevis. Total area 103 sq. m.; pop. 23,177 in 1851, and 24,440 in 1861. The island contains many rugged precipices and barren mountains, the principal of which, Mount Misery, an extinct volcano, rises to 3,711 ft. above the sea. The climate is healthy, but violent hurricanes sometimes occur. Of 43,720 acres of land, the extent of the surface of the island, it is estimated that nearly half is unfit for culture. The soil of the plains, however, which is of a volcanic origin, intermixed with a fine loam, makes amends by its fertility for the barrenness of the mountains. Sugar is the great article of cultivation, the only articles raised in addition to it being a little cotton, coffee, and arrow-root. The value of the principal articles of produce imported into the U. Kingdom from St. Christopher's amounted to 68,328*l.* in 1850; to 134,328*l.* in 1855; to 166,639*l.* in 1860; and to 148,929 in 1863. The exports from the U. Kingdom to St. Christopher's were of the value of 92,419*l.* in 1850; of 96,098*l.* in 1855; of 158,034*l.* in 1860; and of 151,885*l.* in 1863. The island is divided into nine parishes, and contains four towns, Basseterre, Sandy Point, Old Road, and Deep Bay. The first two are ports of entry established by law. Basseterre, in the SW., is the cap. It contains about 800 houses, and, as well as Sandy Point and some other parts of the island, is defended by several batteries. St. Christopher's was discovered, in 1493, by Columbus, who gave it the name it bears; but it was not settled till 1623, when a party of English took possession of it. After many disputes for its occupation with the French and Spaniards, it was finally ceded to Great Britain at the peace of Utrecht in 1713.

CHUDLEIGH, a town and par. of England, co. Devon, hund. Exminster. Area of par., 6,230 acres. Pop. of ditto, 2,108 in 1861. The town, on an acclivity near the Teign, 8 m. S. by W. Exeter, consists chiefly of one wide street of well-built houses, being part of the main line of road from Exeter to Plymouth. The church is an old structure amidst fine trees; the vicarage in the patronage of such of the parishioners as have freeholds to the amount of 5*l.* a year and upwards. There are two dissenting chapels, a grammar school, founded 1668, with a residence for the master, and three exhibitions to the university of Cambridge, a national school, and several charities.

Market on Saturdays. Fairs, Easter Tuesday, third Tuesday and Wednesday in June, and Oct. 2, for cattle and sheep. The serge manufacture was formerly carried on to some extent, but at present there is no manufacture of any kind, and the labouring part of the pop. are chiefly engaged in agriculture. Ugbrook Park, in the immediate neighbourhood (the seat of Lord de Clifford), is considered one of the finest in the kingdom.*

CHUMBUL (supposed to be the *Sambus* of Arrian), a river of Hindostan, which rises in Malwah prov., and falls into the Jumna river, about 25 m. below Etaweh, after a course of about 500 m., generally in a NE. direction.

CHUMPANEER, a town and large district of Hindostan, prov. Gujerat: the former, called also Powanghur, stands on a scarped rock 25 m. NE. Baroda, and is supposed to have been the cap. of a Hindoo principality, before the Mohammedan rule in India. The remains of an ancient city stretch for several miles on either side of it. This town was taken by Humayoon in 1534, and by the British in 1803.

CHUPRAH, a town of Hindostan, prov. Bahar, distr. Sarun, of which it is the cap., on the N. side of the Ganges, along which it extends for nearly a mile; 33 m. W. by N. Patna. Pop about 30,000. It has some trade in cotton and sugar.

CHUQUISACA (formerly *La Plata* or *Charcas*), an inland city of S. America, cap. Bolivia, in a small plain surrounded by heights, on the N. bank of the Cachimayo, and on the high road between Potosi and Santa Cruz de la Sierra, 55 m. ENE. the former, and 220 m. SW. the latter; lat. 19° 29′ S., long. 66° 40′ W. Estimated pop. 10,000, pretty equally divided amongst Spaniards, Indians, and mixed races. The city contains a large and handsome cathedral, with some good paintings and decorations, several monastic establishments with splendid churches, a conventual hospital, three nunneries, and a university. The best houses are but one story in height, but roomy, and have pleasant gardens: it is supplied with water from several public fountains. The climate is mild; but the rains are of long continuance, and during the winter violent tempests are not unfrequent. Chuquisaca was founded in 1539, made a bishopric in 1551, the seat of a royal *audiencia* in 1559, and an archbishopric in 1608.

CIEZA, or ZIEZA (an. *Catina*, or *Cartela*), a town of Spain, prov. Murcia, on the Segura, in a rich well-cultivated plain, 24 m. NW. cap. Pop. 9,516 in 1857. The town has convents for both sexes, a workhouse, public granary, &c.; with manufactures of coarse linens. On the opposite side of the river are ruins supposed by some to be those of the ancient *Carteja*.

CINCINNATI, a city of the U. S. of America, Ohio, cap. co. Hamilton, and, next to New Orleans, the largest and most flourishing commercial town in the W. part of the Union, on the N. bank of the Ohio, about 410 m. W. by N. Washington. Pop. 24,831 in 1830; 46,338 in 1840; 115,436 in 1850; and 161,044 in 1860. The town is built on two inclined plateaux rising from the river, one about 50 ft. higher than the other, and both running parallel to the Ohio. It is regularly laid out; streets wide and clean, and intersecting each other mostly at right angles. They are generally lined with trees on either side, and most of the houses have a small enclosure in front filled with flowering shrubs. Houses mostly of red and particoloured brick; but many are stuccoed, and a few are of stone. A square in the centre of the city is appropriated to public buildings. Here, and in other parts of the town, are numerous churches: the city has also the Cincinnati college, 2 theatres, 4 market-houses, one 500 ft. in length, a court-house, medical college, mechanics' institute, Catholic athenæum, 2 museums, a lunatic asylum, with hospitals, and numerous schools. Manufactures extensive and increasing: the principal are those of iron; next in importance are cabinet work, steam-boat building, and hat-making; the manufacture of cotton and woollen stuffs, and extensive distilleries and flour-mills. Cincinnati is the largest pork-market in the Union. Two-thirds of all the hogs fed in the forests of Ohio, Kentucky, and W. Virginia, are driven here for slaughter and exportation. The buildings for this branch of trade are very extensive, and occupy many acres.

The Ohio is 600 yards wide at Cincinnati, and navigable for small steam-vessels as far as Pittsburgh, 464 m. higher. Lane Seminary, founded in 1829, chiefly for theology, and situated about 2 m. from the city, has 2 commodious edifices, and contains 100 rooms for students. It possesses a library of 10,000 volumes. One of the museums contains a number of enormous organic remains and antique vases, excavated from some of the ancient mounds in Ohio. There are a great many religious and benevolent associations, several academies, a public library, and some excellent hotels. The pop. is composed of emigrants from all the states of America and most of the countries in Europe. There are said to be no less than 30,000 German settlers.

The advance made by Cincinnati has been wonderfully rapid. It was founded in 1789, and in 1800 the population was only 500; in 1810, it was 2,500; in 1815, about 6,500; in 1820, 9,600; and in 1860 it amounted, as already seen, to 161,044. Its picturesque situation, and the beauty of its environs and of the surrounding scenery, have gained for it the title of 'Queen of the West;' while its central position, the abundance of its railway communication, and its rapid increase in population and commerce, make it probable that it will speedily rival in wealth and importance the principal cities of the United States.

CINTRA (*Mons Cynthiæ*), a town of Portugal, 12 m. WNW. Lisbon. Pop. 4,460 in 1858. This Richmond of the Portuguese capital is situated at the head of the rich and beautiful valley of the Collaris, and at the foot of a rugged rock or mountain. The latter 'is in part covered with scanty herbage; in parts it rises into conical hills, formed of immense stones, and piled so strangely that all the machinery of deluges and volcanos must fail to satisfy the inquirer for their origin. On one of the mountain eminences stands the Penha convent, visible from the hills near Lisbon; on another are the ruins of a Moorish castle. From this elevation the eye stretches over a bare and melancholy country, to Lisbon on the one side, and on the other to the distant convent of Mafra, the Atlantic bounding the greater part of the prospect.' (Southey's Letters, ii. 202.) In summer, the citizens of Lisbon resort on the Saturday nights to Cintra, where they spend the Sundays, returning home on Monday. Many of the nobility and the wealthier merchants, especially the English, have villas in the vicinity of the town, which is as much celebrated for its fine air as for the beauty of its situation. It has also a palace, occasionally occupied by the court: in one of its apartments are painted the armorial bearings of all the noble families of Portugal.

The convention agreed to in 1808, after the battle of Vimiera, a memorable incident in the war with Napoleon, by which the French forces under Junot, with their arms and artillery, were

conveyed to France, is usually described as the Convention of Cintra.

CIOTAT (LA), a sea-port town of France, dép. Bouches du Rhône, cap. cant., on the W. side of the Bay of Leques, 15 m. SE. Marseilles, on the railway from Marseilles to Toulon. Pop. 8,444 in 1861. The town is surrounded by an ancient rampart of considerable extent, and in a tolerably perfect condition. Streets regular, and well paved; houses well built. It possesses some good quays, a large par. church built in the 16th century, and a fine public promenade, but is ill-supplied with water. Its port, sheltered by a mole and defended by a fort, is commodious, secure, and accessible to vessels of 300 tons burden. A lighthouse, in the fort, has the lantern elevated 82 ft. above the level of the sea. Ships are built, and oil is manufactured here; and it has a considerable trade in wines and dried fruits, the vicinity being interspersed with vineyards, olive grounds, and plantations of oranges and figs. La Ciotat is said to occupy the site of the ancient *Citharista;* the modern town was, however, founded in the 13th century, and did not acquire municipal rights till 1429.

CIRCARS (NORTHERN), a large marit. prov. of Hindostan, extending along its E. coast for 470 m., between lat. 16° and 20° N., and long. 79° and 85° E.; having N. and W. Orissa, Gundwanah, and Hyderabad, and S. and E. the Carnatic and the Bay of Bengal. It comprises portions of the ancient territories of Orissa and Telingana, and, previously to the British rule, consisted of five divisions or 'circars,' viz. Guntoor, Condapilly, Ellore, Rajamundry, and Cicacole. At present it is wholly included within the territories of the Madras presidency. Area 28,760 sq. m.; pop. estimated at 3,000,000. The territory is bounded W. by a chain of mountains continuous with the E. Ghauts, but no where of any great height. Vizagapatam, between lat. 17° and 19° N., is the most mountainous district, and contains a considerable range of hills, running parallel to the former and to the coast, often closely approaching the latter, and enclosing an extensive and fertile valley, together with the principal range. From Ganjam to Coringa, the coast generally appears mountainous, but thence is low, flat, and sandy, with numerous small coast streams. Chief rivers, the Godavery and Krishna; the first has an extensive and fertile delta at its mouth below Rajamundry. The Chilka lake constitutes the N. limit of the prov.; the only other lake of note is that of Colair in the Masulipatam distr.; but several lagunes of some size are met with on the shores. A black soil prevails in the S. parts of the prov. highly suitable to the cultivation of cotton. S. of the Godavery the climate is extremely hot, and for a month preceding the rains, the thermometer in the country round the mouth of the Krishna sometimes stands for a whole week at 110° Fahr.; in other parts it has been known to stand at 112° at 8 o'clock in the evening, and at midnight as high as 108°. At such times, wood of all kinds readily warps, and glass cracks and flies in pieces; in all the hilly regions and round Masulipatam, a very noxious state of the air prevails throughout the different seasons of vegetation.

The circars are extremely productive of grain, and have long been the granary of Madras during the NE. monsoon, though at present the distr. of Masulipatam annually imports large quantities of rice from Calcutta and Aracan for home consumption. Large crops of paddy and dry grains, cotton, and tobacco of excellent quality, the sugar-cane, and esculent vegetables, are produced in the S.; the same articles, with ginger, yams, turmeric, chilies, &c., in the central parts; a great deal of sugar in the delta of the Godavery; and wheat, maize, the sugar-cane, and an abundance of rice and other grains in the N.

Agriculture is least advanced in Vizagapatam, owing chiefly to an oppressive revenue assessment: many of its hills are wild, and destitute of vegetation. In Masulipatam distr. there are extensive tracts of grass. The total number of black cattle in the circars is about 1,380,000, of sheep 509,000. The Ganjam distr. is interspersed with numerous bamboo jungles. The forests of Rajamundry abound with teak, which tree is found no where else on the E. side of Hindostan. The chief manufactures are chintzes, carpets, and cotton stuffs, in the central; and indigo, punjum cloths, muslins, and silks, in the N. distr.: the piece goods of the circars, which were formerly their staple, are now rather objects of curiosity than made in any considerable quantity. Rum was formerly distilled in the N.; the sugar of Ganjam is in much request, and exported in large quantities: the other exports are wax, salt, pepper, horns, ivory, indigo, tobacco, and other agricultural produce. The external trade is chiefly with Madras, Calcutta, Hyderabad, and the central Deccan. The exports to Europe are chiefly fine cotton goods: all the raw silk used is imported. The natives are mostly Hindoos; Mohammedans are few. The Orissa and Telinga races have become much intermixed, though they still retain distinct dialects, and have distinct traits and customs. The villages consist of mud huts and houses; but the peasantry are not on the whole incommodiously lodged. The roads are amongst the worst in India, and unfit for wheeled carriages; there are but few tanks, bridges, or ferry-boats. The lands appear for a long period past to have belonged either to the government or to zemindars; for no instance has occurred since the British have come into possession of the prov. of any ryot claiming those cultivated by him. The chief towns of the circars are,—Chicacole, Ellore, Coringa, &c., besides those which bear the names of the several districts. Religious temples are not numerous; but in Ganjam, where Juggernaut is the favourite object of worship, their architecture is peculiar; they consist of groups of low buildings, each with a graduated pyramidical roof, terminating in an ornamented conical cupola. In 1571, the rajah of Hyderabad conquered this prov., which, together with Hyderabad, fell under the dom. of Aurungzebe, in 1687: it however became again independent of the Mogul empire in 1724. The English obtained the four most N. circars in 1765; the French had become possessed of Guntoor in 1752; but it also came into British possession in 1788.

CIRCASSIA, more properly TCHERKESSIA, or TCHERKESKAIA, the largest and most important country in the Caucasus, of which mountain-range it occupies nearly the whole N. slope; extending from 42° 30′ to 45° 40′ N. lat., and from 37° to 45° 48′ E. long. At its NW. corner it reaches the Black Sea, but, with this exception, it is bounded on the S. and W. by the main ridge of the mountains which divide it from Georgia, Mingrelia, Imeritia, and Great Abchasia. The N. limit is formed by the rivers Kuban and Terek, which separate it from the lowlands of the Cossacks, Turkmans, Nogay Tartars, and the Russian colonies in the Caucasian steppe; towards the E. it terminates at the junction of the little river Sunsha with the Terek, at which point a host of small streams divide it from the country of the Tchetchentzes. In extreme length, from NW. to SE., Circassia is about 470 m.; in its greatest

width, about 100 m.; in its least, about 40 m., and, at an average, about 70 m. Its area may therefore be calculated at about 33,000 sq. m. Estimated pop. between 3,000,000 and 4,000,000. (Guldenstadt, Reise durch Russland, i. 466–469; Pallas's Trav. in S. Russia, i. 298, 390–392, 395, 422, &c.; Klaproth's Trav. in Caucasus and Georgia, pp. 252, 311, &c.; Lapié, Annales des Voy., xii. 36.)

Political Divisions.—The Circassians are divided into a great number of tribes, who lead a partially wandering life, so that no very precise arrangement can be made with regard to the districts of their country. The E. portion, or that enclosed by the Terek, is divided by Russian geographers into two provinces—*Great Kabardah*, to the SW., and *Little Kabardah*, to the NE. These divisions are not, however, recognised by the Circassians, who know but of one Kabardah, and that in the SW. portion, called by the Russians *Great*. (Klaproth, p. 354.) Between the sources of the Kuban and Terek, and along the courses of those rivers, as far as they run N., the land is wholly occupied by a tribe called the *Abbasines* or *Absne*; and forms the *Little Abasa* of Pallas, the *Altikesek Abchasia* of Guldenstadt. The *Great Abasa* of Pallas, *Basiana* of Guldenstadt, occupies likewise a very considerable part of the Kubanian Circassia; among the rest, the Nottakhaitzi district, mentioned by Spencer. It appears, indeed, that the Absne are the lawful proprietors of all Kubanian Circassia, and that the Circassians have only the right of conquest to the W. portion of their country; that right is, however, very fully established, not only on the N. slopes of the mountains, but even to a very great degree on the W. side, along the shores of the Black Sea (the *Great Abchasia* of Guldenstadt). Spencer makes but little distinction between the Absne and Circassians, and frequently speaks of them as one people: this must, however, be an error, since the former display a very peculiar physical conformation, and their language, with the exception of a few Circassian words, is totally unlike that of their conquerors, and of every other known people, European or Asiatic. The Circassian princes are cruel and oppressive tyrants to their Abassian subjects, so much so, that the latter have in many instances sought the protection of the Russian government; but it does not appear that they are in any moral attribute superior to their taskmasters, since in every age they have been infamous for their robberies by land, their piracies by sea, and their reckless cruelties everywhere. (Guldenstadt, i. 460, 463, 466, 469; Pallas, i. 383–391; Klaproth, pp. 247–263, 283, 311; Spencer's Circassia, ii. 412, &c.; W. Caucasus, i. 20, 200, 212, 247, &c.)

Physical Features.—These have been generally described in the article CAUCASUS (which see), and what is peculiar to Circassia is only the consequence of that country's occupying the N. slope of the mountains. With the exception of the lowlands on the banks of the Kuban and Terek, the whole territory is broken into precipitous mountains, small table-lands, and valleys of the most picturesque and romantic description. Its hydrography belongs to two systems, the waters of Kabardah being all conveyed by the Terek to the Caspian, and those of W. Circassia by the Kuban to the Black Sea. The former river rises near the Kazibeck, and, forcing its way through the pass of Dariel (an. Caucasian Gate), receives, directly or indirectly, thirty-five streams before it quits the Circassian country. Of these, the Malk, which joins it at its E. bend, is scarcely inferior in size to the principal river. It rises near the E. bases

The Kuban rises on the N. base of the Elbours, not far from the sources of the Malk, and receives the water of more than fifty rivers, thirty of which fall directly into its bed. It has every reason to be considered, exclusively, a Circassian river; for though no part of its N. bank be inhabited by Circassians, it does not receive a single drop of water, in its whole course, that does not rise within their territory. A similar remark will apply, in a modified sense, to the Terek, which, like the Kuban, does not receive a single stream from the N., and only one of consequence after entering the Tartar country E. of Little Kabardah. The country between the sources of the Malk and Kuban is watered by various streams; and when it is recollected that, in addition to these, innumerable torrents pour from the upper ranges of the mountains, it will be evident that no land can be better irrigated. The water is in general clear and good, but occasionally impregnated with mineral and other extraneous matters. The tributary streams become flooded in winter, and extremely shallow during the heats of summer; the currents of all are extremely rapid, as are those also of the Terek and Kuban, except where the latter forms morasses, which it does in some parts of the flat country, when its course becomes sluggish, and its water thick and muddy. (Guldenstadt, i. 469, and map; Klaproth, pp. 242—247, 255, 259, 261, 351, &c.; Pallas, i. 385–389, 413–417; Spencer's W. Caucasus, i. 106; Circassia, ii. 412, *et passim.*)

Climate, Soil, and Natural Productions.—These are also the same with those of the Caucasus generally (see CAUCASUS), but the temperature is rather lower than on the S. slopes, except on the banks of the Kuban, where the greater depression more than compensates for the difference of aspect, and where the extensive marshes and the exuberant vegetation create miasma, which render it more pestilential than any other district in the whole region. (Spencer's W. Cauc., i. 106; Circassia, ii. 304.) There is a greater proportion of bare rock in Circassia than in Georgia and the other countries S. of the main ridge, but on every shelf and in every rift, trees, grain, vegetables, and fruit of almost every kind, are produced from most fertile soil. The animals, also, are on the same scale of abundance and variety, whether the wild or domesticated tribes be considered; the quadrupeds, birds, fishes, insects, or reptiles. (See CAUCASUS.) The Circassian horses are nearly as famous and quite as good as those of Arabia. Cattle of all kinds are abundant in the extreme, and in addition to the herds forming the numerous stocks of the pastoral population, the aurochs and argali (wild ox and sheep) still wander among the mountains, with the ibex, and another beautiful variety of the goat. Game of all kinds, winged, hoofed, or clawed, are found in equal abundance, but differing in kind, in the mountains and plains; nor are beasts of prey, as jackals, wolves, bears, lynxes, and tiger cats, &c., much less numerous, though they do not seem to be much regarded by the natives. Wild boars are found, especially among the swamps of the Kuban, and it is affirmed that the tiger is not wholly unknown. The reptile and insect tribes are equally numerous. In one of the late campaigns of the Russians, besides the thousands who fell victims to the bad air, numbers died *from mortified bites of mosquitoes.* (Spencer's Circassia, ii. 317.) Both natives and Russians believe that the mountains abound in gold and silver, but apparently on no good grounds. (See CAUCASUS.) Iron, however, lead, and copper are found; and saltpetre is very abundant. Salt

the brine pits in the Caucasian steppe, and sealed their ports against the trade of Turkey and Persia, they have been almost totally deprived of that necessary. (Guldenstadt, i. 188, 441, &c.; Pallas, i. 339–380, &c.; Klaproth, pp. 309, 324, 356, *et passim*; Spencer's Circassia, ii. 220, 233, 242, 250, 305, 317; W. Cauc., i. 330–341, &c.)

Inhabitants.—The Circassians have long been proverbial for their beauty of form and figure, especially the women, and though it seems they have in this respect been confounded with the Georgians, who are a totally distinct nation, yet all the statements of the modern, and most accurate travellers, concur in describing them as an extremely handsome people, tall, finely formed, slender in the loins, small in the foot and hand, elegantly featured, with fresh complexions, and extremely intelligent countenances. (Pallas, i. 398; Spencer, *passim*, &c.) It would be well did their moral and intellectual attainments correspond with their physical appearance; but it is obvious, even from the statements of their eulogists, that they are mere semi-barbarians, whose darling occupation is robbery and plunder, and who seem to be radically deficient in most of the requisites necessary to form a civilised and flourishing community. They have many points in common with the Arabs; and, like the sons of Ishmael, are quite as barbarous at the present day as in antiquity.

The Circassians are divided into five classes. 1. *Pschi*, or *pschech* (princes); 2. *Uork* (ancient nobles); 3. the freedmen of these princes and ancient nobles, who, by their manumission, become themselves noble, and are called *uork of uork*; 4. the freedmen of these new nobles, called *begualia*; and 5. the vassals or *teh'kotl*. Between the ancient and recent nobility there is no real distinction, except that, in military service, the latter are still under the command of their former masters; nor is there any great practical difference between the begualia and the teho'kolt, or vassals. The latter are, of course, the labourers; and are subdivided into such as are engaged in agriculture, and such as serve the superior classes in the capacity of menial servants. Of the former, many are wealthy, nor is the state of any, one of great degradation, since there are very few, if any, offices of labour which prince or noble would consider as derogatory to himself. To every princely house belongs a certain number of uork, or *usden*, as they are called by the Russians; and the latter are the direct proprietors of the vassals. Of these last, though all are unquestionably slaves, those engaged in agriculture cannot be sold singly; and the sale of any is so rare as almost to be prohibited by custom. On the other hand, it appears the vassal may transfer his duty to another usden; which is, of course, a great protection from ill usage. The vassals pay no money tax, and though they are compelled to supply their lord with all he wants, yet this, from the check upon the noble's power just alluded to, extends no farther, usually, than to bare necessaries; since, should the latter carry his demands too far, he runs the risk of losing his vassal altogether. The relation between prince and usden is precisely the same as that between usden and vassal; the noble must supply the necessities of his sovereign; but should the exactions of the latter become excessive, the former may transfer his allegiance to another prince. The usden must pay the debts of their prince, and the vassals those of their usden; and, in each case, inferior must make good all losses sustained by his superior, whether from robbery or accident; by which arrangement it is evident that all losses or expenses are defrayed, ultimately, by the vassal. The head of the princely house is the leader in war; and his usden are bound to attend him with all their retainers, or as many as may be required. There is no people, not even the Arabs, among whom pride of birth is carried to a greater height than among the Circassians, especially those of Kabardah. In this district, if an usden were to marry or seduce a princess, he would forfeit his life without mercy; and the same result would attend the attempt of a begualia or vassal to ally himself to a noble house; an Abassian prince is, in this respect, considered equal only to a Circassian usden, and can obtain a Circassian wife only from that class. The rigorous enforcement of this custom has preserved the different ranks very distinct, though Pallas has observed, even in the Kabardahs, some traces which indicate a descent from Tartar mothers. (i. 398.) It must be observed, however, that there does not appear to be any restriction upon a man's taking a wife or concubine from an inferior class; and the issue of such connexions take rank from the father, but are not accounted equal to the descendants of a pure stock from both parents. Thus there are princes of the 1st, 2d, and 3d class, &c., according to the greater or less degree of inferior blood which they inherit from their maternal ancestors. This state of society, closely resembling the feudal institutions of the Gothic ages, seems to imply the division of the Circassians into two distinct people, a conquering and a conquered race; but when or how the present relations were established is involved in obscurity. (Klaproth, p. 314, *et seq.*; Pallas, i. 395, 402; Spencer, *passim*.)

Customs, Habits, and Manners of the Circassians.—The whole of the Circassian and Abchasian tribes live in small villages scattered here and there, without the slightest approach to anything resembling a city or walled town; indeed, the prince or noble has an unconquerable aversion to any castle or place of artificial strength, which he regards as only fitted to restrain his state of wild freedom. He lives, therefore, in the centre of his village, which usually consists of 40 or 50 houses, or rather huts, formed of plaited osiers, plastered within and without, covered with straw or grass, and arranged in a circle, within the area of which the cattle are secured at night. These primitive dwellings, which strongly resemble, in form and appearance, the humbler residences in Arabian towns, have, however, the peculiar recommendation of being unexceptionably clean, which is also the case with the persons, dress, and cookery of the inmates. From the slender nature of the buildings, they are evidently not formed for long endurance, and a Circassian village is, in fact, by no means a fixture. The accumulation of dirt in their neighbourhood, the insecurity of the position, and frequently even the caprice of the inhabitants, cause them to be from time to time abandoned. On such occasions the dwellings are destroyed, the household utensils packed up, and the whole colony migrate in search of a new abode. While stationary, however, there is much comfort in a Circassian's hovel, for those who can dispense with superfluities; but, as may be supposed, their domestic arrangements are of the most simple kind. The usual occupations of the higher classes are the chase and war, on which expeditions, or on those of a predatory kind, they depart with no other provision than a little millet, or wheat, and that without the slightest fear of suffering from want, since every man who possesses and can use a rifle is sure of finding provisions on every hedge. In these expeditions the Circassians carry with them tent covers of felt, but chiefly for the purpose of protecting themselves from sudden storms (see CAUCASUS), as, in fine weather, the hardy moun-

taineer throws himself on the ground, and sleeps with no other covering than the heavens. While in his hut, the Circassian of whatever rank is his own carpenter, weaver, carver, and shepherd. It does not appear, however, that the higher classes often take part in agricultural pursuits, not so much because it is considered derogatory, as from that species of indolence (quite consistent with great occasional exertion) which recoils from regular and continuous labour. The occupations of the women consist in spinning and needle-work. They make the clothes of their household down to the very shoes, and also saddle-cushions, housings, and horse trappings, and sheaths for the warriors' swords and poniards. They frequently excel in embroidery, are skilful dairy-women, and sometimes even noblewomen may be seen taking a part in field labour. As in other half-barbarous societies, the greater portion of labour falls upon the females; but their condition is far superior in Circassia to what it is in most other Eastern countries. As Mohammedanism is little more than a profession among these people, their habits, with the exception of some formal observances with regard to food, have undergone but little change by its introduction. The sexes mix freely together while unmarried, and, under the restriction of caste, love matches are probably as numerous here as in other parts of the world. The husband has, however, to purchase his bride of her father, and neither husband nor wife, from the moment of their union, is permitted to appear in the presence of the parents for a year, or till the birth of the first child. It is a still more remarkable custom, that the husband must never be seen in company with his wife; and though the latter is permitted to receive without restraint the visits of strangers, yet the former is never present on such occasions, and the matrimonial correspondence is always carried on by stealth, and in the utmost secresy.

The greatest insult that can be offered to a prince, or usden, is to inquire after the health of his wife or family. The son of a prince is committed, at the age of three days, to the care of an usden, by whom he is brought up, and never again seen by his father till he is married; the son of an usden remains in the paternal household till he is three or four years old, when he, in like manner, is consigned to the care of a stranger. The foster father stands in every respect in the place of the natural parent. He receives no payment for his trouble, but claims all the duty and service of his ward. The cause of this very remarkable custom is said to be the wish to prevent the effect of indulgence consequent on a home education, in enervating the character; but though it destroys the usual affection subsisting between father and son, it establishes another not less strong between the guardian and his ward, which is usually as intense as any exhibited in the social connections of other countries. The daughters are brought up at home, and at the age of ten or twelve years have their waists enclosed by tight-fitting stays, or a broad band of untanned leather, *which is never removed nor loosened* till they are married. On the wedding night the bridegroom cuts this boddice open with his dagger, an operation which is frequently attended with danger. As a fine waist is considered the great beauty of a Circassian, men are also subjected to a very heavy compression on that part, but nothing to that which the females endure. The girdle remains on the latter for a period varying from two to four years, and is drawn tighter as they grow older. Their food is so sparingly given, that they are, still farther to *improve* the form, so sparingly fed, that the young unmarried females have generally a look of ill health. The finest looking women are the young wives.

The dress of both sexes is rather long, that of the men consisting of shirt, tunic, and cloak much resembling those of the Kalmuck Tartars, but formed of better materials, and in general richer; the female costume is not very different, except in being longer. According to the plate (18, p. 398) in Pallas's first vol., the outer robe reaches to the instep, and is furnished with hanging sleeves. The men shave or crop the head, leaving only a single lock of hair hanging from the crown; they wear thick mustachios, and the *learned* classes (priests and physicians) suffer the whole beard to grow. The women's heads have luxuriant tresses, but both sexes eradicate every appearance of hair on all other parts of their bodies, by means of a caustic ointment of unslaked lime and orpiment. The princes and usden rarely go out unarmed, and in his coat of mail, helmet, musket, pistols, bow, quiver, and shield, the Circassian chief forms a most imposing and picturesque object. In this dress they pay their visits of state, and in this also they ride out on their warlike or predatory expeditions. The Circassian, like the Arab, is a strange mixture of ferocity and hospitality; the unfortunate traveller who approaches his country without securing the protection of some chief, is seized as a slave by the first native who meets him; but, on the other hand, should this protection be extended, the whole power of the host, or *konak*, as he is called, is strained to procure not only the safety, but accommodation, of the guest. The form of granting protection is remarkable. The wife of the konak gives the stranger her breast to suck, after which ceremony he is regarded as her son, and the whole tribe as his adopted brethren. Robbery and plunder are honourable occupations; but the charge of thieving is accounted an insult, because it implies detection. The custom of blood revenge is precisely similar, in all its details, to the same custom in Arabia (see ARABIA), and is known by a name *thlil-nasa*, which is said to be similar in etymology to the *thar* of that country. The ransom by fine is, according to Pallas (i. 405), never taken; but Spencer (Circass., ii. 382), on the contrary, affirms, that it is almost always preferred. The exclusive nature of Circassian marriages has been already noticed It is, however, a little inconsistent, that while a Circassian prince would unhesitatingly slaughter an usden of his own tribe, or Abchasian, who should presume to wed his daughter, he *will unhesitatingly sell her* to Turk, Persian, Turcoman, Nogay Tartar, or Kalmuck! Spencer, who professes to admire every institution of these people, has ingeniously discovered (Circass., ii. 373) that this practice has tended to *refine* and *civilise* the inhabitants of the Caucasus! He admits, indeed, that it has occasioned wars and feuds innumerable among the petty tribes, from the rapacity with which they have overrun each other's territory in search of beauty for the foreign market. The greater portion of the females thus sold have, however, always been Imeritians, Georgians, and Mingrelians; the Circassian slave trade having been chiefly confined to the male sex, from which they supplied the Mamelukes and other slave troops of Egypt and Turkey. The fact is, that the suppression of this infamous traffic by the Russians has been one of the main causes of the resistance

325, &c.; Spencer's Circass., ii. 223, 233, 242, 246, 325, 375, 384, &c.)

Laws.—These might have been included in the last article, since they rest only on long-established custom. They are administered in a council of elders, but not always by the reigning prince of the tribe, if any other of his rank possess the requisite qualities in a higher degree. The council consists not of princes and usden only, but also of the wealthier and more aged vassals, who, in the judgment-seat, are regarded as on an equality with the higher classes. The laws themselves are based upon the principle of retaliation, and the business of the court seems to consist of little else than the assessment of damages. Robbery of a prince is punished by the restitution of nine times the property stolen; of an usden by simple restitution, and a fine of thirty oxen. The prince or usden can scarcely commit a robbery on a vassal, since his abstract right to all the property of the latter is tacitly acknowledged, and the punishment of robbery by one vassal of another appears to vary with the circumstances of the case. Fine, as among the Arabs, seems almost the universal punishment, except in cases of murder and adultery; in both which cases the punishment is left in the hands of the injured party. The offending wife has her head shaved, her ears slit, the sleeves of her garment cut off, and in this trim is sent back, on horseback, to her father, who, if he cannot sell, generally kills her. The paramour is certain of death, being a marked man by all the husband's tribe. Polygamy is allowed, but very rarely practised. The Circassians are very attentive to their breeds of horses, and have distinct marks to show the noble races from which they have descended. The stamping a false mark upon a filly is a forgery, for which nothing but life can atone. (Klaproth, p. 319; Pallas, i. 411; Spencer's Circassia, ii. 382, &c.)

Learning is a complete blank. The people, from whom Blumenbach took it into his head to suppose that the Europeans are mostly all descended, have not even an alphabet, and consequently neither book nor manuscript in their own language. The few who read, and they are very few, use the Tartar or Arabic tongues, both of which, the former especially, are very generally understood. The Circassian language is itself totally different from any other at present known, and what is singular, considering the total absence of letters, there is a secret dialect, apparently an old barbarous gibberish, peculiar to the princes and usden, and used by them chiefly on their predatory excursions. (Klaproth, p. 321; Pallas, i. 408.)

Arts, Manufactures, Commerce.—These also are at the lowest ebb; the doctors are simply conjurors or saints, who profess to cure diseases by charms and the roughest applications of actual cautery. Their success may be surmised from the fact, that notwithstanding the length and inveteracy of the war with the Russians, scarcely a single instance of a maimed Circassian warrior is to be met with: to be wounded among these people is to die. Of artificers and skilled mechanics there are only cutlers, armourers, and goldsmiths, who, however, exhibit great ingenuity in the construction and decoration of the warriors' arms. The art of preparing gunpowder has been known for ages in the Caucasus, and the abundance of saltpetre renders the inhabitants independent of other countries for this important element of warfare; their mode of manufacture is, however, very primitive. It has already been stated that the women are the great manufacturers of clothes, which may be said to be the only manufacture which these people possess. They formerly traded with Persia and Turkey for their chain and other armour, and with Tartar tribes northward for salt, the equivalents on their parts being their children and cattle. The Russians have annihilated both trades; and this, as already stated, is one great cause of the hatred entertained against them by the Circassians. (Klaproth, p. 323; Pallas, i. 400, &c.; Spencer, ii. 246, &c.)

Name, History.—The word *Tcherkessia* is Tartar, and literally means *cut the road*; that is, highwayman or robber, one who makes communication unsafe. The general name for these people, in the Caucasus, is *Kasack*, whence it has been inferred that they are of the same race with the Cossacks of the Don and the Wolga; but etymology has indeed run mad upon this point; for this term, like the former, has a general, not a national, signification, and means a man who leads a wandering and martial life. The Circassians themselves recognise neither term; they style themselves *Adigé*, which has been derived by some authorities from the Turco-Tartar *adah* (island), whence it has been inferred that these people came originally from the Crimea. This *may* be the case, but it acquires no strength from the etymological proof, since the Circassians have no word for island (how should they, being necessarily ignorant of the thing?) and their language, as before observed, has no connection with either Turkish or Tartar. From a resemblance in sound between the Tartar name (*Tchetkess*), they have been pretty generally supposed to be identical with the Zyges (Ζυγοὶ) of Strabo (ii. 129, xi. 492). (Stephen of Byzantium, art. Ζυγοὶ, and Procopius, De Bel. Got., iv. 4.) This, again, is not improbable, but the premises are far too weak and uncertain to found a conclusion upon. The Kabardines have a tradition that they are Arab (Pallas, i. 392); but in the W. mountains they say that before their ancestors arrived here, the land was inhabited by men so small, that they rode hares instead of horses (Spencer's Circass., ii.); and, as to the time when this settlement took place, they are profoundly ignorant. Among all this confusion, naturally to be expected in speaking of a barbarous and but little known people, all that can be inferred with certainty is, that the Circassians have inhabited their mountains for many centuries, and that they have always been the same hardy, reckless, daring robber warriors, that we find them at this hour. Christianity is supposed to have found its way among them in the very early part of the Christian era; but, in the palmy days of Turkish power, they nominally embraced Mohammedanism, preserving, however, many Christian ceremonies, and acknowledged a kind of doubtful dependence on the Porte. Their first connection with Russia took place in 1555, when the princes of the Besch Tag submitted to the Czar Iwan Vassilievitch. From that time the Russian power has been constantly increasing in the Caucasus; and, by the treaty of Adrianople (1830), Turkey made over to it the whole Circassian country. By the end of 1864, Russia had become master of the whole of Circassia, and introduced her own form of government.

CIRENCESTER (usually called *Ciceter*), a parl. bor. and par. of England, co. Gloucester, hund. Crowthorne, on the Churn, 89 m. W. by N. London by road, and 95 m. by Great Western railway. Pop. 6,336 in 1861. The limits of the parl. bor. are identical with those of the par. The town is on the line of road from Oxford to Bath, and consists of four principal, and several smaller streets, paved and lighted: houses mostly of stone, and well built; many of the more respectable are detached, and have shrubberies round them. Portions

of its ancient walls (2 m. in circuit) are still traceable, showing that the modern town occupies only a portion of the ancient site, a large part of the enclosed area, on the SE., being occupied by gardens and meadows. The church is in the decorated style of the 15th century, with a lofty tower, and several lateral chapels and ancient monuments of great interest; both within and without, it is elaborately ornamented, and is one of the finest par. churches in England. There are four dissenting chapels; a free grammar-school, founded in the reign of Hen. VII., which had Dr. Jenner for a pupil; blue-coat and yellow-coat schools with small endowments, clothing and educating about forty children; three ancient hospitals, or almshouses, and several other charitable institutions. In the vicinity is an agricultural college of considerable repute. The building, about 1½ m. from the town, is in the Elizabethan style, the principal front being 190 ft. in length, and commanding an extensive view. It includes a private chapel, dining hall, library, museum, and lecture rooms. An experimental farm of about 450 acres is attached to the college, and it has extensive kitchen and botanical gardens. The course of instruction comprises the science and practice of agriculture, chemistry, natural history, veterinary practice, surveying and practical engineering. The business of education is carried on by a principal and professors, under the superintendence of a council of noblemen and gentlemen. Cirencester is a polling place for the E. div. of the co.; and has itself returned two mem. to the H. of C. from the 13th of Eliz., the franchise previously to the Reform Act having been vested in the inhab. householders being parishioners. Registered electors, 439 in 1865.

Cirencester was the *Corinium* of the Romans; and was a place of considerable importance from its being situated at the intersection of three military roads. Numerous Roman remains have been discovered; and near it is an amphitheatre (now called the Bull-ring), being an ellipse of 63 by 43 yards, enclosed by a mound 20 ft. high, on the inner slope of which were turf seats, which are still partially traceable. A magnificent abbey of Black Canons was founded here by Hen. I., whose abbot was mitred, and had a seat in parl. Its revenue at the general dissolution was 1,051*l.*; some slight remains of it still exist. Oakley Park, the seat of Earl Bathurst, is in the immediate vicinity. The ancient annalist, Richard of Cirencester, was a native of the town.

CIUDAD DE LAS CASAS (formerly *Ciudad Real*), an inl. city of Mexico, cap. of the state of Chiapas, in a fertile plain near the border of Guatemala, 450 m. SE. Mexico. Pop. about 4,000, one-eighth of whom are Indians. It has a cathedral, another church, and several chapels. It was the see of the celebrated bishop Las Casas, the protector of the Indians, to whose memory a monument is here erected.

CIUDAD REAL, a city of Spain, prov. Ciudad Real, of which it is the cap., in a plain about 5 m. S. and E. from the Guadiana, 102 m. S. Madrid, 162 m. NE. Seville, on a branch of the railway from Madrid to Seville. Pop. 10,159 in 1857. The city was built after the expulsion of the Moors from La Mancha, to serve as a check upon those who still maintained themselves in the Sierra Morena. Extensive remains of its ancient walls and towers still exist. Streets long and straight, but narrow. The grand square is surrounded by two rows of boxes for viewing the bull-fights and public festivals. It has five churches, eight convents, three hospitals, barracks for troops, a magnificent workhouse, including a school for the instruction of poor children in useful occupations. It was the head-quarters of the famous *Santa Hermandad*, or Holy Brotherhood, an order founded in 1249, for the extirpation of highway robbers.

CIUDAD RODRIGO, a city of Spain, prov. Salamanca, on an eminence on the right bank of the Aqueda, which is here crossed by a bridge of seven arches; 55 m. SW. Salamanca, 146 m. W. Madrid, and 16 m. from the frontiers of Portugal. Pop. 5,730 in 1857. The city has a castle, and is strongly fortified. It is tolerably well built, and has some good public buildings, including a cathedral, founded in 1170, with numerous churches and convents, an episcopal seminary, and a hospital. In the great square are three Roman columns, with inscriptions. The city has two suburbs, and its environs are fertile. Ciudad Rodrigo was taken by the French under Marshal Massena, in 1810. The Duke of (then Lord) Wellington, having come upon it by surprise, with the allied English and Portuguese forces, on Jan. 8, 1812, after a vigorous siege, took it by assault on the 20th of the same month. A large battering train and immense quantities of ammunition were found in the town. The allies lost about 1,200 men, and 90 officers, in the siege and assault. This important achievement procured for the general the title of Duke of Ciudad Rodrigo from the Spanish gov., and of Marquis Torres Vedras from the Portuguese.

CIUDADELA, a city of the Spanish island of Minorca, of which it was formerly the cap., at the head of a deep and narrow bay on the W. coast of the island; lat. 39° 59′ N., long. 3° 54′ E. Pop. 5,726 in 1857. The city has walls, partly of Moorish construction, and partly modern, with stone bastions. In the centre of the town is a large fine Gothic church. The streets are narrow, but it has a considerable number of good houses, inhabited by many of the nobles of the adjacent country.

CIVITA VECCHIA (an. *Centum Cellæ*), a fortified sea-port town of Central Italy, cap. deleg. of same name, on the Mediterranean, 36 m. WNW. Rome, of which it is the port, and with which it is connected by railway. Pop. 24,985 in 1858. Though the streets are narrow, the town is tolerably well-built and laid out; it contains several convents, a lazaretto, a theatre, an arsenal, building-docks, and warehouses, and has a very considerable import and export trade. Its harbour, which was constructed by the Emperor Trajan, is formed of three large moles—two projecting from the mainland, and inclined the one a little to the N., and the other to the S.; and a third constructed opposite to the gap between the others, and serving to protect the shipping from the heavy sea that would otherwise be thrown in during W. gales. The latter mole clearly appears from a passage in Pliny's letters (lib. 6, epist. 31) to have been formed in a precisely similar manner to the breakwater at Plymouth, by sinking immense blocks of stone, which became fixed and consolidated by their own weight, till the structure was raised above the waves. Its extremities are about 90 fathoms distant from those of the lateral moles, and at its S. end there is a lighthouse, with a lantern elevated 74 ft. above the level of the sea. The S. entrance to the harbour is the deepest, having from 8 to 4 fathoms water. Ships may anchor within the port, in from 16 to 18 ft. water, or between it and the outer mole, where the depth is greater. Civita Vecchia is a free port,—that is, a port into which produce may be imported, and either made use of or re-exported free of duty; but quarantine regulations are very strictly enforced. Its imports consist chiefly of cotton, woollen, silk, and linen stuffs; coffee, sugar, cocoa, and other colonial products; salt and salted fish, wines, jewel-

lery, glass, and earthenware. The exports are principally staves and timber, corn, wood, cheese, potash, pumice-stone, alum, and other Italian produce. The shipping, in 1862, consisted of 1,908 vessels, of 300,059 tons, which entered, and 1,885 vessels, of 302,751 tons, which cleared the port. Among them were 65 British vessels of 10,542 tons entering, and 65 vessels of 12,701 clearing. Far more important than the British commerce with Civita Vecchia is the French, which includes about one-half of the whole shipping.

This city was originally called *Trajanus Portus*, and it is to be regretted that it did not continue to bear the name of its illustrious founder.

CLACKMANNAN, the smallest co. of Scotland, on the N. side of the Forth, being, except for a short distance on the E., where it adjoins Fife, every where surrounded by the cos. of Perth and Stirling. Area 29,744 acres, or 46 sq. m. The co. is traversed by the Devon, an affluent of the Forth. The range of the Ochill hills crosses and mostly occupies the part of the co. to the N. of the Devon; but the other and far largest portion consists, for the most part, of clay and carse land, and is remarkably fertile and well cultivated, producing excellent crops of wheat and beans. Estates middle-sized; farms large; farm buildings excellent. There are valuable mines of coal, large quantities of which are shipped at Alloa; ironstone is also abundant. There are some large distilleries and breweries, but little other manufacture is carried on. Alloa is the largest, but Clackmannan is the co. town. Clackmannan is divided into five parishes, and had 2,996 inhab. houses, with a pop. of 24,450 in 1861. It is united with Kinross in returning 1 mem. to the H. of C. Registered electors 680 in 1865. The old valued rent was 2,207*l.*; the new valuation for 1864–5 amounted to 74,000*l.*

CLACKMANNAN, a town of Scotland, cap. of the above co., on an eminence 190 ft. high, on the left bank of the Frith of Forth. Pop. 1,159 in 1861. The town consists principally of one long unpaved street, and is a very unimportant place. On the W. of the town is Clackmannan Tower, the palace of King Robert Bruce, long the residence of a branch of the Bruce family, and now the property of the Earl of Zetland. The par. church is a modern Gothic building. Debtors and criminals are sent to Stirling, the jail of which is partly maintained by the co. of Clackmannan.

CLAGENFURTH (Germ. *Klagenfurt*), a town of Illyria, gov. Laybach, cap. duchy of Carinthia, on the Glan, an affluent of the Drave, in an extensive plain, 21 m. E. Villach, and 40 m. NNW. Laybach, on a branch of the railway from Vienna to Trieste. Pop. 13,478 in 1857. The town was formerly fortified, but its works were destroyed by the French in 1809. It has four suburbs, is well-built, with broad and regular streets. There are five squares, one of which has a leaden statue of the Empress Maria Theresa, and a group (indifferently executed) representing Hercules destroying the hydra. Another square contains the residence of the Prince-Bishop of Gurk, with its galleries of paintings, statuary, a rich cabinet of minerals, and an obelisk erected in honour of Francis I. There are seven churches, two hospitals, several infirmaries, a lying-in hospital, workhouse, house of correction, lyceum with a public library, college, normal high school, Ursuline school for girls, an agricultural society, and a theatre. This town is the seat of the court of appeal for the gov. of Laybach, and of municipal, provincial, and other courts of justice. It has a few manufactures of fine woollen and silk fabrics, and white lead. Clagenfurth is supposed by some to derive its name from the Emperor Claudius, and in its vicinity there are some ruins believed to be those of the ancient *Tiburnia*. It has several times been partially destroyed by fire.

CLAMECY, a town of France, dép. Nièvre, in which it holds the second rank, at the foot and on the declivity of a hill on the left bank of the Yonne, where it is joined by the Beauvron, by both of which it is intersected; 36 m. NE. Nevers. Pop. 5,622 in 1861. Little remains of its ancient castle, and the massive walls by which it was formerly surrounded. It, however, contains several old Gothic churches, and a handsome modern castle surrounded by fine gardens, which stands in the *Place de Vauvert*. Clamecy has manufactures of common woollen cloths, fulling mills, dyeing houses, tanneries, and a considerable trade in wood and charcoal, most of which are sent down the Yonne to Paris. There are good coal mines in the neighbourhood.

CLARE, a marit. co. of Ireland, prov. Munster. It is in a great measure insulated, having Galway Bay on the N.; the Atlantic on the W.; the Shannon, by which it is separated from Kerry, Limerick, and Tipperary, on the S. and SE.; and Galway on the NE. Area, 802,352 acres, of which 259,584 are unimproved mountain and bog, and 18,665 water. Surface in parts almost mountainous; but it has a large extent of low level land. The low grounds, known by the name of the *Corcasses*, on the banks of the Shannon and Fergus, are almost equal to the very best grazing lands in Lincolnshire. The arable lands are mostly light, but fertile. Estates large; tillage farms very small, many being below 5, and very few above 60 or 70 acres. Agriculture bad, but improving; it is still common in many parts to take a succession of corn crops till the land be completely exhausted. Principal crops, oats and potatoes; but wheat and barley are now rather extensively cultivated. Sea-weed and sea-sand are a good deal used as manure; and in the hilly parts the *loy*, or spade, is much employed in cultivation. Cottages mostly of stone, but without lime or other cement. Condition of the occupiers of small tillage farms and cottiers quite as bad as in most other parts of Ireland. Lime is the most important mineral. Manufactures have hardly any footing. Exclusive of the Shannon, the Fergus is the principal river. Clare has 9 baronies and 79 parishes, and sends 3 mem. to the H. of C., viz. 2 for the co. and 1 for the bor. of Ennis, the principal town in the co. Registered electors for the co., 5,509 in 1865. The pop. was 286,523 in 1841; 212,734 in 1851; and 166,305 in 1861. Consequently, the decrease of population, in the year 1841–61, amounted to 42 per cent. In 1841 Clare had 44,870 inhab. houses, and 286,394 individuals, of whom 144,109 were males, and 142,285 females.

CLAUSTHAL, or KLAUSTHAL, a town of the k. of Hanover, cap. of the mining captaincy (*Berghauptmannschaft*) of the same name, and the principal mining town of the Hartz; in a bare and bleak region on the top and slopes of a hill 1,740 ft. above the sea, 26 m. NE. Göttingen, and 56 m. SW. by S. Hanover. Pop. 8,918 in 1861. The inhab. are mostly miners or persons connected with the mines and smelting-houses. The town has a desolate appearance; its houses are chiefly of wood, and even its principal church is of the same material. It contains a mining-school, supported by the king, and possessing an extensive collection of models of mines, mining buildings, machinery, and a cabinet of the Hartz minerals. The chief lead and silver mines in the Hartz are in the neighbourhood, next to which are the Silbersegen. The shaft of one of these mines reaches to 2,000 ft. below the level of the Baltic. The

mines are drained by a tunnel, cut through the mountain to the small town of Grund, a distance of 6 m. The total length of this tunnel, however, with its branches, is nearly double this distance: it was commenced in 1777, and finished in 1799. Nearly all the machinery used in the mines being set in motion by water-power, every little stream around Clausthal is carefully made use of to form a reservoir; and the canals conducting the water thence to the different mills, machines, &c., are said to have an aggregate length of 125 m. There are numerous forges; besides which, camlets, and a few other articles are manufactured.

CLERMONT-DE-LODEVE (see LODEVE). There are many other small towns in France named Clermont; but none of any importance.

CLERMONT-FERRAND (an. *Augustonemetum*), a city of France, dép. Puy-de-Dôme, of which it is the cap., on an affluent of the Allier; 82 m. W. Lyons, and 208 m. S. by E. Paris, on the railway from Bourges to Le Puy. Pop. 32,275 in 1861. The city is finely situated on an eminence, surrounded on the S. and W. by an amphitheatre of mountains, of which the Puy-de-Dôme is the culminating point, and overlooking on the N. and E. the picturesque and rich plain of the Limagne. The city itself is about 1½ m. in circuit, being separated by a boulevard, partially planted with trees, from several considerable suburbs. Though it has some fine structures, it is in general badly laid out; streets crooked, narrow, and dirty; houses lofty, mostly old, and gloomy looking from being built of the lava found in the neighbourhood, with which also the streets are paved. The more modern buildings, however, which are rapidly increasing in Clermont and its suburbs, have a more cheerful and agreeable aspect. It has several squares ornamented with handsome fountains, and is exceedingly well supplied with good water, conveyed to it by subterranean conduits from Royat, a league distant. The principal edifice is the cathedral, a work of the 13th century, and the third, according to Hugo, which has been constructed in this city. Externally it has nothing to recommend it, being unfinished, and crowded amongst a number of mean buildings; but its interior is considered one of the finest existing specimens of Gothic architecture. It is built of Volvic lava, a material well in keeping with its style, and has a choir, and chapels of great beauty, a number of handsome columns supporting a lofty nave and aisles, and much elegant carving and stained glass. Of the five towers it possessed before the revolution, only one remains. Of the other churches, that of Notre Dame du Port, built in 853, is the most ancient, and is elaborately ornamented externally with mosaic work, bas-reliefs, &c. The corn and linen halls, the ancient college, town-hall, cavalry barracks, *Hôtel Dieu*, and another hospital, the prefecture, a public library with 16,000 vols., founded by Massillon, and the theatre, are the other principal public buildings. It has also a botanic garden, museums of natural history and antiquities, and a cabinet of mineralogy, particularly rich in specimens of the volcanic products of the neighbourhood. It is the seat of a bishopric which has to boast of Massillon for one of its incumbents, and of tribunals of original jurisdiction and commerce; and has a royal college of the third class with about 350 pupils, a primary school, and an academy of sciences and belles lettres. Trade considerable, it being the *entrepôt* for the produce of the surrounding deps., consisting of hemp, flax, corn, wines, cheese, leather, and linen fabrics, and for a part of the merchandise of Provence and Languedoc intended for Paris, besides being on the great line of communication between Bordeaux and Lyons. Four large fairs are held annually. Manufactures not very important; the chief are those of silk stockings, druggets, tinted paper, coarse woollens, linen, cutlery, porcelain, cotton yarn, twine, sweetmeats, preserved fruits, and chemical products. There is also a saltpetre refinery. In and round Clermont there are numerous warm chalybeate springs, holding in solution carbonates of lime, and which, on cooling, deposit very extensive sediments. The most remarkable of these is in the suburb of St. Allyre, where a streamlet having raised its bed to a considerable height by means of successive deposits, and subsequently formed a cascade over another streamlet into which it had previously run, has effected the formation of a natural bridge over the latter, 21 ft. in length by 16 ft. high. The little town of Mont-ferrand, formerly containing the stronghold of the Counts of Auvergne, is now one of the suburbs of Clermont, with which it is connected by a fine avenue of willow and walnut trees.

Anterior to the Roman conquest, this city was named *Nemosus*, and was the cap. of the Arverini: Augustus embellished it, and gave it his name. In the 3rd century it was erected into a bishopric. It was several times demolished in the succeeding ages, and especially by Pepin-le-Bref. The counts of Clermont and Auvergne afterwards possessed it. It was here that the celebrated council, which bears its name, was held in 1095, when the first crusade was resolved on. Philip Augustus united this city to his dominions in 1212. Clermont has been the birth-place of many illustrious men, among whom may be specified Gregory of Tours; Pascal, born here on the 19th June, 1623; Thomas, Chamfort, Delille the poet, and General Dessaix, in honour of whom an obelisk has been erected in one of the squares.

CLEVELAND, a town of the U. States, Ohio, on the S. shore of Lake Erie, at the mouth of the Cuyahoga river. Pop. 36,125 in 1860. The town —which had only a pop. of 6,071 in 1840—has grown-up very rapidly, owing to its advantageous commercial position, and at the point where the Grand Canal, connecting the Ohio river (and consequently the Mississippi) with Lake Erie unites with the latter. The opening of this canal has made Cleveland, which was previously quite unknown, a place of much importance, heightened by the subsequent construction of several lines of railway, among them the Cleveland, Columbus and Cincinnati, 141 m. long, and the Cleveland and Toledo, 87 m. long, which place the town in direct communication with the whole railway system of the United States.

CLEVES, an ancient town of the Prussian states, Rhine prov., formerly the cap. duchy of Cleves, and now of a circ., on the railway from Cologne to Utrecht and Amsterdam. Pop. 9,095 in 1861. The town stands on the declivity of some hills, nearly at the NW. extremity of the prov., about 2½ m. from the Rhine, with which it is united by a canal. It is neatly built in the Dutch style, and surrounded by walls, but is not a place of any strength. It has a gymnasium or college, a handsome town-house, with iron foundries, and manufactures of flannel and cotton.

CLITHEROE, a town and parl. bor. of England, co. Lancaster, hund. Blackburn, on the Ribble, 188 m. NW. by N. London, and 20 m. SE. by E. Lancaster, on the Lancashire and Yorkshire railway. Pop. of town 6,990, and of parl. bor. 10,864 in 1861. The town stands at the foot of Pendil-hill, which rises 1,800 ft. above the level of the sea. The houses are of stone; the streets paved, well kept, and plentifully supplied with water from

springs. The parish church, rebuilt in 1828, is a plain building; there is another church, and chapels belonging to the Methodists, Independents, and R. Catholics. In the churchyard is the free grammar-school endowed by Queen Mary in 1554. Clitheroe is a bor. by prescription, and has returned 2 mem. to the H. of Com. since 1 Elizabeth. Under an order of the H. of Com., in 1694, the right of election was vested in the burgesses and freemen, who held in right of freehold in houses or land within the bor.; out-burgesses, holding free burgage tenures in the bor., had also the right of voting. Previously to the Reform Act, the number of burgage tenures was 192, of which not more than a half were occupied by burgesses, and in fact it was a mere nomination bor. The Reform Act deprived it of one of its members; and the electoral limits were at the same time extended so as to comprise various adjoining chapelries and townships. Registered electors 496 in 1865. Under the new municipal corporation act, the bor. consists of one ward, and is governed by 4 aldermen and 12 counsellors. Several branches of the cotton manufacture are extensively carried on; they consist principally of the weaving of calicoes by hand and power looms, cotton spinning, and calico printing. In the neighbourhood are extensive beds of limestone, of which large quantities are burnt for manure and building. A mineral spa near the town is much resorted to. In 1669, the town and neighbourhood suffered severely from an extraordinary outbreak of water from the higher part of Pendil-hill. Markets are held on Tuesday; cattle shows on alternate Tuesdays; fairs on 24th and 25th March; 1st and 2nd Aug.; Thursday and Friday before the fourth Saturday after 29th Sept.; and 7th and 8th Dec.

CLONAKILTY, a marit. town of Ireland, co. Cork, prov. Munster, at the bottom of the bay of the same name; 19 m. SW. Cork. Pop. 3,087 in 1831, and 3,108 in 1861. The town is formed of four streets, that meet in the centre, and of a square. It has a par. church, a R. Catholic chapel, a Methodist meeting-house, an endowed grammar-school, a dispensary, a public library, three reading-rooms, a court-house, bridewell, linen-hall, and market-house. The corporation, under the charter of James I. in 1613, consists of a sovereign, twenty-four burgesses, and a commonalty. It returned two mems. to the Irish H. of C. till the Union, when it was disfranchised. A manor court, held every third Wednesday, has cognisance of pleas to the amount of 2*l*. Markets, Fridays: fairs on 5th April, 1st June, 1st Aug., 10th Oct., and 12th Nov. A party of the constabulary is stationed here. The trade is much limited by the badness of the harbour, which is nearly impracticable for vessels of any size, in consequence of its shallow and shifting bar. Sea-sand is raised here in large quantities, and carried to the adjoining country for manure. Corn is exported to Cork, and coal received in return, chiefly *viâ* Kinsale, from which there is a railway to Cork.

CLONES, an inl. town of Ireland, co. Monaghan, prov. Ulster; 66 m. NW. by N. Dublin. Pop. 2,381 in 1831, and 2,390 in 1861. The town consists of a triangular market-place, in which is an ancient stone cross, and a few streets with mean thatched houses. It has a par. church, a R. Cath. chapel, two Presbyterians and two Methodist meeting-houses, and two dispensaries; and is a constabulary station. A manorial court is held monthly, and petty sessions on alternate Fridays. Fairs are held on the last Thursday of every month. The Ulster canal passes near the town.

CLONMEL, an inl. to. and parl. bor. of Ireland, prov. Munster, partly in Tipperary and partly in Waterford on the Suir, 90 m. SW. by W. Dublin, and 26 m. NW. by W. Waterford, on the railway from Waterford to Limerick. Pop. 13,012 in 1821; 13,503, in 1841; and 11,774 in 1861. The town chiefly lies on the N. side of the river in Tipperary; the communication with the other portion in Waterford being maintained by three stone bridges. The streets, which consist of a main thoroughfare upwards of a mile in length, intersected by several smaller, are well paved and lighted with gas. The co. club house is at the E. end of the town, and near it are extensive barracks for cavalry, infantry, and artillery. It has a parish church, a modern building, with some good monuments, two Rom. Catholic par. chapels, a Franciscan and a Presentation chapel, and meeting houses for Presbyterian Calvinists, Unitarians, Baptists, Primitive and Wesleyan Methodists, and Quakers. An endowed school has been rebuilt at an expense of 5,000*l*.; besides which there are parochial schools for boys and girls, and others are maintained by voluntary contributions. The co. infirmary and dispensary, the fever hospital and the house of industry for the reception of well-conducted paupers and the confinement of vagrants, are in the town, as are two orphan establishments, a mendicity association, and a savings' bank. Here also is the district lunatic asylum for the co., built to accommodate 120 patients.

The bor. was incorporated at a very early period, but its ruling charter was granted by James I. in 1608. The governing body consists of a mayor, two bailiffs, twenty other burgesses, and an unlimited number of freemen: the right of freedom is enjoyed by the eldest son, by apprenticeship or by marriage with a freeman's daughter. Previously to the Union, the bor. sent two mem. to the Irish H. of C., and it now sends one mem. to the imperial H. of C. The elective franchise is vested in the burgesses and freemen resident within 7 m., and in the 10*l*. householders. No. of registered electors 366 in 1862. The electoral boundary comprises 331 acres, but the municipal jurisdiction for other purposes extends over 4,800 Irish acres, of which 1,000 are on the Tipperary side, and the remainder on the Waterford side of the river.

The woollen manufacture was introduced into the town in 1667, when a number of German manufacturers were induced to remove thither: it declined at the Revolution, and has never revived. The cotton manufacture has been introduced, and there are extensive flour mills in the town and its vicinity. The town is well situated for inland trade, being on the main lines of road from Dublin to Cork, and a chief station on the railway from Waterford to Limerick, and having the advantage of river navigation for barges of 50 tons burden to Waterford, a distance of 23 m. There is an extensive salmon fishery on the Suir, and the influence of the tide is perceptible beyond Clonmel. The principal trade is in grain, provisions, cattle, and butter, with all which it supplies the Liverpool, London, and Bristol markets. A considerable portion of the produce goes to Waterford, and numerous carriers conduct the inland trade with all the surrounding country. The butter market is a spacious building, with suitable offices for inspecting and marking the article before it is exposed for sale. Market-days, Tuesdays and Saturdays: fairs are held on 5th May and 5th Nov., and on the first Wednesday of every other month; they are chiefly for cattle.

CLOSTER-SEVEN, a small village of Hanover, duchy of Bremen, on the Aue, 26 m. NE. Bremen. It deserves notice only from its being the place where the famous convention, which bears its

name, was agreed to on Sept. 10, 1757, by which an army of 38,000 Hanoverians and Hessians, commanded by William, Duke of Cumberland, was dispersed and sent into cantonments. This convention was alike unpopular in England and in France: in the first it was looked upon as the result of imbecility and misconduct; and in the latter it was believed, and probably on good grounds, that had Marshal Richelieu not assented to the convention, the Duke of Cumberland must have surrendered at discretion. (The convention is given in Smollett's Hist. of Eng., iii. 413.)

CLOYNE, an inl. town, or rather city, of Ireland, co. Cork, prov. Munster, in a fertile valley, 3 m. E. Cork harb., with which it is connected by railway. Pop. 1,227 in 1831, and 1,434 in 1861. The town, which is small, irregularly built, and far from prosperous, has a large old cruciform cathedral, in which are some good monuments; among others one to Dr. Woodward, bishop of Cloyne, who died in 1794, and was one of the earliest advocates for the introduction of poor laws into Ireland. A little distance from the cathedral is one of those extraordinary round towers, the origin and object of which have given rise to much learned conjecture. It is 102 ft. in height. The old episcopal palace at the E. end of the town is now a private residence; the bishopric of Cloyne having, on the death of Dr. Brinkley, the last bishop, in 1835, been merged in that of Cork. The famous Dr. Berkeley, one of the subtlest of metaphysicians, and most amiable of men, was bishop of Cloyne from 1732 to 1753. The R. Cath. cathedral is a plain building, without any pretensions to architectural beauty. Crowe's charity-school, founded in 1719, gives instruction to 35 pupils in reading, writing, and arithmetic. There is here a constabulary station. Market-day Thursday. A court leet is held annually; a manor court every week; and petty sessions on alternate Wednesdays. At Carrigaeramp, near the town, is a quarry of dove-marble, of which from 2,000 to 6,000 tons are raised annually.

CLYDE, a river of Scotland, and the only important one on the W. coast of that part of the U. Kingdom. It has its source near the S. extremity of Lanarkshire, on the borders of Dumfries-shire and Peebles-shire, in the highest part of the S. mountain-land of Scotland, contiguous to the sources of the Tweed and Annan. Its course is at first N., with a little inclination to the E., till near Biggar it turns NW.; it then makes a sweep round by the SE., till, being joined at Harperfield by the Douglas-water, it re-assumes its NW. course, and, passing by Lanark, Hamilton, and Glasgow, unites with the Frith of Clyde, a little below Dumbarton. The distance in a direct line, from its source to Dumbarton, is only about 52 m., but including its windings, the course of the river is near 75 m. Soon after its junction with the Douglas, it is precipitated over a series of falls celebrated for their picturesque beauty: of these the principal are the falls of Bonington, Corehouse, Dundaff, and Stonebyres. The distance from the highest to the lowest fall is about 6 m.; during the whole of which the river dashes along with great impetuosity. Corehouse Fall is about 70 ft. in height. The Clyde has been rendered navigable at high water as far as Glasgow for vessels of 350 and 400 tons. (See GLASGOW.)

COAST CASTLE (CAPE), or CABO CORSO, the cap. of the British settlements on the Gold Coast of Africa, empire of Ashantee; lat. 5° 6′ N., long. 1° 51′ W. The first colonial establishment formed here was by the Portuguese in 1610, but the Dutch dislodged them after a short period. Finally the British obtained possession of the settlement, in whose hands it has remained since 1661.

The castle is built upon a rock about 50 ft. high, projecting into the sea, its walls being washed by the surf that rolls impetuously along the coast. It is of a quadrangular shape, with bastions at each angle; has barracks, with accommodations for 16 officers and 200 men; but is of little strength, the walls being out of repair, and commanded in every direction by the adjacent heights (but on some of these forts have been erected). The water for the garrison is obtained from tanks, in which the rain from the buildings is collected. (Captain Tulloch's Report on W. Africa.)

The town is situated behind the castle, and presents a dirty and irregular appearance. The native houses have a few small rooms scantily furnished with mats and stools; the fires are made in a corner, with no other escape for smoke than a hole in the roof. There are, however, some superior residences belonging to Europeans, and the merchants have built themselves a neat club-house. The scenery of the neighbourhood has been described by a late distinguished female poet, Mrs. Maclean, better known as L. E. L., whose melancholy death at this place, in 1837, has given an interest to it which it did not previously possess. 'The land view, with its cocoa and palm trees, is very striking—it is like a scene in the Arabian Nights. The native huts I first took for ricks of hay, but those of the better sort are pretty white houses with green blinds. The English gentlemen resident here have very large houses, quite mansions, with galleries running round. Generally speaking, the vegetation is so thick that the growth of the shrubs rather resembles a wall. The hills are covered to the top with what we should call calf-weed, but here it is called bush.'

The climate of this settlement is characterised by excessive humidity. The heat is, however, not so great as might be supposed. In the hottest weather, owing to the tempering influence of the sea breeze, the thermometer seldom rises above 86° Fahr., and rarely, in the coldest, falls below 76°. It has generally been described as exceedingly unhealthy, and the official statements show that such is the fact. During the four years ending with 1826, *two-thirds* of the white troops in garrison died annually; and in 1824 the mortality was in the enormous ratio of 982·2 in 1,000. It is true that these were singularly unhealthy seasons, and that the vice and intemperance prevalent among the troops added considerably to their sickness and mortality. But still, to use Captain Tulloch's words, 'there is unquestionable evidence that in every year, and to all classes of Europeans, the climate proves *extremely fatal*.'

The imports consist of cottons, hardware, and gunpowder, from Great Britain; sugar, rum, and tobacco from the colonies; and of foreign produce, beads, silks, and tobacco. The exports are gold dust, ivory, palm-oil, pepper, cam or dye-wood, tortoise-shell and maize. But the value of the trade is inconsiderable. The total exports from the Gold Coast to the United Kingdom amounted to 42,763*l.* in 1859; to 74,466*l.* in 1861; and to 89,288*l.* in 1863. The imports were of the value of 65,905*l.* in 1859; 144,194*l.* in 1861; and 80,849 in 1863.

COBLENTZ (the *Confluentes* of the Romans), a town and fortress of the Prussian states, prov. Rhine, cap. reg. and circ., on the railway from Cologne to Mayence. Pop. 28,525 in 1861, exclus. of 5,810 military persons. The town stands in a beautiful situation on the point of land at the confluence of the Rhine and Moselle. It has a free-stone bridge across the latter, and one of boats

across the Rhine. The streets are mostly regular, and many of the public buildings are handsome; but, being a fortress, Coblentz has derived but little advantage from its fine situation for commerce. The principal public building is the magnificent castle, erected in 1779 for the elector of Treves. It was converted into barracks by the French; but has since been repaired, and is now used for the holding of the civil and criminal courts. Coblentz has a court of appeal for the regency, a theatre, a gymnasium or college for Catholics, and some other literary establishments. Commerce pretty extensive. Prince Metternich, the late prime minister of Austria, was a native of Coblentz.

Coblentz has been rendered one of the strongest places in the Prussian monarchy, and is deemed one of the principal bulwarks of Germany on the side of France. The fortifications by which it is surrounded are constructed partly on the system of Vauban, and partly on that of Montalembert. They enclose a large extent of ground, and are capable of accommodating 100,000 men. Ehrenbreitstein, 'the Gibraltar of the Rhine,' on the right bank of the river, the fortifications of which had been blown up by the French, has been rendered stronger than ever, and is one of the principal outworks of Coblentz.

COBURG, or more properly SAXE-COBURG-GOTHA, a duchy of Central Germany, and the most S. of the indep. Saxon principalities, consisting of several small detached portions of territory; between lat. 50° 7′ 30″ and 51° 22′ N., and long. 10° 15′ and 12° 40′ E., surrounded mostly by the territories of Bavaria, Prussia, Saxony, Meiningen, Hildburghausen, and Weimar. The area and pop. of its two great divisions are, according to the census of Dec. 1861:—

	Area in sq. m.	Pop. 1861
Saxe-Coburg . .	230	47,014
Gotha . .	586	112,417
Total . .	816	159,431

Coburg Proper is on the S. side of the Thüringer Wald (Thuringian Forest), and is included within the basin of the Rhine, having a general slope to the S. Gotha and Altenburg are situated wholly on the N. side of the Thüringer Wald, and belong to the basins of the Elbe and Weser. The most mountainous parts of the country are the N. of Coburg and the S. of Gotha; through these the Thüringian forest-range passes, the highest summits of which,—the Beerburg, 3,265 ft., and the Schneekopf (snow-cap), 3,243 ft. in elevation,—are in the latter principality. Both divisions are, however, interspersed with fine valleys and fertile plains: Gotha is watered by the Unstrut, Gera, Hörsel, and Saale; and Coburg by the Itz, a tributary of the Mayn, and other rivers. Climate healthy and mild, especially S. of the mountains. The principal occupations of the people are tillage and cattle breeding; but the mountains, which are covered with pine forests, contain little cultivable land, and the forest economy there forms the chief branch of industry. In the valley of the Itz, the vine is cultivated, and hops, flax, and hemp, are also grown in the S.: the other agricultural products are corn, pulse, culinary vegetables, fruits, aniseed, coriander, cummin, safflower, and other medicinal plants: potatoes are a principal article of nourishment. Many hogs are fattened in the woods and sent down the Mayn to Frankfurt and elsewhere: considerable quantities of timber, pitch, tar, charcoal, and potash are obtained from the forests. Iron, coal, excellent millstones, marble, alabaster, gypsum, potter's clay, and salt are mined or quarried. Agriculture flourishes most in Coburg, manufacturing industry in Gotha. The principal manufactures are those of linen cloth, tick, linen, thread, woollen and cotton fabrics, leather, steel, iron, and copper wares, glass, earthenware, buttons, and paper. There are also numerous sawing-mills, linen-bleaching factories, breweries, and distilleries; and great numbers of toys are made at Neustadt in Coburg. A good deal of advantage accrues from the transit trade, the duchy being on the road between Leipzig and Frankfurt. Gotha is the principal trading town, and has several considerable mercantile establishments. The government is a constitutional monarchy; each of the principalities has its own elective assembly, and the two unite into one chamber, composed of 30 members. Every man above the age of 25, who pays taxes, has a vote, and any citizen above 30 may be elected a deputy. New elections take place every four years, for which period also the budget is voted. The annual public revenue for the period July 1, 1861, to June 30, 1865, amounted to 83,925*l.*, and the annual expenditure to 57,851*l.* The greater part of the surplus thus produced went into the private purse of the reigning duke.

Education is well attended to in the duchy. There are 3 gymnasiums and classical schools, 1 academical gymnasium, 2 seminaries for schoolmasters, 35 town schools, and about 350 village schools in the duchy. The ducal house, and nearly all the pop., profess the Lutheran religion, there being only about 2,000 Roman Catholics and 1,000 Jews. Difference of religion, however, does not affect the equal enjoyment of political rights. The Duke of Saxe-Coburg-Gotha holds, together with the Duke of Saxe-Altenburg and the Duke of Saxe-Meiningen, and the Grand Duke of Saxe-Weimar, the twelfth place in the German diet; and the duchy is bound to furnish a contingent of 1,860 men for the service of the confederation. Coburg belonged successively to the counts of Henneberg, the house of Saxony, and that of Saalfield. In 1816, its territories were enlarged by the cession of the principality of Lichtenberg, on the left bank of the Rhine; but the reigning duke disposed of that possession to Prussia. In consequence of the extinction of the line of Gotha in 1826, the Duke of Saxe-Coburg became possessed of the territories of Gotha and Altenburg, for which, by a family compact, Saalfield was exchanged. The house of Saxe-Coburg is famous as one of the most fortunate of all the existing great families of Europe in respect to marriages. The late king Leopold married, first, the heiress to the British throne, next a daughter of the King of the French, and was then seated on the throne of Belgium, after having refused that of Greece. Prince Ferdinand married one of the richest heiresses of the Austrian empire, and his son became king-consort of Portugal. One princess married the Grand Duke Constantine, heir presumptive to all the Russias; another became the Duchess of Kent; and, finally, the late Prince Albert, in wedding the sovereign of the British realms, became progenitor of a new race of kings—'father of our kings to be.' (Tennyson).

COBURG, a town of Central Germany, cap. of the above duchy, on the left bank of the Itz, 106 m. E. by N. Frankfurt-on-the-Mayn, and 130 m. SW. Dresden, on a branch line of the railway from Frankfort to Dresden. Pop. 11,110 in 1861. The streets of the town are mostly narrow and uneven; but it is surrounded by some agreeable public walks, which separate it from its suburbs

and has several handsome public buildings. The Ehrenberg palace, built in 1549, contains a collection of pictures, a library of 26,000 vols., and some apartments adorned with figures in *alto-relievo*, the finest of which is a state banqueting-room, called the *Salle de Géans*, from some colossal *caryatides* which surround it. On an eminence commanding the town stands an ancient castle of the dukes of Coburg, now in part converted into a prison and house of correction, but containing also a collection of armour, and some rooms once occupied by Luther, with the bedstead on which he slept. This castle was unsuccessfully besieged during the 30 years' war by Wallenstein, who had for some time his head-quarters here. Coburg contains five churches, a government house, a gymnasium, with an observatory, and two libraries, a superior ladies' school, a teachers' seminary, a large workhouse, and other charitable institutions, and a riding-school. The principal places of amusement are the theatre, casino, redoute, and musical club. The town is the seat of gov., and of the high board of taxation for the duchy, and of the superior judicial courts and church consistory for the princip. of Coburg. It has manufactures of woollen, linen, and cotton fabrics, porcelain, earthenware, and gold and silver articles; with bleaching and dye-works. The fine seat of the duke, Rosenau, is in the immediate neighbourhood.

COCENTAYNA, a town of Spain, prov. Alicante, 30 m. N. Alicante. Pop. 7,369 in 1857. The town has 2 churches, 2 convents, a hospital, and a house of charity for poor travellers. Neither the streets nor the houses correspond with the number and wealth of the inhabitants, who are more intent upon increasing their substance by agricultural and manufacturing industry, than on beautifying the town. They manufacture cloths, taffeties, handkerchiefs, and other articles. Their fields, which are well irrigated, produce wheat, maize, pulse, wine, oil, and silk.

COCHIN, a small rajahship of Hindostan, near its S. extremity, extending along the Malabar coast, chiefly between lat. 9° 30′ and 10° 30′ N., and long. 76° and 77° E.; having N. and E. the territory of the Madras presidency, S. Travancore, and W. the ocean: average length and breadth about 45 m. each; area, 1,988 sq. m. Its E. boundary is formed by the W. Ghauts, which are here covered with forests of teak and *viti* (a black wood), of large dimensions, which obliges both to be cut into short logs, in order to reach the coast; with poon, jack, and iron woods, &c. Towards Cacadu the hills are covered with grass instead of trees; but though their soil appears good, they are but little cultivated: in the N. there are narrow and well-watered valleys, in which rice is raised, and sometimes two crops a year are reaped. The houses of the cultivators are often embosomed in groves of palms, mangoes, jacks, and plantains. A considerable portion of the rajah's revenue is derived from the teak forests, the timber of Cochin being in great demand in Bengal, and, since 1814, having been sent to the dockyards of Bombay, from which, previously to that period, it was excluded. There are many villages inhabited by Christians and Jews; the latter are settled mostly in the interior, but have a synagogue at Cochin town. This country was for a long period badly governed, and its inhab. much oppressed. The rajah for a time was tributary to Tippoo Sahib, and subsequently became subject to the British.

COCHIN (*Cach'hi, a morass*), a marit. town of Hindostan, prov. Malabar, on a small island near the S. extremity of India; formerly cap. of the above rajahship, but since 1796 it has belonged to the British. Next to Bombay, it is the most eligible port on the Malabar coast; it is 150 m. NW. Cape Comorin, 80 m. SSE. Calicut: lat. 9° 51′ N., long. 76° 17′ E.; and is built on the N. extremity of the island, along the entrance from the sea to the 'Backwater,' an inl. harbour or lagoon, which extends nearly 120 m., being separated from the sea by a narrow peninsulated tract. Under the Portuguese and Dutch, by whom it was successively possessed, Cochin was a flourishing town; but since it has belonged to the English, who in 1806 demolished the fortifications and many of the buildings, it has progressively declined, and the inhab. are now very much impoverished; it still, however, trades with the rest of the Malabar coast, China, the E. Archipelago, and the Arabian and Persian Gulfs. Large supplies of teak floated by the rivers from the forests into the Backwater, are shipped for the ports of the two last-named countries; the other exports are sandal wood, pepper, cardamoms, cocoa nuts, coir, cordage, cassia, and fish-maws. It is the only place on the coast S. of Bombay where ships of any size can be built. Under the walls of the old fort there is always from 25 to 30 ft. water, and ships obtain supplies of fresh water without difficulty. Provisions are extremely cheap, and as a port, as well as a place of trade, it is said to be much superior to Calicut. Jews of both the black and white *castes* are numerous, and have a synagogue in Cochin, almost the only one in India. Cochin is also the see of a Roman Catholic bishop, whose diocese includes Ceylon, and comprises more than 100 churches. Here in 1503 Albuquerque erected the first fortress possessed by the Portuguese in India.

COCHIN-CHINA, a prov. of the empire of Anam, which see.

COCKERMOUTH, a market-town and parl. bor. of England, co. Cumberland, at the confluence of the Cocker and Derwent; 24 m. SW. Carlisle, 12 m. NE. Whitehaven, 306 m. NW. London by road, and 319 m. by London and North Western railway. Pop. of town 5,388, and of parl. bor. 7,057 in 1861. Cockermouth has but few houses of a better sort, and little seems to have been done towards its improvement. The streets are narrow in many places, with a want of foot-pavement everywhere; and though the lower classes seem to be better off than in many other towns in the same co., yet there appears to be little about the place tending to improvement. There are bridges over both rivers, that over the Derwent being 270 ft. long. Though unpaved, the streets are clean, and well supplied with water. A castle on a hill over the town, built shortly after the Conquest, was taken and razed by the parl. forces in the war of 1641. The church of All Saints, erected in the time of Edward III., was rebuilt in 1711, and enlarged in 1825. St. Mary's church, rebuilt in 1850, has a memorial window to the poet Wordsworth, who was a native of the town. The Independents, Methodists, and Society of Friends have places of worship. There are also a free grammar school and some almshouses. The borough returned two mem. to the H. of C. in 23 Edward I., after which the privilege was not exercised till 16 Charles I., since which it has been uninterruptedly enjoyed. Previously to the Reform Act, the franchise was exclusively vested in the holders of burgage tenures in the town of Cockermouth. The boundaries of the parl. bor. were then extended. Registered electors 413 in 1865. The bor. is also a polling-place at elections for mem. for the W. div. of the co. There are collieries at Greysouthern and Broughton, about 3 m. distant.

CODOGNO, a town of Northern Italy, prov. Milan, cap. distr., in a fertile territory, between

the Po and Adda, 15 m. SE. Lodi. Pop. 9,620 in 1861. The town has broad streets and good private buildings, some handsome churches, several colleges and schools, with a hospital and theatre. It is a place of considerable trade, especially in Parmesan cheese, and has some silk manufactures. Near this town the Austrian troops were defeated, in 1746, by the Spaniards, and in 1796 by the French.

COGGESHALL, a town and par. of England, co. Essex, hund. Lexden, the town being on a hill on the NE. bank of the Blackwater, 10 m. W. Colchester. Pop. 3,116 in 1861. The town is ill-built; and the clothing trade, particularly the manufacture of baize, formerly carried on, has almost wholly disappeared; but some branches of the silk manufacture have been introduced; and a few of the inhab. are engaged in the making of toys. The church, a spacious structure, in the perpendicular style, has a large square tower. The river is here crossed by an ancient bridge of three arches. It has an endowed school, three unendowed almshouses; and an annuity of 150*l.* a year, payable by Pembroke Hall, Cambridge, goes to the support and education of the poor. The Cistercian monks had an abbey here, a portion of the ruins of which still remains.

COGNAC, a town and river port of France, dép. Charente, cap. arrond., on the navigable river Charente, 22 m. W. by N. Angoulême. Pop. 8,167 in 1861. The town is ill-built, and contains no edifice worthy of notice, except an ancient castle, now converted into warehouses. The brandy, for the shipment of which the town is celebrated, and which is everywhere known by its name, is made from white wine: that made from red wine is very inferior. In good years wine yields about 1-5th part of its volume of *eau-de-vie*, whereas in bad years it does not yield more than from 1-9th to 1-11th part. All the brandy of Charente is sold under the name of Cognac; but the best qualities are produced in the canton of that name, and in those of Blanzac, Jarnac, Rouillac, Aigre, and Ruffec. The park belonging to the castle is an agreeable public promenade, and in it is a bronze statue of Francis I., erected on the spot where he was born, in 1494. Three councils have been held in Cognac.

COIMBATOOR, a British prov. of S. Hindostan, presid. Madras, between lat. 10° 8′ and 12° 48′ N., and long. 76° 50′ and 78° 10′ E., having N. the Mysore dom., E. the provs. Salem and Carnatic, S. the latter, and W. Cochin and Malabar; area, 8,392 sq. m. Pop. estimated at near 1,000,000. Generally it is a flat open country, with a medium height of 900 ft. above the sea; its surface gradually ascending from the Cavery on the E. to the Ghauts and Neilgherry hills on its W. borders. The W. Ghauts rise from 1,500 to 2,000 ft. above the Coimbatoor plain, and have in one place a remarkable opening, about 31 m. in length, called the Palighautcherry Pass, presenting a clear level way from the Malabar to the Coromandel coast. Next to the Cavery the principal rivers are the Bowany, Noyel, and Amberawatty, all which run more or less E., and join the Cavery before it leaves the distr. Climate on the whole healthy and pleasant; and except in that part facing the Palighautcherry Pass, this prov. is protected by the Ghauts from the violence of the SW. monsoon. There are some marshes in the S. and in the vicinity of the hills; but the soil in general is dry, and well adapted for the *dry* grain culture, to which nearly ten times as much land is appropriated as is occupied by *well*, and twenty times as much as is occupied by *wet*, cultivation. In the N. rice is the chief crop; cotton of several kinds is grown in considerable quantities both above and below the Ghauts, and almost all the tobacco that supplies Malabar comes from this distr. There are altogether about 579,700 acres of pasture land; cattle and sheep numerous. Chief mineral products, salt and nitre, which are occasionally obtained from certain earths impregnated with muriates and nitrates abundantly scattered throughout the distr. In 1818, an aquamarine mine was opened and worked. Weaving is the only art that has attained any perfection. Some of the towns are large and well built; but, excepting in these, mud cottages with red tiled or thatched roofs are almost the only houses. The peasantry, however, are contented, and enjoy comparative comfort. Pagodas or temples are not numerous; and excepting that of Peowra, a little W. of the cap., which contains some well-carved granite figures, they have little notoriety. The areas in front of most of them are ornamented with gigantic groups in pottery covered with chunam of caparisoned horses, elephants, and grotesque figures. Near the Ghauts the ox is adored, and every village possesses one or two bulls, to which weekly or monthly worship is paid. The prov. became subject to the Mysore rajahs nearly 200 years ago, and to the British in 1799. It was greatly depopulated by an epidemic fever, which prevailed from 1809 to 1811.

COIMBATOOR, an inl. town of S. Hindostan, cap. of the above distr. and seat of a collector of revenue under the Madras presid., in an elevated situation on the N. bank of one of the affluents of the Cavery, 90 m. SSE. Mysore, and 270 m. SW. Madras; lat. 10° 52′ N., long. 77° 5′ E. It is tolerably well built, and has a mosque erected by Tippoo, who sometimes resided here. The water is brackish, and 2 m. off both salt and nitre are procured by lixiviating the soil. Five m. to the N. iron is smelted from black sand. Peowra, not far distant, has a temple dedicated to Siva, highly ornamented with Hindoo figures, but destitute of elegance, which was spared by Tippoo when he demolished most other idolatrous buildings. In 1783 and 1790 Coimbatoor was taken by the British, to whom it has permanently belonged since 1799.

COIMBRA, a city of Portugal, prov. Beyra, cap. distr., and see of a bishop, partly on a steep rocky precipice, and partly on a plain contiguous to the Mondego, 115 m. NNE. Lisbon, on the railway from Lisbon to Oporto. Pop. 15,710 in 1858. The town was fortified at a very early period, and has undergone many sieges. The ancient walls and towers still remain, and form its only defence. It has an imposing appearance when seen at a distance, the summits of the adjoining heights being crowned with convents and public buildings; but the interior of the town by no means corresponds with the exterior view, the streets being narrow, steep, crooked, and dirty. The principal public building is the university, the only one in Portugal, transferred thither from Lisbon in 1306. It consists of eighteen colleges, and is divided into six faculties, viz. those of theology, the canon law, civil law, medicine, natural philosophy, and mathematics. It has also attached to it grammar schools, with schools of philosophy and rhetoric, ecclesiastical and civil colleges or seminaries, and a royal college of arts, at which those who intend entering at the university complete their preliminary studies. Different degrees are taken in the respective faculties, the student applying himself principally to the particular branch most connected with his intended profession, which, as Lord Caernarvon sur-

mises, is probably an improvement upon the English system of college education, where the same degree is taken by all, without reference to the nature of their future occupations. (Caernarvon's Portugal and Galicia, i. 42.) The collection of subjects of natural history is tolerably good, the observatory complete, and the instruments in perfect order, the greater part having been made in London and Paris. The present system of education was introduced by the Marquis Pombal, in 1773; it is, however, indebted, for various improvements in the course of study, to Englishmen, who have been instructors; but, with all this, it is still very far behind; and many important branches of knowledge are either not taught at all, or are taught in the worst possible manner. The university is extremely well endowed; and the inferior class of nobles are sometimes competitors for the vacant chairs. The annual expenses of the students do not exceed 50*l.* each, any excess being defrayed from the revenues of the institution. The library consists of three large saloons, containing about 30,000 vols., but they are nearly all of ancient date. The College of Arts, which formerly belonged to the Jesuits, is a remarkably handsome building. The monastery of Santa Cruz, an immense Gothic building in the worst taste, belongs to the order of Augustines, who, in addition to numerous important privileges, enjoy the right of appointing their prior to the office of chancellor of the university. The monks are, for the most part, of noble descent and polished manners, and are often seen mounted on fine horses splendidly caparisoned, being forbidden by the regulations of the monastery to appear on foot beyond its walls. (Lord Caernarvon, i. 43.) On a hill opposite to the town is the superb convent and church of the nuns of St. Clara. Besides these public buildings, there are the cathedral and eight churches, five of which are collegiate, with several other convents, hospitals, &c. There is a fine stone bridge over the Mondego, whose bed, which is progressively rising, is nearly dry in the summer, while in the winter it becomes an impetuous torrent, and overflows the surrounding country. The town it well supplied with water, conveyed to it by an aqueduct. Near Coimbra, on the S. bank of the river, is the *Quinta das Lagrimas*, or Villa of Tears, the residence of the beautiful Inez de Castro, whose murder forms the subject of the fine episode in the third book of the 'Lusiad.' Earthenware of good quality is produced here, with woollen and linen cloths.

Coimbra is said to occupy the site of *Comimbrica*, founded by the Romans 300 years B.C. It suffered severely by the earthquake of 1755, and was a scene of great distress in 1810, when the Duke of Wellington retreated on the lines of Torres Vedras.

COLABBA, an island on the Malabar or W. coast of Hindostan, immediately S. the Island of Bombay, with which it is connected by a causeway, and on which a fine lighthouse and cantonments for the British troops have been erected. (See BOMBAY.)

COLAPOOR, a small rajahship of Hindostan, in the presidency of Bombay, partly above and partly below the W. Ghauts, including the towns of Colapoor, Panellah, Mulcapoor, and Culgong. The rajah of Colapoor is descended from the eldest branch of the family of Sevajee, the founder of the Mahratta empire. He formerly possessed Malwan, and some other ports on the Malabar coast; but his subjects being notorious for piracy, the British compelled him to cede these places in 1812; and in 1829 assumed the government of the country.

COLAPOOR, an inl. town of Hindostan, cap. of the preceding distr., in a valley surrounded on three sides by hills; 125 m. SSE. Poonah; lat. 16° 19′ N., long. 74° 25′ E. It has a citadel; but its chief protection is in two hill forts in the vicinity. The town is neatly built, and contains some lofty trees, gardens, and good tanks.

COLBERG, a fortified sea-port town of Prussia, reg. Coslin in Pomerania, on the Persante, near where it falls into the Baltic, and on the terminus of the railway from Berlin to the Baltic Sea. Pop. 11,760 in 1861, exclus. of a garrison of 1,678. The principal public buildings are the cathedral, townhouse, and the aqueduct for supplying the town with water. There is in the ancient ducal castle a foundation for the daughters of nobles and burgesses. It has a gymnasium, a house of correction, and some manufactures; but its salmon and lamprey fisheries, and its shipping, are the principal sources of wealth. There are salt springs in the vicinity; but, owing to the want of coal and timber, they are of comparatively little use.

COLCHESTER, a parl. bor. and river port of England, co. Essex, div. Colchester, hund. Leyden; 50 m. NE. London by road, and 51¼ m. by Great Eastern railway. Pop. 23,809 in 1861. The town stands on the declivity of a hill rising from the Colne, which cuts off a small suburb. It is well built, has several good streets, is paved, lighted with gas, and adequately supplied with water. Great improvements in its interior have been effected, and are still going on. There are three bridges over the river. A part of the remains of the ancient castle, said to have been founded by Edward the Elder, is occasionally used as a prison. There are eight parish churches: St. Peter's, built previously to the Conquest, has been modernised and enlarged; St. James's dates previously to Edward II., and is a handsome structure; St. Leonard's is also large and convenient: besides these, there are a French and a Dutch Protestant church, and nine dissenting chapels. The remains of the church of St. Botolph's priory, founded in the early part of the 12th century, are said to afford some of the finest specimens of Norman architecture in the kingdom.

Colchester has a free grammar school, founded in the 26th of Elizabeth, with one scholarship in St. John's college, Cambridge, annexed to it; two others, in the same college, revert to this school on failure of applicants of the surname of Gilbert (that of founder) or Torbington; and four founded in Pembroke college, Cambridge, on failure of any boys being sent from the Ipswich grammar school. It educates from thirty to forty scholars; two charity schools, founded in 1708, have been joined to the national school, in which about 400 boys are educated, of whom 148 are clothed by the charity; a Lancastrian school, and an endowed school founded in 1816, for children of Quakers, with a library attached to it. The principal charitable institutions are, a hospital, founded by James I.; several almshouses; and the Essex and Colchester Hospital, built in 1820. A commodious theatre was erected in 1812; and there are literary and philosophical, medical, botanical, and musical societies, all in a flourishing state. Market-days, Wednesdays and Saturdays: the latter a large corn market; but general provisions are on sale daily in the large and commodious market-place. There are large annual cattle fairs on the 5th and 6th of July, 23rd and 24th of the same month, and 20th Oct. and three following days.

Colchester is a bonding port, but the foreign imports are comparatively insignificant; they consist chiefly of wine, oil-cake from Holland, and timber from the Baltic. The trade coastwise is more extensive, the imports being chiefly colonial

produce, and home manufactures, from London; with coals, &c. from the northern counties: the exports, corn and malt. The river is navigable for vessels of 150 tons to 'The Hythe,' a little below the town, where there is a custom-house and commodious quay, warehouses, and bonding, coal and timber yards; larger vessels (chiefly colliers) discharge at Wivenhoe, still lower down, into lighters. On Jan. 1, 1864, there belonged to the port, or rather river, exactly 300 vessels; but of these no fewer than 202 were under 50 tons burden; and their aggregate tonnage and that of the 98 vessels of above 50 tons, amounted to only 16,168 tons. The oyster fishery of the river has been long celebrated, and was granted to the burgesses by Richard I.; it employs a considerable number of the inhab., and a large proportion of the small craft belonging to the town. There is a large distillery at Hythe. A silk manufactory in the town employs between 300 and 400 hands, chiefly females. The weaving of baize (introduced by the Flemings in the reign of Elizabeth) used formerly to be carried on to some extent, but has wholly ceased. At present, the prosperity of the town mainly depends on its retail trade, by which an extensive agricultural district is supplied. During the last war a large military establishment was stationed here, the withdrawal of which caused some deterioration to the borough. Under the Municipal Act its boundaries are contracted to an area of about 2,000 acres immediately round the town; and it is divided into two wards, and governed by a mayor, six aldermen, and eighteen councillors. Borough revenue 3,670*l.* in 1862, of which about one-fourth from rates.

Colchester has (with some interruption) returned two mem. to the H. of C. from the 23rd of Edward I. Previously to the Reform Act the right of election was vested in the free burgesses not receiving alms. The parl. bor. (co-extensive with the ancient liberties) extends over a space of 11,770 acres, divided by the Colne into two nearly equal parts. Number of registered electors, 1,314 in 1862, of which 413 are freemen. Ann. val. of real prop. assessed to income-tax 66,320*l.* in 1857, and 85,727*l.* in 1862.

Colchester has claims to high antiquity, and is supposed by some to have been the *Camelodunum* of the Roman period, though this has been disputed. There is, however, no place in the kingdom where more numerous Roman remains have been discovered. It had many monastic institutions previously to the Reformation; of these, St. John's Abbey, of which the noble gateway is the sole relic, was the chief.

Colchester was made the seat of a suffragan bishop in the 26th Henry VIII. There were two consecrations only, the first in 1536, the other in 1592; on the death of the last diocesan, in 1607, no successor was nominated. In 1648 the town was held by insurrectionary royalists, and endured a siege, by Fairfax, of eleven weeks, when it was starved into surrender, and the leaders hung: half the fine subsequently levied appears to have been paid by Dutch refugees, who had escaped from the Duke of Alva's persecution. It gives the title of baron to the Abbot family.

COLDSTREAM, one of the border towns of Scotland, co. Berwick, on the Tweed, 14 m. SW. Berwick-upon-Tweed. Pop. 1,834 in 1861. Formerly the communication between England and Scotland was here effected by a ford, by which Edw. I. entered the latter with a powerful army in 1296; and it continued to be the chief passage for the Scottish and English armies till the union of the crowns in 1603. It was by this ford, also, that the Covenanters entered England in 1640. A bridge of five arches spans the river, which formed one of the greatest thoroughfares between the two kingdoms previously to the construction of railways. At present, the iron roads have completely thrown the old highway into the shade, and Coldstream bridge lies silent and deserted. The town is irregularly built, and quite Scotch in appearance. It has a weekly corn-market, and a monthly sheep and cattle market, both of considerable importance. There is a par. church and two Presbyterian dissenting chapels, three subscription libraries, and four friendly societies. The means of education are good. General Monk resided at Coldstream in 1659–60, previously to his going to England and effecting the Restoration. During his stay here, he raised a horse regiment, to which he gave the name of the 'Coldstream Guards,' which name the regiment still retains.

COLERAINE, a marit. town and parl. bor. of Ireland, prov. Ulster, co. Londonderry, on the Lower Bann, 4 m. from its mouth, and 47 m. NNW. Belfast, on the railway from Belfast to Portrush. Pop. 4,851 in 1821; 6,143 in 1841; and 5,631 in 1861. The town was built and fortified by the Irish Society of London, to whom the district was granted by James I., in 1613. The town consists of a square, called the Diamond, a main street, and several others, in which are many well-built houses. A wooden bridge, constructed in 1716, and renovated in 1743, connects it with the suburb of Killowen or Waterside, on the W. bank of the Bann. The par. church is a large plain building. The Rom. Cath. chapel, an elegant structure, is in Killowen. The other places of worship are, two for Presbyterians, and one each for Methodists, Independents, and Seceders. The manufactures in the town and immediate neighbourhood are trifling; a few paper-mills and some small tanneries. It has an endowed school, built by the Irish Society; a town-hall, with a dispensary, loan fund, and a mendicity association. The corporation, consisting of a mayor, 12 aldermen, 24 burgesses, and an unlimited number of freemen, is become extinct; and its property is now vested in commissioners. Its jurisdiction extended over the town and liberties, the limits of which were fixed by the charter at 3 m. in every direction from the centre of the town. The town returned two members to the Irish H. of C. until the Union, since which it has sent one member to the Imperial H. of C. Registered electors, 274 in 1865.

There are numerous bleach-greens in the neighbourhood. The salmon and eel fisheries on the Bann, in the vicinity of the town, are valuable. The principal trade is in the export of corn and meal, provisions, including pork, and linens of a fine kind, called 'Coleraines.' The entries at the port, in the year 1863, comprised six British vessels, of 1,338 tons, and three foreign vessels, of 709 tons. The customs duties received amounted to 7,561*l.* in 1859; to 7,941*l.* in 1861; and to 6,168*l.* in 1863. Formerly, the trade of the town was much impeded by the bar at the mouth of the river, which had but 9 ft. water over it at springs, and 5 at neaps; but this defect has been in a great degree obviated by the formation of a harbour at Portrush, 4 m. NE. from the mouth of the Bann, in which vessels drawing 17 ft. water may anchor, being sheltered by a projecting rock from the swell of the ocean. The outlay on this harbour amounted to about 13,000*l.*; and it affords great facilities to the trade of Coleraine, there being also a railway from the town to Portrush.

COLESHILL, a town and par. of England, co. Warwick, Birmingham div., hund. Hemlingham; 116 m. NW. London by London and North West-

ern railway. Pop. of par. 2,053 in 1861. The town derives its name from its being situated on a hill, near the Cole. It has a handsome Gothic church with a lofty spire, several good houses, and a school supported out of lands purchased by the inhab. after the dissolution of the monasteries.

COLLUMPTON, or CULLOMPTON, a town and par. of England, co. Devon, hund. Hayridge, 12 m. NE. Exeter, and 181¼ m. W. London by Great Western railway. Pop. of town 2,205, and of par. 3,185 in 1861. The town is situated in an extensive vale beside the Culm, a tributary of the Exe, and consists of one large street, along the road from Exeter to Bath, and of several smaller streets diverging from it on either side; many of the houses are ancient, and some of them favourable specimens of their day. The church, originally collegiate, is a spacious structure, in the later pointed style, with a lofty and highly ornamented tower, and a beautiful chapel attached. There are seven dissenting chapels; a national school, in which above 200 boys and girls are educated; with other schools, and several extensive charities. Market, Saturdays; fairs, first Wednesdays in May and Nov., for cattle and cloth. There is a woollen mill; and the manufacture of narrow woollen cloths and serges employs a considerable portion of the pop., though the business has much declined. There is also, in the immediate vicinity, a paper-mill, two large flour-mills, and four tan-yards. A monthly session for the district is held in the town.

COLMAR (an. *Columbaria*, or *Colmaria*, a city of France, dép. Haute Rhin, of which it is the cap., in a fertile plain, on the banks of two tributaries of the Ill; 36 m. NNE. Strasbourg, and 234 m. ESE. Paris, on the railway from Strasbourg to Mulhouse and Basel. Pop. 22,629 in 1861. The city was fortified previously to 1673, when Louis XIV., having taken it from Germany, destroyed its defences, and united it to the dominions of the French crown. The city is now surrounded only by *boulevards*, planted with trees, and serving for public walks. It is tolerably well built, but contains few public edifices deserving of notice. The principal are the cathedral, built in 1363, the theatre, and prison. The other public buildings and establishments are the hall of justice, city hall, prefecture, college, with a public library containing 60,000 vols. and several paintings by Albert Durer and others; the deaf and dumb asylum, civil and military hospitals, church of the Dominican convent, now a corn-hall, Protestant church, and museum, containing, amongst other curiosities, a remarkable aërolite, which descended near Ensisheim in 1492, and originally weighed 260 pounds.

Colmar is environed by pleasant walks, gardens, and country houses; and possesses an orangery and departmental nursery grounds. It is the seat of a royal court, and of tribunals of primary jurisdiction and commerce. It has numerous manufactures of cotton stuffs and printed goods, a large cotton and silk ribbon factory, besides others of cutlery, paper, brushes, combs, and leather; and an extensive trade in iron, spices, drugs, and wine, which, with its manufactured goods, it exports largely to Switzerland. The *Columbaria* of the Romans is believed to have replaced the more ancient *Argentuaria*. This town was several times destroyed by the barbarians, and in after times suffered greatly during the wars between the houses of Hapsburg and Nassau. The Swedes took it in 1632.

COLMENAR DE OREJA, a town of Spain, prov. Madrid, 13 m. ENE. Aranjuez. Pop. 4,833 in 1857. The town contains a fine church, two convents, and two hospitals; and is finely situated in a plain productive of wine, oil, and fruit. It has manufactures of woollens, pottery, and Spanish rush; and mill-stones, and fine white stone for building, are found in the vicinity.

COLNE, a market town and chapelry of England, co. Lancaster, hund. Blackburn, par. Whalley, on the Colne, an affluent of the Calder; 26 m. N. Manchester, 15 m. NE. Blackburn, and 238¾ m. N. London, by London and North Western and Midland railway. Pop. 7,906 in 1861. This is a place of great antiquity; but antiquaries are undecided whether it be the *Colunio* of the Romans, or the *Culme* of the Saxons. Many Roman coins have been found here; and Castor Cliff, about 1 m. distant, retains evident traces of a military station, having a regular quadrangular rampart, surrounded by a fosse. The town is situated on an eminence, on a tongue of land formed by the river and the Leeds and Liverpool canal, which passes through a tunnel about 1 m. from the place, and is surrounded by the fine grazing district of Craven. It is a brisk second-rate town, and has of late years been greatly improved. It is well supplied with water by pipes from Flass spring, 2 m. E. The parochial chapel of St. Bartholomew, supposed to be coeval with the reign of Henry I., but repaired in that of Henry VIII., and more recently in 1815, is said to be a 'spacious and decent building.' The Methodists, Baptists, Independents, and Inghamites, have places of worship. A gallery in the first named of these gave way in 1777, from the pressure of the crowd assembled to hear John Wesley, the founder of the society, preach on its opening; but though many were injured by the accident, no lives were lost. A free grammar-school, rebuilt in 1812 by subscription, on the site of one more ancient, educates six boys: Archbishop Tillotson was a pupil in it. The co. magistrates hold sessions here, and a constable for the gov. of the place is chosen annually by the rate-payers. The lord of the manor holds a court baron, and courts leet or halmote are held in May and Oct. This is one of the most ancient seats of the woollen manufacture: a fulling-mill existed in 1311, and about the same period a coal-mine was worked in the vicinity. In addition to the woollen fabrics, shalloons, calamancoes, and tammies, were made in considerable quantities; and a piece-hall, on the principle of those at Bradford and Halifax, was erected in 1775. It is a substantial stone building, containing two rooms, each 162 ft. by 42 ft. The upper room has been used for the sale of woollens during the fairs, and, owing to the decline of the worsted trade, the whole building is now thrown open for the sale of general merchandise on the same occasions. The cotton trade having been introduced towards the close of last century, has nearly superseded the woollen trade, and the pop. is now principally employed in manufacturing cotton goods for the Manchester market. The spinning power is chiefly water supplied in abundance from the streams, steam-engines being used to obviate their occasional failure. The first power-loom was introduced into the district in 1832. The canal already noticed affords a ready mode of conveyance for the coal, slate, lime, and stone raised here. Markets on Wednesday: fairs, March 7, May 13 and 15, Oct. 11, Dec. 21; also a fair on the last Wednesday of the month for cattle and cloth.

COLOGNE, or COLN (Germ. *Köln*), an ancient and celebrated city of Prussia, formerly the cap. of the electorate of the same name, and now of the Rhine prov., and of a reg. and circ. of the same, on the left bank of the Rhine, and at the junction of the great lines of railway from Berlin

to Paris, and from Amsterdam to Frankfort-on-the-Mayn. Pop. 120,568 in 1861, exclusive of a garrison of 7,485. The city, one of the most flourishing in the Prussian dominions, is connected by a fine bridge built of stone, as well as by a bridge of boats, with the town of Deutz, on the opposite side of the river. It is built in the form of a crescent, close to the water; and is strongly fortified. The walls have a number of towers *à la Montalembert*, and form a circuit of nearly 7 m.; but a part of the included space is laid out in promenades and gardens. Though finely situated on the banks of a noble river, on a slightly elevated ground, Cologne has many wood houses, and is ill-built, having been laid out in the Middle Ages, when the object of architects was more directed towards defence against external enemies than interior comfort and beauty. The city has a great many interesting buildings, chief among them the cathedral or minster of St. Peter, a vast and imposing but incomplete Gothic edifice, begun about the year 1248. It is about 400 ft. in length, and the choir rises to the height of 180 ft. To complete the vast structure and add to it a suitable tower, has been the object of all Germany for the last forty or fifty years, and large sums have been collected for the purpose. The church of St. Mary is remarkable for its antiquity, and that of St. Peter for the famous altar-piece painted by Rubens. Several of the other churches are also interesting, particularly that of St. Gereon. The town-house is a fine old building. The hall for the courts of justice was erected in 1824. In the arsenal are preserved many curious specimens of ancient armour. Cologne is the seat of an archbishopric, of the provincial authorities, and of the courts of appeal for the province. Its university, established in 1388, was suppressed during the occupation of the country by the French. The city has two gymnasiums or colleges—one for Catholics, to which is attached a very valuable library, and one for Protestants; there is besides an archiepiscopal seminary for the education of clergymen, a normal school, a commercial school, a public library, with numerous literary institutions, and a theatre. Manufactures important; they consist principally of cotton yarn and stuffs, woollen stockings, bonnets, silks, velvets, tobacco, soap, hats, lace, thread, and clocks. There are tan-works and several distilleries, the most esteemed product of the latter being the well known *eau de Cologne*. The city has a very good port on the Rhine, and is the principal entrepôt of the extensive and increasing commerce between the Netherlands and the countries included within the German customs' union. Rubens was born in Cologne in 1577, and several of its churches are ornamented with his *chéf-d'œuvres*.

Cologne was anciently called *Oppidum Ubiorum*, from its being the chief town of the Ubii, a German tribe. A Roman colony was planted in it by Agrippina, the daughter of Germanicus, who was born in it; hence it obtained the name of *Agrippina Colonia*, and latterly of *Colonia* and Cologne. (Tacit. Annal., lib. xii. § 27; Cellarii Notit. Orbis Antiqui, i. p. 327.) In the middle ages, Cologne was much more populous and wealthy than at present. It was for a lengthened period one of the most important cities belonging to the Hanseatic League. It suffered much at different periods from the intolerance of its magistrates, by whom all Protestants were expelled from the city in 1618.

COLOMBIA, a vast territory of S. America, formerly one country, but, since the year 1831, divided into the states of Ecuador, New Granada, and Venezuela. The territory occupies the N. part of South America, between lat. 12° 25′ N. and 5° S., and long. 60° and 83° W.; having N. the Caribbean Sea, E. British Guiana and Brazil, S. Brazil and Peru, and W. the Pacific Ocean and the repub. of Central America; length E. to W., 1,320 m.; breadth N. to S., 1,080 m.; area 1,155,000 sq. m.

Colombia is naturally divided into 3 distinct zones, or tracts of country. The first comprises the country between the Pacific Ocean and the Caribbean Sea and the Andes; the second, the mountainous region; the third, the immense savannahs which stretch S. and E. from the Andes to the neighbourhood of the river Amazon, and the mountains which border on the Orinoco. Colombia has as much as 2,000 m. of coast on the Caribbean Sea and the Atlantic, and 1,200 m. on the Pacific. The former is a great deal more indented with bays and inlets than the latter; the principal are the Gulfs of Paria, Maracaybo, and Darien, on the Caribbean Sea; with Panama, Choco, and the Gulf of Guayaquil, on the Pacific. Several islands belonging to Colombia surround its coast; as those of Margarita, Tortuga, &c. (Venezuela); I. Rey, Quito, &c. (N. Granada); and Puna (Ecuador). (Hall's Colombia, &c., pp. 26-28; Mod. Trav., xxvii. 7, &c.)

Mountains.—The great Cordillera of the Andes enters the prov. of Loxa from the S., between lat. 4° and 5° S.; in 2° 23′ S., where it is nearly 15,000 ft. in height, it divides into two parallel ridges, in the elevated valley between which, 9,000 ft. above the level of the sea, Quito and other towns are situated. E. of this valley rise the summits of Copaurcu, 16,380, Tunguragua, 16,720, Cotopaxi, 17,950, and Guyambu, 18,180 ft.; and on its W. side, those of Chimborazo, 20,100, Henisa, 16,302, and Petchincha, 15,380 ft. high; all covered with perpetual snows, from amidst which torrents of flame and lava have frequently burst, and desolated the surrounding country. These two ranges afterwards unite, but near 1° N. again separate, enclosing the lofty valley of Pastos, bounded by the still active volcanoes of Azufsal and Gambal, and the extinct one of Chiles. Beyond Pastos, the Cordilleras consist of three ranges, the most W., the elevation of which is generally less than 5,000 ft., follows the coast of the Pacific, and terminates in the Isthmus of Panama; the central range is interposed between the valleys of the Cauca and Magdalena rivers, and terminates near Mompox, between lat. 9° and 10° N.; and the third, being the most E. and highest range, extends to the extremity of the Parian promontory, in long. 62° E. This last-named range divides the waters which flow into the Orinoco on its E., from the Magdalena, Zulia, Tocuyo, &c., and their affluents, on its W. side. Many of its summits reach above the limit of perpetual snow; and it has numerous lower summits, called *paramos*, which rise to 10,000 or 12,000 ft. above the level of the sea, and are constantly enveloped in damp and thick fogs. The city of Bogota, 8,100 ft. above the sea, is built on a table-land formed by this mountain range; as are the towns of Nirgua, San Felipe el Fuerte, Barquesimeto, and Tocuyo; but these are at a much lower elevation than Bogota, the mountains decreasing in height very considerably N. of Merida. The mean elevation of the Andes in Colombia is about 11,100 ft.; their altitude is greatest near the equator. In Venezuela, between the parallels of 3° and 7° S. lat., there is another mountain system, unconnected with the Andean, from which it is separated by the Orinoco and the plains of Caraccas, Varinas, and those in

the E. parts of New Granada. This system has been called the Cordillera, or Sierra of Parima. It is less a chain than a collection of granitic mountains, separated by small plains, and not uniformly disposed in lines; its mean height is not above 3,500 ft., although some summits rise to upwards of 8,000 ft. above the level of the sea. (Humboldt's Pers. Narr. and Researches; Hall's Colombia, pp. 2–6; Mod. Trav., vol xxvii.)

Plains.—Colombia includes the most northerly of the three great basins of the S. American continent, the *Llanos* of Varinas and Caraccas; which, like the *Pampas* of Buenos Ayres, consists of savannahs or steppes devoid of large trees. These, in the rainy season, appear from the high lands as a boundless extent of verdure, but in time of drought they are a complete desert. Humboldt remarks, that 'there is something awful, but sad and gloomy, in the uniform aspect of these steppes.' 'I know not,' he says, 'whether the first sight of the *Llanos* excites less astonishment than that of the Andes. The plains of the W. and N. of Europe present but a feeble image of these. All around us the plains seemed to ascend towards the sky; and that vast and profound solitude appeared like an ocean covered with sea-weeds.' The chief characteristic of these steppes, like those of N. Asia, is the absolute want of hills and inequalities. An uninterrupted flat of 180 leagues extends from the mouths of the Orinoco to Araure and Ospinos; and from San Carlos to the savannahs of the Caqueta for 200 leagues. This resemblance to the surface of the sea strikes the imagination most powerfully where the plains are altogether destitute of palm-trees, and where the mountains of the shore and of the Orinoco are so distant that they cannot be seen. Occasionally, however, fractured strata of sandstone, or compact limestone, stand 4 or 5 ft. higher than the plain, and extend for three or four leagues along it; and convex eminences, of a very trifling height, separate the streams which flow to the coast from those that join the Orinoco. The phenomena of the *mirage*, and the apparitions of large lakes, with an undulating surface, may frequently be observed. These savannahs are watered by the numerous streams which form the Meta, the Apure, and finally the Orinoco; and the periodical overflowings of which convert the whole country, during four months of the year, into an inland sea. The equally well-watered plains of Ecuador are intersected by numerous large branches of the Amazon, and form a part of the great central basin of the continent. (Humboldt's Pers. Narr.; Hall, p. 8; Mod. Trav., pp. 19–21, 226–230.)

Rivers.—The chief are the Amazon, which, in the earlier part of its course, runs almost entirely through Ecuador, near its S. border; and the Orinoco, which, together with all its branches, is wholly included within the territories of Venezuela and New Granada. Besides these, there are the Magdalena, Cauca, Atrato, Zulia, Tocuyo, and Guarapiche, whose waters go to the Caribbean Sea; the Patia, Mira, Esmeralda, and Guayaquil rivers falling into the Pacific; the Yapura, Putumayo, Napo, Piguena, Pastaça, Marona, Santiago, Huallaga, &c., affluents of the Amazon; the Guaviare, Meta, Arauca, Apure, with its numerous branches, Ventuari, Caura, and Carony, which discharge themselves into the Orinoco; and the Cayuni, which passes into the territory of British Guiana.

Lakes.—The most considerable is that of Maracaybo, which is rather a kind of inland fresh water sea, and communicates with the gulf of the same name by a channel about 2 leagues broad and 8 long. (See MARACAYBO.) The lake of Valencia, which is the next in importance, is larger than that of Neufchatel in Switzerland: there are others, both in the plains and in the mountainous regions; the most celebrated of them is that of Guatavita, not far from Bogota, into which, it is affirmed, large sums were thrown by the natives during the period of the Spanish conquests. Some extensive salt marshes are to be met with in different parts of the NW. coast. (Mod. Trav., vol. xxvii.; Account of Colombia, pp. 19–25.)

Minerals.—The Cordilleras teem with metallic wealth; and, though imperfectly explored, have already produced large quantities of gold, silver, platina, mercury, copper, lead, and iron: the gold is mostly obtained by washing the auriferous soil, and comes chiefly from the provs. of Choco, Antioquia, and Popayan; silver is found in the prov. of Pamplona and the valley of the Cauca; platina, on the coast of the Pacific; mercury and cinnabar, in several parts, as well as lead; and iron and pit-coal in abundance near Bogota: copper, in great plenty, is found, especially at Aroa, in New Granada. There are mines of rock salt in the mountains NE. of Bogota, and caves producing nitre near the lake Guavita. Hot sulphureous springs abound in several parts; those of Las Trincheras, about 10 m. from Valencia, are believed to be the hottest hitherto discovered, excepting those of Urijino in Japan. Colombia abounds in stupendous natural wonders: amongst the rest are the natural bridges of Icononzo, not far from Bogota; the fall of Tequendama, the loftiest cataract, and the *Silla de Caraccas*, the loftiest cliff yet discovered. (Humboldt's Pers. Narr. and Researches; Delabeche's Geolog. Manual, pp. 410, 411; Present State of Colombia, pp. 297–314.)

The *climate* of the country between the Cordillera and the Caribbean Sea is extremely hot, and generally unhealthy. In the valley of the Orinoco the heat is also intense; but this tract is not so insalubrious as the sea coast, and is often refreshed by strong breezes. The middle region possesses every gradation of temperature, according to elevation: when at the level of the sea, the thermometer has been found to stand at 115° Fah.; at the height of 4,800 ft. it has descended to 77°; at 8,000 ft. to 50°; at 9,000 ft. high, it becomes extremely cold; and at 15,700 ft. all vegetation ceases. At Caraccas, most rain falls in April, May, and June: Dec., Jan., Feb. are the months of greatest drought. Violent storms, accompanied with thunder and lightning, are frequent at Maracaybo. Earthquakes are very common; many took place at the end of the last century, and one in 1812 overthrew most of the principal towns on the N. coast, with great destruction of human life. Intermittent, putrid, and bilious fevers and dysenteries are the most prevalent diseases on the coast; goitre is nearly universal in the mountainous regions. (Hall's Colombia, pp. 6–10; Account of Colombia, pp. 13–18; Mod. Trav., vol. xxvii.)

Vegetable Products.—The vast forests that line the shores of the rivers, and cover the mountains, abound with fine timber, which would yield a large revenue, if the means of transit to the coast were better. Mahogany, cedars, and an infinite number of woods of great beauty and durability, a very hard species of oak (*Quercus cerus*, Linn.), iron-wood, ebony of various kinds; Nicaragua, Brazil, and numerous other dye-woods; the cocoa and other palms; bananas, plantains, and gigantic mimosas, are found in profusion. Humboldt observes, 'It might be said that the earth, overloaded with plants, does not allow them space enough to unfold themselves. The trunks of the trees are every where concealed under a thick carpet of verdure; and if we carefully transplanted the

Orchidæ, the *pipers*, and the pothos, which a single courbaril or American fig-tree nourishes, we should cover a vast extent of ground.' Venezuela is, generally speaking, more fertile and richly wooded than New Granada. Mangroves and *Cacti* grow thick upon the coast; the tamarind, date, and various other tropical fruits, are nearly every where plentiful, and the *Ficus gigantea* sometimes reaches the height of 100 feet. The cocoa-nut, indigo, cotton, tobacco, yam, and potato, are indigenous to Colombia, as are vanilla, cassia-fistula, cochineal, &c.: the prov. of Loxa and Mariquito are famous for their cinchona bark; cusparia, sarsaparilla, sassafras, squills, storax, and a multitude of other medicinal plants, gums, resins, and balsams, are natives of this country. Arborescent ferns of an enormous size are met with; and the earth in some parts is covered with gramineous plants occasionally 30 ft. high. (Humboldt's Pers. Narr. and Researches; Mod. Trav.; Hall's Colombia, pp. 30, 31, &c.; Account of Colombia, pp. 144–153.)

Animals.—Nature has been equally prodigal of animal as of vegetable life. Jaguars, tapirs, wild horses, hogs, deer in immense numbers, wild dogs, and monkeys of different kinds, are amongst the most common quadrupeds; as vultures, parrots, and parroquets, in large flocks, macaws, scarlet cardinals, flamingoes, pelicans, and an abundance of water-fowl, are plentiful among birds. Immense alligators inhabit the larger rivers and llanos, where, together with large serpents of various kinds, they lie buried in the mud during the dry season, and revive at the first appearance of the rains. The rivers and lakes are well stocked with fish; and the stagnant pools in the llanos abound with the gymnotus, or electrical eel. (For a description of this remarkable animal, see Humboldt's Pers. Narr., 345–377; or Mod. Trav., xxvii. 233–237.) Scorpions, millipedes, scolopendras, termites, mosquitoes, and myriads of other insects abound: the pearl oyster inhabits several parts of the coast.

Agriculture.—Cocoa, coffee, cotton, indigo, sugar, tobacco, hides, cattle, and Brazil-wood, are the principal articles of culture and commerce: the grain, and the nutritious roots known in the West Indies by the name of ground provisions, are produced only in sufficient quantities for home consumption. Maize is grown every where, and, when ripe, is pounded in wooden mortars into a coarse meal, there being no more perfect machinery for grinding it. Wheat is grown on the higher lands, especially in New Granada, where it succeeds as well as in England, and often yields 40 bushels an acre: two crops may be produced in a year. A substitute for bread is found in *cassava*, which is procured, by a process similar to that for making starch, from the yuca root: the plantain is to the mass of the natives what the potato has become to the poor of Ireland; the rice of Colombia is indifferent. Cocoa (properly the *cacao* nut) is principally grown in Venezuela, on the low rich soil of the coast, in Varinas, and near Guayaquil. It does not come into full bearing till after eight or nine years' growth; but, after that, continues in produce from 20 to 30 years, bearing two crops a year, with little trouble or expense. The cultivation of cacao has however diminished, that of coffee having been in part substituted for it. Coffee has been introduced into almost all the temperate valleys of Venezuela, and the prov. of Santa Martha and Mariquita in New Granada; but its culture is conducted with less care than in the W. Indian Islands. Its produce and the trade in it have, however, increased rapidly since the revolutionary war, and it now forms by far the greatest article of export. Cotton is grown in all parts of the country; but principally in the valleys of Aragua, and the provs. Cartagena and Maracaybo. The produce is said to be inferior in quality to that from the uplands of N. America, which is in great measure owing to the defective mode generally followed of cleaning and depriving it of the seed. In the prov. Cartagena, the plant is grown upon newly cleared land, between successive crops of maize. Indigo is cultivated principally in the valleys of Aragua and the prov. Varinas, and formerly was exported in large quantities; but the competition in this article, which British skill and capital has produced in Hindostan, materially affects this branch of agriculture. The tobacco of Caraccas is greatly superior to that of Virginia, yielding only to that of Cuba and the Rio Negro; in some places, as at Cumanacoa, it is even superior to the latter. Under the Spanish regime, the culture and sale of tobacco were monopolised by the government. All individuals authorised to raise it were registered, and the entire produce was brought to the government depôts (*estancos*), and sold to its agents at a certain fixed price, who again sold it to the consumer at a large advance. The Colombian congress originally abolished this among other monopolies; but finding that they could not spare the revenue, of which it was productive, it was again revived. The cultivation of the plant had, however, from some cause or other, so much declined, that the revenue derived from the monopoly ceased to be of any material importance; and a law passed the congress for its abolition, on the 1st of June, 1834.

Previously to the arrival of Columbus, the horse and ox were unknown in the New World; but the llanos are now covered with herds of both. M. Depons, in the early part of the present century, estimated that there were, from the mouths of the Orinoco to the lake Maracaybo, 1,200,000 oxen, 180,000 horses, and 90,000 mules; an estimate which Humboldt thought too low. Sheep and goats are plentiful in the table-lands of Bogota; animal food is cheap and much consumed; and hides, wool, and cheese form a principal portion of rural produce. Agriculture generally is in a very low state, and the government have been lately desirous to promote its improvement by encouraging foreign settlers, and disposing of the waste lands to them at a low rate, and exempting them for a period from taxes. Few people possess estates of 5,000*l.* a year; 5,000 dollars are reckoned a good income. Near Pamplona the grounds are surrounded with stone wall hedges, which give an air of proprietorship not often seen; and in the valley of Serinze (New Granada), a similar plan is adopted, and cultivation is in a tolerably advanced stage. Commonly, however, the natural indolence of the natives precludes this, and 'the Colombian who can eat beef and plantains, and smoke cigars as he swings in his hammock, is possessed of almost every thing his habits qualify him to enjoy, or which his ambition prompts him to attain—the poor have little less, the rich scarcely covet more.' In the llanos the indolence of the inhabitants is such that, after having suffered for half the year from inundations, they patiently expose themselves during the other half to the most distressing want of water, though they know that almost every where they may obtain a good supply at 10 ft. below the surface of the earth. The fertility of the soil and the warmth of the climate have, in fact, indisposed and unfitted the people for any vigorous exertion. (Humboldt; Mod. Trav.; Hall.)

Pearl Fisheries.—Along the coast many of the inhabitants subsist as fishermen, bartering the fish

they catch for maize and other inland produce. There are three pearl fisheries; two on the shores of the Atlantic, and one on those of the Pacific. The first are situated on the coast of the islands Margarita, Cubagua, and Coche, and at the mouth of the Rio Hacha; in the 16th century they were much celebrated, and yielded pearls to the value of half a million dollars annually. The pearls of this coast are remarkable for their beautiful play of light, in which they are much superior to those of the East. The other fishery is at Panama: all of them are now much neglected, and do not yield more than 180,000 dollars a year. The Indians of Cariaco have a singular method of catching wild-fowl, which may here be noticed: they leave calabashes continually floating on the water, that the birds may be accustomed to the sight of them. 'When they wish to catch any of these wild fowl, they go into the water with their heads covered each with a calabash, in which they make two holes for seeing through. They thus swim towards the birds, throwing a handful of maize on the water from time to time, the grains of which scatter on the surface. The birds approach to feed on the maize, and at that moment the swimmer seizes them by the feet, pulls them under water, and wrings their necks before they can make the least movement, or, by their noise, spread an alarm among the flock. . . . . Many have no other trade in the neighbourhood of large towns, and daily take multitudes of these birds, which they sell at a low rate.' (Humboldt's Pers. Narr., ii. 271, 276; Present State of Colombia, pp. 322, 323; Hall's Colombia, pp. 28, 29; Mod. Trav., xxvii. 30, 54, 55, &c.)

Manufactures.—Such of these as are not merely domestic are chiefly leather, hammocks, baizes, blankets, coarse cloths of various kinds, hats, and salt; but none of them is of any importance. The principal salt works are at Araya and Santa Martha. The whole process is left to nature, and consists simply in the washing of the muriatiferous soil by the rains, into shallow basins, where the salt is found incrusted, after evaporation, in a state of great purity. The common pottery is rude, and made by Indian women only. At Caripe, oil is manufactured by the Indians, from the fat of young guachero birds; and on the Magdalena, the negroes stuff their pillows with the wool obtained from the fruit of the mahagua (*bombax*). Such expedients often supply the place of better manufactures, all of which must be procured from abroad, and are comparatively scarce and dear. (Mod. Trav.; Humboldt; Hall's Colombia, &c.)

Trade.—The ports of La Guayra, Rio del Hacha, Santa Martha, Cartagena, Chagres, Puerto-Cabello, Panama, and Guayaquil are those most frequented by foreign traders. The value of the imports and exports of the three states of Colombia from and to the United Kingdom, in the years 1861 and 1862, is shown in the subjoined statement:—

		1861	1862
		£	£
New Granada	Imports from	811,304	774,311
	Exports to	826,083	1,615,636
Venezuela	Imports from	9,397	23,767
	Exports to	229,991	411,940
Ecuador	Imports from	95,029	68,608
	Exports to	1,076	10,060

The internal trade of the Colombian states is of no great importance. The want of internal communication is a considerable disadvantage; throughout the whole country there is scarcely a road passable for wheel carriages; and every species of commodity is conveyed on mules. The ways generally are mere tracks, formed by the tread of successive travellers, and even in what were formerly termed royal roads, all that has been done is to cut down the trees. Bridges are few, and except those of Valencia and Capitanejo, consist of only a few rough planks, with branches laid across; or of ropes, upon which a suspended basket is made to run from one end to the other. In the more precipitous and dangerous passes, where mules can scarcely be used, it is customary for travellers to be carried in chairs fastened to the backs of men, who obtain a miserable livelihood by continually exposing themselves to risks, such as those which beset the chamois-hunter. (See ANDES.)

Government is vested, in each of the states, in a senate and a house of representatives, both consisting of members elected by the cantonal deputies of the provinces, in a provisional assembly, held once in four years. In Colombia, previous to its partition, the right of suffrage in the election of deputies required the parochial voter to be a Colombian, above the age of 21, the owner of property worth 100 dollars, or exercising some trade or profession, and able to read and write (this last qualification to be peremptory after 1840). To be a cantonal elector, it was requisite to be a native of the canton, possessed of property worth 500 dols., or an income of 300 dollars: to be a senator, it was necessary to have an income of 500 dollars, or to be of a learned profession. The executive power was vested in a president and vice-president, the former of whom could not continue in office longer than eight years successively; and neither he, nor any of the ministers, could be members of the congress. With some variations, this government has been adopted by the existing states. The political government of each department is, by law, vested in the hands of an *intendente*, appointed by the president, with the sanction of the congress, with authority over the administration of justice, police, finance, and defence; but without the command of an armed military force. The provinces are under the administration of governors, with powers similar to those of the intendente; the cantons and parishes have each their own officers.

The civil and criminal codes are an ill-digested collection of the laws of Castile and of the Indies, royal ordinances and other Spanish decrees, and colonial regulations; and their administration is very unfavourably spoken of. The judges were elected by the congress, from lists given by the president. Trial by jury, and the liberty of the press, were amongst the first enactments of the Colombian congress.

Religion, the Roman Catholic, the ceremonies and festivals of which are celebrated with great splendour. The Inquisition was abolished in 1821; but the clergy still possess considerable power, and though general toleration is afforded to persons of other creeds, they are not at liberty to perform their rites in public. The clergy are paid by the state: convents are still numerous, but diminishing, and dissent from Catholicism is spreading. Many Indians have embraced Christianity.

The ranks of the different armies are filled with Indians and mixed races, in a tolerable state of discipline. In addition to these, there is a militia, consisting of the whole male population between 16 and 40 years of age. Considerable pains have been taken by the states of Colombia to raise a navy; but their maritime force is inconsiderable. A marine school has, however, been established at Carthagena.

During the Spanish regime elementary education was sadly neglected, and all the more impor-

tant branches of useful knowledge professed at the universities of the Caraccas, Bogota, and Quito, were so taught as to be really worse than useless; and instead of expanding and enlightening the mind, served rather to imbue it with the grossest prejudices. But considerable progress has since been made towards the establishment of a better order of things. Primary schools were ordered to be established in every parish, by the congress of 1821; Lancastrian schools exist in the principal towns, and the universities have been remodelled. The Colombian congress applied certain property formerly belonging to the clergy to the aid of public education; and the legislatures of the present republics have been anxious to carry into effect the system adopted by it. Several public journals are established in different parts of the country.

Architecture has made but little progress, and almost the only specimens worth notice are confined to Bogota. Painting is successfully cultivated in that city and Quito, and music in Caraccas; but, generally speaking, the fine arts are in a very backward state. The besetting vice of the Colombians is indolence, which retards all their social progress: they are courteous, hospitable, and, when intimately known, friendly and cordial; temperate in their habits, and grave in their deportment; but suspicious, reserved, slow, and imbued with much national pride. The manners, dress, habits, and amusements of those of European descent resemble those of their Spanish ancestors.

History.—Ecuador, and especially the valley of Quito, contains many monuments of the sway of the Incas. Venezuela was the first part of the new continent discovered by Columbus in 1498. The Spaniards found more difficulty in conquering this than any other part of their American territories; but, before the middle of the 16th century, both Venezuela and New Granada had been erected into captaincies, governed by viceroys from Spain. In 1808, after the invasion of Spain by Napoleon, a spirit of insubordination broke out in these colonies; in 1811, their independence was declared; and, in 1819, Venezuela and New Granada united into one republic, under the name of Colombia. In 1822, the royalists in Ecuador were defeated by Gen. Sucre; Bolivar headed the revolutionists elsewhere; and in 1823 the struggle ended with their complete independence. In 1829, Venezuela separated from the other states; rejoined them for a short period in 1830; but in Nov. 1831 separated anew; since which period Colombia has remained divided into the above three republics. But such is the state of insecurity in which all these governments exist, that it is highly probable that, for the sake of gaining the necessary power to resist foreign aggression, they will, before long, be again consolidated into one united state of Colombia.

COLUMB (ST. MAJOR), a town and par. of England, co. Cornwall, hund. Pyder. Area of par. 11,680 acres. Pop. of ditto, 2,879 in 1861. The town is situated on an eminence, at the foot of which is a small river, 4 m. from the sea, and 14 m. NE. Truro. It had formerly a communication with the sea by means of a canal, now fallen into disuse. It has a large old church, and two methodist chapels. Market-day, Thursday.

COLUMBIA, a distr. of the U. S. of America, lying between the states of Virginia and Maryland, on both sides the Potomac, about 120 m. from its mouth; length and breadth, 10 m. each; area, 100 sq. m. Pop. 75,080 in 1860; and 39,834 in 1830. Surface gently undulating; soil naturally thin, sandy, and sterile. Climate healthy; mean temp. of the cap. about 55° Fahr. The Potomac traverses the distr. chiefly in a SE. direction, receiving in its way through it a tributary from the E., by its junction with which a peninsula is formed, on which the city of Washington is built. At the confluence of the two rivers there is an excellent harbour and a navy-yard, to which ships of the largest tonnage may ascend. The yard covers a space of 37 acres, and in it are made all the anchors, cables, and blocks required for the service of the U. S. navy.

Washington is the cap. of the U. States, the seat of the general government, and the residence of the president and other principal officers of state. (See WASHINGTON.) The other chief towns are Georgetown and Alexandria; the former is separated from Washington by Rock Creek, another affluent of the Potomac. Alexandria is on the right bank of the river, 7 m. below Washington.

Considerable quantities of flour and other domestic produce are brought down the Potomac, but neither the commerce nor shipping of the distr. are of great importance. Alexandria and Georgetown have together about 19,000 tons shipping. There are three colleges in the district, all in active operation:—the Columbia Institute at Washington; the Roman Catholic university at Georgetown; and the theological seminary at Alexandria; connected with which is a medical department, and a preparatory school. The district is under the immediate government of congress. It was ceded to the U. States by Maryland and Virginia in 1790; and in 1801 it was enacted that the laws of these states should continue in force in the portions ceded by each. Congress first met here in 1800.

COLUMBIA, a town of the U. S. of America, cap. S. Carolina, and seat of the state government, in an elevated plain near the centre of the state, near the Congaree river; 100 m. NNW. Charleston, and 68 m. NE. Augusta. Pop. 7,052 in 1862. The streets, which are 100 ft. wide, intersect each other mostly at right angles, and it has many good houses. It has a state-house, court-house, gaol, and several places of worship. The S. Carolina college, founded in this town in 1804, has two large brick edifices, and possesses a philosophical apparatus, cabinet of minerals, and library of 10,000 vols. Here is also a theological seminary, established in 1829. Columbia was founded in 1787.

COLUMBIA RIVER, a large river of N. America, the principal in the Oregon territory, with an extremely tortuous course. It rises in the Rocky Mountains, in about the 51st deg. of N. lat., and the 116th deg. of W. long. Its course is first NW. till about the 53rd deg. lat.; and then nearly S. for about 245 m. till its junction with the Flathead, or Clarke's river. It then pursues a WSW. course, being precipitated over some very high falls, till it reaches Fort Okanegan, in about 48° N. lat. and 120° W. long., when it flows S. to Fort Neperces, a distance of 155 m., where it is joined by the Great Snake river from the SE. After receiving the latter it turns to the W.; and pursuing that direction during the remainder of its course, it falls into the Pacific Ocean, between Cape Disappointment on the N. and Point Adams on the S., in 46° 18′ N. lat. and 124° W. long. Its embouchure is 5 or 6 m. in width. It has not, where deepest, more than from 4½ to 5 fathoms over its bar, on which the sea breaks with considerable violence, making its ingress and egress, to sailing vessels, a work always of considerable difficulty, and practicable only, it is said, at certain seasons. Vessels of 400 tons may ascend the river to Fort Vancouver,

about 100 m. (dir. dist.) from its mouth; and sloops may ascend it for about 80 miles farther. At the Long Narrows, by which the navigation is first interrupted, the river is precipitated over an upper and a lower fall respectively 20 and 8 ft. in height.

COLUMBO, a sea-port town of Ceylon, the modern cap. of the island, and seat of government, on the W. coast, towards its S. extremity; lat. 6° 55′ N., long. 79° 45′ E.: pop. estimated at 60,000. The town has a fort, defended by walls flanked with several bastions, and is built upon a peninsula projecting into the sea, having on the land side a fresh water lake of some size. It contains the residences of the governor and most of the British inhabitants. The *pettah*, or inner town, a few hundred yards E. from the fort, has a mixed pop. of Dutch, Portuguese, and their descendants. The native Ceylonese reside chiefly in the suburbs. The town within the walls is regularly laid out, and built in the European style; houses, chiefly of stone, clay, and lime, are seldom more than a story in height, but each has in front a large wooden verandah. The English have substituted Venetian blinds in their houses for the glass windows used by the Dutch. The fort contains the government house, a handsome building of two stories, the English church, courthouse, library, museum, several hotels, and a lighthouse 97 ft. high. There are also in Columbo a Dutch and a Portuguese church, several Protestant dissenting chapels, with missionary and other schools. To the N. of the fort is a small semicircular bay, on which a wooden quay has been built, but the depth of water is not sufficient to admit of vessels above 100 tons burden coming alongside. The bay is sheltered and defended by a projecting rock on which two batteries are erected; but from this rock a bar of shifting sand stretches across the mouth of the bay, within which the larger class of ships can venture only during the fine weather of the safe season. Besides its small bay, Columbo has an open roadstead, which, however, is safe only during the NE. monsoon: were the town more favoured in this respect, it would be the most eligible port in the island, since it is placed in the centre of the cinnamon country, is the depôt for nearly all the foreign trade of the island, and has a somewhat extensive traffic by means of internal navigation. Columbo is ill supplied with water. Its climate is healthy, though damp and destructive of books, clothing, &c. The Portuguese erected a fort here in the early part of the 16th century, of which the Dutch dispossessed them in 1656; and the town was taken from the latter by the English in 1796, which change of masters was afterwards ratified by the peace of Amiens.

COLUMBUS, a city of the U. States, cap. Ohio, of which it is nearly in the centre, on the banks of the Scioto, immediately above the point where it is joined by the Whetstone river, 100 m. NE. Cincinnati; lat. 39° 47′ N., long. 83° 3′ W. Pop. 18,550 in 1860. The town was founded so late as 1812, the land on which it stands having previously been a wilderness. It is well situated on land rising gradually from the river; the streets, which are broad and straight, cross each other at right angles, being for the most part lined with substantial houses. It has a square which comprises 10 acres; and a convenient wharf extends along the margin of the river. But the navigation of the latter (an affluent of the Ohio) being liable to interruption, the city is united by a canal to the Ohio canal, which opens an easy communication with the lakes on the one hand, and the Mississippi on the other; and its trade is farther promoted by its being on the line of railway from Indianopolis to Zanesville. A bridge across the river unites the city with the suburb of Franklinton. The public buildings comprise a state house, commanding a fine view of the surrounding country; an edifice for the accommodation of the officers of the state; a state penitentiary; a lunatic asylum, and asylums for the blind, and for deaf and dumb persons; a Lutheran theological seminary, and numerous churches. Here, as in the other towns of the U. States, there is ample provision for the education of the young in elementary and superior schools. The town has factories of various sorts, with tanneries, breweries, distilleries, and printing-offices.

COMBOOCONUM, an inl. town of Hindostan, prov. Carnatic, distr. Tanjore, 20 m. NE. that city. Pop. estimated at 40,000. It was anciently the cap. of the Cholas, one of the most ancient Hindoo dynasties in the S. of India of which any traces have been discovered, and who gave their name to the whole coast of Cholamundul or Coromandel. Its ancient splendour is evinced by its pagodas and tanks. It is chiefly inhabited by Brahmins.

COMILLAH, an inl. town of Hindostan, prov. Bengal, distr. Tipperah, of which it is the cap., on the S. bank of an affluent of the Brahmaputra river, 50 m. SE. Dacca. The roads round it have been much improved by the labour of convicts. Six m. W. of Comillah are the remains of many brick buildings, and of a fort 200 ft. square, the residence of the former rajahs of Tipperah.

COMO (CITY OF) (an. *Comum*), a city of Northern Italy, cap. of the province of same name, at the SW. extremity of the Lake of Como, 23 m. NNW. Milan, with which it is connected by railway. Pop. 20,614 in 1861. The city is encircled by an amphitheatre of hills, one of which to the S. is surmounted by the old fort of Baradello. It is defended by double walls, flanked with massive towers, and has four gates. Its interior is crowded with dark streets, numerous old churches, and dismantled dwellings of the *cittadini*. The suburbs, however, in which more than half the pop. resides, contain many good streets and buildings; Borgo de Vico, the chief, stretches along the shore of the lake for a considerable distance, and is adorned with the Odescalchi and Iovian palaces, besides numerous other handsome edifices. Como has 12 churches, the principal of which, the cathedral, commenced in 1396 and finished in 1513, is an imposing building, notwithstanding its incongruous character. It is of white marble, the front is of light and not inelegant Gothic, the nave is supported by Gothic arches, the choir and transepts are adorned with composite pillars, and a dome rises over the centre. In front of the cathedral is a statue of Pliny the younger, a native of Como, with a bas-relief alluding to his writings, and an inscription to his honour on each side the grand entrance. In one of the squares a monument is erected in honour of Volta, also a native of this city. Como possesses a lyceum erected by the French, with some fine philosophical apparatus, and a library of 15,000 vols., an ecclesiastical college, 3 gymnasia, 2 female seminaries, a hospital, workhouse, orphan asylum, and many other charitable institutions, a cabinet of nat. history, and botanic garden, a new theatre, and an amphitheatre. Como is a bishopric, and the seat of the provincial council, and of civil, criminal, and commercial tribunals. At one period it was the principal seat of the Inquisition. It has manufactures of woollen cloths, silks, cotton yarn, and soap, for which latter article it is celebrated. Its trade, which is facilitated by a port on the lake, is chiefly

with the Swiss canton of Ticino, and with Germany, to which it sends rice, and raw and manufactured silks. The artisans of Como have, in all ages, been noted for their disposition to emigrate as hawkers of goods, or in search of employment, and they may be met with all over Europe, as vendors of telescopes, spectacles, and barometers. The fine climate and situation of Como attract many visitors. Como is said to have been founded by the Orobii, the earliest inhab. of this district. It was taken by the Romans 196 B.C.; and owed its principal importance under them to a colony of Greeks planted in it by Julius Cæsar, when it took the name of *Novumcomum*. Near it is the Villa d'Este, once the property and residence of Queen Caroline of England. In the middle ages it belonged to the Ghibelline party, and was the rival of Milan. Under the French it was the cap. of the dép. of the Lario.

COMO (LAKE OF), (It. *Lago di Como*, an. *Larius Lacus*),a famous lake of N. Italy, which, in modern times, has derived its name from the above city. This fine sheet of water is very irregularly shaped, being divided by the triangular district which has Bellagio at its apex, into three great arms, one of which stretches from Bellagio SW. to Como, another N. to Riva and Novate, near the mouth of the Maria river, and a third SE. to Lecco, and the outlet of the Adda. These divisions of the lake are sometimes called from the chief towns on their banks, the lakes of Como, Bellano, and Lecco. Its greatest length, following its windings, may be about 45 m.; but it is no where above 4 m. in width. The depth is said to vary from 40 to 600 ft. It receives the waters of the Upper Adda, and several other rivers, but its only outlet is by the Lower Adda. Owing to the great height of the surrounding mountains, which expose it to sudden squalls, and the influence of currents, its navigation is rather dangerous to sailing vessels; but steamers traverse it in all directions with ease and expedition. The climate round the lake is mild and delightful; and, except in its more N. part, near the mouth of the Upper Adda, its banks are remarkably healthy. Throughout its whole extent its banks are formed of precipitous mountains, from 2,000 to 3,000 ft. high; in some places overhanging the water, and in others partially clothed with wood, and studded with hamlets, cottages, villas, chapels, and convents. The most beautiful point of view is at Bellagio. The upper waters are there seen winding up to the very foot of the higher chain of the Alps, and terminating within a short distance of the terrific pass of the Splugen; the loftier hills that border the lake of Lecco rise on one side, and on the other the wider expanse of the lower lake retires behind the beautiful foreground, rocks, and hanging woods that form the point of Bellagio.

The younger Pliny had several seats on the border of this lake. The principal of these stood, one upon a height commanding a view of the lake, and the other so close to its edge as to admit of fishing lines being thrown into the water from the bed-rooms. (Epist., lib. ix. § 7.) Many attempts, but very unsuccessful ones, have been made to identify the site of these villas. The *Villa Pliniana*, 5 m. NE. from Como, is, from its having near it an intermittent fountain, usually supposed to occupy the site of one of these villas. But Pliny does not say that the intermitting fountain which he describes was on his estate, or near his seat (iv. s. 30); and there is no real ground for supposing that the *Villa Pliniana*, which was built near the middle of the 16th century, has anything in common with either of the villas described by Pliny.

COMORIN (CAPE), a promontory forming the S. extremity of Hindostan, in Travancore, 188 m. NW. Columbo, in Ceylon; lat. 8° 4′ N., long. 77° 44′ 30″ E. Its approaches are beset with rocks. Notwithstanding its remarkable position, it never attracted the least attention from the Hindoo geographers; and, what is more singular, modern authorities differ considerably as to its lat. The above is that given by Heywood.

COMORN (Hungar. *Komarom*), a fortified town of Hungary, in the NW. part of that king., cap. co. of the same name, on a point of land formed by the confluence of the Waag with the Danube; 46 m. WNW. Buda, on the railway from Buda-Pesth to Vienna. Pop. 12,175 in 1858, excl. of garrison. The citadel, built by Mathias Corvinus, in the 15th century, is held to be impregnable, and its works have been so much strengthened during the present century, that it is now one of the strongest fortresses in Europe. The town is irregularly built, and the streets are narrow and dark. It contains 4 Catholic and 2 Protestant churches, a Greek church, and a synagogue, a county hall, town council house, many large magazines and barracks, a hospital, Cath. and Prot. high schools, and an assurance-office for vessels navigating the Danube, which river is here crossed by both a flying bridge and a bridge of boats. It has manufactures of woollen cloths, and considerable trade in corn, wine, honey, fish, and timber, by the Danube. There are numerous vineyards in its neighbourhood.

COMPIEGNE, a town of France, dép. Oise, cap. arrond., on the Oise, which is here crossed by a handsome bridge of three arches; 33 m. E. by S. Beauvais, on the railway from Paris to St. Quentin. Pop. 12,137 in 1861. The town is ill laid out and ill built, but contains many public and private edifices worthy of notice; amongst them the town-hall, a curious Gothic building, and several churches. But the glory of Compiegne is its royal palace, one of the most remarkable in France for extent and magnificence. A palace was originally built here by the Merovingian kings; but the present edifice was commenced under Louis XV., finished by his successor, and renovated by Napoleon. It has a noble front towards the forest of Compiegne, 623 ft. in length; all the apartments are on a single floor, communicating with each other. The peristyles, *salles des gardes*, ball-room, theatre, and a superb gallery, are especially deserving of admiration. The gardens surrounding this palace are much more extensive than those of the Tuileries, which they rival in beauty. Compiegne contains a public library with 28,000 vols., and a theatre. It was formerly fortified by walls flanked with towers, and entered by seven gates. Charles the Bald established an abbey here, and gave the town the name of *Carlopolis*, after which it rose considerably in importance, and became the seat of many national councils and assemblies, as well as the burial-place of several of the French kings. But in proportion as the consequence of St. Denis increased under the kings of the third race, that of Compiegne declined. It was at the siege of this place, in 1430, that the famous heroine Joan of Arc fell, through the mean jealousy of the governor, into the power of the English.

COMPOSTELLA, an inl. town of Mexico, state Guadalaxara, 36 m. from the Pacific Ocean, and 100 m. W. by S. Guadalaxara. In its vicinity there are some silver mines; and to the NW. of it, tobacco of a superior quality was formerly grown.

CONCAN, a narrow tract of country, prov. Bombay, comprising a portion of the ancient Hindoo subdiv. of *Kankana*, whence its name. It extends both N. and S. of that city, along the

Malabar coast, between lat. 15° 50′ and 20° 15′ N., and long. 72° 40′ and 73° 54′ E., having N. the collectorate of Surat, and a detached portion of the Guicowar's dom.; E. the distr. Ahmednuggur and Poonah and the Sattarah dom.; from which it is separated by the W. Ghauts; S. a portion of the Sattarah territory, and W. the ocean. Length N. to S. 310 m.; breadth varying to nearly 60 m. The territory is commonly divided into Southern and Northern Concan, the former with an area of 6,770 and the latter of 5,500 sq. m. The general aspect, though there are many fertile tracts, is that of a congeries of steep and rocky mountains, intermixed with a multitude of ravines and chasms, and interspersed with jungle. It formerly abounded in fortified heights, difficult of access, most of which have been dismantled by the British since their conquest of the country in 1819. The coast has a very straight general outline, but is broken by a great number of shallow harbours, which, previously to the British rule, were the resort of numerous pirates. The W. Ghauts, which bound the Concan to the E., rise to the elevation of from 2,000 to 4,000 ft., with an abrupt face towards the W. The passes over them are impracticable for wheeled carriages. They are mostly composed of primitive trap-rocks; but their summits are covered with a thick crust of laterite or ferruginous clay-stone, of which material much of the surface of the Concan is composed. In the S. shelly sand-stone is met with. There are many mountain streams, but none deserving the name of a river. Concan produces all the grains of Malabar, but is chiefly celebrated for its hemp and cocoa-nuts. Oil grains, the sugar-cane, turmeric, ginger, &c., are grown in the S. The land in S. Concan is assessed on the ryotwar, and in the N. on the village system. In some instances ill-cultivated tracts of land are allotted for a term of years at a low rent to a speculator for the purpose of improvement. A large proportion of the inhab. are Hindoos, and *Suttees* (burnings of widows) are said to have been more frequent here than in any other part of India, Bengal excepted. Many Bheels and Coolies inhabit the Ghauts and N. Concan. A large portion of the Bombay native army was formerly, and to some extent is still, recruited from these districts. The Augria family once possessed nearly the whole of Concan; it subsequently belonged to the Peishwa, on whose fall it came into the possession of the British.

CONCEPCION, a city of Chili, in the S. part of the Republic, cap. prov. of same name, on the right bank of the Biobio, 8 m. E. from its mouth, and about 270 m. SSW. Santiago; lat. 36° 43′ 25″ S., long. 73° 5′ 33″ W. Estimated pop. 12,000. It stands upon a low neck of land between the Biobio and the SE. angle of the Bay of Concepçion, and occupies a surface of about a sq. mile. Streets intersect each other at right angles; houses mostly only one story in height in consequence of the great frequency of earthquakes, and many are built entirely of unbaked bricks. Concepçion was formerly a flourishing town, containing several good buildings, and 20,000 inhab.; and, previously to 1835, it possessed a massive cathedral, but this and the greater part of the city were in that year totally destroyed by an earthquake. It is the residence of a bishop and the military governor of the prov. Manufactures and trade are said to be at present of little importance.

The Bay of Concepçion is a large square inlet, open on the N., while the S. and W. sides are formed by a high promontory jutting out from the main land, and bending into the shape of an elbow, each side being 3 or 4 leagues long. The diameter of the space thus enclosed is about 5 m. The mouth is divided by the island Quirinquina, which lies across it, into 2 channels; the N. entrance has 30 fathoms water, diminishing gradually to 12 fathoms in the middle of the bay; the S. entrance has 30 fathoms at its commencement, and 11 fathoms at its entrance into the Talcahuano anchorage. There are 3 harbours; that of Talcahuano, close to the small fortified town of the same name, under the promontory in the SW. angle, is the most secure from winds, and that in which ships generally lie. Full 12 fathoms water are found in all parts of the bay within ¾ m. of the beach; the holding ground is excellent, and the bottom free from rocks.

Concepçion was founded in 1763, after the destruction of the old city of Penco by inundation, during an earthquake.

CONCORD, a town of the U. S. of America, cap. New Hampshire, and seat of the state government, co. Rockingham, on the Merrimac, 63 m. NNW. Boston. Pop. 10,890 in 1860. The town consists chi fly of two streets, extending for above 2 m. along the W. side of the river, which is here crossed by two bridges. It contains the state-house, a handsome stone building, and the state prison. The courts were removed to Concord from Portsmouth in 1823. It is a town of considerable trade, and has a water communication with Boston by means of the Merrimac and Middlesex canal.

CONDE', a town of France, dép. du Nord, cap. cant., at the confluence of the Hague with the Escaut (Scheldt), 25 m. SE. Lille, on the railway from Lille to Valenciennes. Pop. 5,804 in 1861. The town is strongly fortified by works constructed by Vauban: is well built, and contains a handsome town-hall and a fine arsenal. A canal, 15 m. in length, connects Condé with Mons, in the Netherlands. It was taken by Louis XI. in 1478.

CONDE' SUR NOIREAU, a town of France, dép. Calvados, cap. cant., on the road between Caen and Domfront, 23 m. SSW. the former. Pop. 7,234 in 1861. The buildings are generally heavy; the town contains, however, two old churches worthy of notice. It formerly possessed a castle with a large tower, but little now remains of that edifice. It has some commercial activity, and fabrics of woollen, cotton, and linen articles, and cutlery.

CONDOM, a town of France, dép. Gers, cap. arrond., on a height the foot of which is washed by the Baise, which is here crossed by two bridges, 23 m. NW. by N. Auch. Pop. 8,070 in 1861. The town is ill-built, but improving; is surrounded by *boulevards* planted with trees, and has numerous villas in its environs. In its centre is a large open space, in which is the parish church, formerly the cathedral, which, despite the mutilations it has undergone, is still a magnificent Gothic edifice. Pens, corks, earthenware, brandy, woollen yarn, and leather are produced here; and there is a brisk trade in corn, flour, and wines. It has a tribunal of original jurisdiction and a communal college. It owes its origin to a monastery, which existed in the 9th century, but was of a much earlier date. It was formerly the seat of a bishopric, once filled by Bossuet.

CONDRIEU, a town of France, dép. Rhone, at the S. extremity of which it is situated, cap. cant., on the Rhone, 21 m. S. Lyons. Pop. 2,566 in 1861. The town has acquired some celebrity for excellent white wines, the original plants producing which were, it is said, brought thither from Dalmatia by order of the emperor Probus.

CONGLETON, a market town and bor. of England, co. Chester, hund. Northwich; 22 m. S. Manchester, and 161¼ m. NW. London by London

and North Western and North Staffordshire railway. Pop. 12,344 in 1861. The town stands in a remarkably healthy situation, on the Dane, in a deep valley bordering on Staffordsh. The principal street is upwards of a mile in length, paved, and lighted with gas: it contains many ancient houses of timber framing and plaster; at the W. end are many detached mansions, surrounded by gardens and shrubberies, and chiefly occupied by the more opulent manufacturers. It has an episcopal chapel, in the patronage of the corporation; a Catholic and several large dissenting chapels; a grammar-school, nominally free for the sons of burgesses; an infant school, established in 1835; several large Sunday-schools; and many charitable institutions and bequests, the latter chiefly held in trust by the corporation; a town-hall; and public assembly-rooms, built in 1822, contiguous to which is a modern market-place. Silk is the staple manufacture of the town; the silk-mills being mostly erected along the banks of the river. The trade consists chiefly in the throwing of raw silk, the spinning of waste ditto, the manufacture of thrown silk into plain ribands by power looms, of which there are about 254 in the town, and the weaving of ribands and broad cloths by hand-looms. There are also cotton spinning factories, and a few tanneries and leather-manufactories. Certain lands reserved under an enclosure act are held in trust for the benefit of the poor. The bor. is divided into 3 wards, and governed by 6 aldermen and 18 counsellors.

CONGO, otherwise LOWER or S. GUINEA, a country in SW. Africa, to which various boundaries have been assigned by the old and more recent travellers. The Portuguese, who discovered it in 1487, included in Congo all the coast of W. Africa from Cape Lopez Gonsalvo (Loango), in lat. 0° 37′ S., long. 8° 35′ E., to Cape Negro, in lat. 15° 50′ S., long. 11° 55′ E.; for they found the whole of that tract inhabited by negro tribes, resembling each other in every respect, and subject to one paramount chief, called Mani-Congo (Sovereign of Congo); but in process of time this empire became dismembered; inferior chiefs threw off their allegiance and erected separate kingdoms, which are at present known as Angola (a name now more frequently applied to the district over which all these kingdoms extend), Loango, Benguela, and lastly Congo Proper.

The *boundaries* of Congo Proper are at present marked N. by the river Congo or Zaire, which at about lat. 6° 5′ separates it from Loango; S. by the river Dando, in lat. 8° 20′ S., dividing it from Angola; W. the Congoese coast is washed by the S. Atlantic ocean, while to the E. it has the unknown countries of Fugeno and Matamba, the Mountains of the Sun, &c. According to the investigations of Ritter, Congo consists of two distinct regions: that next to the sea, or the *littoral*, is low and flat, is traversed by many streams, and abounds in sandy deserts, but is elsewhere very fertile. The climate in this region is exceedingly unfavourable; and pestilential emanations, and swarms of noxious animals, expose the lives of the inhab. to perpetual danger. The other region consists of the terraces, or acclivities, ascending from the plain to the high table-land in the interior. This is by far the finest part of the country, and the richest and most populous. The river Zaire, which descends from the interior to the coast, has its great cataracts in passing through this region.

This river is a most conspicuous object in the topography of Congo: it is a magnificent stream, particularly towards its embouchure: it overflows during the rainy season, and fertilises the surrounding country; but these risings take place also in the dry season, elevating the current 7 ft., —increased to 12 ft. by the rains. It is exceedingly deep; Massey's sounding-machine having indicated 113 fathoms, and yet the lead had not touched the bottom. In the upper parts, the current varies in strength from 2½ to 5 m. an hour, but is sufficiently strong in the channel to prevent a transport entering the river without the aid of a powerful sea-breeze. At about 140 m. from its mouth, the Zaire narrows to from 300 to 500 yds. for about 40 m.; its banks bristling with precipitous masses of slate, which sometimes intercept the stream, and form rapids and cataracts, called by the natives *yellala*. Beyond these craggy regions, the Zaire expands in breadth to 2, 3, and even to 4 m.; and near the place where Captain Tuckey was compelled to abandon his journey, the width and majestic appearance of the river, the verdure of the land, which was here well peopled, combined to render the scene agreeable in the highest degree. (Tuckey's Expedition, pp. 337–348; Journ. Royal Geog. Soc., iii. 220.)

The banks of the Zaire, from its mouth to Embomma (about 60 m.), are clothed with a most exuberant vegetation, presenting to the eye a continued forest of tall and majestic trees, clothed with foliage of never-fading verdure.

The supposed identity of the Congo with the Niger was long a question agitated among geographers; and its decision was one of the objects of Tuckey's expedition. This question has been, as every one knows, set at rest by the Messrs. Lander. But it is sufficiently clear from the information collected by Tuckey, that the Zaire, at no great distance from the point to which he had ascended, divides into two great arms, the most N. of which has its source in a lake or marsh.

The *natural productions* of Congo have been admirably arranged by Professor Smith, a member of Tuckey's expedition (who unhappily lost his life in the course of it), and Mr. Brown. Large trees are only found in the valleys, or thinly sprinkled over the sides and summits of the hills, and consist for the most part of the *Adansonia*, *Bombax pentandrum*, *Anthocleista*, *Musanga* (native term, but allied to *Cecropia*), *Elæis guiniensis*, *Raphia vinifera*, and *Pandanus candelabrum*. Intermixed with these, on the alluvial banks of the Quorra, large patches of the Egyptian papyrus form a grand feature in the vegetation. The edible productions are maize, cassava, sweet and bitter, two kinds of pulse, the *Cytisus cajan*, a species of *Phaseolus*, and ground nuts (*Arachis hypogæa*). The common yam, besides another species of *Dioscorea*, so bitter as to require four days' boiling before it be eatable, with the sugar-cane, capsicum, and tobacco, are alimentary plants of secondary importance. The most valuable fruits are plantains, papaws, limes, oranges, pine-apples, pumpkins, tamarinds, and a fruit about the size of a small plum, called safu. The plant, however, of most importance to the natives is the oil palm (*Elæis guiniensis*), from which is extracted the best palm wine; this and two other species of palm (*Raphia vinifera* and a *Hyphæa*) are to the Congoese what the cocoa-tree is to many of the Asiatic islanders. The indigenous fruits are the *Anona senegalensis*, *Sarcocephalus*, a species of cream-fruit, *Chrysobalanus*, *Icaco*, a species of *Ximenia*, and another of *Antidesma*. (Professor Smith's Journal in Tuckey's work, with remarks thereon by Mr. Brown, *passim*; Quarterly Review, xviii. 350, 351.)

The *animals* appear to be those chiefly which are found in every part of this great continent; lions, leopards, elephants, buffaloes, antelopes, wild hogs, porcupines, hares, and monkeys. The river abounds

with good fish, and also with those huge monsters the hippopotamus and crocodile. Domestic animals are few and scarce; those mostly met with are hogs, goats, fowls, Muscovy ducks, and pigeons, and a few sheep, generally spotted with hair instead of wool. The natives eat these animals in a manner quite characteristic of their rooted laziness. They remove neither skin, feathers, nor hair; and scarcely warming them by the fire, tear the meat in pieces with their teeth. (Dr. Leach and Mr. Crouch, in Appendix to Tuckey's work; Quarterly Review, xviii. 351.)

Government and Population.—If we may depend on the traditions of the people, who have neither annals nor history, Congo was formerly a powerful empire under a single sovereign, or rather absolute despot. But it is evident, from the accounts of the early travellers, little as they are, in many respects, to be depended on, that, when first visited by Europeans, the government of Congo did not differ materially in its form from what we find it at the present day; and that it consisted of a sort of confederacy of small states under a principal sovereign. (Prevost, Histoire Générale des Voyages, v. 1–7.) It would appear, however, to be pretty certain that the power of the superior monarch has materially declined during the last 200 years. At all events, Congo is now split into an infinite number of petty states or *chenoushipe*, each governed by a *chenou* or chief. These chieftainships would, in Europe, be said to be fiefs, held under a principal sovereign, called *lindy* or *blindy N'Congo*, residing at Banza Congo. But it would seem that most of these chiefs affect a nearly total independence; and being all despots in their own limited spheres, and frequently at war with each other, and with the principal sovereign, the country is uniformly almost in a state of the most frightful anarchy. At the death of a *chenou*, it is not his son, but his brother or maternal uncle that succeeds him.

The inhab. are said to be a mixed race; but the Portuguese never visited the country in such numbers as to produce any impression on the physical character of the people; and the Congoese are certainly one of the least favoured negro varieties. Speaking generally, they seem to be sunk in the lowest state of degradation. They are incorrigibly indolent; have little or no clothing; and though they raise Indian corn, agriculture is in the lowest state, and they frequently suffer the extremity of famine. Their religion is the grossest species of feticism. The Portuguese having established missions in different parts of the country, the natives sometimes exhibit in their religion an odious mixture of Christianity and idolatry. They are prone to all sorts of excesses and debauchery. The women are degraded to the condition of beasts of burden; and prostitution to strangers is considered as a necessary part of hospitality. Still, however, they are not wholly destitute of good qualities; and are said to be sincere, hospitable, and compassionate. Having been long a principal seat of the slave trade, a considerable part of the disorders that prevail in the country are with much probability ascribed to the enormities growing out of that detestable traffic. This is said to isolate one petty state from another, and to occasion perpetual wars; the slaves being mostly prisoners taken in battle, or kidnapped on the public roads. But, admitting the influence of these causes, still we apprehend that the intellectual inferiority of the negro race is at bottom the real cause of the degraded condition of Congo, and of all the other negro states. The Congoese are said frequently to decapitate their prisoners, and burn their bodies; and if such barbarity be practised when the prisoners may be sold, the presumption would seem to be that it would become much more prevalent were the traffic put an end to. (See Tuckey, *passim*; and Ritter's Geography of Africa, French translation, i. 379–387.)

The country has been represented as very populous, and as studded with towns and villages swarming with inhab. Carli, one of the early missionaries, gravely reports that a king of Congo marched against the Portuguese at the head of an army of 900,000 men. (Prevost, *ubi suprà.*) But it is evident that a country in the state we have described cannot be thickly peopled; and, in point of fact, Tuckey states that the most considerable *banza*, or cap., of a petty state that he visited did not contain more than 100 huts and 600 persons. In Embomma he found 60 huts, with 500 inhab.; and at Inga 70 houses, in which not more than 300 persons resided. It is true that his observations in the interior were not very extended; and he admits that the upper banks of the Zaire (where his operations unhappily ended) were considerably more populous than those towards the coast; but still it is abundantly certain that the accounts of the extraordinary pop. of the country have no better foundation than the imagination of the writers. According to the statements of the missionaries, the cap. of the country, which they divided into six provinces, was built on a mountain about 150 m. from the sea, and was called by them St. Salvador. They speak in the most extravagant terms of the beauty and salubrity of the situation.

CONGOON, a sea-port town of Persia, prov. Fars, on the Persian Gulf, 130 m. S. by E. Schiraz. Pop. from 6,000 to 7,000. It has an excellent roadstead, where a frigate may ride in safety in the most tempestuous weather, and good water and firewood may be procured in abundance. (Kinneir's Persian Empire, p. 81.)

CONI, or CUNEO, a town of N. Italy, cap. div. and prov., on a hill at the confluence of the Stura and Gesso, 45 m. S. by W. Turin, with which it is connected by railway. Pop. 22,510 in 1861. This was formerly a strong fortress, and sustained without capture various sieges, till being delivered up to the French they dismantled it in 1801. It is still, however, surrounded by a wall, with two gates; it has a cathedral, three other churches, a royal college, hospital, workhouse, and some public baths. Its principal street is wide and handsome, and is lined throughout with porticoes: the other streets are, in fact, mere lanes. Coni is the seat of a court of primary jurisdiction and a bishopric, and the residence of the intendente and military commandant of the div. It has some silk fabrics, and carries on a considerable trade, being a sort of *entrepôt* to Turin and Nice.

CONJEVERAM (*Canchipura*, the golden city), a considerable town of Hindostan, prov. Carnatic, distr. Chingleput, in which it is the chief military station under the Madras presidency. It stands in a valley 36 m. WSW. Madras, and 25 m. E. Arcot; lat. 12° 49′ N., long. 79° 41′ E. It is tolerably populous, and covers a large space of ground, which is in great part occupied by extensive gardens and cocoa plantations. It has two remarkable pagodas; one, dedicated to Siva, contains many pillars handsomely sculptured, and some well-carved figures of elephants, &c.; the other, which is smaller, has a great deal of curious workmanship and sculpture, which, for truth of proportion and delicacy of execution, is scarcely surpassed by any other Hindoo edifice. There are numerous weavers amongst the pop.; who manufacture red handkerchiefs, turbans, and cloths for native dresses. Small pagodas, and *choultries*, or travellers' houses, abound both in the town and its vicinity: the valley of Conjeveram

is fertile, contains many substantial tanks, and appears in a prosperous state.

CONNAUGHT, one of the four provs. into which Ireland is divided, on its W. coast, containing the cos. of Galway, Leitrim, Mayo, Roscommon, and Sligo. (See IRELAND.)

CONNECTICUT, one of the smallest of the U. States, in the N. part of the Union, between lat. 40° 58′ and 42° 2′ N., and long. 71° 53′ and 73° 50′ W., having N. Massachusetts, E. Rhode Island, W. New York, and S. Long Island Sound; length, E. to W., 90 m.; average breadth, about 52 m.; area, 4,674 sq. m. Pop. 460,147 in 1860. The state ranks third in the Union as to density of pop., having 98 individuals to the sq. m. Surface generally undulating. A chain of mountains of inconsiderable height runs N. and S. through the W. part of the state. The principal river is the Connecticut: it rises in New Hampshire, and having passed through Massachusetts, intersects this state nearly in its centre; and then bending to the E., falls into Long Island Sound, a little below Newhaven, after a course of 410 m., 250 of which have been made navigable by means of locks and canals. Along the coast are several excellent harbours; the best are those of New London and Newhaven. Climate very variable: an extreme degree of heat and cold are experienced at different seasons; but the sky is usually serene, and the country healthy. There are some sterile districts; but the soil is for the most part fertile, and (for America) well cultivated. European grains, Indian corn, flax, hemp, and culinary vegetables, are raised in abundance; orchards are numerous, and apples so plentiful that cider is a considerable product. The pasture-lands are good; large herds of cattle are reared, and butter and cheese are made in large quantities. Farms vary in size from 50 to 200 acres. There are mines of iron ore, lead, and copper; but, excepting the first, none of them are wrought. Marble, black-lead, porcelain clay, and freestone, are found in many parts. The chalybeate waters of Stafford are celebrated. Manufactures occupy more attention than rural industry, and are more considerable, in proportion to the population, than in any other state of the Union, Rhode Island excepted. The principal are those of cotton and woollen stuffs, iron and tin ware, leather, fire-arms, carriages, powder, clocks, gin, and snuff. There were 49 savings banks on April 1, 1863, with an invested capital of 23,446,936 dollars. A considerable coasting trade and traffic with the W. Indies are maintained. The principal articles of export are cattle, horses, mules, grain, fish, candles, soap, butter, and cheese. The state is divided into eight counties. Hartford is the chief city, and is, in conjunction with Newhaven, the seat of governm.; the other principal towns are Middletown, New London, and Norwich. These contain several colleges, learned societies, and public schools. The state school-fund, founded in 1821, is the most considerable of any in the Union; the capital amounted, Feb. 28, 1863, to 2,049,426 dollars, while the revenue was 132,589 dollars. Yale College, founded at Saybrook in 1700, and removed in 1716 to Newhaven, contains the finest cabinet of minerals in the Union, and an extensive library. The legislature of the state consisted, in 1863, of a senate of 21 mems., and a H. of Representatives of 237 members. The senators, representatives, governor, and lieut.-governor are all elected every year, on the first Monday in April, by the vote of all male citizens who have resided one year in the state, and have attained the age of 21. The judges of the supreme courts are appointed by the assembly, and hold their offices during good behaviour, or until they are 70 years of age, when they must retire. Connecticut sends four mems. to the national H. of Representatives, and two senators to the national senate. This portion of the Union was first colonised in 1635 and 1638, by two colonies united in 1665. Its subsequent progress has been one of almost uninterrupted prosperity.

CONSTANCE (an. *Constantia*, Germ. *Konstanz* or *Costnitz*), a city of the grand duchy of Baden, cap. circ. same name, or Seekreis (*Lake Circle*), finely situated on the Rhine, at the point where it emerges from the Lake of Constance, 100 m. SSE. Carlsruhe, 26 m. E. Schaffhausen, on the terminus of the Basel-Constance railway. Pop. 7,816 in 1861. Constance is a highly interesting city, from its historical associations. In the 15th century it is said to have contained from 30,000 to 40,000 inhab.; and its streets and many of its buildings remain unaltered since that period, though several of them are wholly, or almost wholly, deserted. It is fortified by a wall flanked with towers, and surrounded by a ditch; has three suburbs, one of which, Petershausen, is on the opposite bank of the Rhine, but communicates with the city by a long covered wooden bridge built upon stone piers. The cathedral or *minster*, begun in 1052, is a handsome Gothic structure with a lofty steeple, commanding an extensive view of the lake and country, as far as the mountains of Vorarlberg and the Grisons. The doors of the main portal are curiously carved; and the choir is supported by sixteen pillars, each of a single block. A fine high altar, and several interesting tombs and relics, attest the ancient wealth and grandeur of the see, which was formerly the most considerable in Germany, and had large possessions in, and jurisdiction over, Switzerland. A plate of metal let into the floor of this cathedral, near the entrance, marks the spot where John Huss stood when he was condemned in 1415. The Franciscan convent, the first prison of Huss, is now a ruin; and the Dominican convent, to which he was afterwards removed, has been converted into a cotton factory. The *kaufhaus* (market-hall), erected in 1388, is interesting, as being the place of meeting of the famous Council of Constance, held from 1414 to 1418. The concourse of ecclesiastics and others, from all parts of Christendom, at this council was such that not only the houses in the town were crowded, but booths were erected in the streets, while thousands of pilgrims were encamped in the adjacent fields. Religious processions, dramatic representations, and entertainments of every description, hourly succeeded each other; and thousands of individuals were employed solely in transporting thither the choicest delicacies of Europe. The great object of this council was to vindicate the authority of general councils, to which the Roman pontiff was declared to be amenable. And having done this, the council proceeded to depose three popes or antipopes, John XXIII., Gregory XII., and Benedict XIII.; they next elected Martin V., and thus put an end to a schism which had lasted forty years. But, notwithstanding its merit in these respects, the Council of Constance is justly infamous, for the treacherous seizure and execution of John Huss and Jerome of Prague, notwithstanding the safe-conduct granted to the former by the Emperor Sigismund, the president of the assembly, who wanted power or inclination effectually to vindicate his pledge. Huss suffered at the stake, on the 6th of July, 1415; and Jerome, who had attended him to the council, was burnt on the 30th of May, 1416. The opinions of Wycliffe were also condemned; and an order was issued to commit his works and bones to the flames. Various relics of this period, and a collection of

Roman and German antiquities found in the neighbourhood, are preserved in the *kauf haus*.

Constance contains an ancient palace, a lyceum, a hospital, a conventual school for females, several collections of art and science, and a theatre. The suburb of Peterhausen contains a grand ducal residence, formerly a Benedictine abbey; that of Kreuzlingen is fortified, and possesses a convent, in the church of which there is some elaborate carving. The suburb of Bruhl is the scene of the martyrdom of Huss and Jerome. On the bridge across the Rhine there are mills for various purposes.

Constance is the seat of the circle and district government. It was a place of considerable commercial importance till the period of the Reformation, since which it has, until very recently, progressively declined. The chief resources of its inhab. are derived from the culture of fruit and vegetables, some trade, the navigation of the lake, and a few manufactures, chiefly of cotton cloth and yarn, and silk fabrics, which have latterly been a good deal extended. This is one of the oldest towns in Germany. It was founded or enlarged by the Romans in the 4th century. It was a free imperial city till 1548, when Charles V. placed it under the ban of the empire; next year it was attached to the Austrian dominions, and in 1805 to Baden.

CONSTANCE (LAKE OF), (an. *Lacus Brigantinus* or *Suevicus*, Germ. *Bodensee*), a lake of Central Europe, the largest belonging to Germany, between lat. 47° 29′ and 47° 49′ N., and long. 9° 2′ 30″ and 9° 45′ E., surrounded by the territories of Baden, Wirtemberg, Bavaria, Austria (Vorarlberg), and Switzerland. Length, NW. to SE., about 34 m., greatest breadth about 8½ m.; area, about 200 sq. m.; elevation above the level of the sea, 1,255 ft.; greatest depth, 964 ft. Its most N. portion consists of a narrow prolongation, called the Neberling Lake. The Rhine enters the Lake of Constance on the SE., and issues from its NW. extremity at the city of Constance, connecting it with the lake called the Unter or Zeller-see, which contains the fertile isl. of Reichenau, and is sometimes considered part of the Lake of Constance. The banks of the latter are mostly flat or gently undulating, and distinguished for their fertility. They abound with corn-fields and orchards, and some tolerable wine is grown on them. The S. shore especially is studded with a picturesque line of ruined castles and other remains of the middle ages; and both sides are crowded with numerous towns and villages, the principal of which are Landau, in Bavaria; Friederichshausen, a summer resort of the king of Wirtemberg, Miersburg, and Neberling, in Baden; Arbon, in Switzerland; and Bregenz, in the Austrian dominions. The waters of this lake are green, clear, and subject to sudden risings, the cause of which has not been satisfactorily explained. Numerous aquatic birds and *Crustacea* inhabit this lake; and it is abundantly stocked with fish. Its navigation is somewhat dangerous, owing to sudden squalls: considerable traffic, however, takes place upon it, and a number of steamboats run almost hourly from Constance to the different ports situated around it.

CONSTANTINA (vulg. *Kosantinah*), an inland city of N. Africa, Algeria, cap. of its E. prov., beyond the Lesser Atlas, on a peninsulated height, surrounded on three sides by the Rummel, or Wad-el-Kebir (*Ampsaga* of the ancients), which runs in part through a deep ravine, crossed by an ancient bridge, 114 yards above the water, and 113 yards in length; 190 m. ESE. Algiers; lat. 36° 24′ N., long. 6° 8′ E. The hill, on which the city stands, appears to have been separated from the opposite heights of Setah-el-Mansurah by an earthquake, or some other natural convulsion. On the SW. side it gradually declines downwards to the plain, and on that side only the city is accessible. The present city is about 1½ m. in circ. Pop. 34,500 in 1861, of whom 6,500 Europeans, about a half Kabyles, a fourth Moors, and the rest Turks and Jews. The ancient city was much larger, extending on the other side of the ravine, and down into the plain.

Constantina is strong, as well by art as by nature: the walls on the land side are 5 ft. thick, and have, in many parts, casemates behind them. There are 4 gates, all of Arabic construction, built however, in great part, of the materials of Roman edifices: the superb gates, with columns of red marble, mentioned by former travellers, no longer exist. On its N. side, on the most elevated part of the plateau, is the Kasba, or citadel, occupying the site where was formerly the Numidian citadel, and more recently the Roman capital, parts of both which edifices still exist. The palace, built within these few years, is a large edifice, handsomely fitted up. There are said to be 13 mosques, exclusive of chapels, but none of them deserve any especial notice. Streets narrow and dirty; houses generally two stories high, covered with tiled roofs, *à dos d'âne*; they are constructed of brick, raised on a foundation of stones, the remains of the ancient buildings. Many of them are large and well furnished, and there are no indications of extreme poverty in any class of the inhabitants. There are many remains of antiquity; but these have suffered much of late years, having been taken down, and employed as materials for the fortifications. The bridge over the ravine, already alluded to, was originally constructed by the Romans. There are also several Roman cisterns, and a church, probably of the æra of Constantine, with arches. The inhabitants are industrious: the principal manufactures are those of saddles, bridles, boots, slippers, and garters; a few coarse blankets are also made; and the late bey employed 25 men in the manufacture of gunpowder. A considerable trade is carried on with the S., the inhab. receiving gold-dust, ostrich feathers, slaves, and the finer sort of haiks, both silk and wool, in return for corn, saddlery, and articles of European manufacture. From 1,200 to 1,500 mule-loads of corn used to be annually sent to Tunis. The land round the town is fertile, and mostly belongs to the community. The actual cultivators pay four-fifths of the produce as rent.

A French force of 8,000 were foiled in an attempt to take this city in 1836, and suffered much on their retreat. In the following year another French army, proceeding from Bona, sat down before it on the 6th of October, and took it by storm, after a desperate resistance, on the 13th of the same month.

CONSTANTINOPLE, so called from its founder, or rather restorer, Constantine the Great (Turk. *Stamboul*), a famous city of Turkey in Europe, cap. of the Turkish dominions, and the first city of the Mohammedan world; a distinction which it has held since 1453, when it ceased to be the cap. of the Eastern empire. Its situation, whether considered in a commercial or political point of view, is the finest imaginable; and it seems naturally fitted to be the metropolis of an extensive empire. It occupies a triangular promontory near the E. extremity of the prov. of Roumelia (an. *Thrace*), at the junction of the sea of Marmora with the Thracian Bosphorus, or Channel of Constantinople, being separated from its suburbs of Galata, Pera, and Cassim-Pacha by

the noble harbour called the Golden Horn; lat. 41° 0′ 12″ N., long. 28° 59′ 2″ E. Pop. uncertain, but supposed to amount, including the suburbs, to above a million.

Constantinople is shaped somewhat like a harp; the longest side of the triangle being towards the sea of Marmora, and the shortest towards the 'Golden Horn.' Its length, E. to W., is about 3½ m.; breadth varies from 1 to 4 m. Its circ. has been variously estimated at from 10 to 23 m.; but measured upon the maps of Kauffer and Le Chevalier, it appears to be about 12½ m. in circuit, and contains, according to Dallaway and Gibbon, an area of about 2,000 acres. Like Rome, Constantinople has been built on seven hills, six of which may be observed, distinctly enough, from the port, to rise progressively above each other from the level of the sea to 200 ft. above it; the seventh hill, to the SW. of the others, occupies more than one-third of the entire area of the city. Each of these hills affords a site to some conspicuous edifice. The first is occupied by the Seraglio; the second crowned with the Burnt Pillar, erected by Constantine, and the mosque of Othman; the mosques of the sultans Solyman, Mohammed, and Selim stand on the summits of the third, fourth, and fifth; the W. walls of the city run along the top of the sixth; and the Pillar of Arcadius was erected upon the seventh.

This amphitheatre of peopled hills, with its innumerable cupolas and minarets interspersed with tall dark cypresses, and its almost unrivalled port, crowded with the vessels of all nations, has, externally, a most imposing aspect, to which its interior forms a lamentable contrast. The expectations of the stranger are, perhaps, nowhere more deceived. The streets are narrow, crooked, steep, dark, ill-paved or not paved at all, and dirty; though, by reason of the slope of the ground on either side towards the sea and harbour, and the great number of public fountains, much of the filth is conveniently cleared away. Adrianople Street, running from the gate of the same name to the Seraglio, is the only one deserving the name of street; the rest are mere lanes. The houses are mostly small and low, being built of wood, earth, or, at the best, of rough or unhewn stone. It is the palaces, mosques, bagnios, bazars, khans, &c. that make so splendid a show at a distance. Dallaway (Constantinople, p. 70) and Sir J. Hobhouse believe that its streets were anciently not more regular than at present; and that from the frequent and sudden devastations by fire, mentioned by the Byzantine historians, its houses were formerly, as now, built mostly of wood or other fragile materials. About a century after its restoration, Constantinople is reported (Gibbon, ch. xvii.) to have contained 'a capitol, or school of learning, a circus, 2 theatres, 8 public and 153 private baths, 52 porticos, 5 granaries, 8 aqueducts, or reservoirs of water, 4 spacious halls for the meetings of the senate or courts of justice, 14 churches, fourteen squares, 344 streets, and 4,388 houses, which for their size or beauty deserved to be distinguished from the multitude of plebeian habitations. It contains, at present, 14 royal and 382 other mosques, or houses of Mohammedan worship, 40 colleges of Mohammedan priests, 183 hospitals, 36 Christian churches, several synagogues, 130 public baths, nearly 200 khans, and numerous coffee-houses, caravanserais, and public fountains; besides some extensive subterranean cisterns, the aqueduct of Valens, several remarkable pillars and obelisks erected by the Greek emperors, and other monuments which, together with the walls, the castle of 'Seven Towers,' &c., are interesting remains of antiquity, and for the most part in a tolerable state of preservation. (Andréossy, p. 124; Cours Méthodique de Géographie, p. 625; Hobhouse.)

Constantine surrounded the city with walls, chiefly of freestone, flanked at variable distances by towers. These have been, in many parts, demolished at different periods by the violence of the sea, and by frequent earthquakes, and on the side facing the port are especially in a very ruinous state. The city was increased towards the W. by Theodosius II., who built the walls on the land side which still bear his name. These consist of a triple range, rising one above another, about 18 ft. apart, and defended on the outside by a ditch 25 to 30 ft. broad, and 12 to 16 ft. deep. The outer wall is now very much dilapidated, and in many places is only a little above the level of the edge of the ditch; it seems never to have had any towers. The second wall is about 12 ft. in height, and furnished with towers of various shapes, from 50 to 100 yards apart. The third wall is above 20 ft. high, and its towers, which answer to those of the second, are well proportioned. These walls are constructed of alternate courses of brick and stone; and the inner ones, notwithstanding the ravages of time, earthquakes, and numerous sieges, are still tolerably perfect. On both the other sides of the city the walls are only double, and, generally speaking, not so lofty. They are frequently adorned with crosses and other ornaments, which have not been removed by the Turks; and in many parts there are bas-reliefs, and inscriptions by the Greek emperors who have built or repaired the several portions. When Dr. Clarke visited the place, he says there were in all 478 mural towers, and probably about the same number still exist.

Constantinople originally possessed 43 gates, 18 of which opened on the land side, 12 towards the Golden Horn, and 13 towards the Propontis. Only 7 gates now exist, or are at present used, on the land side, the centre one of which, the *Top-Kapoussi*, or Cannon Gate, is the *Porta Sancti Romani*, through which Mohammed II. made his triumphal entry into the city. Near the SW. angle of the city is the *Heptapyrgium*, or castle of 'Seven Towers' (though it has now but four towers), an irregular fortress, supposed to have been built about the year 1000. It was enlarged in succeeding ages, and in great part rebuilt by Mohammed II., who made it a state prison, it being useless as a fortress. The Golden Gate, erected by Theodosius to commemorate his victory over Maximus, was originally profusely ornamented with beaten gold, and surmounted by a gilded bronze statue of Victory. Mohammed II. walled it up. When Wheeler saw it, it was still adorned with bas-reliefs, in white marble, representing several scenes of classic mythology; but these must have disappeared, since more recent travellers speak of it as only an ordinary arch between two large marble pillars, and ornamented with Corinthian pilasters, 'd'un style assez médiocre.'

The ancient Byzantium, founded by Byzas the Megarean, B.C. 656, and ultimately destroyed by Severus, not long before the building of Constantinople, occupied the first hill or apex of the triangle, at present the site of the Seraglio. Its walls, according to Herodian, were Cyclopean, and so skilfully adjusted that they seemed like one entire mass. Most authors say that there are no vestiges of Byzantium; but Dr. Walsh affirms that 'part of the walls of this very ancient city are actually standing, and cut off the gardens from the adjoining streets.' The Seraglio, which is believed to be of about the same extent as the ancient Byzantium, is nearly triangular, about 3

m. in circuit, and entirely surrounded by walls; those of the city forming its boundary towards the port and sea of Marmora, while on the W. it is shut in by a lofty wall with gates and towers, built by Mohammed II., soon after the capture of Constantinople. Its whole surface is 'irregularly covered with detached suites of apartments, baths, mosques, kiosks, gardens, and groves of cypress.' The apartments are chiefly on the top of the hill, and the gardens below, stretching to the sea. Though externally picturesque, from the contrast of its light and elegant minarets with its dark, solemn, and stately trees, the Seraglio is unmarked by anything to characterise it as the habitation of royalty. The greater part of its interior is not open to the public; but those acquainted with it say that it contains little worthy of admiration, and that that little has been imported from Europe. The palace consists of various parts built at different times, and according to the taste of successive sultans, without any regard to uniformity or architectural rule; and it is, therefore, a heap of houses clustered together without any kind of order. Outside are two courts, the first of which is free to all persons, and is entered by the Bab-a-hoomajún or *Sublime Porte*, the principal of the gates on the city side,—a ponderous, unsightly structure, covered with Arabic inscriptions, guarded by fifty porters, and having a niche on either side in front, in which the heads of state offenders are publicly exposed. The irregular but spacious area into which this gate leads, formerly the *Forum Augusti*, contains the mint, the vizier's divan, and other state offices, the infirmaries for the sick belonging to the Seraglio, and the church of St. Irene, believed to have been built by Constantine, and in which the second general council was held by Theodosius. (Andréossy, 16.) This church resembles St. Sophia on a small scale, and contains much marble and mosaic work: the Turks have converted it into an arsenal. The second quadrangle is smaller, being about 300 paces only in diameter; but is more regular and handsome than the former. It is laid out in turf, intersected by paved walks, and supplied with fountains. On the left hand are the treasury, the divan, or hall of justice, and the smaller stables (the larger stables, containing, according to Tournefort, 1,000 horses, are in another place, facing the sea of Marmora). On the right are the offices of the attendants, nine kitchens, and the entrance to the private apartments. All round the court runs a low gallery, covered with lead, and supported by columns of marble. At its farther end is the tall Corinthian column erected by Theodosius the Great to commemorate his victory over the Goths; and near it are the Baba-Saadi, 'Gates of health and happiness,' which lead to the throne-hall, the royal library, the apartments of the sultan, the harem, and other suites of rooms, embellished with a costly but tasteless magnificence. The throne-hall is isolated, lofty, built in great part of marble, and adorned with handsome marble columns and stained glass windows. The throne itself is a canopy of velvet fringed with jewels, supported by four columns covered with gold, pearls, and precious stones; but its effect is destroyed by horse-tails, and other paltry ornaments, suspended from the roof. The state apartments closely resemble each other; their chief furniture consists of sofas, carpets, and mirrors. The walls are wainscotted with jasper, mother-of-pearl, and veneered ivory inlaid with mosaic flowers, landscapes, and sentences in Arabic. The pavilions of the harem are built upon arches, and roofed by domes covered with lead or spires with gilded crescents. They have many balconies, galleries, cabinets, &c. Baths of marble and porcelain, rich pavilions overlooking the sea, marble basins, and spouting fountains, are sprinkled over the rest of the surface within the Seraglio. The number of inmates, and others connected with the Seraglio, have been estimated at upwards of 10,000; but this is probably much beyond the mark. All are provided for by the sultan. And Tournefort (Lett. v. vol. ii. p. 104) states that, when he visited the place, besides 40,000 oxen yearly, the purveyors furnished for the use of the Seraglio daily 200 sheep, 100 lambs or goats, 10 calves, 200 hens, 200 pairs of pullets, 100 pairs of pigeons, and 50 green geese. But, notwithstanding the general accuracy of Tournefort, we have no doubt that in this instance he was misled, and that Mr. Elliott (i. 395) has done right in rejecting this statement.

On the third hill is the *Eski Serai*, or Old Palace, said to have been the residence of the later Greek emperors; a building surrounded by a lofty octangular wall about 1 m. in circuit, and to which, when a sultan dies, his harem is removed. It presents nothing remarkable.

The mosques of Constantinople have all an open space around them, generally planted with trees, and refreshed by fountains. The principal mosque, the celebrated St. Sophia, stands on the W. declivity of the first hill, near the *Sublime Porte* of the Seraglio. It was begun and finished under the Emperor Justinian, between the years 531 and 537. It is in the form of a Greek cross, 269 ft. in length, by 243 ft. wide, or about 3-5ths the length of St. Paul's, London, by nearly the same width; and surmounted in its centre by a dome, the middle of which is 180 ft. above the floor. The dome is of an elliptical form, and much too flat to be externally beautiful, its height not exceeding 1-6th part of the diameter; which is 115 ft., or 15 ft. more than that of the dome of St. Paul's, and 18 ft. less than that of St. Peter's at Rome. It is lighted by twenty-four windows ranged round its circumference, and rests upon four strong arches, the weight of which is firmly supported by four massive piles, strengthened on the N. and S. sides by four columns of Egyptian granite. The present dome is not coeval with the building; the original one, which was less lofty and more circular, having been thrown down by an earthquake twenty-one years after its erection. There are, besides, two large and six smaller semi-domes, the whole of which blending internally with the principal one, form altogether a magnificent expanse of roof. Four minarets, but each of a different shape, have been added to this mosque by the Mohammedans. The building has been outwardly so much patched and propped up in different ages, that it has lost whatever beauty it may have originally possessed, and is now a heavy, unwieldly, and confused-looking mass. It is entered on the W. side by a double vestibule, about 38 ft. in breadth, which communicates with the interior by nine bronze doors, ornamented with bas reliefs in marble. The interior is spacious and imposing, not being broken by aisles or choirs; but the variegated marble floor is covered with mats and carpets: the mosaics of the dome, &c., have been whitewashed over by the Turks; the colossal seraphim and other sculptures have been in great part destroyed, and the general *coup d'œil* is spoiled by 'a thousand little cords depending from the summit to within 4 ft. of the pavement, and having at the end of them lamps of coloured glass, large ostrich-eggs, artificial horse-tails, vases and globes of crystal, and other mean ornaments.' (Hobhouse.) The building is said to contain 170 columns of marble, granite, porphyry, *verd-antique*, &c., many of which were brought from

the temple of Diana at Ephesus, and other ancient structures. The cost of the building, owing to the ambiguity of the Byzantine historians, cannot be accurately determined; but Gibbon observes (Decline and Fall, ch. xl.), that 'the sum of one million sterling is the result of the lowest computation.' Yet with all this, Justinian seems to have failed in making St. Sophia a really fine edifice. Sir J. Hobhouse says of it,—'My impression was, that the skill of the one hundred architects, and the labour of the ten thousand workmen, the wealth of an empire, and the ingenuity of presiding angels, had raised a stupendous monument of the heavy mediocrity which distinguished the productions of the sixth century from the perfect specimens of a happier age.'

Most travellers agree in preferring the mosques of Solyman the Magnificent and Achmet to St. Sophia. The former of these, called the Solymania, was built in 1556, of the ruins of the church of St. Euphemia at Chalcedon. It is 216 ft. in length by 210 ft. broad, and has a handsome dome, supported on four columns of Thebaic granite, 60 ft. high, pavements, galleries, &c., of marble, several minor cupolas, four fine minarets at the angles, a spacious court-yard leading to it, with galleries of green marble on either side, and twenty-eight leaded cupolas, and a very handsome gate of entrance ascended to by a flight of at least twenty marble steps. The whole of this mosque is in very good taste. Behind it, in an enclosed court shaded with trees, is the mausoleum of Solyman, an octagonal building, and the handsomest of all the royal sepulchral monuments, which are very numerous in the city. The mosque of Achmet I., between St. Sophia and the Propontis, was constructed in 1610, and has a very beautiful marble pavement. It is the only mosque which possesses six minarets. These are of extraordinary height and beauty, and each has three Saracenic galleries surrounding it. The Osmanlé, or mosque of Othman, completed in 1755, has a light and elegant dome, and is tastefully ornamented. The other principal mosques are those of Mohammed II., Bajazet, Selim II., Mustaphá III., the Validea, &c. The last named, founded by the mother of Mohammed IV., contains a double row of fine marble pillars, chiefly brought from the ruins of Troy. Another mosque has become an object of curiosity, from its containing a sarcophagus, supposed to have been that of Constantine the Great. Many of the mosques have, like St. Sophia, been formerly Greek churches; the remainder have been erected mostly by the Turkish sovereigns, the viziers, or wealthy individuals. The royal foundations comprise a college, with a public library, a hospital, and an almshouse; and the mosques in general have attached to them some charitable institutions. They derive their revenues from villages and lands belonging to them, and held by a tenure not dissimilar to that of our church-lands. The incomes of some of the mosques are very large; that of St. Sophia has been said to amount to 800,000 livres annually (Hobhouse); Dallaway says 3,000*l.* (p. 58.)

The largest space in Constantinople is the *Al-Meidan*, or Horse-course, the ancient Hippodrome. It is at present 300 yards long by 150 wide. (Elliott.) In it formerly stood the celebrated group of four horses, originally transported thither from Rome, and afterwards removed to the cathedral of St. Mark, at Venice. It still contains the granite obelisk from Thebes, set up by Theodosius the Great; the broken pyramid of Constantine Porphyrogenitus, shorn of its bronze plates; and between the two, the hollow spiral brass column, which originally supported the golden tripod in the temple of Delphi. The last consists of three serpents, twisted together. Mr. Elliott describes it as being at present about 12 ft. high, mutilated at the top, and much injured in the centre. Close to the Hippodrome formerly stood the imperial palace, the senate-house, and the forum. No remains of these exist. The Hippodrome continues to be used by the Turks for feats of activity, both on horseback and on foot.

In the Adrianople Street is the 'Burnt Pillar,' so called from its having been blackened by repeated conflagrations. It was erected by Constantine the Great, and was originally 120 ft. in height, and composed of ten blocks of porphyry, each upwards of 9 ft. high, and 35 ft. in circumference, resting on a marble pedestal 20 ft. in height. The joints of the column were concealed by embossed brass or iron hoops, and the whole supported a colossal bronze statue of Apollo, said to have been the work of Phidias. (Gibbon, ch. xvii.) The statue and three of the blocks were thrown down by lightning in 1150, and the whole height is now only 90 ft. In the centre of the city the pillar of Marcian may be seen, enclosed in a private garden. It is of granite, with a Corinthian capital of white marble, surmounted by an urn of the same material. The finest of all, the Arcadian or Historical column, erected early in the 5th century, and covered with a series of bas-reliefs, representing the victories of Theodosius the Great, was taken down at the end of the 17th century, and only 14 ft. of it are now above ground. (Dallaway, pp. 113, 114.) Dallaway readily traced the vestiges of the *Boucolèon* palace, built by Theodosius II., opposite the Sea of Marmora.

The means for the supply of Constantinople with water are worthy of remark. The aqueduct of Valens, which communicates with another and more extensive, though similarly constructed aqueduct, beyond the walls, continues, as anciently, to convey water into the city. It was originally built by the Emperor Hadrian; and rebuilt first by Valens, and again by Solyman the Magnificent. It runs from the summit of the third to that of the fourth hill, consisting of a double tier of forty Gothic arches in alternate layers of stone and brick. It is in some parts considerably dilapidated, and its E. extremity especially is much injured. Andréossy estimates that it was originally nearly 1,280 yards in length; it is now, he says, 669 yards long, and about 74 ft. in height. (Andréossy, p. 432.) There are several other aqueducts on both sides the port, which, as well as the *beudts*, or reservoirs, without the walls, were chiefly the work of the Greek emperors, though they have been augmented and kept in repair by the Turkish sultans. All the water that supplies Constantinople comes from Belgrade, a village a little to the NE. of the city. An American traveller (Sketches in Turkey in 1831–32) has estimated the quantity brought into the city at 15,000,000 gall. every twenty-four hours, and states that the various water-courses about Constantinople must exceed 50 m. in length. The whole of these important works are under the superintendence of an officer with great powers, and are annually inspected by the sultan.

The Greek emperors constructed many large cisterns within the walls, both open and subterranean: the former have been gradually filled with earth, and converted into gardens; but several of the subterranean ones still remain entire. The principal are contiguous to the Hippodrome. The largest, or *Cisterna Basilika*, is a vault of brick-work, covered with *terrace* composition, 336 ft. in length by 182 ft. broad, and supported by 336

marble pillars, each 40 ft. 9 in height. (Clarke, pp. 170, 171.) It still affords water to the inhabitants, being supplied by the city aqueduct, and many wells are sunk into it. Another vault, the *Cisterna Maxima*, called by the Turks 'the thousand and one columns,' is, according to Mr. Elliott, 240 ft. long by 200 wide, 5 fathoms deep, and sustained by 14 rows of 16 double columns of white marble, the capital of one pillar forming the base for another. This cistern is now dry, and half filled with earth: it is at present used as a rope-walk, or place for spinning silk. Not far from it is another cistern, also dry, but capable of holding 1,500,000 gallons of water. (Elliott.)

The fountains are amongst the chief ornaments of the city.* There are almost as many as there are streets; one is to be found in every piazza, market-place, and mosque. They are uniformly square, with a spout at each side and a leaden roof; and are generally gilded, painted, inscribed with sentences from the koran, or otherwise decorated. The public baths are built mostly of marble, on a uniform plan, and covered with little flat domes: their interior is generally handsome and spacious; and the price of a bath, the first of oriental luxuries, is so low that a poor man can enjoy a hot bath for a penny. In the better sort, coffee, sherbet, and pipes are furnished to the bathers. Few houses of consequence are unprovided with a commodious bath.

The greater number of the *khans* (bazaars) and *bezestins* (or changes) are built of stone or brick. The *khans* and *serais*, or inns, are for the most part royal or charitable endowments, each capable of accommodating from 100 to 1,000 persons. They consist of open squares, surrounded by rooms, in several stories, and possess recommendations for outweighing their want of architectural elegance. Most of them are intended for travelling merchants. Excepting a small present to the servant at departing, strangers are gratuitously lodged in them, and during their residence in the city are masters of their rooms, of which they keep the keys. 'They are for all men, of whatever quality, condition, country, or religion soever, and the construction of them has contributed to attract the merchandise of the furthest boundaries of Africa and Asia to the capital of Turkey. During fires or insurrections, their iron gates are closed, and they afford complete security to the persons as well as goods of the merchants.' (Hobhouse.)

The covered *bazaars* have more the appearance of a row of booths in a fair, than a street of shops. Each is appropriated to a separate article of merchandise. The shops are all open in front, and under cover of a common roof; the sills of the windows, as in ancient Pompeii, forming the counters. (Elliott.)

The better sort of coffee-houses are open on one side, and have a fountain playing in the midst of a range of marble seats, and recesses furnished with pillows, mats, and stuffed carpets. A row of them, near the Solymania, is frequented by opium eaters; but there are not nearly so many of these individuals in the Turkish capital as is generally imagined. All the public buildings of Constantinople are crowned by cupolas, in consequence of which, their number, at a distance, seems to be as great as that of the private houses. The domes, as well as the minarets of all the sacred structures, are terminated by a crescent.

The houses of opulent Turks are built, like the *khans* and most other large houses in the E., round a court, which has always a fountain playing in its centre. Occasionally these residences are not ill-constructed; but the common dwellings are mere comfortless wooden boxes, with unglazed windows, and without fire-places. (Dallaway.) House-rent is said to be higher in Constantinople than in any other city in the world; this is ascribed to the frequency of fires, a house not being reckoned worth more than five years' purchase, if so much. The fact is, that these fires are very often intentional; and that they are resorted to for the same purpose that public meetings and petitions are got up in England—to make the sultan aware of the public discontent, and of the necessity of appeasing it! A striking instance of this sort is given by Porter (Observations on the Turks, p. 92), and similar instances may be found in other travellers. We do not know that any thing could better evince the atrocious nature of the despotism under which Turkey has so long groaned, than the circumstance of its making fire-raising a sort of constitutional resource!

The Golden Horn (an. *Sinus Byzantinus*) has usurped the ancient name of the promontory on which Byzantium was built, and which was first called Κέρας Χρύσεον, *Chrysoceras*, or Golden Horn. (Clarke's Trav., viii. 176, 182.) It is one of the finest and most secure harbours in the world, capable of containing upwards of 1,000 sail of the line, and of a depth sufficient to admit of goods being landed on the quays from the largest ships, in many places without the assistance of boats. It extends from the Seraglio Point inland, for about 4½ m. NW., with a breadth varying from a furlong to half a mile. At its entrance it has a light-house on either side, and is defended by some batteries on the Seraglio Point. At its upper end the ancient *Lycus*, now called the Sweet Waters, falls into it, and it is continually cleared by the stream of that river, in conjunction with a current setting into it from the Bosphorus. It exhibits a most picturesque and animated scene, covered, as it always is, with merchant vessels, steamers, ships of war, and *caïques* of all descriptions. Along the SW. side of this harbour, the *Fanar*, or Greek quarter, extends nearly the whole way from the seraglio to the western walls of the city. Beyond the walls, on the same side, is the suburb of Azoob or Ejoop, in the mosque of which the new sultan is always installed in his office. The upper extremity of the harbour, anciently called the *Marcidum Mare*, is now, as formerly, a low, marshy, unwholesome tract; but about 1½ m. beyond, in the Valley of the Sweet Waters, the Sultan Achmet III. had some grounds laid out in the French style, with the addition of gaudy kiosques, coffee-houses, &c., to which the inhabitants of the city and suburbs frequently resort.

On the NE. side of the harbour are the suburbs of Galata, Topkanah, Pera, and Cassim Pasha. The first two stand side by side on the shore opposite to the Seraglio, and E. end of the city. Pera is on a hill to the NE. behind both; and Cassim Pasha to the NW. of all, opposite the Fanar. Galata was built by the Genoese in the 13th century, and walled in the 15th. It is about 4 m. in circuit, divided into three quarters, and inhabited chiefly by European and other merchants. It has twelve gates and contains a citadel or tower, 140 ft. high, built by the Emperor Anastasius, a very fine fish-market, several mosques, a handsome fountain, and a great number of shops. Tournefort remarks that 'one tastes in Galata a snatch of liberty not to be found elsewhere in the Ottoman empire. Galata is, as it were, Christendom in Turkey; taverns are tolerated, and the Turks themselves freely resort thither to take a cheerful glass.' Topkanah (*an arsenal*) contains an arsenal, artillery-barracks, and magazines, and a cannon foundry. Pera is beautifully situated, but irregularly built and ill-paved. It is about 2 m. in

length; its pop. is almost wholly Frank, and it contains the residences of most of the European ambassadors, besides four Catholic and one Greek church, a monastery of dervishes, and a Mohammedan college. In 1831 it suffered severely from a fire, which destroyed 10,000 houses, amongst which were the palaces of nearly all the ambassadors, and property estimated to be worth 8,000,000 dollars. Cassim Pasha contains the great naval arsenal, dock-yards, barracks, quarters for slaves and workmen, the palace of the capitan-pasha, &c. There are no suburbs on the W. side of Constantinople, only a few cemeteries and scattered cottages beyond the walls. The immediate vicinity towards Thrace consists generally of an expanse of open downs; the solitude and desolation which prevail on this side are remarkable. On the Asiatic continent, about a mile across the Bosphorus from the Seraglio Point, stands the town of Scutari (an. *Chrysopolis*); and about 2 m. S. of it, the ancient Chalcedon.

Manufactures few: the principal are those of silk and cotton fabrics, arms, morocco leather, saddlery, horse-trappings, shoes, and other articles of ordinary use and consumption, together with those of tobacco bowls, tubes, and mouth-pieces. The latter branches of industry employ many hands, and one bazaar is devoted solely to those articles. The *keffkil* earth is dug in several parts of Asia, rudely fashioned into pipe-bowls in Constantinople, and exported in large quantities to Hungary, Germany, and France, where the bowls are re-manufactured, and receive the name of *meerschaums*. The best tubes are formed of the stems of the cherry or jessamine tree, both of which are largely cultivated in the neighbourhood for the purpose. The rank of a person in this city being determined *by his pipe*, it is often adorned in a very costly manner, and the price of a *tchibouque* may vary from 20 *paras* to 20,000 piastres. The fisheries of Constantinople are by no means unimportant: the sea and harbour abound with shoals of tunny, sword-fish, &c., and the 'sweet waters' with a profusion of fresh-water fish.

The foreign trade is considerable. Imports, chiefly corn, iron, timber, tallow, and furs, from the Black Sea; cotton stuffs and yarn, tin, tin-plates, woollens, silks, cutlery, watches, jewellery, paper, glass, furniture, indigo, cochineal, orpiment, &c., from England and other parts of Europe; corn and coffee from Alexandria; a good deal of coffee from Brazil and the W. Indies, in American bottoms, which traffic has latterly much increased; sugar, partly from the E., but chiefly from the W. Indies; wax, copper, drugs, gums, porcelain, overland from China (a trade which existed in the time of the Romans); and slaves, chiefly from Georgia, Circassia, and Africa. Exports comparatively trifling: chiefly silk, carpets, hides, wool, goats' hair, potash, wax, galls, bullion, and diamonds. The trade, which, as a whole, is less than might have been expected in a city of such size, is for the most part in the hands of English, French, Armenian, and Greek merchants, and Jew-brokers. The more wealthy Armenians (a nation constituting a considerable proportion of the pop.) are money-changers, bankers, jewellers, physicians, and apothecaries; the lower classes are employed in the most laborious occupations. As chintz-printers and muslin-painters, the Armenians here surpass most European artisans. The Greeks are much less numerous than before the Greek revolution.

Constantinople is the residence of a Greek, an Armenian, and a Catholic-Armenian patriarch. The first has now no authority in the newly erected kingdom of Greece. Elementary schools are to be met with in every street; and in every quarter there are Turkish free-schools for the poor, the expenses of which, as well as the board and lodging of many of the pupils, are defrayed out of the revenues of the mosques. The number of these elementary schools amounted to above 1,200 in the year 1864, according to an official return, while of upper schools, or colleges, there were 522. Some of the *medresses*, or colleges attached to the mosques, have between 400 and 500 students, who are lodged and educated on the foundation, and have each several professors, the salaries of the principal among which are equivalent to about 100*l.* a year. In these seminaries all the members of the *ulemah* are educated, and no one can be admitted into the hierarchy or the law without having first graduated in one of them. The Mohammedan law had prohibited the Turks from learning European tongues; but the late sultan established a school for the instruction of native youths in French, outside the Seraglio. The French and Austrian embassies have schools for the acquisition of Turkish by their members. There are 16 public libraries, 9 or 10 of which are attached to the royal mosques, and contain about 2,000 manuscripts each, mostly copies of the koran and commentaries on it. The private library in the Seraglio is richer than any of the rest, and contains some valuable Greek and Latin MSS.

'Amid the novelties that strike the European on his arrival, nothing surprises him more than the silence that pervades so large a capital. He hears no noise of carts or carriages rattling through the streets; for there are no wheeled vehicles in the city, except a very few painted carts, called *arabahs*, drawn by buffaloes, in which women occasionally take the air in the suburbs, and which go only at a foot-pace. The contrast is still more strongly marked at night. By ten o'clock every human voice is hushed.' Constantinople is not a healthy place of residence for strangers; it is subject to sudden changes of temperature; and the strong *etesian* or N. winds, which prevail in the summer, and do injury to trade, by preventing the access of ships from the Ægean and Mediterranean, are also detrimental to public health and comfort. Earthquakes, the plague, and devastating fires, often consuming 2,000 or 3,000 houses, cause great destruction of life and property. In other respects, too, it is a most unpleasant place of residence to a European or other stranger. In many cases property is not secure, justice is notoriously corrupt, the police is bad, the place is infested with cats, rats, and, as most travellers say, with herds of wild dogs, and birds of prey, which act as scavengers. Sir J. Hobhouse states, that 'Constantinople is distinguished from every other capital in Europe, by having no names to its streets, no lamps, and no post-office.'

The history of this renowned city for a lengthened period is given by Gibbon. It was originally founded by Byzas, from whom it derived the name of *Byzantium*, *anno* 656 B.C.; and having been destroyed by Severus, was rebuilt, A.D. 328, by Constantine, who made it the cap. of the Roman empire. On the subjugation of the Western empire by the barbarians, Constantinople continued to be the cap. of the Eastern empire. Its wealth and magnificence were celebrated during the middle ages. It has sustained numerous sieges, but has only been twice taken; first, in 1204, by the Crusaders, who retained it till 1261; and, lastly, by the Turks, under Mohammed II., May 29, 1453, when the last remnant of the Roman empire was finally suppressed.

CONSUEGRA, a town of Spain, prov. Toledo, on the Amarguillo, 38 m. SE. Toledo. Pop. 6,870 in 1857. The town has 2 churches, 3 convents, a

palace, and a variety of Roman inscriptions and antiquities. On a neighbouring hill are the remains of its ancient castle. Streets tolerably regular, but narrow and steep. The vicinity produces grain, wine, oil, barilla, and soda, and has quarries of azure-coloured marble, jasper, and other stones. It has fabrics of coarse stuffs, baize, and serge.

CONWAY, a town and parl. bor. of N. Wales, co. Caernarvon, hund. Isaf, on the æstuary of the Conway river: 15 m. NW. by W. from the Menai Bridge, and 224½ m. NW. London by the London and North Western railway. Pop. of par. 1,855, and of parl. bor. 2,523 in 1861. The town, which is of a triangular shape, stands on a steep slope, and is surrounded by lofty walls, fenced with 24 round towers. The lower face of the triangle borders on the river; and at its farthest angle, on the verge of a slate rock, its magnificent castle

'Frowns o'er old Conway's foaming flood.'

This noble structure was built by Edward I. in 1284. 'A more beautiful fortress never arose. Its form is oblong, placed in all parts on the verge of the precipitous rock. One side is bounded by the river; another by a creek full of water at every tide, and most beautifully shaded by hanging woods. The other two sides face the town. Within are two courts; and on the outside project eight vast towers, each with a slender one of amazing elegance issuing from its top, within which had been a winding staircase. In one of the great towers is a fine window, in form of an arched recess, or bow, ornamented with pillars. The great hall suited the magnificence of the founder. It extended 130 ft. in length, was 32 broad and of a fine height. The roof was supported by eight noble arches, six of which still remain. There were two entrances into the fortress, one from the river, and one from the town. (Pennant's Tour in Wales, iii. 123, 8vo. ed.) The town is poor and inconsiderable, without trade or manufacture of any sort. Much of the ground within the walls is used for gardens. The bor. is one of the contributary bors. to Caernarvon in returning a mem. to the H. of C. The limits of the bor. extend to a considerable distance beyond the walls of the town. The port dries at low water.

The old and dangerous ferry over the river has been superseded by a magnificent suspension bridge completed in 1826. The length of the bridge between the centre of the supporting towers is 327 ft.; and it is elevated 18 ft. above high-water mark. The construction of this and the Menai Bridge, and the excavations and improvements that have been made at Penmanmawr and other places, have made the road, formerly so dangerous, from St. Asaph and Conway to Bangor and Anglesea, one of the best and safest in the empire.

COOCH-BAHAR, or VIHAR, a rajahship of Hindostan, prov. Bengal, between lat. 26° and 27° N., long. 89° and 90° E.; having N. Bootan, and on all other sides the distr. of Rungpore, with which it is incorporated; length about 90 m; greatest breadth, 60 m. Its rajah also possesses some tracts beyond the Mogul limits of Bengal, not subject to tribute, and on which opium is extensively cultivated. The S. part of this country is fine and fertile, but N. of the cap. it is low, marshy, and interspersed with jungle and coarse rank vegetation. The Cooch or Rajbangsi tribes eat various kinds of flesh, and are considered by the Bengalese and other Hindoos as very low and impure. Notwithstanding provisions are cheap as compared with other districts, and rents low, many of the natives, especially in the N., are so indigent as to be frequently obliged to sell their children for slaves. Hoe-cultivation is common. In 1582, Abul Fazel relates that the chief was a powerful sovereign, having Assam and Camroop under his government, and able to bring into the field 1,000 horse and 100,000 foot; in 1661 this territory was conquered by the Moguls, and devolved, with the rest of Bengal, to the British in 1765.

COOKSTOWN, an inl. town of Ireland, prov. Ulster, co. Tyrone, on the Ballinderry river, 9 m. W. from Lough Neagh. Pop. 2,883 in 1831, and 3,257 in 1861. The town consists of one long street, planted on each side, with a transverse street crossing it. The par. church is a large Gothic structure: there are three meeting-houses for Presbyterians, two for Methodists, and near the town is a Rom. Cath. chapel. There is also a dispensary and a constabulary station. Linens are manufactured here, and bleached in the vicinity. Markets for grain are held on Tuesdays, and for general sales on Saturdays; fairs on the first Saturday of every month.

COORG (*Hodoogoo*), an anc. rajahship of Hindostan, prov. Mysore, formerly independent, but now under the pres. of Madras. It lies for the most part between lat 12° and 13° N., and intersected by the 76th parallel of E. long.; having N and E. the Mysore territories, and on all other sides those of the Madras presidency; length N. to S. about 70 m., breadth very irregular: area, 2,340 sq. m. To the W. it is bounded by the W. Ghauts, parallel to which there is a succession of lofty narrow ridges, enclosing valleys of various extent. The chief elevations are, Tadiandamole 5,781 ft., and Soobramany 5,682 ft. above the sea: the principal valley is that between Markara and Naknaad, 18 m. long, by 15 m. broad, with an extremely uneven surface, in the lowest part of which runs the Cavery. The geology of Coorg strongly resembles that of the Neelgherries; the principal rocks being sienite, granite, and greenstone, and the subordinate ranges uniformly capped with the detritus of these, cemented by argillaceous earth, and coloured by oxide of iron: porcelain clay frequently occurs. The whole country, with few exceptions, is covered with forests, but not overloaded with jungle, excepting in the vicinity of the Mysore dominion; where elephants, game, and other wild animals are found. Sandal and other valuable woods abound. Both the botany and zoology of this region offer a rich field to observers, but have hitherto been but little studied. From the greater elevation, the temperature is much below that of either Malabar or Mysore, and remarkable for its equality. The climate is, in general, highly suitable to European constitutions, though the monsoon rains, from June to Sept., often fall with great violence. The Coorgas are a Nair tribe of martial habits; they have few towns, or even villages, of any size, preferring to live in jungles and wilds. They cultivate rice in the valleys, which are very productive, though the quantity of land under culture be very trifling. The pastures are excellent, and cattle are abundant. Manufactures limited to the blankets worn by the pop. Cotton cloths are imported. Contrary to the custom in Malabar on the other side of the Ghauts, hereditary rights and possessions in Coorg descend in the male line, and some family disputes arose in 1808, in consequence of Beer Rajendra (who had expelled the troops of Tippoo from Coorg) having left, at his death, the government of his dom. to his daughter, to the prejudice of his brother, who was ultimately established in possession by the British government. The country was annexed to the British dominions in 1832.

COOTEHILL, an inl. town of Ireland, prov.

Ulster, co. Cavan, on a small river of the same name, 26 m. W. by N. Dundalk. Pop. 2,178 in 1831, and 1,994 in 1861. The town consists of four broad streets, neatly laid out and well kept. It has a par. church, a Rom. Cath. chapel, two Presbyterian meeting-houses, places of worship for Moravians, Quakers, and Methodists: a market-house, a court-house, and a bridewell. There is an extensive trade in grain and coarse linens. The corn markets are held on Saturdays, the general markets on Fridays; and fairs on the second Friday in every month.

COPENHAGEN (*Kiobenhavn*, merchants' haven), the cap. of Denmark, a well-built city, principally on the E. coast of the island of Zealand, but partly also on the contiguous small island of Amak, the channel between them forming the port. Pop. 155,143 in 1860. The town is well fortified. The ramparts, which extend for about 5 m., are flanked with bastions, and surrounded by a deep ditch filled with water. It is also defended by a very strong citadel, and by the *Three Crowns* battery, constructed at the entrance of the port on a bank of sand, about 1,500 fathoms from shore. The city is usually divided into the old town, the new town, and Christianshavn. The first is the largest and most populous, and having at different periods suffered much from fire, most part of it has been rebuilt on an improved plan, though some of the streets are still narrow, crooked, and inconvenient. In the new town the streets are straight and broad, though generally ill-paved, the squares regular and spacious, and the private houses and public buildings the finest in the city. The part called Christianshavn, from its being built by Christian IV., stands on the island of Amak. It is intersected by various canals, and communicates with the other parts of the town by bridges. Public buildings numerous, and many of them superb. Among others may be specified the castle of Christiansborg, destroyed by fire in 1795, and since rebuilt. It has a picture-gallery, comprising a complete collection of Danish pictures, with a fine collection of the Dutch school; a chapel ornamented by bas-reliefs from the chisel of Thorwaldsen; and the royal library, one of the best in Europe, containing, exclusive of manuscripts, above 450,000 volumes. The part of the new town called Amalienborg was entirely rebuilt by Frederick V. between 1745 and 1765. It consists chiefly of an octagon, divided by four broad rectangular streets, in which is the palace of the king. In the centre is a bronze equestrian statue of Frederick V., erected by the East India Company. There are also the royal palaces of Rosenburg and Charlottenborg, appropriated to public purposes; the university, the town-house, the theatre, the exchange, and the barracks. The cathedral church of Notre Dame, nearly destroyed during the bombardment in 1807, has been rebuilt; and is enriched by statues of Christ and the Apostles, by Thorwaldsen. The tower of the church of the Trinity, 115 ft. in height, is used as an observatory: it also contains the library of the university, and the great globe of Tycho Brahe. The church of Our Saviour is reckoned the finest in the town: its spire, nearly 300 ft. in height, is a masterpiece of art. The educational, literary, and scientific establishments of Copenhagen, rank with the first of their class, and reflect infinite credit on the government and the people. Besides the university, to which we have elsewhere alluded, there is a polytechnic school, a metropolitan school, a royal school of marine, a royal school for the higher military sciences, and a normal school. There is, also, a royal society similar to that of London, a Scandinavian society, and a society of northern antiquaries. The academy of arts is and has long been in a flourishing condition. Besides the royal library in the palace of Christiansborg, the university library has above 100,000 volumes, and a large collection of manuscripts. The *Classen* library, bequeathed to the public by the general of that name, is mainly devoted to science and natural history; and, exclusive of these, there are several other minor but still valuable collections.

The hospitals are numerous and well conducted. The most splendid is that of Frederick V. The lying-in hospital has attached to it a school of midwifery and a foundling hospital. The royal institution for deaf and dumb admits patients from all parts of the kingdom.

If distillation be excepted, the manufactures of Copenhagen are neither very extensive nor important. There are about 258 distilleries, mostly on a small scale, and about 50 breweries, with sugar refineries, tobacco manufactories, and soap-works. Cotton and woollen goods, linens, silks, gloves, and hats are also produced, but in limited quantities.

The trade of the port is considerable. There arrived, in 1860, 4,015 vessels, of 115,502 lasts (of 2 tons each); in 1861, 3,252 vessels, of 127,224 lasts, and, in 1862, 3,233 vessels of 126,862 lasts. Of these, there were British vessels 120 in 1860; 160 in 1861; and 249 in 1862. The principal articles of import are—anchors, pitch, and tar, from Sweden and Norway; flax and hemp, masts, sail cloth, and cordage from Russia; tobacco and rice, from the United States; wines and brandy from France; and coal, earthenware, cottons, and colonial produce from England.

The harbour is formed, as already stated, by the channel or arm of the sea running between Zealand and the opposite island of Amak. The entrance to it is narrow; but the water is sufficiently deep to admit the largest men-of-war. There are dry docks, and every facility for the building and repairing of ships. Copenhagen is the station of the Danish navy. The bank of Copenhagen, founded in 1736, was remodelled in 1818: it is now a private institution. The charge of the public health is entrusted to a commission. The police is under a special establishment; and besides the garrison, the citizens are formed into a national guard.

Copenhagen is not a very ancient city, having been founded in 1168. It has at different periods suffered severely from fires, particularly in 1728, 1794 and 1795; but how disastrous soever at the time, these visitations were in the end advantageous, the narrow streets and wooden houses of which the town formerly consisted having been replaced by broad streets and handsome stone buildings. Besides the loss of her fleet Copenhagen suffered severely from the bombardment by the English in 1807, and by an inundation in 1824. But she has fortunately recovered from both these disasters, and by her literary and other establishments has placed herself at the head of civilisation in the north of Europe.

The environs of Copenhagen are celebrated for their beauty. Fredericksberg, a magnificent castle, the summer residence of the king, stands on a rising ground within a moderate distance of the city. Its gardens are open to the public, and are a favourite resort. Fredericksborg, another royal residence, is situated about 21 m. N. Copenhagen. It is a vast, but incongruous pile, partly brick and partly stone, and partly of Greek and partly of Gothic architecture. It has some fine pictures and a series of portraits (partly imaginary) of the sovereigns of Denmark.

COPIAPO, the most N. town of Chili, formerly the cap. of the prov. of same name, now incor-

porated with that of Coquimbo. It stands on the right bank of the rivulet of Copiapo, 30 m. from the Pacific, and 178 m. NNE. Coquimbo; lat. 27° 10′ S., long. 71° 5′ 15″ W. Pop. estimated at 3,000. The town is connected by railway with Caldera. Most of the houses are built of sun-dried bricks whitewashed; and, the better to resist earthquakes, used to be constructed with great solidity; but in 1819 it was destroyed by the earthquake that caused such devastation throughout a great part of Chili. In 1822 it suffered severely from another earthquake. The harbour of Copiapo on the Pacific is good; and at a small village on the shore most of the ore from the mines of the prov. is smelted, and the metal is exported.

COQUIMBO, or LA SERENA, a sea-port town of Chili, in the N. part of the republic, cap. of the prov. of same name, on the Chuapa, near its mouth; 270 m. NNW. Santiago; lat. 29° 53′ 43″ S., long. 71° 18′ 40″ W. Estimated pop. 7,000. The town is clean, and tolerably well laid out; streets intersect each other at right angles; houses mostly of sun-dried bricks, and only one story in height, but interspersed with numerous gardens of fruit-trees and evergreens. It has several churches and convents, a public school, and a hospital. It is the seat of the intendent of the prov., and is the residence of many families, and in some sort the cap. of N. Chili, as well as the chief mercantile port. The exports amounted to 3,201,266 dollars in 1863, and to 4,898,870 dollars in 1864; the imports to 318,356 dollars in 1863, and to 678,041 dollars in 1864. (Report by Mr. Consul Tait, dated March 18, 1865.) The harbour or bay of Coquimbo is large, well-sheltered, and secure at all seasons. There is sufficient depth of water for ships of large burden, 9 fathoms being found 300 yards off shore, and nearly 3 fathoms close in shore. A railway connecting Coquimbo and Serena with Las Cardas and the mines in the interior was opened on 26th April, 1862. The line was entirely constructed and is worked by Englishmen. Coquimbo was founded by Valdivia in 1544. About 25 m. up the valley of Coquimbo are some singular parallel roads, of which Captain Hall has given an account.

CORDOVA (an. *Corduba* and *Colonia Patricia*), a famous city of Spain, cap. prov. and kingdom of the same name in Andalusia, on the Guadalquivir, 73 m. NE. Seville, and 185 m. SSW. Madrid, on the railway from Madrid to Seville and Cadiz. Pop. 42,909 in 1857. The city occupies a large oblong space of sloping ground, enclosed by walls flanked with towers originally erected by the Romans; and afterwards, repaired, strengthened, and extended by the Moors. But a great part of this space is now covered with gardens and ruined buildings, and but little remains of its ancient grandeur. Streets narrow, crooked, and dirty; and a few either of the public or private buildings are conspicuous for their architecture; the latter seldom exceed two stories in height. The great square, *Plaza Real*, or *de la Constitution*, is, however, large and regular; the houses surrounding it are lofty, and furnished with porticoes and balconies. There is a suburb of some extent on the S. bank of the river, with which the city communicates by means of a stone bridge of 16 irregular arches, 860 ft. in length, and 23 ft. in width, constructed by the Moors towards the close of the 8th century, and the approach to which is guarded by an old Saracenic castle, still maintained in a state of defence. The city contains a cathedral, 13 parish churches, about 40 convents, 7 hospitals, a foundling and another asylum city-hall, bishop's palace, 3 colleges, besides other schools. By far the most remarkable public edifice is the cathedral or *mezquita*, formerly a mosque, built by the Moors at the latter end of the 8th century upon the ruins of a Gothic church, which is itself believed to have replaced a Roman temple. Both of these edifices have apparently furnished many pillars and other materials for the present building. The mezquita externally is unprepossessing, and little calculated to attract notice; but the singularity of its interior strikes every one with astonishment. It is a gloomy labyrinth of pillars, 356 ft. in length N. to S., by 394 ft. broad E. to W., and lighted only by the few doors that remain open, and some small cupolas in different parts of the roof, which latter is flat, and only 35 ft. above the pavement; being supported in most places by a kind of double arcade of horse-shoe arches. The columns supporting these arches, and which amount to several hundreds, are of jasper, marble, porphyry, granite, *verd-antique*, and various other materials, and differ as much in their architectural as in their geological character. They are all, however, of the same height; 'for the Arabs, having taken them from Roman buildings, served them in the same manner that Procrustes did his guests: to the short ones they clapped on monstrous capitals and thick bases; those that were too long for their purpose had their base chopped off and a diminutive shallow bonnet placed on their head.' (Swinburne's Travels, ii. 89.) The number of aisles or naves is lengthwise 19, and transversely from 32 to 35. A considerable space at the S. end was parted off for the use of the *Imans*, and now serves for the chapter-house, sacristy, and treasury of the cathedral. In the front of this space is what is called the *zancarron*, an octagon Moorish sanctuary, 15 ft. in diameter, richly ornamented without and within, and domed over by *a single block of white marble*, carved into the form of a scallop-shell. Adjoining this, in 1815, another small apartment was brought to light, preserving, in a remarkable degree, its pristine decorations. The gorgeousness of this little chamber will perhaps give an idea of that of the building generally in the time of the Moors; for the splendour of almost all the rest of the *mezquita* has entirely disappeared; the gilding and ornaments of the roof, the arabesques and inscriptions on the walls, and the mosaics of the pavement, have nearly all vanished; and of the 24 gates, formerly plated with brass, and curiously embossed, only 5 remain open. The sacristy contains some tolerable paintings, and the church is very rich in jewels, plate, and silks. The *mezquita* stands within a court planted with orange-trees, palms, and cypresses, and surrounded with a cloister, on the N. side of which a square belfry has been built.

The bishop's palace is a large and rather handsome building, containing a suite of state apartments, in one of which there is a large collection of portraits of the bishops of Cordova. Previously to the late civil war, 2,000 poor persons were daily supplied with food from the bishop's kitchen, which mistaken bounty accounts sufficiently for the swarms of beggars with which the town is infested. The famous palace of the Moorish sovereigns is now unoccupied; it had been converted into a royal stud-house, where the best horses in Spain were reared: the stables are now empty. The manufactures have participated in the general decay of the place; there are at present only some trifling fabrics of ribands, lace, hats, baize, and leather after the Moorish fashion: the latter article was formerly very extensively manufactured; and was known in commerce by the name of *cordovan*, and from it the term

cordwainer has been derived. In 1833, a handsome quay was erected above the bridge, but as there is but little trade, and the river is for 9 months in the year navigable only for boats, the quay would seem, like many other public works in Spain, to be more for show than for use.

Cordova is said by Strabo to have been founded by the Romans under Marcellus; but as there were several distinguished persons of that name, this leaves the epoch of its foundation uncertain. No mention is made of it before the age of Cæsar and Pompey, but it soon after attained to great distinction as a rich and populous city, and a seat of learning. (Cellarii, Not. Orbis Antiqui, i. 86.) In 572 it was taken by the Goths, and in 692 by the Moors, under whom it became the splendid cap. of the 'Caliphate of the West,' and subsequently of the kingdom of Cordova. In 1236, however, it was taken and almost wholly destroyed by the impolitic zeal of Ferdinand III. of Castile, and has never since recovered its previous prosperity. Cordova has given birth to some illustrious men, among whom may be specified the two Senecas, Lucan the poet, and the famous Arabic physicians, Avicenna and Averroes.

Cordova, an inl. town of Mexico, state Vera Cruz, at the E. foot of the volcano of Orizaba, and on one of the roads between Vera Cruz and La Puebla; 50 m. SW. the former, and 72 m. ESE. the latter city. Estimated pop. 6,000. Streets wide, regular, and well paved; houses built mostly of stone. In the centre of the town there is a large square, three sides of which are ornamented with Gothic arcades; the fourth is occupied by the principal church, an elegant structure, richly decorated within. Cordova contains two convents, each with a hospital attached; many of its edifices have domes, towers, or steeples. Cotton and woollen fabrics and leather are made here; and there are besides numerous distilleries, sugar-mills, and bee-hive farms; but the principal employment of the inhab. is the culture of tobacco and coffee. The vicinity is extremely fertile, and abounds in fruits, timber, game, and fish.

COREA (called by the natives, *Chaou-Seen*, by the Chinese, *Keaou-le*, and by the Manchoo Tartars *Sol-ho*), a marit. country of NE. Asia, tributary to China, consisting of a large oblong-shaped peninsula, with an adjoining portion of the continent, and a vast number of islands, which are especially numerous on the W. coast. The whole of the dominions lie between lat. 33° and 43° N., and long. 123° 50′ and 129° 30′ E.; having E. the Sea of Japan; S. the Straits of Corea; W. the Yellow Sea and Gulf of Leao-tong; NW. the prov. Leao-tong; and N. Manchoo Tartary. From the latter it is separated by a mountain chain, and the Thu-men-Kiang river, and from Leao-tong mostly by a wooden wall or palisade. Length, NW. to SE., 550 m.; average breadth of the peninsula, about 130 m. Total area, inclusive of islands, probably about 80,000 sq. m. Corea is generally mountainous. A mountain range runs through it longitudinally, much nearer its E. than its W. coast. The E. declivity of this range is steep and rugged; its W. one declines gradually into a fertile and well-watered country. All the principal rivers run W., and discharge themselves into the Yellow Sea; the chief is the Ya-lu-kiang in the NW., which is navigable for large ships to about 22 m., and for small vessels for a distance of nearly 120 m. above its mouth. The coasts, as well of the islands as of the continent, are generally rocky and difficult of access; though there are some spacious and secure harbours. The climate of the N. is very rigorous; the Thu-men-kiang, for six months in the year, is thickly frozen over, and barley is the only kind of corn capable of being cultivated in that region; even the S., though in the same lat. with Sicily and Malta, is said to experience sometimes very heavy falls of snow. The climate of this part of Corea, however, must be on the whole mild, since cotton, rice, and hemp are staple products; and Gutzlaff conjectures (Voyages, &c., p. 319), that many other plants, common to the S. of Europe, flourish. Gutzlaff observes, 'In point of vegetation, the coast of Corea is far superior to that of China, where barren rocks often preclude any attempt at cultivation; but here, where the land is fertile, the inhab. do not plough the ground.' (p. 337.) Agriculture may be better farther inland, but on the coast it is much neglected: wheat, millet, and ginseng are amongst the chief articles cultivated. Tobacco was introduced by the Japanese about the beginning of the 17th century, and potatoes, by Gutzlaff and Lindsay, in 1832. The orange, citron, hazle-nut, pear, chesnut, peach, mulberry, *Morus papyrifera*, *Fucus saccharinus*, and the wild grape, are common; but the art of making wine from the latter seems to be unknown. An ardent liquor is, however, made from rice. The mountainous parts of the N. are covered with extensive forests: pines are very abundant on the coasts; and in the interior there is a species of palm producing a valuable gum, from which a varnish, giving an appearance little inferior to gilding, is made. Oxen, hogs, and other domestic animals common to Europe are reared: there is a spirited breed of dwarf horses not exceeding 3 ft. in height; panthers, bears, wild boars, cats, and dogs, sables (whose skins form an important article of tribute), deer, and an abundance of game, storks, and water-fowl of many sorts, are found; caymans of 30 or 40 ft. in length are said to be met with in the rivers, and venomous serpents are not rare. In the winter, whales, seals, &c. visit the shores. The mineral kingdom produces gold, silver, iron, rock salt, and coal.

People.—The pop. has been estimated at 15,000,000, but there are no real grounds for this estimate, which, we have little doubt, is greatly beyond the mark. Gutzlaff represents the coasts as thinly inhabited. We have elsewhere stated that the Coreans are superior in strength and stature to the Chinese and Japanese, but that they are inferior to either in mental energy and capacity. (See Asia.) They are gross in their habits, eat voraciously, and drink to excess. The dress of both men and women is very similar to that of the Chinese, though the Coreans do not, like that people, cut off their hair. Their houses are also like those of China, being built of bricks in the towns, and in the country are mere mud hovels; each house is surrounded by a wooden stockade. Their language or languages are peculiar, differing from those of their immediate neighbours. In writing they use alphabetic characters, though the symbolic characters of the Chinese are also understood and sometimes resorted to. They have a copious literature, and are very fond of reading, as well as of music, dancing, and festivities. Polygamy is permitted, but the women do not appear to be under such restraint as in China. (M'Leod.) The religion of the upper orders is that of Confucius, while the mass of the people are attached to Buddhism; but neither appears to have much influence. Christianity, which was introduced by the Japanese, appeared to be extinct when Gutzlaff visited Corea in 1832.

Manufactures and Trade.—The manufactures are few: the principal are a kind of grass-cloth, straw-plait, horse-hair caps, and other articles for

domestic use: a very fine and transparent fabric woven from filaments of the *Urtica japonica*, cotton cloth, and a very strong kind of paper made of cotton, and rice-paper; which articles, together with ginseng, skins, some metals, horses, and silk, constitute the chief exports. What trade there is, is principally with Japan, from which they import pepper, aromatic woods, alum, buffaloes', goats', and bucks' horns, and Dutch and Japanese manufactured goods. There is, however, some trade with China carried on at Fungwang-ching (the *Phœnix-town*), beyond the Leao-tong border; but this trade is conducted with great secrecy, in consequence of the jealousy of the government of any intercourse with foreigners. This jealousy is so great, that no Chinese is allowed to settle in Corea, nor any Corean to leave his own country; Europeans are scarcely ever suffered to land, or remain any length of time on the coast; and the N. frontier is abandoned for many miles, in order that no communication should take place with the Manchoo Tartars. Little skill in ship-building is displayed by the Coreans; their junks do not carry more than 200 tons, and are quite unmanageable in a heavy sea. In the construction of their fishing-boats not a nail is used. Metallic articles and money are rare. The only coin in circulation is of copper, but payment is often made in silver ingots.

Corea is divided into 8 provs. King-hi-tao, the cap., is placed on the Kiang river, in about 37° 40′ N. lat., and 127° 20′ E. long., or about the centre of the kingd. The gov. is said to be despotical: most of the landed property in the country belongs to the king, of whom it is held in different portions as fiefs, which revert to the sovereign at the decease of the occupier. Besides the revenues from these domains, a tenth part of all kind of produce belongs to the king. Justice is in many respects very rigid. Rebellion, as in China, is punished by the destruction of the rebel with his entire family, and the confiscation of their property. None but the king may order the death of an official person: the master has always power over the life of his slave. For minor crimes the general punishment is the bastinado, which is pretty constantly at work. The Chinese interfere but little with the internal administration of Corea; but the king can neither assume the government, nor choose his successor or colleague, without the authority of the court of Pekin, to which he sends tribute four times a year: the tribute consists of ginseng-root, sable-skins, white cotton paper, silk, horses, and silver ingots. The Corean ambassador is treated at Pekin with but little consideration. There seems reason to believe, that, like some other states in Asia, Corea is tributary to the more powerful nations on either side, and that it also sends a yearly tribute to Japan, consisting of ginseng, leopards, skins, silks, white cotton fabrics, and horses; but for which an acknowledgment is made in gold articles, fans, tea, and presents of silver to the ambassadors

History.—Corea was known to the Chinese from a very early period, and is reported to have been civilised by the Chinese sovereign Khil-su, about 1,120 years before our æra. After experiencing several revolutions, it was invaded and conquered by the Japanese in 1692, who, however, abandoned their conquest in 1698. The Coreans having called in the aid of China during that struggle, Corea has since formed a subordinate part of the Chinese empire.

CORELLA, a city of Spain, prov. Navarre, in a fertile plain on the Alama, 13 m. W. Tudela, 12 m. SE. Calahorra. Pop. 5,023 in 1857. The town has two churches, 4 convents, a hospital, and some remains of an ancient castle. The inhabitants are employed in the extraction of liquorice and madder juice, and in the manufacture of brandy, oil, and flour.

CORFE-CASTLE, a market town and bor. of England, co. Dorset, Blandford div., hund. Haislor, in the Isle of Purbeck, 32 m. SSW. Salisbury. Pop of par. 1,901 in 1861. The town is most probably indebted for its origin to its castle, on a steep rocky hill, a little to the N., formerly a place of considerable strength. But its importance, in more modern times, was owing to its having enjoyed the privilege of returning two mems. to the H. of C. from the 14th of Elizabeth down to the passing of the Reform Act, by which it was disfranchised. The inhab. are mostly employed in the neighbouring clay-works and quarries.

CORFU (an. *Corcyra*), an island in the Mediterranean, forming (since 1864) part of the kingdom of Greece, and the most important, though not the largest, of the Ionian Islands. It lies between lat. 39° 20′ and 39° 50′ N., and long. 19° 35′ and 20° 6′ E.; off the S. part of the coast of Albania, from which it is separated by a channel only 3-5ths of a m. wide at its N. extremity, 6 m. at its S. extremity, and 15 m. in the centre. The shape of Corfu is elongated; the island describes a curve, the convexity of which is towards the W.; length NW. to SE. 41 m.; breadth greatest in the N., where it is 20 m.; but it gradually tapers towards its S. extremity. Area, 227 sq. m. Pop. 69,414 in 1860, including 5,765 aliens and strangers. The native pop., in 1860, was composed of 33,520 males and 30,129 females—a rather remarkable preponderance of the male sex, particularly in a seafaring population. Surface hilly, particularly in the NW., where the peak of St. Salvador rises 2,979 ft. above the level of the sea. The streams watering it are few and small, and mostly dried up in summer. Climate mild; the mean maximum temp. in the open air for the five years ending December, 1838, was about 88° Fahr.; and the average minimum 31° Fahr.; but Corfu is subject to sudden transitions from heat to cold, owing, amongst other causes, to the proximity of the snowy mountains of Epirus. Earthquakes also are frequent. The more elevated lands are rugged and barren, but the plains and valleys are fertile, and productive of wheat, maize, oats, olive-oil, wine, cotton, flax, and pulse. Corfu yields no currants. Oil is the great staple of this isl., which has, in fact, the appearance of a continuous olive wood, a consequence partly of the extraordinary encouragement formerly given to the culture of the plant by the Venetians. There is an oil harvest every year, but the great crop is properly biennial, the trees being suffered to repose for a year. Next to oil, salt, obtained from saltpans along the shores, oranges, citrons, and other fruits, besides honey and wax, are the other chief articles produced. Corfu is divided into 6 cantons; it sends 12 mems. to the legislative assembly of Greece. Corfu, the cap., is the only town worthy of mention; the rest are mere villages.

The city and port of Corfu lie on the E. side of the island, on the channel between it and the opposite coast, which is here about 5 m. wide; lat. 39° 37′ 39″ N., long. 19° 56′ 34″ E. It consists of the town and citadel, both fortified; and has several suburbs, one of which is supposed to occupy the site of the ancient city of *Corcyra*, founded by the Corinthians about the same time with Syracuse. The citadel, separated from the town by wet ditches and outworks, and an esplanade, is built upon a rocky cape projecting into the sea, and contains the barracks, arsenal, military hospital, the former residence of the British lord high

commissioner, now the seat of the Greek government, and a lighthouse erected upon a point 233 ft. above the level of the sea. The town has three gates towards the sea, and one on the land side. It is not well built; streets narrow and irregular, and houses mostly small and ill-contrived. Corfu is strengthened by two other fortresses besides its citadel—Fort Neuf and Vido. The latter is built on a small island of the same name (an. *Ptycha*), nearly 1 m. N. from the city, and has had much pains and (British) expense bestowed on its improvement. Corfu contains a cathedral, and several Greek and Roman Catholic churches and chapels, a university, gymnasium, ecclesiastical seminary, and several primary schools. Around it there are some pleasant walks, interesting from classical associations; the esplanade is well planted with trees, and forms an agreeable promenade. The town is well supplied with water, which is conveyed by means of iron pipes from Benizza, a distance of 7 m. Roads have been made from Corfu to most of the principal towns and villages in the island. The harbour between the island of Vido and the city is safe and commodious, and vessels anchor in from 12 to 17 fathoms water. The *canal*, or channel of Corfu, is a little difficult of navigation, but has deep water throughout; there is a lighthouse on the rock of Tignoso at its N. entrance, and a floating light is moored off the point of Leschimo near its S. extremity. The city of Corfu is the seat of the supreme court of justice, the chief special courts for the island, and of a Greek archbishop. In 1716 it was unsuccessfully besieged by the Turks, and did not fall into their hands until the end of last century.

Corfu is the chief seat of the external trade of the Ionian Islands. The roads in it are good, having been greatly improved since it has been under British protection. Most of the inhab. belong to the Greek church. It is believed to be the country of Phæacia, or Scheria, mentioned by Homer, on which Ulysses was wrecked, and afterwards hospitably entertained by King Alcinous. It became afterwards a celebrated colony and naval station of the Corinthians, and a quarrel between it and the mother country led to the Peloponnesian war. It was also an important naval station under the Romans. It belonged successively to the Eastern Empire, the Normans, and Venetians, and shared the fate of the Venetian republic in 1799. The island, with the rest of the Ionian republic, was placed under the protectorate of Great Britain by the congress of Vienna, but ceded to Greece in 1864. A Greek garrison arrived at Corfu, and took possession on the 28th of May, 1864.

CORINGA (*Caranga*), a considerable sea-port town of Hindostan, prov. N. Circars, distr. Rajahmundry, and 33 m. SE. that town; lat. 16° 40′ N., long. 82° 44′ E. Excepting Blackwood's Harbour, Coringa Bay contains the only smooth water to be found on the W. side of the Bay of Bengal, during the SW. monsoon. A wet dock has been formed, and many small vessels are annually built here. In 1784, a remarkable inundation of the sea took place, destroying much property and many inhabitants.

CORINTH (Κόρινθος), a famous city of Greece within the Morea (an. *Peloponnesus*), near the isthmus of the same name, between the gulfs of Lepanto (*Corinthiacus Sinus*) on the W., and of Egina (*Saronicus Sinus*) on the E., 7 m. from the nearest point of the latter, and 2 m. from the nearest point of the former; lat. 37° 53′ 37″ N., long. 22° 52′ 5″ E. Pop. 2,150 in 1860. The town is situated at the N. foot of a steep rock, 1,336 ft. in height, the *Acrocorinthus* or *Acropolis* of Corinth, the summit of which is now, as in antiquity, occupied by a fortress. The present town, though thinly peopled, is of considerable extent, the houses being placed wide apart, and much space occupied with gardens. The only Grecian ruin at present to be found in Corinth is a Doric temple, with but a few columns standing. There are some shapeless and uninteresting Roman remains, supposed to have been baths; but there is nothing approaching to a well-defined building, and we may exclaim with the poet,—

'Where is thy grandeur, Corinth? shrunk from sight,
Thy ancient treasures, and thy rampart's height;
Thy god-like fanes and palaces!—Oh, where
Thy mighty myriads and majestic fair!
Relentless war has pour'd around thy wall,
And hardly spared the traces of thy fall!'

The situation of Corinth is extremely advantageous, being placed on a narrow isthmus between the seas that wash the E. and W. shores of Greece, she could hardly fail to become an important emporium; while the Acrocorinthus, if properly fortified, would be all but impregnable, and the possession of the isthmus would enable her to command all access by land between the two great divisions of Greece. No wonder, therefore, that Corinth was early distinguished by the wealth, commerce, luxury, and refinement of her citizens. In the earlier ages of antiquity, the attempt to sail round the Peloponnesus, or to double Cape Malea, was regarded as an undertaking of the greatest hazard; and to obviate this danger, the usual practice was to land goods, coming from the W. shores of Greece, Italy, and Sicily, destined for the E., at the harbour of *Lechæum* (the nearest point to Corinth), on the Corinthian Gulf, and to convey them across the isthmus to *Cenchreæ*, on the Saronic Gulf, where they were again shipped for their final destination. The products of the E. coasts of Greece, Asia Minor, and the Black Sea, destined for the W. parts of Greece, Italy, &c., were conveyed through the Corinthian territory in an opposite direction; so that the city early became the seat of perhaps the most important transit trade carried on in antiquity. In addition to this, Corinth at an early period founded Corcyra, Syracuse, and other important colonies; established within her walls various manufactures, particularly of brass and earthenware; had numerous fleets, both of ships of war and merchantmen; and was the centre of an active commerce that extended to the Black Sea, Asia Minor, Phœnicia, Egypt, Sicily, and Italy. In the magnificence of her public buildings, and the splendour of the *chefs-d'œuvre* of statuary and painting by which they were adorned, she was second only to Athens. The opulence, of which she was the centre, made her a favourite seat of pleasure and dissipation, as well as of trade and industry. Venus was her principal deity, and the temple and statue of the goddess were prominent objects in the Acropolis. Lais, the most famous of the priestesses of Venus, though of Sicilian origin, selected Corinth as her favourite residence; and so highly was she esteemed, that a magnificent tomb (described by Pausanias) was erected over her remains, and medals struck in commemoration of her beauty! In consequence, Corinth became not only one of the most luxurious, but also one of the most expensive places of antiquity, which gave rise to the proverb—

'Non cuivis homini contingit adire Corinthum.'
Hor., Epist. i. 17. 36.

The Acropolis is one of the most striking objects in Greece. It has some famous springs, and is in most parts precipitous. Livy calls it, '*Arx inter omnia in immanem altitudinem edita, scatens fonti-*

bus' (lib. 45, § 28); and Statius says, that it throws its shadow over both seas—

> ——— 'qua summas caput Acrocorinthos in auras
> Tollit, et alterna geminum mare protegit umbra.'
> Theb., lib. 7. lin. 106.

If properly fortified, it would render all access to the Morea by land impracticable; and as a fortress, it might be rendered not less secure than Gibraltar. (Clarke, vi. 568, 8vo. ed.) It is, in fact, one of the keys of Greece; and was, therefore, aptly said by the oracle to be one of the *horns* which a conqueror should lay hold of to secure that valuable *heifer* the Peloponnesus. The view from its summit is one of the most extensive, and at the same time richest in classical associations, of any in Greece. Athens is seen in the distance; and the eye wanders over six of the most celebrated of the Grecian states,—Attica, Achaia, Bœotia, Locris, Phocis, and Argolis.

The government of Corinth, like that of the other Grecian states, was originally monarchical. It then became subject to the oligarchy of the Bacchidæ, and was again, after a period of ninety years, subjected to kings or tyrants. Periander, the early part of whose reign was that of a Titus, and the latter of a Tiberius, was the last of its sovereigns. At his death the Corinthians established a republican form of government, inclining, however, more to aristocracy or oligarchy than democracy. It seems to have been judiciously devised; and the public tranquillity was less disturbed in Corinth than in most Grecian states.

When the Achæans became involved in a war with Rome, Corinth was one of their principal strongholds. Though the Roman senate had resolved upon the destruction of the city, Metellus was anxious to avert the catastrophe; but his offers to bring about a reconciliation, which might have saved Corinth, were contemptuously rejected, and his deputies thrown into prison. The Corinthians suffered severely for this inconsiderate conduct. The consul Mummius, having superseded Metellus, appeared before Corinth with a powerful army; and after defeating the Achæans, entered the city, which had been left without any garrison, and was deserted by the greater number of its inhabitants. It was first sacked, and then set on fire; and it is said that the accidental mixture of the gold, silver, and copper, melted on this occasion, furnished the first specimens of the *Corinthian brass*, so much esteemed in subsequent ages! Not satisfied with the total destruction of the city, the natives of Corinth who had escaped were carefully hunted out and sold as slaves, their lands being at the same time disposed of to strangers, mostly to the Sicyonians. The destruction of Corinth took place anno 146 B.C.; and it is worthy of remark that this also was the epoch of the destruction of Carthage, both these great cities having been sacrificed nearly at the same moment to the insatiable rapacity and ambition of Rome. According to Strabo, the finest works of art which adorned Rome in his time had been brought from Corinth; but it seems pretty clear that many, if not the greater number, of these masterpieces had been destroyed. Polybius, who was present at the destruction of the city, had the mortification to see the Roman soldiers playing at dice on a picture of Aristides, a contemporary of Apelles, for which Attalus king of Pergamus subsequently offered 600,000 sesterces, or about 5,000*l.* of our money. (Strabo, lib. viii.; Plin. Hist. Nat., lib. 35, cap. 4, &c.) We need not, indeed, be much surprised that the soldiers should have made use of such a dice-board, when we find the consul himself assuring the masters of the vessels selected to convey the pictures and statues to Rome, that if any of them were lost or injured, he should compel them to supply others in their stead at their own cost! (Velleius Paterculus, lib. i. cap. 13.)

Corinth remained in the ruinous state to which it had been reduced by Mummius, till a colony was sent thither by Julius Cæsar. Under its new masters it once more became a considerable city, as is evident from the account given of it by Pausanias (lib. ii.), and is much distinguished in the gospel history. After being sacked by Alaric, it came, on the fall of the Eastern empire, into the possession of the Venetians. The Turks took it from the latter in 1458; the Venetians, however, retook it in 1687, but lost it again to the Turks in 1715. It is now a principal place in the monarchy of Argolis and Corinth, kingdom of Greece. For some time after the establishment of Greek independence, the city prospered, but it was almost entirely destroyed by an earthquake in 1858.

CORINTH (ISTHMUS OF). Where narrowest, about 6 m. E. from Corinth, this celebrated isthmus is about 5 m. across. The advantages that would result to Corinth, and to the commerce of Greece, by cutting a canal or navigable channel through this isthmus, were perceived at a very early period; and attempts to accomplish so beneficial a work were made by Periander, Demetrius Poliorcetes, Julius Cæsar, and other Roman emperors: all of them, however, proved abortive, though parts of the excavations are still visible. This want of success has been variously accounted for; but we incline to think that it was wholly owing to the difficulty of the ground. The isthmus is high and rocky; and at a period when the construction of locks was unknown, the canal must either have been excavated to the required level, or been partly excavated and partly tunnelled, either of which operations would have been all but impracticable. As the next best resource, ships were drawn by means of machinery from one sea to another; but it is clear that none but the smaller class of vessels could be so conveyed.

The isthmus has been repeatedly fortified. The first instance of this of which we have any certain accounts took place on the invasion of Greece by Xerxes. It was afterwards fortified by the Spartans and Athenians in the time of Epaminondas. During the decline of the Eastern empire, the defence of the Peloponnesus principally depended on this bulwark, which was strengthened and renovated under Justinian. It was restored for the last time by the Venetians in 1696. (See Dodwell's Greece, ii. 185, and the authorities there quoted.)

The Isthmus of Corinth was also famous in antiquity for the games celebrated there, every fifth year, in honour of Neptune and of Palæmon or Melicertes, with the utmost splendour and magnificence. They continued in vogue after the Olympian and other public games had fallen into disuse. After the destruction of Corinth the Romans committed the superintendence of the Isthmian games to the Sicyonians; but on its restoration by Julius Cæsar, Corinth recovered its ancient presidency. Dr. Clarke discovered at the port of Schœnus, on the E. side of the isthmus, the remains of the temple of Neptune, the theatre, stadium, and other public buildings, described by Pausanias as connected with the Isthmian solemnities.

CORK, a marit. co. of Ireland, prov. Munster, in the SW. part of the island, having S. St. George's Channel, E. Waterford and Tipperary, N. Limerick, and W. Kerry and the Atlantic Ocean. It is the most extensive of all the Irish

cos., containing 1,769,563 imp. acres, of which about one-third are unimproved mountain and bog. It has every variety of surface and soil; in the W. it is rugged and mountainous, but the N. and E. districts are distinguished by their richness and fertility. There is a great deficiency of timber, otherwise the country would be eminently beautiful. Climate extremely mild, but moist. Property principally in very large estates. Tillage farms for the most part small; those of larger size are frequently held in partnership, or have been divided amongst the family of the occupant. Where such practices prevail, agriculture cannot be otherwise than in a very backward state. Potatoes engross a great part of the attention and labour of the smaller class of occupiers; and after them the ground used to be subjected to a series of corn crops, as long as it was capable of bearing any thing. But an improved system has been introduced of late years on several large estates; and better implements and breeds of cattle are now generally met with. Oats is the principal corn crop, but wheat is also extensively produced. There are extensive dairies in the vicinity of Cork and in other districts; and the exports of corn, flour, provisions, and other articles of agricultural produce from Cork, are very extensive. The average value of land, per 100 acres, was 108*l.* in 1841; 132*l.* in 1851; and 165*l.* in 1861. (Census of Ireland, part v. 1864.) Different branches of the linen manufacture have been established at Cork and other towns, and there are some large distilleries. The coast of Cork is deeply indented by the sea, and has some of the finest bays and harbours in the world, among which Bantry Bay and Cork Harbour are pre-eminent. Principal rivers, Lee, Bandon, Blackwater, Ilen, Funcheon, Bride, and Awbeg. Principal towns, Cork city, Youghal, Bandon, Kinsale, Mallow, Fermoy. Cork contains, exclusive of the city of the co., 23 baronies and 269 parishes, and returns eight members to the H. of C., viz. two for the co., two for the city of Cork, and one each for the bors. of Youghal, Bandon, Mallow, and Kinsale. Registered electors for co. 15,716 in 1861. In 1841, the co. of Cork had a population of 775,360; in 1851, of 565,754; and in 1861 of 464,697. The pop. per square mile was 296 in 1841; 225 in 1851; and 189 in 1861. Consequently the decrease of pop. from 1841 to 1861 amounted to 107 per square mile.

Cork, a city and river-port of Ireland, prov. Munster, on the Lee, 11 m. above where it discharges itself into Cork harbour; 136 m. SW. Dublin by road, and 164¾ by Great Southern and Western railway. Pop. 85,745 in 1851, and 80,121 in 1861. Cork is the third city of Ireland in respect of pop. and commercial importance, and forms a co. in itself, having a local jurisdiction separate from that of the co. of Cork, by which it is surrounded. The co. of the city extends over 48,006 acres, of which 2,683 are comprised within its municipal boundaries. The city lies in the vale of the river Lee, and is surrounded by hills of considerable elevation, which render the climate moist, though not unhealthy. It owes its origin to a religious establishment founded at a remote period. Previously to the arrival of the English, it was inhabited by a colony of Danes, and then, and for a long time after, consisted of a single street in an island formed by the river. Even so lately as the reign of Elizabeth, it is described as 'a little trading town of much resort,' but consisting of a single street. After the revolution it began to improve, and at length, chiefly in consequence of its vicinity to Cork harbour, a principal place of rendezvous for the Channel fleet during wars with France, and its being a great mart for the supply of the fleets and colonies with provisions, it rose rapidly to wealth and importance, until it became the second city of Ireland. The pop. in 1821 amounted to 100,658 souls, and in 1831 to 107,016; after this period, a decline set in, and continued steadily to the present time, as shown in the statistics of pop. above given.

The city, situate on the river Lee, which here diverges into several branches, and forms an island, is 11 miles inland from the entrance of the river into Cork harbour. The public buildings are, the cathedral, 6 parish churches, and 2 chapels of ease, 4 Roman Catholic parochial chapels, 4 monasteries, and 2 nunneries, with a chapel attached to each; 2 Presbyterian, 4 Methodist, 1 Baptist, 1 Independent, and 1 Friends' meeting-houses; the episcopal palace of the bishop of the consolidated dioceses of Cork, Cloyne, and Ross; the diocesan library; the county court-house; the military barrack; the queen's college; the county and city prisons; the house of correction; the bank of Ireland, provincial, national, and savings banks; the north and south infirmaries; the lunatic asylum; the custom house; the commercial buildings; the chamber of commerce; and the Royal Cork Institution. The head-quarters and staff of the Cork or southern military district of Ireland are stationed here. Near the city is a cemetery, after the plan of Père La Chaise, on the site of the old botanic garden. The New Wall is a picturesque public walk, 1½ miles in length along the S. bank of the river, from Albert Quay to the pier opposite the convent at Blackrock; and the Mardyke, a public walk, a mile in length, on the W. of the city. A park has been enclosed, containing about 240 acres, extending from the Victoria-road along the south bank of the river to Blackrock. There are 9 bridges over the river and its branches; and in Patrick Street there is a handsome bronze statue to the memory of Father Mathew, the apostle of temperance.

The corporation consists of the mayor, 16 aldermen, and 48 town councillors. The number of burgesses on the roll in the year 1864 was 1,850; and the revenue of the city in 1863, 11,793*l.* The borough returns 2 members to parliament; constituency 3,143 in 1865. The assizes for the county and city are held here.

The principal manufactures are tanning, distilling, brewing, iron foundries, gloves, ginghams, and friezes. The trade is extensive, chiefly in grain, provisions, and butter; and there are 12 markets in different districts.

The harbour, pre-eminent for its capacity and safety, is situate 11 miles below the city; it is 3 miles long, 2 broad, completely land-locked, and capable of sheltering the whole British navy. Its entrance is by a channel, 2 miles long and 1 broad, defended by batteries on each side, and by others in the interior. The upper portion extends for about 5 miles below the city to Passage, and this part since 1820 has been considerably deepened by steam dredging, so that vessels of 600 tons can unload at the quays, where at low water there is a depth of 7 feet. The tide flows up 1½ miles above the city. Within the harbour are Great Island, Little Island, Foaty Island; Spike Island, on which is a bomb-proof artillery barrack, and where a convict depôt has been lately established for the reception of persons sentenced to transportation; Hawlbowline Island, containing an ordnance depôt, and Rocky Island, in which there are 2 powder magazines, excavated from the rock. The number of vessels entered inwards in 1863 was 375—tonnage, 115,634; and the number cleared outwards, 93—tonnage, 28,691. The Great

Southern and Western railway connects the city with Dublin. The Cork, Blackrock, and Passage railway runs along the river through the city park, from the road near the Monerea marsh; the Cork, Bandon, and Kinsale railway terminates at Albert Quay; and the Cork, Queenstown, and Youghal, at Summer Hill.

The net annual value of property under the Tenement Valuation Act is 122,114*l.*; and the property and income tax for the year ended 5th April, 1863, amounted to 22,068*l.* (Thom's Directory, 1865.)

The corporation derived its privileges from a series of charters, commencing with one from King John, when Earl of Morton and viceroy of Ireland. The mayor, recorder, and aldermen are justices for the city. The corporate business is transacted by the court of common council, composed of the mayor, recorder, sheriffs, and aldermen; and by the court d'oyer hundred, formed of the freemen at large. The mayor resides in the mansion-house, a large and elegant building on the Mardyke. The courts are those of the mayor and sheriffs, which have jurisdiction in pleas to any amount above 40*s.*; those of a lower rate are adjudicated in the court of conscience. The former of these courts sits weekly, as does the city sessions court, for criminal cases. The mayor, sheriffs, recorder, and aldermen are the recognised judges of these courts; but virtually the recorder presides. A police-office, or magistrates' court, is also held. The city court-house is a fine building erected at an expense of 20,000*l.* The prison is divided into 32 wards, besides day and work-rooms.

There is also a bridewell for the temporary confinement of persons under examination. The assizes for the co., and one of the general sessions for its E. riding, are held here. The county gaol and house of correction are situated a short distance from the city. A female convict depôt, for the reception of prisoners from all parts of the country, till the arrival of the transport ship to convey them to their destination, is in the S. suburb.

The foreign trade is carried on with Portugal, whence wines and salt are brought; with the Mediterranean, for wine and fruit; and with the Baltic, for timber and articles for naval equipment; timber is also imported from Halifax and Canada. The West India trade has declined, in consequence of the great facilities for supply from those colonies through the English ports. During war, Cork harbour is a great naval station, and the place of rendezvous for most of the outward-bound convoys. Naval arsenals and stores, which have now become nearly useless, having been abandoned by the government, though in the best state of preservation, were fitted up on its smaller islands.

The appearance and habits of the citizens of Cork are exclusively mercantile. The attempts that have been made to elevate the city in the scale of literature and science have not had that success which their more sanguine promoters anticipated; though they have probably succeeded better than a careless observer might suppose. Some rather distinguished persons have been natives of Cork, among whom may be specified Arthur O'Leary, O'Keefe, Barry the artist, Maclise the artist, and Sheridan Knowles. The newer part of the city indicates an increasing state of prosperity; in it are the town residences of the wealthy merchants; while the adjoining country, for several miles round, is studded with their villas and country seats. But, on the other hand, several extensive districts of the suburbs evince the existence of comparative destitution; lines of cabins being built and peopled like those in the surrounding rural villages. But improvement is notwithstanding, said to be advancing, even in those quarters in which there is the greatest poverty, and where old habits and prejudices are sure to linger longest. The food of the working classes consists chiefly of potatoes, which is all but equivalent to saying that their wages are low, and their condition alike degrading and precarious. Several remains of antiquities, chiefly monastic, are to be traced, as are considerable remains of the ancient walls, some parts of which are in a perfect state. Coins struck at a royal mint in the time of Edward I. have been occasionally found.

CORLEONE, an inland town of Sicily, prov. Palermo, cap. dist., near the source of the Belini, on the declivity of a hill rising from a fruitful, well-cultivated plain; 22 m. S. by W. Palermo, near the railway from Palermo to Girgenti. Pop. 13,123 in 1861. The town is well built, and has several churches and convents, a royal college, a prison, and some other public buildings.

CORNWALL, a marit. co. of England, forming the extremity of the SW. peninsula, being everywhere surrounded by the sea, except on the E., where it adjoins Devonshire, from which it is separated nearly in its whole length by the Tamar. Area, 851,200 acres; of which about 650,000 are arable, meadow, and pasture. In many parts Cornwall is rugged and moorish; but though its general aspect be bleak and dreary, it has numerous valleys of great beauty and fertility. The temperature is particularly equal, being so far embosomed in the Atlantic that it is neither so cold in winter, nor so warm in summer, as the cos. more to the E. The winds, however, are very variable, and often violent; and the air being surcharged with moisture, harvests are late, and fruit is inferior in flavour to that raised in the E. and midland cos. The raising of corn and potatoes are the principal objects of Cornish agriculture, which has been much improved of late years. Property much divided and 'vexatiously intermixed.' Farms for the most part small, and held under lease for 14 or 21 years. The principal wealth of Cornwall is derived from its mines of tin and copper. It is believed that the Phœnicians traded thither for tin, and that the mines have been wrought ever since. The total quantity of tin produced in Cornwall amounts to about 5,000 tons a year. The Cornish copper mines, though they were not wrought, with spirit or success, till the beginning of last century, are now become of great value and importance. Their produce, which a century ago did not exceed 700 tons pure metal, amounts at present to about 12,000 tons. The copper and tin mines number about 240, giving employment to 60,000 persons. Ores of lead, antimony, manganese, &c., are also met with. Gold is sometimes found in the *stream-works*, or places where the alluvial deposits are washed in order to procure grain tin. Silver is also found intermixed with the lead ores, and is extracted to a considerable extent. About 5,000 tons of soapstone, and about 7,000 tons of China clay, are annually shipped for the Potteries and other seats of the porcelain manufacture. The miners and others engaged in the Cornish mines are under the especial jurisdiction of the stannary courts: these were much improved by a late act, and are said to transact the business brought before them expeditiously, cheaply, and well. The oppressive duties formerly imposed on the coinage of tin were repealed in 1837. The pilchard fishery is extensively carried on along the Cornish coasts, particularly at St. Ives, Mount's Bay, and Megavissey; and is a considerable source of employment and of wealth to the co. Principal towns, Truro, Helston, Penzance, St. Ives,

Falmouth. Previously to the Reform Act, Cornwall sent forty-two members to the H. of C., but now it sends only fourteen, viz. four for the co., two each for the bors. of Bodmin, Falmouth, and Truro, and one each for the bors. of Launceston, Helston, St. Ives, and Liskeard. Registered electors for the co., 10,643 in 1865, of which number 5,908 for the east division, and 4,735 for the west division. The pop. of the co. was 355,558 in 1851, and 369,390 in 1861. Gross annual value of real property assessed to income tax—in eastern division 587,179*l.* in 1857, and 655,615*l.* in 1862; in western division, 548,283*l.* in 1857, and 511,272*l.* in 1862. Cornwall is divided into 9 hundreds; 203 whole parishes, with parts of 3 others; 14 registry districts; 13 poor-law unions; and 11 county courts.

CORO, a marit. city of Venezuela, cap. prov. of the same name, in a sandy and arid plain, near the head of El Gofete, an arm of the Gulf of Maracaybo, 3 m. SW. the Caribbean Sea, and 210 m. WNW. Caracas; lat. 11° 23′ N., long. 69° 48′ W. Estimated pop. 10,000. It is well situated for commerce, and has had a considerable trade with the West India Islands, especially Curaçoa, in mules, goats, hides, skins, cheese, and pottery; but this has now very much dwindled, and the inhabitants are poor. The streets of Coro are regular, but unpaved, and the houses mean: the only public buildings are, two churches, a convent, several chapels, and a hospital. The climate is dry and hot, but not unhealthy; so great, however, is the scarcity of water, that it has to be brought thither daily, on the backs of mules, a distance of 2 m. Coro was the second European settlement formed on this coast, and was considered the capital of Venezuela till the transference of the seat of government to Caracas, in 1576.

COROMANDEL (*Cholomandala*), COAST OF, forming the E. shore of Hindostan, from Point Calymere, lat. 11° 20′, to the mouth of the Krishna river, 15° 50′ N., probably deriving its name from the Chola dynasty, who formerly ruled in Tanjore. It is destitute of any good harbours, and, from the great surf, it is usually difficult anywhere to effect a landing. The monsoons on this coast are always in a contrary direction to those on that of Malabar. From the middle of October to the middle of April, winds from the NE. prevail, during which period the storms are so violent and dangerous that all British ships of war are ordered to quit the coast by the 15th of October. In the middle of April the SW. winds set in, and a period of great drought commences.

CORREZE, a dép. of France, reg. South, formerly part of the Limousin, having N. the déps. Haute Vienne and Creuse, E. Puy-de-Dôme and Cantal, S. Lot, and W. Dordogne. Area, 586,609 hectares. Pop. 310,118 in 1861. Surface hilly and mountainous. Its N. part is intersected by a mountain chain, dividing the basin of the Loire from that of the Dordogne. The latter, which runs through the SE. part of the dép., is the only navigable stream, the Corrèze, from which the dép. derives its name, being available only for rafts and boats. Climate comparatively cold; soil stony and inferior, except in some of the larger valleys. Heaths and wastes occupy more of the surface than the arable lands; sufficient corn, however, chiefly rye and buckwheat, is grown for home consumption. Agriculture is in a backward state, partly owing to the obstinate attachment of the cultivators to ancient routine practices, and partly to want of capital, and to the minute division of the land. Chestnuts, buckwheat, and potatoes constitute the principal dependence of a large portion of the pop.; and when these fail, the inhabitants suffer severely. Vineyards occupy about 15,200 hectares. Some of the wines are tolerably good, and though no great quantity of wine be produced, still, as few of the labouring classes can afford to drink it, some is exported. The meadows are extensive, and considerable numbers of oxen are reared for the Paris market and the plough. There are upwards of 400,000 sheep, chiefly an indigenous breed, yielding annually about 450,000 kilogr. of wool. Property much subdivided, there not being in the whole dép. above a dozen properties which pay a government tax of 1,000 fr Corrèze has mines of copper, iron, argentiferous lead, antimony, and coal; but, with the exception perhaps of coal at Lapleau, none of them are wrought to any considerable extent. Manufacturing industry is even in a less prosperous state than agriculture. There is, however, a large gun manufactory at Tulle, and a cotton mill at Brives. Tulle is generally supposed to be the grand seat of the manufacture of the species of point lace called *point de Tulle*; in point of fact, however, there is not a single lace-worker in the dép., nor has there been, time immemorial, a lace-frame in Tulle. Trade chiefly in cattle, wine, poultry, agricultural produce, and truffles. The dép. is divided into three arronds. Chief towns, Tulle, the cap., Brives, and Ussel. There exists a general usage (for it is inconsistent with the law of France) in this dép., whereby the eldest son becomes entitled to a clear fourth of the paternal property, over and above an equal share with each of the other children. The peasantry exhibit a remarkable dislike to enter the military service, but prove afterwards very good soldiers. Marmontel, Cabanis, and Latreille were natives of this dép.

CORSHAM, a par. and village of England, co. Wilts, hund. Chippenham; 98¼ m. W. London by Great Western railway. Pop. of par. 3,196 in 1861. The village, in an open pleasant district, 8 m. NE. Bath, consists chiefly of one long street of neatly-built houses, with a market-house near the centre, erected in 1784. The church is a cruciform Gothic structure, with a tower. There are also two dissenting chapels; and an almshouse, founded in 1688, at present supporting six old women. A free school for boys and girls was built by the Methuen family, to which the manor belongs; and who have a fine mansion, with a good collection of pictures, near the village. The manufacture of woollens, formerly carried on to a considerable extent, has long been discontinued, agriculture being now the chief employment of the inhabitants. Sir R. Blackmore, the author of various epic poems, now known only by the satirical allusions made to them by Pope and other wits of the time, was a native of Corsham.

CORSICA (Fr. *Corse*), a large island of the Mediterranean, belonging to France, of which it forms a dép.; between lat. 41° 27′ and 43° 1′ N., and long. 8° 37′ and 9° 30′ E. Its S. extremity is 10 m. N. Sardinia, from which it is separated by the Strait of Bonifacio. Piombino, about 55 m. distant, is the nearest town in Italy, and Antibes, 120 m. NW., the nearest point in France. Shape somewhat oval, with a projecting appendage at the NE. extremity: length, N. to S., 100 m.; greatest breadth, 44 m.; area, 874,741 hectares. Pop. 252,889 in 1861.

The E. shores of Corsica are generally low and sandy, and in many parts marshy; the W. shores are more lofty, and indented with several extensive harbours or bays, the principal of which are those of Valineo, Ajaccio, Sagone, Porto, Calvi, and St. Florent. Corsica has several small islets,

especially at its S. extremity. It is, generally speaking, hilly. A chain of mountains traverses it from its N. to its S. extremity, for the most part nearer to its W. than to its E. coast; the highest summits of this chain are Monte Rotondo, 8,766 ft., and Monte d'Oro (the *Mons Aureus* of Ptolemy), 8,700 ft. above the level of the sea. The declivities of the central chain are steep: it abounds in clefts and gorges; valleys are few, excepting in the lower hill ranges, and even there they are narrow. The plains along the E. coast amounting to about 1-24th part of the whole surface, though rich and densely peopled in the time of the Romans, are now mostly abandoned. Were they drained and cultivated, they would be again, as of old, the best part of the island. The majority of the rivers run W., but the two largest, the Golo and Savignano, have an E. course: most of them are mere torrents, and none of them are navigable or adapted even for rafts, by reason of their rapidity. There are a few insignificant lakes in the centre of the island; but the largest collections of waters are some lagunes on the E. coast, a topographical feature which this part of Corsica shares with the opposite coast of the Tuscan Maremme and the Campagna di Roma. These stagnant waters render the adjacent parts unhealthy, giving rise to intermittent fevers, &c., similar to those of the corresponding Italian shores; but elsewhere the climate is sufficiently salubrious. The temperature of course varies with the elevation; in the low lands the maximum is 92½° Fahr., in the mountains the minimum is 25¼° Fahr. The most prevalent winds are—the *scirocco*, or SE., which brings rain; the N., which often brings snow; and the SW., which is commonly very violent. The aspect of the country is, in the words of Hugo, 'a vast elevated region, the culminating points of which are covered with snow, surrounded by lower ranges of mountains, their summits bare, but their sides covered with thick forests of fir and oak; narrow and dark glens, through which roll impetuous torrents; and here and there an isolated human habitation, perched on some solitary crag, like the inaccessible eyrie of an eagle. As we approach nearer the sea the valleys enlarge, and show traces of culture, and villages begin to enliven the banks of the rivulets; the hill-sides are covered with olive, orange, and laurel trees; while their tops are crowned with woods of chestnut, whose time-honoured trunks, notwithstanding the little depth of soil they grow in, have attained an enormous size. On the sea-shores, obscured by an unhealthy fog, ruined habitations, corn-lands, *makis* (close copses), and marshes alternate with each other, and the traveller hastens to quit this pestiferous tract for a brighter sky and a purer air upon the uplands.' Granite, mica, porphyry, alabaster, and marble of various colours, serpentine, jasper, and asbestos of remarkably long fibre, are plentiful in Corsica. The island probably contains neither gold, silver, nor copper; but there is a vein of lead at Barbaggio, and iron mines are worked in several places: the produce of the last occupies ten forges at Catalane. Quarries of statuary marble are worked; pipe-clay, emeralds, and globular masses of granite and porphyry are found; the last, which are prized as gems, have been hitherto met with no where but in the bed of one of the torrents. There are an abundance of warm, mineral, and saline springs. The upper soils consist chiefly of decomposed granite and silex, with a small proportion of chalk and other calcareous matters, and the remains of animal and vegetable substances. In many parts the land is very fertile; agriculture is, however, in a very backward state, and artificial irrigation almost unknown.

Landed property in Corsica is extremely subdivided, and is almost all occupied by owners. 'For centuries the laws have promoted an equal succession among children; the Genoese, when rulers, abetted this system, and the French law of succession, which found Corsica in an extravagantly parcelled state, has confirmed and aggravated it. These ancient and modern agrarianisms, unaccompanied by the remedies of capital and of various roads to industry, have made a proprietor of almost every Corsican, and have, it is true, averted bare mendicity, but also generally created a narrow situation, without resources, pregnant of family intrigues, and not unbloody dissensions, litigious propensities, and various checks on population; and, combining with these incidents, they have fostered maxims which again serve to the same end of disconnecting all landed property. It is a distinctive trait, that *the Corsican rather starves than sells land*; that inheritances which lose in value by division still must submit to it; and advantageous offers are the more readily refused the more such land would aggrandise and connect the purchaser's estate.' (Consular Report.) The inhab. do not live in cottages dispersed over the country, but in villages, many of which are built on the summits and declivities of the mountains.

The forests are remarkably fine, and abound with timber of the best quality, and which supplies the best masts for the dockyards at Toulon; but such is the indolence of the inhab., that this source of wealth is comparatively neglected. The *makis*, previously mentioned, are dense thickets of cystus, bay, myrtle, and thorn, which rapidly grow up on rich untilled lands, into inextricable masses of 3 to 12 ft. in height, and which, when burnt—the usual mode of getting rid of them—form admirable manure. The orange, citron, and pomegranate grow in the open air, and yield excellent fruit. The olive is badly managed; but much more oil is produced than is required in the island, and is therefore exported. The vine is tolerably well cultivated in most of the cantons; and, notwithstanding that but little art is displayed in the manufacture of wines, the red wines of Sari, and the white of Cape Corsica, are very good, and exported to the Continent. The corn grown is not adequate to the demand, but its deficiency is made up by the abundant supply of chestnuts. Vast quantities of honey are produced in the island. The honey has a bitterish taste, supposed to be imparted by the abundance of box-wood and yew. A great portion of the immense quantity of honey consumed in France is supplied from Corsica. The island produced so much wax in ancient times that the Romans imposed on it an annual tribute of 100,000 lb. weight. Subsequently the inhabitants revolted, and they were punished by the tribute being raised to 200,000 lb. weight annually, which they were able to supply. Wax is to honey in Corsica as one to fifteen, so that the inhabitants must have gathered 3,000,000 kilogrammes of honey. When Corsica became a dependency of the papal court it paid its taxes in wax, and the quantity was sufficient to supply the consumption not only of the churches in the city of Rome, but those in the Papal States. Brittany likewise supplies a great quantity of honey, but of inferior quality to that of Corsica. The annual value of the honey and wax produced in Corsica is estimated at 5,000,000 f., or 200,000*l*. Tobacco, though little cultivated, is said to be preferable to that of France, and the mulberry and flax are grown with advantage. Cattle constitute the

principal wealth of the farmers and peasantry. Most kinds are small, but the ox, horse, mule and ass are all strong and active; the cows afford good milk, from which much cheese is made. The sheep are black, with four or even six horns; there are about 300,000 in the island: hogs very plentiful. Goats are large and strong; the *moufflon*, considered by Buffon to have been the original of the sheep, is found in this island. Game is extremely abundant, as are wild boars and foxes; turtles are obtained in great number, and are important articles of trade. There is a great profusion of the most excellent fish in the surrounding seas, and the Corsican mullet was among the delicacies supplied to the Roman tables. (Juv., Sat. v. 1. 92.) Red coral of a fine deep colour is found in many places round the coast. But, owing to the indolence and apathy occasioned by the dependence of the people on small patches of land, and the want of capital and manufactures, everything is conducted according to a system of routine, and very few improvements are either attempted or even so much as thought of. Agricultural implements are all of the most wretched description, and they hardly know anything even of the advantages of manure. All the more laborious employments are devolved upon the females, who are the slaves rather than the companions of their husbands, or upon emigrants from Lucca, Tuscany, and other parts of Italy, by whom the island is annually visited. The fisheries are wholly abandoned to the Genoese and Neapolitans. Their manufactures are limited to the fabrication of some coarse woollens used by themselves, a few forges and tanneries, a glass factory, a pottery (in which asbestos is used), a manufactory of tobacco-pipes, and one of soap. The exports are nearly confined to timber, firewood, wines, dried fruits, oil, silk, leather, and fish, in comparatively trifling quantities. The roads are wretched; those called *royal* being in parts almost impracticable even for mules.

In 1793 Corsica was divided into two departments—those of Golo and Liamone; but since 1811 these have been again united: the seat of the prefecture is Ajaccio. A royal court is established in the capital; there are five courts of original jurisdiction, one in each arrond., and three tribunals of commerce, viz. at Ajaccio, Bastia, and Ile-Rouse. There are no churches but those of the Catholic establishment in Corsica; the dep. is a bishopric suffragan to Aix. Corsica forms the 17th military division of France: it contains ten fortresses.

In person, habits, and disposition, the Corsicans bear a considerable resemblance to the natives of Italy. They are brave, sober, and hospitable; but subject to violent gusts of passion, and in the last degree revengeful and implacable. This, in fact, is the distinguishing trait of their character, and has been supposed to indicate a peculiar ferocity of disposition. It appears, however, rather to have originated in the long-continued misgovernment of the Genoese, when the grossest corruption prevailed, and money or interest could procure impunity for the most atrocious crimes. Under such circumstances, the avenging of injuries became, as it were, a private duty; and the Corsican would have considered himself degraded who had not obtained that redress for himself that was denied by law. It is needless to point out the sanguinary practices, crimes, and enormities to which such a state of things must necessarily lead. The improved and more vigorous government introduced by the French has, however, done a good deal to lessen the temptations to vengeance; though it will be long before the passion be wholly subdued among a people in the situation of the Corsicans. They use an Italian dialect, with a large number of Arabic words and Spanish idioms intermixed. The dress of both sexes bears a similarity to that of the Italians: the men wear a kind of Phrygian bonnet, and commonly go armed with a long knife, pistol, musket, and bayonet. At Cargese, on the W. coast, there is a Greek colony of Mainot origin, consisting of about 700 individuals, the descendants of some Greeks who settled in Corsica in 1676, who preserve their dress and religion, but have adopted Catholic rites of worship. The tract they inhabit is the best cultivated in the isl. The Phocians, who afterwards founded Marseilles, and the Phœnicians, have both been considered the first inhab. of Corsica; and by them the island was called *Cyrnos*. It was afterwards conquered by the Carthaginians, from whom it was taken by the Romans about B. C. 231. In the middle ages, the Goths, the emperors of the East, Saracens, Franks, House of Colonna, Pisans, and Genoese, successively possessed it. Insurrections against the latter continued at intervals for several centuries, till the Genoese finally ceded it to France in 1768. The pop. under the gallant Paoli made a determined resistance; but ultimately they were forced to submit, and the island has since belonged to France, with the exception of two short periods, in 1796 and 1814, when it was occupied by British troops. The names of Pascal Paoli and of NAPOLEON, both natives of Corsica, are sufficient to confer on it an enduring celebrity.

CORTONA, or COTRONE (an. *Crotona*), a city and sea-port of Southern Italy, prov. Catanzaro, cap. district and cant., near the mouth of the Esaro (an. *Æsarus*), on the Ionian Sea. Pop. 5,910 in 1861. The town is surrounded by walls and defended by a strong citadel. The latter fronts the sea, and is separated from the town by a ditch and drawbridge. It has a cathedral and several other churches, 2 convents, a seminary, and 2 hospitals. The harbour is protected on the S. by the projecting tongue of land on the side of which the town is built, and on the N. by a mole; but it is too shallow to admit of vessels of considerable size, and is not very safe.

Cortona was once one of the richest, most populous and powerful cities of Magna Græcia. Various accounts have been given of its origin, but it is sufficient to say that it was founded by emigrants from Greece at a very remote period. It speedily rose to eminence. Pythagoras resided here for a considerable period after leaving Samos; founded a very extensive school; and is said, by his example and his precepts, to have effected a very considerable change in the manners and conduct of the inhab. It had also a celebrated school of medicine. Ancient writers have praised its invigorating air, which was said to give superior strength to the men, and beauty to the women. Milo, famous alike for his success as a wrestler at the Olympian and Pythian games, and for his tragical end, was a native of Crotona. It produced many other celebrated wrestlers, so that it became a proverbial saying, that the last wrestler of Crotona was the first of the other Greeks. (Strabo, ii. 262.) The mode which Zeuxis took to paint his famous picture of Helen is a sufficient compliment to the beauty of the fair Crotoneans. (The curious reader will find this subject thoroughly discussed in Bayle, art. 'Zeuxis.') In the third year of the 67th Olympiad, some exiles from Sybaris, having taken refuge in Crotona, the latter, on refusing to give them up, was attacked by 30,000 Sybarites; and though the Crotoniats are said to have been able only to bring 10,000 men into the field, they gained a complete victory over

the Sybarites, and took and sacked their city. (Ancient Universal History, vi. 424, 8vo. edit.) But their success in this conflict is said to have been followed by a renewal of that corruption of morals which Pythagoras had done so much to correct, and by a decline of the martial virtues. At all events, the Crotoniats were not long after signally defeated by the Locrians, and do not appear to have again recovered their former power or influence. Still, however, Crotona was a large city at the epoch of the invasion of Italy by Pyrrhus, though it appears to have suffered severely in the contests to which it led. Livy says, '*Urbs Croto murum in circuitu patentem* 12,000 *passuum habuit, ante Pyrrhi in Italiam adventum. Post vastitatem eo bello factam, vix pars dimidia habitabatur: flumen* (*Æsarus*) *quod medio oppido fluxerat, extra frequentia tectis loca præterfluebat.*' (Liv. 24, § 3.) It was afterwards taken by the Carthaginians, and the inhabitants removed to Locri. Subsequently, however, it received a colony from Rome. In the war between Charles of Anjou and Frederick of Arragon, it was taken by surprise, and sacked; and it has since continued in the depressed state in which we now find it.

About 6 m. SE. from Crotona, at the extremity of the narrow projecting tongue of land, now called Capo Nau or Delle Colonne (the *Lacinium Promontorium* of the ancients), stood a famous temple of Juno, hence frequently called *Diva Lacinia*. It is said by Livy to be *nobile templum, ipsâ urbe nobilius*. It was of great antiquity, was surrounded by magnificent groves, and was held in such veneration that it was annually resorted to by crowds of pilgrims from all parts of Italy and Greece. The Helen of Zeuxis was placed, with many other articles of great rarity and value, in this sacred edifice, whose sanctity was respected both by Pyrrhus and Hannibal. But succeeding conquerors have had less forbearance; and a solitary Doric column is now all that remains of this once venerated and splendid edifice.

CORTONA, a town of Central Italy, prov. Firenze, on the declivity of a steep hill, which commands a magnificent prospect of the Thrasimene lake, the mountains of Radicofani, and the wide and variegated vale of Chiana, 52 m. SE. Florence, and 22 m. NW. Perugia, on the railway from Florence to Perugia. Pop. 27,960 in 1861. This, which was one of the 12 principal cities of Etruria, is supposed to have been founded by the Pelasgi, and is probably among the most ancient towns in Italy. 'Its original walls still appear round the city, as foundations to the modern, which were built in the 13th century. Those Etruscan works are most entire towards the N. Their huge, uncemented blocks have resisted, on that side, the storms of near 3,000 winters; while on the S. they have yielded to the silent erosion of the *sirocco*. None of the stones run parallel; most of them are faced in the form of *trapezia*; some are indented and inserted in each other like dove-tail. This construction is peculiar to the ruins of Tuscany: it is far more irregular, and therefore, I presume, more ancient than the Etruscan work of Rome. No part of these walls is fortified.' (Forsyth's Italy, p. 99.) The town is commanded by a castle built by the Medici, on the summit of the hill on which it stands. It has a cathedral, which possesses some fine works of art, several other churches, and a theatre. There is a temple of Bacchus, and the remains of some baths ornamented with mosaic work. Next to the city walls, however, the most interesting relic of antiquity is a small sepulchral chamber a little below the town, formed of large blocks of sandstone, the construction of which proves that the architects of the Etruscan period were acquainted with the principle of the arch. Cortona is the residence of a bishop; it has an ecclesiastical and some other seminaries, and was the seat of the Etruscan academy, founded in 1726, which had here a library, a cabinet of natural history, a museum of antiquities, engravings, and gems; but these collections have been dispersed. In the middle ages, Cortona was attached to the Ghibelline party; since the early part of the 15th century it has always been subject to Florence, except during the short interval it belonged to the French under Napoleon.

CORUNNA (Span. *Coruña*), a city and sea-port of Spain, prov. Galicia, NW. extremity of the kingdom, on the E. side of a small peninsula, forming the S. extremity of the Betanzos Bay; 13 m. SW. Ferrol, 315 m. NW. Madrid, on the terminus of a railway from Madrid. Pop. 27,354 in 1857. Corunna is divided into the Upper and Lower Towns, the former, situated on more elevated ground, is surrounded by walls and bastions, and defended by a citadel: the other is situated lower down, on the isthmus joining the peninsula to the mainland, from which it is separated by ramparts and a ditch. The streets in the Upper Town are comparatively steep and narrow. Among the public buildings are 4 churches, 5 convents, a palace for the captain-general, and the supreme court of justice of the prov.; 2 barracks, an arsenal, 2 hospitals, and a school of design, mathematics and navigation, supported by the commercial consulate.

There is a fine commodious quay, and a good building yard. The harbour, which is safe and well-sheltered, is commanded by Port St. Anthony, on an insulated rock at its mouth, and by Fort St. Diego on the mainland. It is the station for steamers between Spain and the Havannah, and between Spain and Falmouth. At the bottom of the harbour is the suburb of St. Lucia. On the N. shore of the peninsula, is the famous lighthouse, called the Tower of Hercules, or the Iron Tower, 92 ft. in height, and which, being built on high land, is visible at sea in clear weather 60 m. off. The tower is said by Humboldt to be of Roman construction, and is believed to be of the æra of Trajan. It was repaired in 1791. The principal manufacture carried on in the town is that of fine table and other linen, with which the royal palaces used to be supplied, and of course linen. It has also fabrics of hats, canvass, and cordage, and a royal manufactory of cigars, in which about 500 women are employed. Corunna is famous, in the history of the struggle between Spain and Napoleon, for being the point to which Sir John Moore directed his disastrous retreat in 1808; and for his death in the engagement which took place under its walls, on the 16th of January, 1809, previously to the embarkation of the British, when a superior French force under Marshal Soult was repulsed with great loss.

COSALA, a town of Mexico, state of Sonora, in a mountainous district, 200 m. SE. El Fuerte, and 60 m. from the Pacific Ocean. Pop. estimated at 7,000. The town is the third in the state in point of size. It derives importance partly from being a depôt for goods passing to and from the port of Guaymas, on the Gulf of California, but chiefly on account of its mines, one of which, called Guadalupe, contains an extremely rich vein of gold; and, being at a considerable elevation, is free from water.

COSLIN, or KOSLIN, a Prussian town, prov. Pomerania, cap. reg. and circ. of same name, on the Niesenbecke, about 4 m. from where it falls into the lagoon Jamund, which communicates with the Baltic, and on a branch line of the railway

from Berlin to Dantzic. Pop. 12,110 in 1861. Having been nearly destroyed by fire in 1718, it was rebuilt on a regular plan by Frederick William I., whose statue has been erected in the market-place by the citizens to commemorate the beneficence of the monarch and their gratitude. It is the residence of the governor of the regency, and has a court of appeal, and a society for the promotion of agriculture, and various schools. Mount Gollen, a little to the E. of the town, is one of the highest elevations on the Pomeranian coast.

COSSEIR, KOSSAIR, or KOSIR, a sea-port town of Upper Egypt, on the W. shore of the Red Sea, 93 m. E. by S. Ghenneh, or Kenné, and 102 m. ENE. Thebes; lat. 26° 6′ 59″, long 34° 23′ E. Pop. estimated at from 1,500 to 2,000. It is situated near the centre of a semicircular bay, about 5 m. across, sheltered on the N. by a sandy point of land, where vessels may lie in 5 fathoms water within 60 yards of the shore. The town is meanly built; the houses being low, and built of sun-dried bricks made of a white calcareous earth; only a few have two stories. Immediately on the NW. is a small citadel defended by round towers, on which a few small guns are mounted. This fortress is the residence of the governor and garrison. A caravan road leads from Ghenneh to Cosseir, which is the centre for all the traffic between the upper valley of the Nile and the Arabian ports; and to this circumstance it owes its existence, as it has neither trade nor manufactures of its own, and the surrounding country is perfectly bare of all vegetation. Old Cosseir is about 10 m. NW. of the modern town, on the N. bank of a small inlet, from which the sea has now mostly retired. Of the latter town only a few ruins exist. Berenice, the great port for the eastern traffic of Egypt under the Ptolemies, was situated a good deal further S.

COSSENZA, or COSENZA (an. *Consentia*), a city of Southern Italy, cap. of prov. of same name, on the margin of a valley surrounded by hills, at the confluence of the Crati and Busento, 12 m. E. from the Mediterranean. Pop. 8,250 in 1861. The city is intersected by the Busento, which is here crossed by two bridges, and the lower parts of the town are said to be unhealthy. It has only one good street, the others being narrow, crooked, and dirty. The *tribunale*, or palace of justice, is a fine edifice; an old castle, now converted into barracks, crowns the summit of an eminence on the opposite side of the river. It has also a cathedral, several churches and convents, a grand seminary, a royal college, a hospital, a foundling hospital, 2 academies of science and *belles-lettres*, and a theatre. It is the seat of the provincial courts and authorities, and of an archbishop. Earthenware and cutlery are made here; and it has a considerable trade in silk, rice, wine, fruits, manna, and flax. In the 16th century there was here a famous academy, founded or improved by Bernardino Telesio.

In antiquity Cossenza was the cap. of the Brettii. Alaric, by whom it was besieged anno 410, died before its walls, and was buried in the bed of the Busento. It was taken and sacked by the Saracens, who were expelled from it by the Normans, and has suffered much from earthquakes, particularly from those of 1658 and 1783. The extensive forest of Sila lies a little to the W. of Cossenza.

COSSIMBAZAR, an inl. town of Hindostan, prov. Bengal, distr. Moorshedabad, and about 1 m. S. of that city, of which it is the port; on the left bank of the Bhajirathi, or Hooghly river; lat. 24° 10′ N., long. 88° 15′ E. It is one of the most considerable trading towns in Bengal, and during the rainy season has an unequalled variety and extent of water carriage. A vast quantity of raw silk is thence exported to Europe, and to almost every part of India; and a great deal consumed annually by the natives in the manufacture of carpets, satins, and other stuffs. Cossimbazar is also noted for its stockings, which are wire-knitted, and esteemed the best in Bengal. Its vicinity is flat and sandy, and abounds with a great variety of wild animals.

COSTAMBOUL, or COSTAMANI, a town of Asiatic Turkey, Natolia, cap. pachalic, 235 m. E Constantinople, and 50 m. S. from the nearest point of the Black Sea, in a dreary and unfertile country, intersected by deep ravines and numerous water-courses. Estimated pop. 12,500. It stands in a hollow, in the centre of which rises a lofty and perpendicular rock crowned with a ruined fortress, formerly possessed by the Comneni. The houses are built of wood and stone; and the palace of the pacha, a poor edifice, opens into the *mydan* or square. There are 30 mosques, with minarets, 25 public baths, 6 khans, and a Greek church. The trade of the town is but inconsiderable, and there are no manufactures. In the later ages of the Greek empire, Costamboul was the cap. of an independent prince, who was first expelled by Bajazet, reinstated in his possessions by Timour, and finally subdued by Mahomet I.

CÔTE-D'OR, a dép. of France, in the E. part of the king., between lat. 46° 56′ and 48° 2′ N., and long. 4° 7′ and 5° 3′ W., formerly part of the prov. of Burgundy, having N. the deps. Aube and Haute Marne, E. Haute Saône and Jura, S. Saône-et-Loire, and W. Yonne and Nièvre. Area, 876,116 hectares; pop. 384,140 in 1861. Surface mostly hilly and mountainous. The principal chain connecting the Faucilles with the Cevennes runs nearly through its centre, separating the streams which flow into the Seine from the affluents of the Saône. A part of this range gives its name to the dep., having been termed the Côte-d'Or, from the number and excellence of the vineyards on its declivities. Both the Seine and Armançon have their sources in this dep.; and the Saône winds along its SE. border. Climate temperate; but said to have become colder within the last 30 years, from the woods having been extensively cut down. Soil for the most part gravelly or calcareous; and in the E. and S. very fertile. The arable land is estimated at 457,000 hect., forests 198,000, meadows 63,000, and vineyards 26,450 do. The vine culture is by far the most important branch of industry carried on in this dep. It has been said that the wines of the Côte d'Or have degenerated within the last forty or fifty years; but this is not really the case, though, from the extension of vineyards in less favourable situations, the quantity of secondary and inferior growths bears a larger proportion to the superior growths, the supply of which is limited, and apparently unsusceptible of increase. The best wines are produced in two contiguous tracts to the SE. of the Côte-d'Or range. One tract, called the Côte-de-Nuits, extends between Dijon and Nuits; the other, the Côte Beaunoise, is comprised between Nuits and the Dheune. To the Côte-de-Nuits belong the first class wines of the *Clos Vougeot*, *Romanée*, *Chambertin*, *Corton*, and *Richebourg*; to the Côte Beaunoise the celebrated but secondary growths of *Volnay*, *Bomard*, *Beaune*, and others, and some fine white wines, as *Montrachet*, and *Meursault*. The total annual produce of wine is estimated at 700,000 hectolitres, or 18,500,000 gallons. Agriculture is in a medium state of advancement. More than sufficient corn is grown for home consumption, principally wheat,

oats, barley, and rye. Hemp, flax, and some leguminous and oleaginous plants are also cultivated. Dijon is famous for its mustard. Cattle abundant: both the ox and horse are used for the plough, except in the mountainous districts, where the spade is employed. The first attempts to improve the breeds of sheep in France were made in this dep., and here they have been eminently successful. The annual produce of wool is estimated at 245,600 kilogs. There are some fine natural pastures on the banks of the Saône, but the system of irrigation pursued in the Vosges and elsewhere is not adopted. Hogs are numerous, and bees are extensively reared. Property in this is less subdivided than in most other deps. in France. Mineral products numerous and valuable, especially iron and coal. There are above 100 furnaces for smelting iron, and its production and manufacture into different articles constitute a very considerable branch of industry. There are also numerous breweries and distilleries, with establishments for the manufacture of beet-root sugar, mustard, and vinegar; tanneries, potteries, and cloth fabrics. Wine, however, forms the principal article of export. The trade of the dep. is much promoted by the canal of Burgundy, by which it is intersected. It is divided into 4 arronds., 36 cantons, and 727 communes. Chief towns, Dijon, Beaune, and Chatillon-sur-Seine. There are several Roman antiquities in this dep., especially a sculptured column near Cussy, supposed to have been erected in the time of Diocletian.

COTES-DU-NORD, a marit. dép. of France, region of the NW., formerly part of the prov. of Brittany, having E. Ille-et-Vilaine, S. Morbihan, W. Finistère, and N. the British Channel. Area, 688,562 hectares. Pop. 628,676 in 1861. Coast generally steep, rocky, much indented with the mouths of small rivers, the chief of which is the Rance, and surrounded, particularly towards its W. end, by many small islands. A chain of heights, called the 'Black Mountains,' runs through the centre of the dep. E. and W., sending off numerous branches on either side: the highest point of these is the Menez-Haut, about 1,115 ft. above the level of the sea. Soil mostly stony, primitive formations being everywhere found near the surface: the plain on both sides the mountain-chain are often sandy and sterile. Arable lands occupy 411,000 hectares, meadows 54,500 do., heathy wastes and forests about 170,000 do. Agriculture is in a very backward state: in some cantons asses only are employed in farm labour: more corn is however grown than is required for home consumption; it is mostly oats, wheat, and rye. This dep. is beyond the limits of the vine culture, but the annual produce of cider is estimated at 500,000 hectolitres. The sheep are generally small and weak, but the rearing of black-cattle and horses engrosses a considerable share of attention; and the latter especially are strong and much esteemed. The fisheries of cod, mackerel, and pilchards yield an annual sum of about 600,000 fr., and while they constitute one of the most important resources of the dep., are useful as preparatory schools for seamen. The forests are extensive, and abound with wild animals. Iron and lead mines are wrought; but the dep. is not rich in other minerals. The culture of flax, and its manufacture into linen, are pursued to a great extent. The linens of Brittany are mostly exported to S. America. Sailcloth, woollens, parchment, leather, shoes, and beet-root sugar are amongst the other principal articles of manufacture. Two canals, that of the Ille and Rance, and that between Nantes and Brest, pass through different parts of this dep. It is divided into 5 arronds, 48 cantons, and 375 communes. Chief towns St. Brieuc, the cap., Dinan, Guingamp, Lannion, and Loudeac. The Bas-Breton is the language commonly spoken, but most of the upper classes understand French. Many Celtic and Roman antiquities are scattered over this dep., of which the temple of Lanleff is the principal.

COTHEN (Germ. *Köthen*), a town of Central Germany in the duchy of Anhalt, on the Ziethe, 76 m. SW. Berlin, and 33 m. NW. Leipzic, on the railway from Leipzic to Magdeburg. Pop. 11,112 in 1861. Cöthen is divided into the old and new town, and is well built. Among the public buildings are the old ducal palace, with a gallery of paintings, cabinet of natural curiosities, and a good library; the new ducal *Schloss*—former residence of the reigning family of Anhalt-Cöthen, which became extinct in 1847—three churches, a synagogue, orphan and female asylums, a teachers' seminary, and a school for the indigent. Gold and silver lace, woollen cloth, linens, tobacco, and leather are manufactured here; and there is some trade in corn, butter, cheese, and wool.

COTOPAXI, a celebrated volcano of S. America, in the republic of Ecuador (Colombia), belonging to the E. or more inland chain of the great Cordillera of the Andes; in lat. 0° 40′ S., and long. 78° 39′ W., 34 m. SSE. Quito. Its shape is a perfect cone; it consists chiefly of mica, but in part of obsidian; its absolute height is 18,878 ft. above the level of the ocean, the upper 4,400 of which are covered with perpetual snow. Its summit is not more than about 9,800 ft. above the great longitudinal valley between the two chains of the Cordillera; but such is its steepness that Humboldt was unable to ascend it above the point at which the perpetual snows commence. The crater appears to be surrounded by a kind of circular wall, which, especially on the S. side, has the aspect of a parapet; and, probably owing for the most part to the heat, this summit of the cone is never covered with snow, and looks at a distance like a dark stripe. On the SE. side of the mountain, near the snow-limit, there is a comparatively small projecting mass of rock, studded with points, and called the 'Head of the Inca' by the Indians, who have a popular tradition that it formed originally a part of the summit of Cotopaxi. Humboldt himself inclines to the belief that the cone supporting the present crater, like the somma on Vesuvius, is composed of a great number of strata of lava heaped upon each other. 'Cotopaxi is the most dreadful volcano of the kingdom of Quito, and its explosions are the most frequent and disastrous. The mass of scoriæ, and the huge pieces of rock thrown out of this volcano which are spread over the neighbouring valleys, covering a surface of several square leagues, would form, were they heaped together, a colossal mountain. In 1738, the flames of Cotopaxi rose *nine hundred metres* (4½ furlongs) above the brink of the crater. In 1744, the roarings of the volcano were heard as far as Honda, a town on the borders of the Magdalena, and at the distance of 200 common leagues. On the 4th of April, 1768, the quantity of ashes ejected was so great that in the towns of Hambato and Tacunga day broke only at three in the afternoon. The explosion that took place in the month of January, 1803, was preceded by a dreadful phenomenon, the sudden melting of the snows that covered the mountain. At the port of Guayaquil, 52 leagues distant in a straight line from the crater, we heard day and night the noises of the volcano, like continued discharges of a battery; we distinguished these tremendous sounds even on the Pacific Ocean, to the SW. of the island of Puna.' (Humboldt's Researches, English trans., i. 115–125.)

COTTBUS (Germ. *Kottbus*), a town of Prussia, prov. Brandenburg, cap. circ. same name, on the Spree, 42 m. S. by W. Frankfurt-on-the-Oder, and 67 m. SE. Berlin, on a branch line of the railway from Berlin to Breslau. Pop. 11,112 in 1861. The town is walled, and has four churches, two hospitals, a gymnasium, and library, an orphan asylum, and a girls' school. It has three suburbs, and is commanded by a castle built on a height to the E. Cottbus is the seat of the council for the circ., and of a municipal court. There are considerable fabrics of woollen and linen stuffs and stockings, with breweries and distilleries. This town was made over to Prussia by the congress of Vienna, previously to which it belonged to Saxony.

COVE OF CORK. (See QUEENSTOWN.)

COVENTRY, a co. and city of England, within the co. of Warwick, 10 m. NNE. Warwick, 18 m. ESE. Birmingham, 85 m. NNW. London, and 94 m. by London and North Western railway. Pop. of mun. city 40,936 and of parl. city 41,647 in 1861. Coventry stands on a gentle declivity on the N. Western railway, and is watered by the Radford and Sherborne brooks. Streets of the old town (with the exception of Cross Cheaping, where the splendid cross formerly stood, and which is now used as a corn market), generally narrow and ill-paved, and the upper parts of a few of the houses, which are high, project and present a sombre appearance. Within the last forty years, however, the suburbs have been considerably extended, several new lines of streets having been laid out, and many new houses erected. The principal buildings are, St. Michael's church, one of the finest specimens of the lighter Gothic in England, with a beautiful steeple, 303 ft. in height; St John's and Trinity churches, Christ Church, attached to the old and beautiful spire of the Greyfriars' monastery; a Catholic chapel; several dissenters' meeting-houses; the county hall, erected in 1785; St. Mary's hall, erected (Henry VI.) for the Trinity guild, now used for meetings of the town council, and public concerts; a neat and commodious theatre; the drapers-hall; the canal office; the free school; the gaol, and the barracks. Coventry was, conjointly with Lichfield, the see of a bishop, but on the recommendation of the ecclesiastical commissioners, it has been joined to the diocese of Worcester.

Under the Municipal Corporation Act the city is divided into six wards; and is governed by a mayor, 10 aldermen, and 30 counsellors. The jurisdiction of the corporate authorities extends over the city and the co. of the city, including, in all, an area of 15,070 acres. The recorder holds a court of quarter sessions, and a court of record for the recovery of debts to any amount. The sheriff holds a county court monthly. Coventry has regularly sent 2 mems. to the H. of C. since 1453. Previously to the Reform Act the right of voting was exclusively in the freemen of the city who had served a seven years' appenticeship in the city or suburbs. Registered electors 5,576 in 1862. The limits of the parl. bor. correspond with the ancient limits of the pars. of St. Michael and the Holy Trinity, except that it does not include the hamlet of Kerestey. It embraces an area of 4,920 acres. The municipal boundary is co-extensive with the co.

Coventry has been the seat of 12 parliaments: one (Henry IV.) in 1404, called, from lawyers being excluded, *parliamentum indoctum*; the other (Henry VI.) in 1459, called *parliamentum diabolicum*, from its numerous acts of attainder. The city was incorporated by Edward III., and the first mayor chosen in 1345. It was erected into a county by Henry VI., with the hamlets belonging thereto, and lying within the vill, or township.

This city has many extensive and well-endowed charities; of these, one of the most celebrated is the free school, founded by John Hales in the reign of Henry VIII., in which the celebrated antiquary, Dugdale, received the early part of his education; it has a revenue of 800*l.* a year, and exhibitions to both universities. Here are also various charity, national, and infant schools, as Bonds' hospital, at Bablake, for 45 old men, with a revenue of 1,050*l.* a year; and Wheatley's school and hospital, at the same place, for 40 poor boys, with nearly 600*l.* a year; Ford's hospital, in Grey-friars-lane, for 35 old women; Fairfax's school, in St. John's par., for 40 boys; Mrs. Catharine Bailey's school, in St. Michael's par., for 35 boys; the Blue Coat school in Trinity par., for 50 girls; White's charity, amounting to about 2,500*l.* per annum; and the House of Industry, formerly the White-friars' monastery. A library was established here in 1791; it is regulated by a committee. A mechanics' institute was founded in 1828. Here is also a society for the diffusion of religious and useful knowledge; general and self-supporting dispensaries, and a public hospital.

Previously to 1436, woollen cloth caps and bonnets were an important article of manufacture. In the early part of the 16th century, Coventry became famous for the production of a blue thread, called 'Coventry true blue.' But this was given up before 1581, after which woollen and broad cloths continued the staple until the destruction of the Turkey trade in 1694. The manufacture of striped and mixed tammies, camlets, shalloons, and calimancoes, flourished during a part of the last century, but is now almost discontinued. This was succeeded by silk throwing and riband weaving, now the staple business of the place, and watch making. When first introduced, about a century and a half ago, the riband trade was for some time confined to a few hands, but it afterwards increased so as to exceed that of every other town in England. The alteration of the law as to the silk trade in 1826, and the commercial treaty with France of 1860, though productive of considerable loss and injury at the time, have, by introducing a spirit of competition, and stimulating the manufacturers to call all the resources of science and ingenuity to their aid, been the causes of great improvement. Lute-strings may now be purchased more cheaply in Coventry than in France. Plain goods of English manufacture are fully equal to those of the French; but the latter have the advantage in style and fashion, and in the brilliancy, though not in the permanency, of their colours. It is the general practice for the work to be given out to be executed in the houses of the workmen. The manufacturers employ girls and young women, who work together on the premises of the manufacturers, in winding and warping the silk for the out-door weavers. In 1839 it appeared, from the report of Mr. Fletcher to the commissioners of inquiry into the condition of the hand-loom weavers, that the operative loom owners in the city and suburban villages held 3,967 looms, of which 3,145 were worked by members of their own families, and the remaining 822 by journeymen and half-pay apprentices. It further appears from the same report, that 27 master manufacturers employed in loom shops or factories 1,862 looms. No official report of the state of manufactures in Coventry has been made since that time, and it is probable that no great changes have taken place. Large quantities of ribands are exported but the prin-

cipal demand is for the London and country markets. There are several large dyehouses, for dyeing the silk, employing from 300 to 500 hands.

The manufacture of watches was introduced about a century ago, and has continued progressively to increase. Large quantities are prepared for the home and foreign markets; some manufacturers employing, when the trade is in a state of activity, great numbers of hands. The wages of the workmen vary from 15*s.* to 70*s.* per week, the larger amounts being paid to those only who are proficients in working at the *patent lever* and other superior watches, which are now produced here equal in quality to those made in London. Coventry is advantageously situated for commercial operations, lying nearly in the centre between the four greatest ports of the country—London, Bristol, Liverpool, and Hull, and having direct communication by railroads and canals with the metropolis and principal towns in the kingdom. Corp. revenue, 14,938 in 1862. Gross annual value of real property assessed to income tax 120,931*l.* in 1857, and 157,342*l.* in 1862.

During the monastic ages, Coventry had a splendid monastery, and a large and beautiful cathedral, similar to that at Lichfield. The latter was destroyed by a barbarous order of Henry VIII., and only a few fragments of it now remain. The city was formerly surrounded with walls of great strength and grandeur, with 32 towers and 12 gates. It has been always renowned for its pageants and processions, and particularly, in the monastic ages, for the performance of *Mysteries*. The legend of Peeping Tom, and the Lady Godiva, is too well known, through the exquisite poem of Tennyson, 'I waited for the train at Coventry,' to require any special notice. An effigy of the over-inquisitive tailor may be seen in the upper part of a house at the corner of Hertford Street. The tradesmen of Coventry were formerly famed for their affluence. In 1448, they equipped 600 men armed for the public service. Many eminent persons have either been born or bred at Coventry, among whom were, Nehemiah Grew, curator, in 1672, to the Royal Society for the anatomy of plants, and in 1677, sec. to the Royal Society. Coventry gives the title of earl to the descendants of John Coventry, mayor of London in 1425. Market-days, Wednesdays and Fridays. The principal fair, held first Friday after Trinity Sunday, is called Show Fair, and continues eight days, on the first of which the representation of the Countess Godiva's procession is sometimes enacted.

COVILHA, a town of Portugal, prov. Beyra, on the E. slope of the Sierra de la Estrella; 20 m. SW. Guarda. Pop. 6,158 in 1858. The town rises amphitheatrewise between two streams. In the upper part there is an antique castle and tower, and in the lower part, on the margin of one of the streams, is a manufactory of fine cloths, druggets, and baizes, carried on by a company in Lisbon, containing above 120 looms. There are nine churches, with a hospital and a workhouse.

COURLAND, a government of Russia in Europe, on its W. frontier, having N. the Gulf of Riga and Livonia; E. the gov. of Witepsk; S. that of Wilna, and a small portion of Prussia; and W the Baltic. Area about 10,000 sq. m. Pop. 553,300 in 1846, and 567,078 in 1858. Near Mittau, and along the shores, the surface is flat, and is overspread with marshes and sandy heaths; but the interior is mostly undulating, there being a chain of hills along the bank of the Duna, which sends ramifications over the whole country. The Duna forms the E. and a part of the N. boundary: the other principal rivers are the Aa and Vindau. There are many lakes. Speaking generally, the atmosphere is damp, the sky cloudy, and the temperature low and variable. Soil generally light and sandy, requiring much manure; it is most fertile towards the E.: two-fifths of the surface is occupied by forests, chiefly of pine, fir, birch, alder, with a considerable intermixture of oaks. Agriculture is the principal occupation of the people, and notwithstanding the badness of the soil, has advanced more than in any of the neighbouring provs. More corn is grown than is necessary for home consumption; it is chiefly rye, barley, and oats. Flax and hemp, and a few fruits and pulse, besides a little tobacco, are also cultivated. Pasturage is scarce, and but few cattle are reared; the oxen and horses are both of a bad quality, and the sheep yield only a coarse species of wool. Bees are kept only to a trifling extent. Iron, lime, and turf, and occasionally amber, are found. Manufactures quite insignificant, and mostly domestic: in respect to them, Courland ranks nearly last amongst the Russian govs. There are a few of paper, copper articles, and earthenware, and some brandy distilleries and tile factories. Mittau, the cap., is the only town of any size: the principal sea-ports are Lebau and Vindau, both on the W. coast. The exports, which are principally corn, flax, hemp, and hemp-seed, skins, and salted meat, are said to amount to about 2,500,000 roubles a year, and the imports about 600,000. The inland trade is almost entirely in the hands of the Jews, of whom there are about 20,000 in the gov. Most of the pop. are Lutherans, and of *Letton* origin. Courland was anciently a part of Livonia, and was conquered in the 13th century by the Teutonic Knights; in 1561 it became a fief of Poland. After the fall of that power, it remained for a short time independent under its own dukes; but in 1795 it was united to Russia.

COURTRAY, or COURTRAI (Flem. *Kortryk*, Lat. *Cortoriacum*), a fortified and manufacturing town of W. Flanders, 17 m. E. Ypres, 25 m. S. Bruges, on the railway from Ghent to Tournay. Pop. 24,652 in 1856. The town is situated on the navigable river Lys, by which it communicates with the principal towns of Flanders. Houses well built; streets spacious and remarkably clean. The principal public buildings are the town house and the cathedral of Notre Dame, which are fine old Gothic edifices beautifully ornamented. The church of St. Martin is also a handsome structure. There is a nunnery, a collegiate school, an excellent academy of design, two orphan asylums, a savings' bank, and an exchange and a chamber of commerce. The spinning of linen thread, and the weaving of plain and damask linens, employ a large portion of the inhabitants. The fine linens of Courtray are known throughout Europe. Nearly all the weaving is performed on the handloom at home, and much of it by cottage farmers. The annual quantity of unbleached linen brought to the Courtray market is about 30,000 pieces, two-thirds of which are bought by the merchants of the town, and the rest by those of Belgium, France, and England. The spinning of cotton yarn, and the manufacture and dyeing of various cotton fabrics, constitute an important branch of industry. Courtray has also establishments for the manufacture of soap, candles, salt, tobacco, chicory, chocolate, oil, wax, paper, and pottery; besides numerous breweries and tanneries.

The surrounding plain is abundantly productive of all kinds of field and garden crops, especially flax, of which immense quantities are grown of the finest description, and the vicinities of the town are picturesquely varied by numerous bleaching-fields. Courtray was first built in the 6th century.

It was anciently known under the name of Cortoriacum, and in the 7th century it was a municipal city. Like the other towns of Flanders, it has been subject to many vicissitudes, has sustained several memorable sieges, and been burnt and plundered in war. Under its walls was fought, in 1302, the famous battle of the Spurs, between 20,000 Flemings, consisting chiefly of weavers of Ghent and Bruges, and a French army composed of 7,000 knights and noblemen, and 40,000 infantry. In this conflict the flower of the French chivalry was slain, and the victorious Flemings collected from the battle-field about 6,000 pairs of gold spurs worn by their proud and defeated foes. Among the antiquities that have been found, are numerous medals of the Cæsars. Fairs for all kinds of merchandise are numerously attended on Easter Monday and Aug. 24.

COUTANCES (an. *Constantia*), a town of France, dép. La Manche, cap. arrond., on a hill on the N. bank of the Soulle, 6 m. E. from the sea, and 16 m. WSW. St. Lô. Pop. 8,062 in 1861. Streets narrow, steep, and ill-paved; houses mostly of stone, roofed with slate. It contains several old churches worthy of notice, especially a Gothic cathedral, having two spires in front, and a large square tower surmounting the centre of the cross; it is a conspicuous object, and a landmark for ships in the Channel. The town has a bishop's palace, a communal college, a public library with 5,000 volumes, and a small theatre. Druggets, cutlery, and parchments are produced here; it has also marble-works, and a brisk trade in corn, butter, poultry, flax, hemp, and horses. In its immediate vicinity are the remains of an ancient aqueduct, with many of the arches still very perfect. Coutances was the birthplace of the Abbé de St. Pierre.

COWES (WEST), a town and sea-port of England, co. Hants, Isle of Wight, liberty West Medina, par. Northwood, 75 m. SW. London, 10 m. W. Portsmouth, on the acclivity and summit of a hill rising immediately from the W. bank of the Medina, at its embouchure in the channel between the Isle of Wight and the opposite coast of Hampshire. Area of par., 4,270 acres: pop. 4,591 in 1861. Streets narrow and very irregular; but, as the houses rise above each other from the water's edge to the summit, they have a striking effect, many of the upper and more modern ones being handsome structures commanding splendid and extensive views. In the immediate neighbourhood are numerous elegant villas. The town, which is much resorted to as a fashionable sea-bathing place, possesses ample accommodations for visitors, in hotels, lodging-houses, assembly-rooms, and reading-rooms. A crescent-shaped battery, defending the entrance to the harbour, has some heavy pieces of ordnance and accommodation for a company of artillery. E. Cowes, on the opposite side of the river, ¾ m. from W. Cowes, is a small irregular built hamlet, of the par. of Whippenham, at the foot of a hill. Pop. 1,954 in 1861. Here is the custom-house of the port. The harbour and roadstead of Cowes are amongst the best and most convenient in the English Channel, and form the rendezvous of the Royal Yacht Club, and the station where their annual regatta is held. Many merchant vessels and yachts are built in the harbour. Many large ships, outward or homeward bound from or to London, are accustomed to touch at Cowes before proceeding on their voyage. It has also a considerable coasting trade. The exports consist chiefly of agricultural produce and malt; the imports of coals, manufactured goods, colonial produce, and other articles of general consumption. There are hourly steamers to Portsmouth and Southampton, and passage boats to Newport, up to which the tide flows.

CRACOW, a small and formerly—until Nov. 16. 1846—a nominally independ. state of Central Europe, once part of the k. of Poland, at the present time a circle of Galicia; between lat. 50° and 50° 15′ N., and long. 19° 8′ and 20° 12′ E. Length, E. to W., 46 m.; breadth varying from 5 to 15 m; Area, 488 sq. m. Surface generally undulating, consisting of the last ramifications of the Carpathian mountains. The Vistula, which bounds it on the S. in its whole extent, receives several small streams from the N. in this part of its course, one of which, the Brinica, forms the W. boundary of the Cracow territory. Climate healthy and temperate; mean annual temp. 47½° Fahr. Soil very fertile, producing sufficient corn for home consumption, and an abundance of pulse, culinary vegetables, and fruit. The territory contains rich mines of coal, zinc, and alum; some iron is also found; and there are quarries of marble, building stone, and freestone. By the third partition of Poland, in 1795, Cracow passed under the dominion of Austria; but it was reconquered by the Poles in 1809, and incorporated with the grand duchy of Warsaw. At the Congress of Vienna, in 1815, the territory was erected into an independent neutral republic, under the protection of Russia, Austria, and Prussia. Agreeably to the amended constitution of 1833, the government was vested in a senate composed of a president and eight senators, two of whom were elected for life, and the other six, as well as the president, for six years. One of the latter was elected by the clergy (*chapter*) of Cracow. There was a legislative chamber composed of two senators (one of whom, chosen by the chamber, presided at its deliberations), 4 justices of the peace, 2 delegates of the clergy, 2 of the university, and 20 representatives, chosen by the electoral colleges of the city and territory. This assembly was convoked every three years to vote the budget, to inquire into the administration of the public funds, to elect the members of the senate and the different tribunals, and to discuss the laws presented for its sanction by the senate. But from 1826 to 1846 the territory was garrisoned by Austrian troops; and at the latter date, as above stated, it was incorporated into the Austrian empire.

CRACOW (an. *Carrodunum*), a city of Central Europe, previously to the 17th century, the metropolis of the k. of Poland; on the N. bank of the Vistula, where it is joined by the Rudawa, 160 m. SSW. Warsaw, and 200 m. NE. Vienna, on the railway from Vienna to Lemberg. Pop. 41,086 in 1857, excl. of garrison. The city is divided into three portions, one of which, the Jews' quarter, is built on an isl. in the Vistula. The city has, besides, several suburbs. Cracow has near it Mount Wawel, a rock of moderate elevation, but considerable extent, on which are the castle and cathedral; and two barrows, said to be the burial-places of the founder of the city and of his daughter Venda. The city itself is old, and irregularly built; but its streets are broad, and its churches and other public buildings, having many of them interesting monuments, and being associated with some of the most important events in Polish history, invest it with much interest. It was formerly fortified, but the ramparts have been converted into public walks. The royal castle of Cracow, built in the 14th century, and formerly the residence of the kings of Poland, though not in ruins, is greatly decayed. It has been partly destroyed by fire at different times, and imperfectly restored; but it has suffered more from the effects of war, having been in great part demolished by Charles XII. in

1702, and still more from its change of masters: at one time it was used by the Austrians for barracks, and now serves for a workhouse. Of the 76 churches formerly in Cracow, about 40 are in ruins; the cathedral alone has retained its splendour and costly decorations, for which, and for its monuments, it is celebrated. Around its interior are 20 small chapels, crowned with domes in the Byzantine style. Most of the Polish kings and many illustrious men are buried in it; among others it contains the tombs of Casimir the Great, of John Sobieski, the deliverer of Vienna, and of the 'last of the Poles,' Kosciusko and Poniatowski. The other churches and palaces have fine paintings, statues, and ancient monuments. The episcopal palace is the most striking of the modern edifices, its walls being adorned with paintings in fresco, representing the most remarkable events of Polish history.

The university, founded and endowed by Casimir the Great, and improved by Ladislaus Jaghellon, has lost most of its ancient importance. Cracow contains a college, a school of arts, an academy of painting, a public library with 30,000 vols. and 4,500 MSS., an observatory, and a botanical garden. The articles of export and import consist principally of skins, linen, wax, corn, wood, Hungarian wines, and manufactured articles from England and Germany.

About a league W. of the city is an artificial tumulus erected to the memory of Kosciusko. 'On the 16th of Oct. 1820, the senate of Cracow, accompanied by vast numbers of the nobles and the people from all the adjacent provinces, proceeded to deposit the first load of earth upon an eminence not far from the walls of the city, which had been selected to bear a mountain tumulus in honour of the patriotic general. For four years this great work was eagerly pursued; citizens of every rank toiled at the wheelbarrow; parcels of the sacred soil were sent to join the mass from all the great battle-fields which had been sprinkled with Polish blood; and the mound gradually rose to an altitude of about 150 ft. This monument of clay, planted on the soil which has been most frequently and grievously convulsed by political revolutions, will probably maintain its place as long as the world is habitable by men. Of all the structures of our age, if structure it can be called, this alone seems raised for all time—a thing lasting in itself, lasting by the name it bears, and lasting by the spirit which made it, when those who raised it shall all be scattered in uncollected dust.' (Reeve's Sketches of Bohemia.)

The city is said to have been built about the year 700, by Krak, a Polish duke, from whom it derived its name. It successively belonged to the Moravians and Bohemians, and was taken from the latter at the end of the 10th century by Boleslaus the Great, who made it the cap. of Poland. In the 16th century it contained three times its present number of inhab.

CRAIL, a royal and parl. bor. of Scotland, co. Fife, 2 m. from the *East Neuk* of Fife, or Fife Ness. Pop. 965 in 1861. It is a decayed place, destitute of trade or manufactures. Many of the houses, however, are of that massive description that indicates former greatness. David I. had a palace here, which is now entirely demolished. The par. church was once collegiate, with a provost, sacrist, and ten prebendaries. The famous James Sharp, afterwards archbishop of St. Andrew's, murdered by the Covenanters on Magus Muir in 1679, was once minister of Crail. Coal is abundant in the neighbourhood.

CRANBOURNE, a town and par. of England, co. Dorset, div. Shaston. Area of par., 15,730 acres. Pop. of ditto, 2,656 in 1861. The town is situated in an open pleasant district, 12 m. SSW. Salisbury. The church is a fine old structure, partly in the Norman, and partly in the earliest Gothic, with a noble tower in the later Gothic style. There is an almshouse for three old people, and a few smaller charities. The ribbon manufacture, formerly carried on here, has declined, and the inhabitants are now chiefly employed in agriculture. This par. is the supposed arena of the battle between the British, under Boadicea, and the Romans. Numerous barrows are dispersed over it, in which bones and urns have been found. On the Castle-hill, S. of the town, are the remains of a circular fortification, enclosing an area of six acres. Cranbourne Chase, a tract extending nearly to Salisbury, was celebrated during both the Saxon and the Norman periods. An old embattled manor house, called the Castle, still exists, which was occasionally the royal residence: in its hall courts were held; and there is a dungeon for the confinement of those who infringed on the game laws. Bishop Stillingfleet was a native of Cranbourne.

CRANBROOKE, a town and par. of England, co. Kent, lathe of Scray, hund. Cranbrooke. Area of par., 10,460 acres. Pop. of ditto, 4,128 in 1861. The town, on the Crane (a small stream traversing the Weald district), 38 m. SSE. London, consists of a main street, nearly 1 m. in length, and a smaller one diverging from it. Many of the houses are well built, and it is partially paved and lighted, and amply supplied with water. The church, rebuilt about 1730, in the later Gothic style, has a lofty embattled tower. There are also six dissenting chapels; a grammar-school, endowed by Queen Elizabeth; a writing-school, founded in the same reign, with a small endowment; and a national subscription school. The woollen trade, introduced here by Edward III., and long considerable, has disappeared; and the trade in hops is now the staple business of the place. Sir R. Baker, the antiquary, and Huntington, the founder of a religious sect, were natives of this place.

CRAYFORD, a town and par. of England, co. Kent, lathe Sutton-at-Hone; 11 m. E. by S. London by road, and 14¾ m. by London, Chatham, and Dover railway. Area of par., 2,380 acres. Pop. of ditto, 3,013 in 1861. The town, situated on the Cray, about 4 m. above its confluence with the Darent, and on the great road from London to Dartford, consists of a long irregular street. The church is a good modern structure, on an acclivity at the higher end of the town. Its market has been long discontinued, but an annual fair is held Sept. 8. Until a recent period, extensive printworks were carried on a little below the town; and a mill for flattening iron and splitting iron into hoops, one of the first of its sort constructed in England, was, until recently, in operation. In the parish are numerous artificial caves, upwards of 100 ft. in depth, increasing in magnitude as they recede from the earth's surface. Some of them contain several distinct apartments, excavated in the chalk, supported by pillars left at intervals for the purpose. Their origin is a matter of dispute; some having supposed them to be mere chalk quarries, while by others they are supposed to be places of security excavated by the ancient Britons or Saxons as receptacles for their families and goods during periods of danger. The Roman station *Noviomagus* is supposed to have been near Crayford, contiguous to which, A.D. 457, was fought the great battle between Hengist and Vortigern, which ended in the total defeat of the Britons.

CRECY, an inconsiderable village of France, dép. Somme, 11 m. N. Abbeville, famous in history

for the victory gained here on the 25th of August, 1340, by the English forces under Edward III. over the French under their king Philip of Valois. The French army is believed to have amounted to about 120,000 men, while that of the English was under 40,000; but the superior discipline and good order of the latter more than counterbalanced their inferiority in point of numbers, and enabled them to achieve one of the greatest victories of which we have any account. The loss of the French, in the battle and pursuit, has been estimated at 1,200 knights, 1,400 gentlemen, 4,000 men at arms, and about 30,000 inferior troops. Besides the king of France, there were in the defeated army the kings of Bohemia and Majorca, both of whom were killed. The crest of the former, consisting of three ostrich feathers, with the motto *Ich Dien* (*I serve*), was adopted by the Black Prince, the eldest son of Edward, whose bravery was most conspicuous on this occasion; and has been continued as the crest and motto of all subsequent princes of Wales down to the present times. The loss on the part of the English was comparatively trifling. It has been said that cannon were first employed by the English in this battle, and that they contributed not a little to their success. (Rapin's Hist. of England, iii. 458, 8vo. edit.; Hume's ditto, cap. 15.)

CREDITON, a town and par. of England, co. Devon, hund. Crediton, 7 m. NW. Exeter, on the London and South Western railway. Area of par., 11,440 acres. Pop. of town, 4,048, and of par., 5,731 in 1861. The town is situated in a narrow vale between two steep ridges, through which the Creedy flows and joins the Exe a little lower down. It is divided into two distinct parts, the E. or ancient town, and the W. more modern and larger part, consisting chiefly of a broad street along the principal line of road from Exeter to N. Devon. The church, a noble building in the later pointed style, with a fine tower springing from the centre, was rebuilt in 2 Henry VII. There are four dissenting chapels; a free grammar school, founded by Edward VI., for boys of Crediton and Sandford par.,—it has three exhibitions to either university; a blue-coat school, founded 1730, and incorporated with a national school established 1814, in which 150 boys are instructed, 80 of whom are clothed; a mathematical school, founded 1794, for 12 boys; two sets of ancient almshouses; and several minor charities. The majority of the labouring pop. are now employed in agriculture. Formerly there were several large woollen and serge manufactories: at present, however, there are no resident manufacturers, though many females weave long ells at their own dwellings, for manufacturers resident in N. Towton. This town sent members to the parl. at Carlisle, in Edward I. (Willis's Not. Parl.) It was several times the head-quarters of each party during the last civil war. In 1743 it was nearly destroyed by fire, and was also seriously injured by fire in 1769.

CREETOWN, a neat marit. village of Scotland, co. or stewartry of Kirkcudbright, par. Kirkmabreck, at the head of Wigtown Bay, where it receives the Cree, and on the road between Dumfries and Portpatrick. Pop. 969 in 1861. The hills in the neighbourhood of Creetown seem to be almost entirely composed of granite; and an extensive granite quarry, within 2 m. of the village, has furnished materials for the Liverpool Docks. There used formerly to be large beds of sea shells in the vicinity, the shipment of which for manure to other places was a considerable source of employment; but these are now nearly exhausted. The late Dr. Thomas Brown, the celebrated ethical philosopher, was born here in 1780, his father being minister of the parish.

CREFELD, a thriving town of Rhenish Prussia, cap. circ. same name, in a fertile plain, 6 m. W. from the Rhine, and 13 m. NW. Dusseldorf, on the railway from Cologne to Utrecht and Amsterdam. Pop. 50,584 in 1861. It is the principal town in the Prussian dom. for the manufacture of silks, silk velvets, and silk thread. It has also fabrics of woollen, cotton, and linen stuffs, lace, oilcloth, camlets, and earthenware; with tanneries and distilleries. The town is well built, with wide streets and neat houses. It has four churches, an orphan and a deaf and dumb asylum, a hospital, a high school, police and commercial courts, and is the seat of a court of justice. In its vicinity is an old castle, now used for a silk-dyeing establishment. In the latter half of the seventeenth and beginning of the eighteenth centuries, its pop. was greatly augmented by many reformists and Mennonites, expelled from the neighbouring duchy of Juliers, and who, in return for their hospitable reception, introduced those manufactures to which the town owes all its prosperity.

CREMA, a town of Northern Italy, prov. Cremona, on the Serio, 25 m. ESE. Milan. Pop. 8,240 in 1861. The town is surrounded by a brick wall, a ditch, and some other old fortifications, and has a castle, which, before the use of artillery, was considered one of the four strongest fortresses in Italy. It is well built; streets spacious; palaces and public edifices numerous, including a cathedral and many other churches, a hospital, three separate charitable asylums, and two theatres. It has manufactures of lace, hats, linen thread, and silks, and is celebrated for the excellence of its flax. Very good wine, fruit, and fish are obtained in its vicinity. Crema was founded about 570 A.D., during the reign of Alboin, the first Lombard king of Italy. In 1159 it was sacked by Fred. Barbarossa; it was taken by the French in 1797, the day after the capture of Lodi.

CREMONA, a city of Northern Italy, cap. deleg. same name, on the left bank of the Po, 46 m. SE. by E. Milan, and 26 m. NW. Parma, on a branch of the railway from Milan to Venice. Pop. 28,591 in 1861. The town is of an oval shape, about 6 m. in circ.; is surrounded by walls, bastions, and wet ditches, and defended by a citadel. It is well laid out, but has a melancholy appearance, from the evident signs of decay, and large tracts of grass being seen in many of the broad and regular streets. Among its 44 churches, the *Duomo* alone has any particular attractions. This is an ancient edifice in the style of architecture approaching to Saxon, mixed with a sort of mongrel Italian. If not beautiful, it is at least picturesque; and its lofty tower, 372 ft. in height, is singularly so, being adorned with a sort of rich open work: it is one of the highest in Italy. The interior is composed of a nave with two aisles, divided by eight immense pillars, above which are a series of paintings by Bordenone. Near the cathedral is an octagon baptistery, said to have been once a temple of Minerva. In the town-hall, among others, there is a fine picture by Paul Veronese.

Cremona is the residence of the delegate of the prov. and seat of a bishopric; it has civil, criminal, and commercial tribunals, a lyceum, gymnasium, superior and female schools, several well-attended infant schools, which were the first institutions of the kind opened in Italy, a public library, numerous collections of works of art, two theatres, barracks, a *monte-di-pietà*, and several hospitals, asylums, and other charitable institutions. The manufactures of silk and cotton fabrics are considerable, and there are others of porcelain and earthenware, dyes, and chemical products. During

the 17th, and the earlier part of last century, Cremona was highly celebrated for its musical instruments, especially its violins made by the Amati and Straduarius. Instruments by these makers are now very scarce, and fetch an extraordinary price; and the manufacture of violins and strings has greatly declined. Cremona has a brisk trade in corn, flax, cheese, silk, oil, honey, wax, &c.: the flax grown in its vicinity is much esteemed. This city is very ancient: it was probably founded originally by the Gauls, and, together with Placentia, was the seat of the first colony established by the Romans in Cisalpine Gaul; but its antiquities have been swept away by the successive revolutions it has undergone. Having espoused the cause of Brutus, Augustus divided its territory among his veterans; and this being insufficient for the purpose, he added to it the territory of Mantua, as is well known from the line of Virgil:—

'Mantua væ miseræ nimiùm vicina Cremonæ!'
Eclog. ix. 28.

But it speedily recovered from this disaster, and rose to great wealth and eminence. Certainly, however, it was, as Tacitus says, 'bellis civilibus infelix.' In the struggle between Vitellius and Vespasian it was occupied by the troops of the former, and, being taken by those of the latter, it was sacked and burnt by the infuriated soldiery. (Tacit. Hist., lib. iii. §§ 26–33.) It was again, in as far as practicable, restored by Vespasian. From the 12th century, downwards, its history is identified with that of Milan. In 1796 it opened its gates to the French; and from 1800 to 1814 was the cap. of the dép. Alto-Po. Vida, bishop of Alba, one of the best modern Latin poets, was born at Cremona in 1490.

CRETE (vulg. CANDIA), a large and celebrated isl. of the Mediterranean, belonging to the Grecian Archipelago, of which it forms the S. boundary. It lies between 34° 57′ and 35° 41′ N. lat., and 23° 29′ and 26° 20′ E. long., its NW. extremity being 80 m. SE. Cape Matapan, in Greece, and its NW. termination 110 m. SW. the nearest point of Asia Minor. It is long and narrow, its length from E. to W. being about 160 m., with a breadth varying from 6 to nearly 50 m., but averaging about 20 m. Area, 3,200 sq. m. Pop. estimated at 158,000; of whom 100,000 are native Greeks, 44,000 Turks, and the remainder Hellenes, Jews, and other foreigners. Previously to the breaking out of the Greek Revolution, the pop. was estimated at about 270,000. At the period when it was acquired by the Venetians, Crete had probably a pop. of 500,000 or 600,000, but it fell off greatly under their oppressive sway. Its fertility, and the number and magnitude of its ancient cities, warrant the supposition that the pop. in antiquity may have amounted to 1,000,000 or 1,200,000. (Pashley, ii. 326.) The isl. at present belongs to Turkey, and is divided into the three prov. of Candia, Retimo, and Canea, so named from their respective capitals. These prov. are subdivided into 20 eparchies, or districts, of which Candia comprises 11, Retimo 4, and Canea 5.

Topography.—Crete is almost wholly covered with mountains. A serrated range stretches through its whole extent E. to W.: in the E., although rugged and barren, it attains no great elevation; but as it proceeds westward, its peaks increase in height, and are covered with snow even in June. At the W. extremity of the island, the range of the White, or Sphakian mountains, rises to perhaps 5,000 ft., and Ida (now Psiloriti) the loftiest as well as the most famous of the Cretan mountains, nearly in the centre of the island, is, according to Sieber 7,674 ft. high. Ida, however, has little besides its height and classical celebrity to recommend it. The different mountain ranges abound with grottos and caverns, some of which are alike extensive and celebrated. Every classical reader must be acquainted with the history of the famous labyrinth in which Minos kept the Minotaur killed by Theseus. A cavern of great extent and intricacy, and which answers in all the most essential particulars to the accounts given of the labyrinth, in a hill at the S. foot of Mount Ida, about 3 m. from the ruins of Gortyna, has been visited and described by Tournefort (i. 65), Cockerell (Walpole's Memoirs, i. 405), and others. It has been supposed by some that this cavern, which consists principally of many long, winding, and narrow passages, which can only be safely explored by means of a clue, was a quarry whence the stones used in the building of Cnossus and Gortyna had been derived; but any such supposition seems wholly out of the question; it is not possible to imagine, had it been a quarry, that it should have been excavated in narrow winding passages, as that would have added immeasurably to the difficulty and cost of procuring the stones. Tournefort has supposed it to have been originally a natural cavern, and that it had been improved and perfected by art, to make it a place of concealment, or refuge, in periods of distress.

On every side of the island, but especially on the S., the mountain region extends quite to the coast, which is generally lofty and inaccessible. The N. shores present several remarkable headlands, as capes Busa (Corycum), Spada (Psacon), Melek (Cyamon Pr.), St. John, Salmone, &c., and are indented by many extensive bays, the chief of which are those of Kisamos, Khania, Sudha, Armyro (*Amphimalle*) and Mirabel. There are some tolerable harbours on this shore; but of these the S. coast is entirely destitute, and presents only one point worthy of notice, Cape Matala, the most southerly of all, belonging to Europe. Several small islands surround Crete, as Grabusa, Dhia, Gozo, &c., and in the Bay of Sudha are the Leucæ, supposed to be the isles of the Syrens celebrated by Homer. The plains are few; the chief are those in the N. of Crete, surrounding the towns of Canea, Candia, &c., and the larger one of Gortyna or Messara in the S., through which the Messara, the largest stream, flows. There are no rivers of any importance, but every little ravine in the furrowed sides of the mountains bears its tribute of melted snow to the rich alluvial valleys lying at their feet, rendering them abundantly fertile. At the E. and W. extremities of Crete there are a few unimportant lakes.

Climate and Natural Products.—In the lower parts of the country it never freezes, and in summer the heat would be intolerable if not tempered by N. winds, which are then prevalent. Rains occur mostly in the spring and autumn. The country is generally healthy, and subject to few endemic diseases. Granite, schist, slate, &c. are amongst the primary rocks of the mountains, but calcareous formations, as in Greece, are the most common. Crete is not rich in metals; there are no mines, though Diodorus Siculus and other ancient writers preserve the tradition that iron was first discovered here. The mountains are clothed with woods of oak, chesnut, walnut, and pine trees, and the plane, cypress, myrtle, wild olive, vine, carob, aloe, arbutus, *ficus indicus*, and a multitude of fine fruits and vegetables grow spontaneously, while the ground is fragrant with aromatic herbs. For luxuriant vegetation it presents a wide and favourable contrast with some of the arid regions of continental Greece. The wild boar, wild goat, wolf, &c. are met with in the

forests, and game of various kinds is plentiful. Birds of prey are numerous, but reptiles are few. (Pashley, Scott, &c.)

Agriculture.—From 1821 to 1830, Crete suffered the worst evils of a sanguinary and devastating war, and though its agriculture be now somewhat revived, it is still in a deplorable state. Its male pop. has been more than decimated, its olive plantations and vineyards uprooted, its villages burned down, and much of its most productive land been overgrown with rank vegetation. The soil is for the most part light, and but little adapted for the culture of grain. Wheat, barley, and oats are, however, grown, and, previously to the Greek revolution, wheat was annually exported; but sufficient corn is not produced for home consumption, and Crete is obliged to depend for supplies on Egypt and Barca. The chief products are oil, silk, wine, raisins, carobs, valonea, wool, oranges, lemons, wax, honey, linseed, and almonds. Cotton and flax are also cultivated, and in the mountains many of the fruits and vegetables of colder climates. The oil is good. Cretan wine is frequently eulogised by ancient authors. In the middle ages it held the first place amongst the exports, and under the names of Malmsey and Muscadine, considerable quantities were sent to England. The pastures are fine, and cattle of all kinds are reared, but their exportation is prohibited. Poultry are everywhere plentiful. Almost every peasant has his own farm; those who have not, cultivate the lands of the aga, or district governor, on a kind of metayer system, the lessor furnishing the seed and all the necessaries of husbandry, and dividing the crops in equal proportions with the cultivator, after deducting the seventh, to be paid to the government, and the seed previously advanced. The Mussulman rural population has been diminishing ever since the island fell under the Egyptian rule. Finding they are no longer able to obtain the forced labour of the Greeks, they are continually selling their lands, which are as eagerly purchased by the Greeks, who often borrow money for the purpose at an interest of 20 to 30 per cent. per ann. Landed property gives at an average a nett profit of 8 to 10 per cent. per ann.

Commerce and Trade.—The subjoined table exhibits the exports of the island (Report by Mr. Consul Frank Hay on the Trade of the Island of Crete, dated April 26, 1865) for the year 1864:—

Articles	1864					
	Quantity	Rate			Value	
		£	s.	d.	£	s.
Olive Oil . tons	2,825	40	0	0	113,000	0
Soap . . ,,	5,029	34	0	0	170,986	0
Silk . . lbs.	18,150	1	2	0	19,965	0

Cotton . cwt.	503	9	0	0	4,527	0
Total . £	..		..		344,407	14

The manufactures of the island are inconsiderable. The chief are those of soap, leather, and spirits: the rest consist only of domestic manufactures, as coverlids, sacking, and coarse cloths, woven by women and children. There are twenty-four soap manufactories at work, capable of producing 6,000 tons a year, though little more than half that quantity is made. The article is of good quality, highly esteemed in the Levant, and fetches the highest price in the market at Trieste.

Government.—Crete is governed by a pasha, and each province by a president with a large salary, who is either a European or Asiatic Turk. In each province there is a council consisting of the cadi, treasurer, and other functionaries, and of a Turkish and a Greek representative from each of its districts, chosen however not by the district they represent, but by the pasha himself, from whom they receive a salary. These councils decide on all judicial questions within their respective provinces, and professedly according to the code Napoleon. The will of the president determines the council.

The armed force amounts to about 4,500 men, chiefly Arabs and Albanians. There are eight fortresses, mounting altogether 468 pieces of cannon. The fortifications of the principal towns are kept in good order; but those of the others are in the most neglected state.

Before the Greek revolution, the Christians and Mohammedans were nearly equal as to numbers; the balance is now greatly in favour of the former. The island is divided into eight bishoprics, the metropolitan bishop residing at the town of Candia. There are thirty large monasteries and many small ones in the island; and, like the mosques, they are all endowed, and possess extensive lands. The patriarch of Constantinople receives annually from Crete about 250,000 piastres (2,500*l.*). The priesthood are generally very ignorant.

People.—The Cretans are stronger built than the inhab. of the other Greek islands; but it is said that generally they have not the same intelligence or vivacity. They are frugal, inoffensive, and superstitious in the extreme. Both ancients and moderns have accused them of being excessively addicted to lying and thieving; but Pashley (i. 36) thinks that in the interior, at least, they hardly deserve this character. They are polite and ceremonious, and dress like other Greeks, except that the men all wear high boots, and the women, when abroad, cover the face. Their dwellings are mean and comfortless; the food of the peasantry consists mostly of barley bread, cheese, olives, pulse, and vegetables, cooked with an abundance of oil. The language is modern Greek.

Antiquities and History.—Crete is highly interesting from its classical associations. Its history leads us back to the earliest mythological ages. It was the birthplace of Jupiter, 'king of gods and men.' Adventurers from Phœnicia and Egypt introduced arts and sciences into Crete, while Greece and the rest of Europe were involved in the darkest barbarism. The laws of Minos served as a model to those of Lycurgus; so that Crete became, as it were, a channel by which the civilisation of the East was transferred to Europe. Its wealth, and the number (100) and flourishing condition of its cities, particularly those of Cnossus, Gortyna, Cydonia, &c., are repeatedly referred to by Homer. Unluckily, however, the most violent animosities usually subsisted among the principal cities of the island, which formed so many independent republics; and Crete was thus prevented from playing any conspicuous part in the affairs of Greece, or from making that figure in history it could hardly have failed to make had it been a single state. It was conquered by the Romans, after an obstinate resistance, anno 67 B.C. After being possessed for a while by the Byzantine

emperors, the Saracens took it in the 9th century; but being expelled in 952, it was again restored to the Eastern empire. The Genoese, and the Marquis of Montserrat, afterwards successively possessed it. The Venetians bought it of the latter in 1204; and in 1669, after a 24 years' war, it was conquered by the Turks. The revolution in Greece was followed by one in Crete, which deserved, and would doubtless have obtained, a happier issue had not the allies confirmed the gift of the island, in 1830, by the sultan, to Mehemet Ali, for his services during the war. Before the outbreak of the Greek revolution, Crete was the worst governed and most oppressed province of the Turkish empire. Since it has belonged to Egypt, notwithstanding the tyrannical rule of the viceroy, some amelioration has been experienced; but the Cretans 'still sigh to be united to Greece, or to be taken under the protection of some European power,' a protection to which their ancient fame, and their sacrifices in the cause of freedom, give them a well-founded claim.

CREUSE, a dép. of France, reg. centre, having N. the déps. Indre and Cher, E. Allier and Puy-de-Dôme, S. Corrèze, and W. Haute Vienne. Area, 556,830 hectares; pop. 270,055 in 1861. Surface mostly mountainous, with a general slope towards the N. Some of its mountains are so environed with volcanic products as to leave little doubt that they were formerly active volcanoes. Plains of any extent few. Rivers numerous, including the Creuse (whence the dép. has its name), Cher, Tardes, &c., but none navigable. Climate rather severe; the summer being comparatively short, and the winter long and rigorous. Soil, except in the valleys, sandy and little productive. Arable lands occupy about 240,000 hect., pastures, 132,000 do., and heaths, wastes, &c., 122,000 do. Agriculture is in general very backward, and is no where pursued on a large scale. Corn, the chief part of which is rye, is not grown in sufficient quantity for home consumption. Fruits of various kinds are cultivated, but wine is furnished from the neighbouring déps. Cattle-breeding is rather an important branch of industry. The oxen, which are of a middle size, fatten readily, and form a portion of the supply for the Paris market. The sheep supply annually about 350,000 kilog. of wool, but it is mostly of inferior quality. Hogs are reared both for home consumption and for exportation. The management of bees is well understood, and the honey and wax are excellent. Property is here very much subdivided; more than three-fourths of the estates in the dép. being assessed below 20 fr. a year. Some coal mines, and quarries of granite, building-stone, and plastic clay, are worked. Manufactures very few: the chief are those of carpets, at Aubusson and Felletin; a porcelain factory at Bourganeuf, and some fabrics of paper, coarse woollen and linen cloths, glass, earthenware, and leather. The exports are limited to some thousand head of cattle, timber, coarse woollens, carpets, and pottery, with a very curious article, namely, hair, which the females of this dép. supply in exchange for articles of dress, to the extent of many cwt. a year, sent to the *coiffeurs* of Paris. The imports include most articles of prime necessity, including all the wine and nearly all the wheat consumed, with iron, salt, colonial produce, horses, silks, and drugs. The depressed state of agriculture and manufactures, and the consequent want of employment, occasion the annual emigration of from 22,000 to 28,000 labourers, who resort to other parts of the kingdom in search of work and wages. They leave home in small parties of from 4 to 12, which sometimes augment on the road to 300. Each of these parties travels under the conduct of a master, who undertakes work, and engages and pays those who travel with him. The period of emigration is from March to December. Creuse is divided into 4 arrond., 25 cantons, and 269 communes. Chief towns, Gueret, the cap., Aubusson, Bourganeuf, and Felletin. Generally speaking, this dép. is remarkably free from crime. The whole are poor and economical, but excessively litigious. The women share in the most laborious occupations.

CREWKERNE, a town and par. of England, near the S. border of the co. of Somerset; in a vale watered by the Parret and Axe, 16 m. SE. Taunton, on the London and South Western railway. Area of par., 5,810 acres. Pop. of town, 3,566, and of par., 4,705 in 1861. The town consists chiefly of five streets, diverging from a central market-place, and is paved, lighted with gas, and amply supplied with water. The church, a cruciform structure in the later Gothic style, has a fine elaborately-ornamented tower, and the windows and interior also present rich specimens of tracery. A free grammar-school, founded in 1449, has an annual revenue of 300*l.*, and there are four exhib. from it to any college in Oxford. There is also a national subscription school, and two sets of almshouses, founded in 1707; the one for six old men, the other for six old women. There are manufactures of sail-cloth, dowlas, and stockings, each of which employs a considerable number of hands.

CRICKLADE, a parl. bor. of England, co. Wilts, hunds. Highworth, Cricklade, and Staple, in an open level tract, at the junction of the Churn and Key with the Isis; 75 m. WNW. London, by road, and 81½ m. by Great Western railway, *viâ* Purton station. Pop. 36,893 in 1861. The borough consists chiefly of one long street of meanly built houses, paved, but not lighted, and very inadequately supplied with water. It comprises two par., St. Mary and St. Sampson, and a township, including in all an area of 5,840 acres. The church of the former par. is small and antique, while that of St. Sampson is a spacious cruciform building, with a lofty and highly ornamented tower. It has numerous escutcheons, bearing the cognisances of the earl of Warwick, and other eminent individuals, and is a fine specimen of the Gothic. In the churchyard is a well-preserved cross, with canopied niches, which was removed from the High Street, and placed here when the old town-hall was demolished. The remains of a priory, founded in the 1st of Henry III., are now used as tenements for paupers. There are two national schools, supported by subscription; formerly an ancient free school existed, but the endowment has been lost; a charity, producing 12*5l.* a year from land, is appropriated to the apprenticing of poor children. The Thames and Severn canal passes through the N. end of the town; and a branch, joining the Wilts and Berks canal at Swindon, crosses within 1 m. of it. The inhab. are chiefly engaged in agriculture.

Cricklade returned 2 mems. to the H. of C. from the 21st of Edward I. to the 1st of Henry VI., with some interruptions; and from the latter reign, continuously to 1780, the right being exclusively vested in freeholders and copyholders of the bor. lands, and leaseholders of the same for not less than 3 years. In 1780 (after a contested election) the bor., in consequence of its notorious corruption, was thrown open, and the freeholders of the 5 adjoining divisions of Highworth, Cricklade, Staple, Kingsbridge, and Malmesbury, admitted to a participation in the elective franchise. Registered electors, 1,749 in 1861. The bailiff of Cricklade is returning officer. This town has considerable claims to antiquity; but the story of the

University of Oxford being founded by the professors and students of an ancient school established here, appears to be wholly destitute of foundation.

CRIEFF, a burgh of barony of Scotland, co. Perth, on a gentle acclivity on the N. bank of the Earn (a tributary of the Tay), 17 m. W. Perth. Pop. 2,363 in 1861. The place lies near the foot of the Grampian Hills, at the mouth of one of the important passes to the Highlands, and is the second town in the co. It formed, more than once, the head-quarters of the Duke of Montrose, during the civil wars in the reign of Charles I., and was burnt by the Highlanders in 1715. It was formerly the greatest cattle market in Scotland, but that was transferred to Falkirk in 1770. Its chief distinction now consists in its manufacturing industry. There are in Crieff about 500 hand-loom weavers, chiefly employed in the cotton trade. There is, also, a considerable trade in tambouring and flowering webs for the Glasgow manufacturers, carried on by females. About 300 acres of land in the immediate vicinity of the town are let to the inhab. in small patches, technically called *acres*; or in still smaller portions, called *pecks*. There are three places of worship connected with the established church, and several chapels belonging to Presbyterian dissenters, and an episcopal chapel.

CRIMEA, the *Chersonesus Taurica* of the ancients, a peninsula of Russia in Europe, government of Taurida; between 44° 28′ and 46° N. lat., and 32° 33′ and 36° 22′ E. long. It is united on the N. to the mainland by the isth. of Perekop, 5 m. in width, and has on its E. the *Sivache*, or Putrid Sea (which see), the Sea of Azoff, and the Straits of Yenicalé, by which it is separated from the Isle of Taman, being everywhere else surrounded by the Black Sea. It is estimated to contain about 15,000 sq. m. Pop. estimated, in 1858, at 500,000. The Crimea is divided into two distinct parts, one lying N. and the other S. of the river Salghir, which flows from W. to E., and is the only stream of any importance in the peninsula. The former consists almost entirely of vast plains, or steppes, destitute of trees, but covered with luxuriant pasture, except where they are interspersed with heaths, salt-lakes, and marshes. The climate of this region is far from good; being cold and damp in winter, and oppressively hot, and very unhealthy in summer, particularly along the Putrid Sea. The aspect and climate of the other, or S. portion of the peninsula, are entirely different. It presents a succession of lofty mountains, picturesque ravines, chasms, and the most beautiful slopes and valleys. The mountains, formed of strata of calcareous rocks, stretch along the S. coast from Caffa, on the E., to Balaclava on the W. The Tchadyadag, or Tent mountain, the highest in the chain, rises to the height of about 5,110 ft. above the level of the sea, and several of the other summits attain to a considerable elevation. The climate of the valleys, and of the slopes between the mountains and the sea, is said to be the most delicious that can be imagined; and, besides the common products, such as corn, flax, hemp, and tobacco, vines, olives, fig-trees, mulberry-trees, pomegranates, and oranges, flourish in the greatest profusion. Pallas, Dr. Clarke, and others, have given the most glowing descriptions of this interesting region. According to Clarke, 'If there exist a terrestrial paradise, it is to be found in the district intervening between Kutchukoy and Sudak, on the S. coast of the Crimea. Protected by encircling alps from every cold and blighting wind, and only open to those breezes which are wafted from the S., the inhabitants enjoy every advantage of climate and of situation. Continual streams of crystal water pour down from the mountains upon their gardens, where every species of fruit known in the rest of Europe, and many that are not, attain the highest perfection. Neither unwholesome exhalations, nor chilling winds, nor venomous insects, nor poisonous reptiles, nor hostile neighbours, infest their blessed territory. The life of its inhabitants resembles that of the golden age. The soil, like a hot-bed, rapidly puts forth such variety of spontaneous produce, that labour becomes merely an amusing exercise. Peace and plenty crown their board; while the repose they so much admire is only interrupted by harmless thunder, reverberating on rocks above them, or by the murmur of the waves on the beach below.' (Clarke, ii. p. 252, 8vo. ed.) But if this description be as faithful as it is eloquent, it will not certainly apply to any other portion of the Crimea, not even to the famous valley of Baidar. At certain seasons of the year the finest parts of the peninsula are infested with swarms of locusts, which frequently commit the most dreadful devastations, nothing escaping them, from the leaves of the forest to the herbs of the plain. Tarantulas, centipedes, scorpions, and other venomous insects, are also met with in most parts; and even to the S. of the mountains the air in autumn is not everywhere salubrious, and malignant fevers are not uncommon.

Owing to the thinness of the population, and their want of industry, the Crimea, which in antiquity was the granary of Athens, and whose natural fertility is nowise diminished, does not produce a tenth part of what it might do. The steppe, or N. portion, is in general more suitable for grazing than for tillage, and is depastured by immense numbers of sheep, horses, and black cattle. Some of the rich Nogaï Tartars are said to have as many as 50,000 sheep, and 1,000 horses; and the poor classes have 100 of the former and 10 of the latter. Thousands of cattle often belong to a single individual: camels also are abundant. Breed of horses improved by crossing with Arabs. Sheep mostly of the large-tailed species peculiar to the Kirghises. The buffalo is domesticated, and yields a rich milk; and the culture of bees is a good deal attended to. Though they have renounced their migratory habits, the Tartars, who constitute the bulk of the population, have little liking to, or skill in, husbandry. Exclusive of milk and other animal food, they subsist chiefly on millet, producing, however, in some years, as much as 150,000 chetwerts of wheat for exportation. The mountainous, or S. portion of the peninsula, furnishes large quantities of indifferent wine, with flax, fruits, timber, honey, and wax; but the cultivation of corn is so little attended to, that even in the best years its inhabitants have to import a large proportion of their supplies. The most important and valuable product of the Crimea is the salt derived from the salt-lakes in the vicinity of Perekop, Kaffa, Koslow, and Kertsch. It is monopolised by the gov., and yields a considerable revenue. The quantity exported from the lakes near Kertsch amounts to from 1,500,000 to 2,000,000 poods a year: the lakes of Perekop are even more productive. At Koslow there is only a single lake. About 13,000 men are employed in the works; each pood costs the treasury 4 copecks, or thereabouts, the expense of production being seldom greater than from 6 to 10 copecks. Government sells this salt at 80 copecks per pood, except the portion destined for the consumption of the peninsula, which only pays 15 copecks.

Exclusive of salt and corn, the other principal articles of export are wine, honey (of an excellent quality), wax, morocco leather, hides, a considerable quantity of inferior wool, with lamb-skins, which are highly esteemed. Silks and cottons, in the style of the Asiatics, form the basis of the import trade; and there are also imported woollen stuffs, wine, oil, dried fruits, tobacco, jewellery, drugs, and spices. The only manufacture worth notice is that of morocco leather. Principal towns—Kertsch, Caffa, Balaclava, and Koslow, or Eupatoria. Sevastopol, the finest harbour in the peninsula, is one of the chief stations of the Russian fleet. Baktchiserai was the capital under the khans; Simpheropol is, however, the modern capital, not of the Crimea only, but of the entire gov. of Taurida.

The population consists of Tartars, Russians, Greeks, Germans, Jews, Armenians, and gipsies. The variety of different nations found in the Crimea, and the fact that each lives as in its own country, practising its peculiar customs, and preserving its religious rites, is one of the remarkable circumstances that render the peninsula so curious to a stranger. The number of Tartars has declined considerably, by emigration and otherwise, since the occupation of the country by the Russians; but they still form the nucleus and main body of the population. They consist, 1st, of Nogaï Tartars, living in villages, who pique themselves on their pure Mongolian blood; 2d, of Tartars of the steppe, of less pure descent; and 3d, of those inhabiting the S. coast, a mixed breed, largely alloyed with Greek and Turkish blood, and despised by the others, who bestow on them the contemptuous designation of *Tut*, or renegade. They are all attached to the Mohammedan faith, and Simpheropol is the seat of one of the two muftis of the Russian empire. The Tartars are divided into the classes of nobles (*moorzas*), of whom there are about 250, priests (*mullahs*), and peasants. A mullah is at the head of every parish, and nothing is undertaken without his consent. The peasants plough his land, sow and reap his corn, and carry it home; and it is seldom that the proprietor takes tithe of the priest. In summer the feet and legs of the peasantry are bare, but in winter they are clothed after the Russian fashion. They are simple in their manners and dress; and their sobriety, chastity, cleanliness, and hospitality have been highly eulogised, and probably exaggerated; they live principally on the produce of their flocks and herds; are wedded to routine practices; and if they be not, as Pallas seems to have supposed, decidedly averse from labour, they at all events are but little disposed to be industrious. The emigration that took place after the occupation of the country by the Russians was owing quite as much to the efforts of the latter to convert the Tartars into husbandmen, as to the excesses they committed. (Reuilly, p. 176.) In their diet they make great use of honey, and are much addicted to smoking. Every family has two or more copies of the Koran, which the children are taught to read; but in despite of this, and of the schools established in their villages, they are, for the most part, exceedingly ignorant.

The Greeks established themselves in the Crimea, and founded several colonies upon its coasts, nearly six centuries before the Christian era. The country fell successively into the possession of Mithridates, and of the Romans, Goths, and Huns. In 1237 it was taken possession of by the Tartars. About the same time its ports were much resorted to by the Venetians and Genoese: the latter of whom rebuilt Caffa, the ancient Theodosia, and made it the centre of their power and of the extensive commerce they carried on in the Euxine. In 1475 the Turkish sovereign Mahomet II. expelled the Genoese, and reduced the peninsula to a sort of colonial dependency of the Ottoman empire, leaving it to be governed by a khan or native prince. This state of things continued for about three centuries, or till Catherine II. stipulated for the independence of the Crimea. In 1783, the khan having abdicated, the armies of Russia took forcible possession of the country, which was secured to her by the peace of 1791. The Crimea became the theatre of one of the most sanguinary wars of modern times in 1854. Great Britain and France having taken part in a dispute between Turkey and Russia, and not finding themselves able to attack the latter power with sufficient energy at the mouth of the Danube, resolved to invade the Crimea in the summer of 1854. Having effected a landing, there followed, Sept. 20, the battle of Alma, the capture of Balaclava, and the siege of Sebastopol, extending from Oct. 17, 1854, to Sept. 8, 1855. The treaty of Paris, of March 30, 1856, net result of the war, nominally crippled the power of Russia in the Black Sea, by reducing the fleet of war and the aggressive strength of the maritime forces in Sebastopol. Succeeding years, however, proved the entire ineffectiveness of these treaty stipulations.

CROATIA (AUSTRIAN), called by the inhab. *Horvàth Orszag*, a prov. of the Austrian empire, regarded as forming the marit. portion of Hungary; between lat. 44° 7′ and 46° 23′ N., and long. 14° 23′ and 17° 31′ E.; having NW. Carniola and Styria, NE. Hungary Proper, E. and SE. Slavonia, Turkish Croatia, and Dalmatia, and SW. the Adriatic. Shape very irregular; length NE. to SW. 150 m., breadth varying from 30 to 125 m. Area, 9,900 sq. m. Pop. 876,009 in 1857. The S. portion of Croatia is mountainous, being intersected by the Julian Alps and their ramifications. N. of the Save the surface is rather hilly than mountainous, but a continuation of the Carnic Alps traverses the N. portion of the country, dividing the waters which flow into the Drave from those which flow into the Save and Unna. The valleys are numerous, and there are some considerable plains. The principal rivers are the Drave, separating Croatia from Hungary; the Unna, which for the most part forms its boundary on the side of Turkey; and the Save and Kulpa by which it is intersected. Climate varies very much in different parts. Along the Adriatic, it is similar to that of the opposite coast of Italy; and the olive and other fruits of S. climates grow in perfection: in the N. also it is warmer than in Hungary; but in the elevated mountain region of the S., snow frequently falls in Aug. or Sept., and lies till the following April or May. The mountain ranges are composed chiefly of limestone; they however afford not only fine marble, alabaster, and gypsum, but porphyry, gneiss, clay-slate, and quartz. The upper soil is frequently gravelly or sandy; it is less fertile in the S. than in the N., where maize, barley, buckwheat, millet, and oats are grown in considerable quantities. But little wheat and rye are cultivated, and the flax and hemp produced are sufficient only for home consumption. The most abundant fruit is the Damascene plum, of which the favourite beverage of the Croats and Illyrians is made. The vine is, however, cultivated to some extent in the N., and a strong and full-flavoured wine is made, most part of which is consumed in the prov. There are large forests, and timber is an important product. The pastures are limited, and but little fodder is grown, so that the rearing of cattle is but little attended to. Hogs, which feed in the

woods, are the most plentiful domestic animals. Iron, copper, lead, and a little silver are found in various parts; and small quantities of gold are obtained by washing the sands of the Drave. Coal, sulphur, and salt are the other chief mineral products. Manufactures very few, and of the rudest kind. Croatia is divided into six cos.; its principal cities, Agram, the cap., Warasdin, Carlstadt, Bellovar, Kreutz, and Fiume, the principal sea-port. It has its own provincial diet, the same as all the other provinces of the empire (see AUSTRIA), and is likewise represented in the reichsrath, or central parliament. The inhab. are either Roman Catholics, or of the united Greek Church; the former are under the bishop of Agram; the latter have their own bishop, who resides at Kreutz. The Croats are of a Slavonian stock, speaking a dialect which has a greater affinity with the Polish than any other language: they are the descendants of the Chrobaks, who settled here in 640, and established several extensive *zupanies*, or duchies. Towards the end of the 10th century, Croatia was erected into a kingdom, which acquired dominion over parts of Dalmatia and Bosnia: about 1180, it was incorporated with Hungary. Its present constitution, which made it an integral part of the Austrian empire, was proclaimed Feb. 26, 1861.

CROATIA (TURKISH). See BOSNIA.

CROMARTY, a small co. of Scotland, consisting of various detached portions, about 14 in number, almost wholly included in Ross-shire, with which it is connected in the return of a member to the H. of C. Its area, incl. Ross, is 3,157 sq. m., or 2,016,375 acres; pop. 81,406 in 1861. The old valued rent was 1,074*l.*; the new valuation, for 1863–4, was 8,178*l.* Registered electors 48 in 1864.

CROMARTY, a sea-port town and parl. bor. of Scotland, cap. of the above co., on a low alluvial promontory, at the S. entrance to the Cromarty Frith. Pop. 1,491 in 1861. Though irregularly built, it is neat and clean. Owing to its situation, its communication with different parts of the country is interrupted by friths and arms of the sea. The Cromarty Frith, the mouth of which is formed by two richly wooded hills, nearly alike, and about 2 m. apart, extends about 10 m. inland, forming a most spacious bay, with deep water, and sufficient to afford safe anchorage for every navy in the world. Cromarty, though in former times a royal burgh, was disfranchised by the Scottish parliament in the 17th century, and is now only a burgh of barony. It has an excellent pier and harbour, vessels of 400 tons coming close up to the quay. The inhabitants have long engaged extensively in the herring fishery. In some instances, not fewer than 20,000 barrels are stated as having been cured in the town in a single year. Cromarty has long carried on a considerable trade in the hempen manufacture, including sacking and sailcloth. It also enjoys an extensive trade in pork for the English market, the value of the quantity exported varying from 15,000*l.* to 20,000*l.* annually. Ship-building is carried on to a trifling extent. A steamboat plies between Cromarty and Leith; and there is also regular steam communication with London. Cromarty unites with Dingwall, Dornock, Kirkwall, and Tain in sending a member to the H. of C. Registered electors 33 in 1864. Sir Thomas Urquhart, the eccentric but learned author of the 'Jewel,' 'Logopandecteision,' and numerous other works, was proprietor of the whole co. of Cromarty.

CROMER, a sea-port town and par. of England, co. Norfolk, hund. N. Erpingham, on a high cliff on the NE. coast, 21 m. N. Norwich. Area of par., 800 acres; pop. of do. 1,232 in 1831, and 1,367 in 1861. Cromer was formerly but a small fishing station; but of late years it has been much resorted to by sea-bathers, attracted by the fine beach and picturesque scenery of the vicinity. The older part consists of mean, badly arranged tenements; but the more modern houses, near the sea, are much superior, and pleasantly situated. The church, in the later Gothic style, has a pinnacled tower, 160 feet in height. There is also a dissenting chapel, and a national subscription school. Some remains of an ancient abbey, and of the old walls which surrounded the town, are still traceable. A fort and two half-moon batteries were erected during the late war on an adjoining eminence. About ¾ m. E. of the town is Foulness lighthouse, furnished with a revolving light, and having the lantern elevated 274 feet above the level of the sea. In consequence of the dangerous character of the coast, there are three other lighthouses betwixt this place and Yarmouth. The parish was formerly of much greater extent, and at the period of Domesday Book included the town of Shipden; which subsequently with its church, and also a considerable number of houses in an adjoining parish, were swept off by an inroad of the ocean. The sea is here, in fact, constantly gaining on the land. In the winter of 1825, some cliffs contiguous to the lighthouse, 250 ft. in height, were precipitated into the sea, their fragments covering 12 acres. (Lyell's Geology, i. 396.) The inhabitants are mostly engaged in the fishery; the coasting trade is also carried on, though under considerable difficulties, from the want of a proper landing-place, which makes it necessary to employ carts to load and unload the vessels lying on the beach at low water Cromer Bay is exceedingly dangerous, and has thence obtained from the sailors the expressive name of the 'Devil's Throat.' Exports chiefly corn; imports, coals, tiles, and oil-cake. Many attempts have been made to construct a pier, but it has always been swept off. Life-boats are kept in constant readiness on the beach, and have been the means of rescuing many from destruction.

CROMFORD, a chapelry and town of England, co. Derby, hund. and par. of Wirksworth, on the Derwent, near the S. end of Matlock Dale; 13 m. N. by W. Derby, and 145 m. NW. London by Midland railway. Pop. 1,291 in 1831, and 1,140 in 1861. The town is mostly on the N. side of the stream, and is surrounded on the N., S., and W. by lofty calcareous rocks: the houses are mostly small neat buildings, occupied by work-people employed in the adjoining cotton factories. There is a neat episcopal chapel, founded by Sir R. Arkwright; a Wesleyan chapel; two good school-rooms, built in 1833; and almshouses for six poor widows. The town owes its rise to Sir R. Arkwright, the great founder of the British cotton-manufacture, who built here two large cotton mills—(the first in 1771, the other a few years subsequently)—where his great improvements were brought into successful operation: these and another factory are still in the possession of his family. Lead and lime mines are worked in the immediate vicinity. The S. terminus of the Cromford and Peak Forest railway is at this town; and from it a canal extends to the Erewash canal near Langley Bridge.

CRONSTADT (Ger. *Kronstadt;* Hung. *Brasso*), a town of Transylvania, near its SE. extremity, being the largest and most populous, as well as the principal manufacturing and commercial town in that country; cap. co. of the same name in the 'Saxon-land,' in a narrow valley, 120 m. SE.

Klausenburg. Pop. 26,826 in 1857. 'If the reader will understand the situation of Kronstadt, let him imagine an opening in the long line of mountains which separate Transylvania from Wallachia, in the form of a triangle, between the legs of which stands an isolated hill. Within this triangle lies the town of Kronstadt, and on the top of the isolated hill there is a modern fortress of some strength. The mountains come so close down on the little valley, that the walls are in many places built part of the way up their sides.' (Paget, Hungary, ii. 434.) Cronstadt Proper, or the 'Inner Town,' is small, rectangular, surrounded by walls, towers, and ditches, and entered by five gates. It is regularly and well built, with paved streets. The inhabitants are mostly of Saxon descent. Blumenau, the E. suburb, is chiefly inhabited by Szeklers, as Bulgarey, the S. suburb, is by Wallacks; the latter is built on a height interspersed with gardens, and separated from the inner town by a large open esplanade, ornamented with avenues of trees and a Turkish kiosk. Alstadt, the other suburb, is on the N. side. The chief public edifices in Cronstadt are the great Lutheran church, a venerable Gothic building of the 14th century; the Lutheran college, Wallack and Roman Catholic churches, the former rebuilt by Elizabeth, empress of Russia, in 1751, town-hall, barracks, two hospitals, the workhouse, several different schools, and the great market-house. In the latter, Saxons, Greeks, Armenians, Jews, Moldavians, Szeklers, Hungarians, Turks, Wallacks, and gipsies meet to make up the bustling and motley crew. Its proximity to Turkey has introduced a good deal of Turkish habits and manners. But Cronstadt is principally distinguished by its industry.

'A rapid stream rushes in various channels through the streets, and makes itself useful to a host of dyers, feltmongers, tanners, and millers, with which this little Manchester abounds. Kronstadt and its neighbourhood are, in fact, the only parts of Transylvania in which any manufactured produce is prepared for exportation, and here it is carried on to a considerable extent. The chief articles produced are woollen cloths of a coarse description, such as are used for the dresses of the peasants, linen and cotton goods, stockings, skins, leather, wooden bottles of a peculiar form and very much esteemed, and light wagons on wooden springs. The principal part of its exports are to Wallachia and Moldavia. A considerable transit commerce between Vienna and the principalities is likewise carried on through Kronstadt, which is chiefly in the hands of a privileged company of Greek merchants.' (Paget, ii. 435, 436.) The first paper-mill and printing press in Transylvania were established at Cronstadt.

CRONSTADT, or KRONSTADT, a strongly fortified marit. town of Russia in Europe, gov. Petersburg, of which city it is the port, besides being the principal station of the Russian navy. Pop. 29,116 in 1858. The town stands on the SE. extremity of the sandy island of Kotline in the Gulf of Finland, about 20 m. W. Petersburg, with which it is connected by regular steamers. Its shape is triangular, its base being towards the S. Being, as it were, the outwork of Petersburg, it is very strongly fortified. The narrow channel which bounds the island of Kotline S., and is the only practicable passage from the Gulf of Finland to the cap., is protected on the side of Cronstadt by a fortress erected on a detached islet; and on the opposite side by the batteries of the Riesbank and the castle of Cronslot. The streets of Cronstadt are regular and generally paved; but the houses are mostly of wood, and only one story in height. There are about 160 stone buildings, most of which belong to the government. The town is divided into two grand sections, those of the commandant and the admiralty, and into four subdivisions; it is traversed by two navigable canals, those of Peter the Great and of Catherine. The former, commenced in 1721 and finished in 1752, is 3½ furlongs in length, by about 30 yds. wide, and bordered with stonework. It is in the form of a cross, one of its arms communicating with a dock paved with granite, in which ten ships of the line may be repaired at once. The Catherine canal, begun in 1782, is much more extensive, and bordered with granite: it communicates with the mercantile port, and is used chiefly for commercial purposes. Between these two canals is the Italian palace, built and formerly inhabited by Prince Menschikoff, now a school for Baltic pilots with 300 pupils. The other principal public buildings and establishments are, the naval hospital with 2,500 beds, the civil hospital, arsenal, cannon and ball foundry, admiralty, barracks, custom-house, Protestant college, several schools, nobility's club, three churches, and two chapels appropriated to the Greek faith, and Lutheran, English, and Roman Catholic chapels. Peter the Great had a residence and a garden here: the latter continues to be a public promenade; but of the trees planted by the creative hand of Peter, only a few remain: here is, however, a bust of the great emperor on a column, which bears an inscription stating that he founded Cronstadt in 1703. On the S. side of the town are the three ports: the E. or Imperial port will accommodate 35 ships of the line, besides small vessels; the second or middle port, used chiefly for the equipment or repair of ships, has been already noticed, and has attached to it some building docks and pitch-houses, and a powder-magazine; the W. or mercantile port is capable of accommodating 600 vessels of any size. All these ports are very strongly fortified, of a convenient depth, and safe; but the freshness of the water injures ships which remain long in them; and the bay of Cronstadt is liable to be blocked up with ice for several months of the year.

Two-thirds of the whole external commerce of Russia is carried on through Cronstadt. Most ships load and unload here, and goods are conveyed to and from Petersburg by means of lighters, the channel higher up being generally available only for vessels drawing not more than 7 or 8 ft. of water. (For further particulars respecting the trade of Cronstadt see PETERSBURG.)

CROWLAND, a town and par. of England, co. Lincoln, parts of Holland, wapent. Elloe. Area of par., inc. Deepening Fen, 29,070 acres. Pop. of town 2,413 and of par. 3,148 in 1861. The town is situated in a low flat district, 8 m. NE. Peterborough, on the rivers Welland and Nene, and the Catwater drain. The communication between its different parts was formerly kept up by a bridge of singular construction, impassable for carriages, built in the reign of Edw. II.; but as the two streams have both been covered in, sewer-like, in recent years, the 'triangular bridge,' as it is called, stands now in the middle of a rather broad thoroughfare; a singular object for the curious traveller. At Crowland was formerly one of the most celebrated of English abbeys. The present church forms but a small portion of that originally attached to the abbey, but it is, notwithstanding, a very fine specimen of the later Gothic style: its W. front is elaborately ornamented, and has statues of several kings and abbots. The windows and interior tracery are also very splendid. The remains of the abbey are highly interesting. It

was built on piers, of which many remain. The ruins are partly in the Norman and partly in the different periods of the Gothic style. It was originally founded by Ethelbald, in 716: though several times destroyed, it was as often rebuilt with augmented splendour: its endowments were most ample; and its revenue at the dissolution in the reign of Henry VIII. amounted to 1,217*l.* 5*s.* 11*d.* a year. From this period it fell into decay; and during the civil war (after being for some time occupied as a garrison) was almost wholly demolished. A market formerly held in the town has long been removed to Thorney; but there is still an annual fair, on Sept. 5, for cattle and flax. The inhab. are chiefly employed in agriculture. The par., formerly for the most part an unprofitable morass, has, by dint of draining, been converted into rich arable and pasture land: to assist in this are several powerful windmills, which pump up the superfluous water into channels, which conduct it off. An extensive fishery (formerly belonging to the abbey, and now to the crown) includes many decoys for wildfowl of which this parish furnishes a large supply to various markets. Geese are also largely reared. (Stukeley's Itinerarium Curiosum, p. 33.)

CROYDON, a town and par. of England, co. Surrey, hund. Wallington, 9 m. S. London by road, and 10 m. by South Eastern and by London, Brighton, and South Coast railway. Pop. of town 20,325, and of par. 30,240 in 1861. The town is situated on the borders of Banstead Downs, near the source of the Wandle. The parish church, the finest in the co., in the later pointed style, has a lofty tower with pinnacles, and contains many fine old monuments, chiefly of archbishops of Canterbury. This originated in the circumstance of the archbishops of the metropolitan see having formerly resided in a palace here, the remains and grounds of which were sold in 1780. There are several other churches, built by parliamentary grant, within a recent period: one near Croydon Common, with 400 free sittings, the other at Norwood, with 632; also a number of dissenting chapels; a free school, founded 1710, for 20 children; a school of industry for girls; a school for educating 150 children of Quakers, removed from Islington, 1825; a Lancastrian school; and a national school. The last occupies the schoolroom of the Trinity Hospital, founded by Archbishop Whitgift in 1596, for a warden, schoolmaster, chaplain, and not less than 30 or more than 40 poor brothers and sisters: the income, which originally amounted to about 200*l.* a year, is now nearly 2,000*l.*; the Archbishop of Canterbury is visitor. The building (with a chapel annexed) forms three sides of a quadrangle, in the domestic style of that period: there are also two sets of almshouses, and several minor charities; a small theatre, seldom opened. A handsome town-hall, surmounted by a dome, was built in 1807, in which the summer assizes of the co. are held, alternately with Guildford; when not thus used, it is occupied as a corn-market. On the site of the old town-hall is a structure used as a prison during the assizes, and at other times as a poultry and butter market. The co. magistrates hold petty sessions weekly for the district; and there is a court of requests for debts under 5*l.*, whose jurisdiction extends over the hundred. Market, Saturday. Fairs, July 6, for cattle; Oct. 2, horses, cattle, sheep, pigs; the latter is also a crowded pleasure fair, and noted for the large quantity of walnuts brought to it. The principal line of road from London to Brighton passes through Croydon, and it also communicates with the metropolis by two lines of railways. In consequence of this facility of intercourse a great many persons engaged in London during the day have taken up their residence at Croydon, which has led to the erection of a vast number of 'villas' and other houses of a similar description. The members for the E. division co. Surrey are elected here. Croydon is the centre of a poor union of 10 parishes. At Addiscombe, 1½ m. distant, a military college was established in 1809, for cadets in the E. I. Company's service; it had, till its extinction, which took place with that of the company, about 14 professors and masters in the various departments, and usually from 120 to 150 students.

Croydon is the supposed site of the *Noviomagus* of Antonine's Itinerary. On Broad Green, near it, are traces of the Roman road from London to Arundel, and many Roman coins have been found: there are also many remains of an older period; amongst others, a cluster of twenty-five tumuli, on a hill, between the town and Addington Park (the Archb. of Canterbury's seat), and a circular encampment with a double moat.

CRUZ (SANTA), the most S. of the Virgin Islands in the W. Indies, belonging to Denmark, and situated in the Caribbean Sea, about lat. 17° 45′ N., and long. 64° 40′ W.; 60 m. ESE. Porto Rico. Length, E. to W., 20 m.; average breadth, 5 m. Area about 100 sq. m. Estim. pop. 32,000. There is a chain of hills in the N.; but the island is generally level. The coasts are much indented, and present numerous harbours, the best of which are those of Christianstadt and Friederichstadt. The rivulets are dried up during a part of the year, and water is then scarce and bad. The climate is unhealthy at certain seasons. Soil fertile, producing the sugar-cane, cotton, coffee, and indigo. The average value of the produce of sugar amounts to about 1,200,000 rix dollars, and that of rum to 500,000 rixdollars a year. Timber is scarce. The principal town, Christianstadt, the cap. of all the Danish possessions in the W. Indies, is situated on the declivity of a hill on the NE. shore of the island; it is well built, and has 5,000 inhab. Its port is secure, and defended by a battery. Friederichstadt, on the W. coast, has 1,200 inhab. This island was discovered by Columbus in his second voyage. The Dutch, English, French, Spaniards, and Danes alternately possessed it till 1814, when it was finally ceded to Denmark.

CSABA, a large market town of Hungary, in the Great Hungarian plain beyond the Theiss, 63 m. SSW. Debreczin. Pop. 27,865 in 1857. The inhab. are mostly Protestants. Previously to 1840, Csaba was but a village, 'the largest village in Hungary.' It has an extensive trade in corn, wine, cattle, fruit, hemp, and flax.

CSANAD, a town of Hungary beyond the Theiss, cap. co. of same name, on the Maros, 7 m. SE. Mako. Pop. 2,903 in 1857. It was formerly a populous and flourishing place; but its castle is now in ruins, its bishop non-resident, and the county meetings have been transferred to Mako.

CSONGRAD, a market town of Hungary, between the Danube and Theiss, on the right bank of the latter, immediately after the influx of the Körös; 31 m. N. Szegedin, on the railway from Szegedin to Pesth. Pop. 16,200 in 1857. The town is well built, and contains the ruins of an ancient castle. It was the original cap. of the co. of same name; but the county meetings are now held at Szegeden.

CUBA, an isl. belonging to Spain, being the largest, most flourishing, and important of the Antilles, or W. Indian isls. It was discovered by Columbus, Oct. 28, 1492; and was first called Juana, in honour of Prince John, son of Ferdinand

and Isabella; afterwards Ferdinando, in memory of the Catholic king; then successively Santiago and Ave Maria, in deference to the patron saint of Spain and the Virgin; and by Spanish geographers *La lengua de pájaro*, as being descriptive of its form. The name *Cuba* was that in use among the aborigines at the time of its discovery.

Form, Position, and Extent.—Its figure is long and narrow, approaching to that of a crescent, with its convex side looking towards the Arctic Pole; its W. portion, lying between Florida and the peninsula of Yucatan in Mexico, leaves two entrances into the Gulf of Mexico; the distance from Cape St. Antonio, the most W. point of the island, in lat. 21° 54′ N., long. 84° 57′ 15″ W., to the nearest point in Yucatan, is 125 m. across; and that from Point Icacos, the most N. point in the island, in lat. 23° 10′ N., long. 81° 11′ 45″ W., to Cape Tancha, the S. extremity of Florida, being 130 m. across. Point Maysi, the E. extremity of Cuba, lat. 20° 16′ 40″ N., long. 74° 7′ 53″ W., is 49 m. NE. by E. from Cape San Nicholas Mole, in Hayti; and Cape Cruz, in Cuba, is about 95 m. N. from the nearest point of Jamaica. The greatest length of the island, following its curve, is about 800 m.; its breadth, which is very irregular, varies from 130 to 25 m. The total area of the island is stated, in the census of 1861, to embrace 48,489 sq. miles, or about as large as Belgium, Holland, Denmark, and Switzerland taken together. Its coasts are very much indented, and it is surrounded by many islands, islets, and reefs. Notwithstanding the general difficulty of approaching its shores, it has several excellent harbours, that of the Havannah being one of the best in the world. The land along the sea-shore, almost all round the island, is so low and flat as to be scarcely raised above the level of the sea, which greatly increases the difficulty, especially in the rainy season, of communicating with the interior. In the lagoons, near the shore, especially on the N. side of the island, which are filled with sea water during spring tides, sufficient salt is collected for the use of the inhab. A cordillera stretches from the one end of the isl. to the other, dividing it into two unequal sections, that on the N. side being for the most part the narrower of the two. Of the geology little is known beyond what may be found in Humboldt. The cordillera is one great calcareous mass, which is found to rest on a schistose formation. Its summit presents a naked ridge of barren rocks, occasionally interrupted by more gentle undulations. It attains, in some parts, to an elevation of about 7,000 ft.

Climate.—In the W. half of the isl. the climate is such as to be expected along the N. limit of the torrid zone, presenting many inequalities of temp. from the near neighbourhood of the American continent. The seasons are spoken of as the rainy and the dry, but the line of demarcation is not very clearly defined. The warmest months are July and August, when the mean temp. is from 28° to 29° of the centigrade, or from 82° to 84° Fahr. The coldest months are Dec. and Jan., when the mean temp. is nearly 10° Fahr. less than under the equator. During the rainy season the heat would be insupportable but for the regular alternation of the land and sea breezes. The weather of the dry season is comparatively cool and agreeable. It never snows, but hail and hoar frost are not uncommon; and at an elevation of 300 or 400 ft. above the level of the sea, ice has been found several lines in thickness, when the N. wind has happened to prevail for several weeks in succession. Hurricanes are not so frequent as in Hayti and the other W. Indian isls., and seldom do much damage on shore. In the E. part of the isl., particularly in the neighbourhood of Santiago, earthquakes are not unfrequent. The most severe on record are those which took place in 1675, 1682, 1766, and 1826.

Animal Kingdom.—The only indigenous quadruped known in the island is the *jutia* or *hutia*, shaped liked a rat, but from 12 to 18 in. in length, exclusive of the tail; of a clear black colour, feeding on leaves and fruits, and inhabiting the hollows and clefts of trees. Its flesh, though insipid, is sometimes eaten. Amphibious oviparous animals, the crocodile, cayman, manati, tortoise, and *jicotea*; the first on the coast, and the others in the rivers and lagoons. The *perro jibaro* is the domestic dog restored to a state of nature. It becomes fierce and carnivorous, though not so much so as the wolf of Europe; never attacking man until pressed in the chase. Whatever be their original colour, they uniformly degenerate into a dirty black, with a very rough coat. In spite of the efforts made to extirpate them, they increase in numbers, and do great damage among the cattle. The domestic cat, called the *gato jibaro*, when it becomes wild, commits similar depredations on the poultry yard. The most valuable of the domestic animals are the cow and pig. The sheep, goat, and ass are not in such general use, although within these few years the great jackass of the peninsula has been introduced with some success, for the purpose of breeding mules. The feathered race are remarkable for the beauty of their plumage; but are far too numerous for separate notice. The rivers, though not large, are well supplied with excellent fish, as are the bays and inlets with the natives of the deep. Oysters and other shell-fish are also numerous, but of inferior quality, and adhere to the branches of the mangrove trees which surround the coast. Snakes of a large size are of rare occurrence, though some have been seen 10 or 12 ft. long, and 7 or 8 in. in diameter. Of insects the bee is turned to valuable account by the exportation of its wax, and the use made of its honey. The mosquito tribe are troublesome, and the phosphorescent family are remarkable for the brilliancy of the coloured lights they exhibit.

Vegetable Kingdom.—The forests are of vast extent. Mahogany and other hard woods are indigenous, and several sorts are well suited for ship-building. The palm tribe are as remarkable for beauty as utility, and of vines there is great variety, some of such strength as to destroy the largest of the forest trees in their parasitical embrace. The tropical fruits are plentiful and various; of these the pine-apple, orange, and its varieties, are the most highly valued. Of the alimentary plants, the *platano*, or plantain, is by far the most important. Next in order come the sweet and bitter *yuca*, the sweet root being eaten as a vegetable, and the bitter converted into bread after its poisonous juice has been extracted. The sweet potato, the yam, and other farinaceous roots are also known, although not in such general use as in the British West Indies. The maize or Indian corn is indigenous, and in extensive use; the green leaves for fodder, under the name of *malloja*, and the grain in various forms for man and beast. Rice is cultivated in considerable quantity; and a variety of beans, especially the *garbanzo*, so well known in the peninsula. Garden stuffs are scarcely known, except in the Havannah and other large towns, and there only in the dry season. The culture of flowers is still less attended to.

Mineral Kingdom.—The pursuit of the precious metals was the great object of the first discoverers, but if gold was found at all, it was probably in

washing the sands of some of the rivers, as no traces of the supposed mining operations are now to be found. The gold and silver sent to Spain from Cuba, Hayti, and Jamaica, soon after the discovery and conquest of these islands, consisted, most likely, of the accumulations of the aborigines. In the course of the 17th century, the copper mines near Santiago, in the E. part of the island, were wrought with some success, but were abandoned upwards of 100 years ago, from the imperfect knowledge which then existed, of the art of extracting the metal from the ore. When the mines were abandoned, a large quantity of the mineral, amounting to several hundred tons, was left on the spot as worthless, but having been subjected to analysis by one of the present English proprietors, it was found to be so rich in metal as amply to repay the expense of sending it to Swansea for smelting. In consequence of this discovery, the old workings were explored, and companies formed for the purpose of renewing the mining operations on a scale of considerable magnitude. One of these, called the English Company, has been highly successful, employing many miners and labourers, some of them slaves, some emigrants from the Canaries, and some articled servants from Cornwall. Powerful steam engines have been erected by this company to assist in preparing the ore for shipment at Santiago. In the neighbourhood of Santa Clara, another copper-mine has been opened by an American company. At first, the mineral thence obtained was sent to be smelted at New York; but latterly, like that from Cobre, it has been shipped to the great smelting-houses in Wales. Of 51,307 tons of copper-ore imported into the U. Kingdom in 1848, no fewer than 30,679 tons were brought from Cuba. Coal of tolerable quality has been found in the neighbourhood of the Havannah, but though several pits have been opened, the English coal, carried out in the sugar ships as ballast, may still be sold at a cheaper rate. The coal of Cuba is highly bituminous, and in some places degenerates into a form resembling the asphaltum which is found in the pitch lake of Trinidad, and in various parts of Europe. The ships of the discoverers were careened with this bitumen, which is often found near the coast in a semi-liquid state, like petroleum or naphtha. Marbles and jaspers, of various colours, and susceptible of a high polish, are found in many parts of Cuba, and in its chief dependency, the Isle of Pines. The mineral waters of San Diego, Madringa, and Guanabacao have obtained some celebrity, but with the exception of the last, which is within a few miles of the Havannah, they are difficult of access, and therefore not much resorted to.

Population and Industry.—There have been various censuses of the population: the first in 1775, when it amounted to 170,370; a second in 1791, when it was 272,140; a third in 1817, when it was 551,998, and with transient persons, 630,980; and a fourth in 1827, when the permanent population was 704,487, and with transient persons, 730,562. According to the last census, of the year 1861, the pop. numbered 1,396,530; among them 793,484 whites. The coloured population, numbering 603,046, was divided into 225,843 free persons, 6,650 called 'emancipated,' and 370,553 slaves.

The increase of the slave population has been very rapid, being due chiefly to the continued importation of slaves from Africa. In some years, since the peace of 1815, as many as 30,000 blacks are believed to have been imported into Cuba in a single year. Spain had indeed agreed by treaty in 1820 to abolish the trade; but this treaty was little better than a dead letter, and it is only since 1835, when a more efficient treaty with Spain was entered into, that the trade sustained any considerable diminution. It is highly probable that slavery will soon entirely cease in Cuba, having lost its chief support in the United States, by the downfall of the slave-holding Southern states in 1865.

The raising of sugar constitutes by far the most important branch of industry carried on in Cuba. Its culture has advanced with extraordinary rapidity, especially since 1809, when the ports of the island were freely opened to foreigners. It is principally shipped from the Havannah; and its export from that city, which in 1760 amounted to about 5,000,000 lbs., had increased in 1800 to above 40,000,000 lbs., in 1820 to above 100,000,000 lbs., and in 1849 to 240,800,000 lbs. The exports from the whole island in the year 1861, amounted to 1,127,351,750 libras, or 10,065,640 cwts., valued at 67,641,105 pesos, or 14,373,736*l.*

The culture of coffee advanced for a while with equal or even greater rapidity than that of sugar, In 1800 there were but 80 plantations in the island; in 1817 there were 779; and in 1827 there were no fewer than 2,067, of at least 40,000 trees each. But the low prices of coffee which subsequently prevailed, not merely checked this astonishing progress, but occasioned the abandonment of a great many coffee plantations. While, in 1837, the exports of coffee exceeded 53,000,000 lbs., they only amounted to 17,353,425 lbs. in 1848. In 1861, the total exports of coffee amounted to 150,277 cwts., valued at 2,523,300 pesos, or 536,202*l.* More important than that of coffee is the cultivation of tobacco, celebrated for its excellence in all parts of the world. The exports of tobacco, in 1861, were no less than 6,163,396 cwts., valued at 16,912,500 pesos, or 3,593,906*l.* Since the outbreak of the civil war in the American Union, cotton, once an important article of culture, but subsequently neglected, has been again raised in small quantities. Indian corn, rice, beans, plantains, and even wheat, are also raised, but not in anything like sufficient quantities for the demand, flour and rice being, in particular, very largely imported. Cattle have become extremely numerous, being estimated at about 1,300,000 head; but while hides form a large article of export, fresh and salted meat, and jerked beef, nevertheless, occupy a prominent place among the imports. Horticulture is very little attended to. Of manufactures, the most important are the making of sugar, molasses, and rum, the preparation of coffee, the making of cigars, the bleaching of wax, and the manipulation of the minor staples of the island.

Internal Communication.—Down to a recent period the means of communication between the different parts of the island were very deficient. The common roads were in general badly constructed; and during the rainy season were, for the most part, impracticable for wheel carriages. The long narrow shape of the island, by lessening the distance from the interior to the sea coast, obviated in some degree these difficulties. But down to a very late period it was customary in most parts for the negroes to be employed in the severe drudgery of carrying produce in baskets on their heads to and from the estates, to the seaports, or to the public roads. Within these few years, however, this system has been wholly abandoned by the introduction of a very well-planned system of railways. At the commencement of 1865, there were 27 different lines, of a length of 818 miles, either finished, or in course of construction. The principal line, as well as the first con-

structed, runs from Havannah to Guines and La Union; it was commenced as early as November, 1835. Another important line, from Cardenas to Macagua, was started in 1838; and a branch, from Cardenas to Jucaro, in 1839: The other lineswere constructed since 1840, and the whole of them afford the most rapid and perfect means of communication to the inhabitants of every important place in Cuba. The carriages on some of the railways are drawn by horses, so that they have been constructed at a comparatively small cost. They have, however, been of the greatest service to the island; and may, perhaps, be regarded as the principal cause of the late extraordinary extension of cultivation and general prosperity of Cuba.

Currency.—Paper money is unknown. The coins in use are Spanish doubloons or ounces, which are a legal tender for 17 hard dollars, and at the exchange of $8\frac{4}{37}$ per cent. are worth 3*l.* 10*s.* 10*d.*; also the subdivisions of these doubloons, the half being 8·4 dols.; the quarter, 4·2 dols.; the eighth, 2·1 doll.; and the sixteenth, 1½ doll. Mexican and Columbian doubloons, or ounces, are also in circulation, and are legal tender for 16 hard dollars, equal to 3*l.* 6*s.* 8*d.*; they are sometimes in demand for exportation, at a premium. Their aliquot parts are worth eight, four, two, and one dollar respectively. Of silver coins, the Spanish pillar dollar is worth 4*s.* 2*d.*; and is only legal tender at its nominal worth; but it is generally in demand for export, at a premium of from 2 to 5 per cent. Mexican, U. States, and S. American dollars are also legal tender at their numerical value, and are occasionally in demand, at a trifling premium. For small payments, the coins in circulation are the four, two, one and half real pieces, which are equal to the half, quarter, eighth, and sixteenth of a dollar respectively.

Trade.—The total exports of Cuba, in the year 1861, amounted to 104,887,001 pesos, or 22,288,487*l.* As already stated, sugar is the principal article exported, engrossing about two-thirds of the value of the whole. Next follows tobacco; then coffee, wax, and honey. The total value of the miscellaneous articles exported in 1861, was 14,748,746 pesos, or 22,288,487*l.* The exports of Cuba to the United Kingdom are not separately given in the Board of Trade returns, but figure together with those of Porto Rico. For both they amounted to 4,271,793*l.* in 1861. There is no obstacle whatever to the establishment of foreigners as merchants in the island. The law says that those who are naturalised in Spain may freely carry on trade with the same rights and obligations as the natives of the kingdom, and that those who have not been naturalised, or have a legal domicile, may still carry on trade under the regulations stipulated in the treaties in force between the respective governments; and in default of such conventional relations, the same privileges are to be conceded as those enjoyed by Spaniards carrying on trade in the country of which such foreigners are natives. In practice this last condition is not much attended to, as foreigners are allowed to establish themselves as merchants without any inquiry as to the rights or privileges enjoyed by Spaniards in the country they come from.

Government and Social State.—Public Education is not much attended to; but in this respect there has recently been a great improvement. Elementary schools have been extended; and an institution has recently been established for the instruction of engineers. There are two colleges in the Havannah, with numerous and eminent professors, and literary societies. Several daily newspapers, some of them conducted with considerable ability, are published in the capital and other large towns.

Morals and Religion are both at a low ebb, a consequence partly and principally of the Inquisition and of the degrading superstition so long established in the island, and partly of the institution of slavery. But improvement is not less perceptible in the character and conduct of the people than in their industry and physical comforts.

As respects its civil jurisdiction, Cuba is divided into three provs., of which the Havannah, Santiago, and Trinidad are the caps. The captain-general, governor, or supreme military chief of the island, is, at the same time, civil governor of the W. prov.: but, except in military matters, the governors of the other prov. are perfectly independent of the captain-general, and are responsible only to the court of Madrid. The island is also divided into three military divisions—a western, central, and eastern; the chiefs of which are, of course, subordinate to the captain-general. The royal court (*Real Audiencia*) of Puerto Principe, of which the captain-general is the *ex officio* president, has the supreme jurisdiction in all civil and criminal affairs. In the principalities there are *Ayuntamientos*, and in the rural districts *Jueces Pedaneos*, who combine the exercise of judicial functions with those of police commissioners. Spain ordinarily keeps a marine force of from 40 to 50 vessels, most of them small vessels, stationed at the island. In 1864, the navy thus employed consisted of 4 frigates, 15 steamers, and 32 small craft.

CUCKFIELD, a market-town and par. of England, co. Sussex, rape Lewes, the town being in a commanding situation, on the high road from London to Brighton, 34 m. S. from the former, and 13 m. N. from the latter. Area of par., 10,500 acres: pop. of do., 3,539 in 1861. It is a neat little town. The church, a spacious structure, has a lofty spire, covered with wooden shingles, that have assumed the colour and appearance of blue slate. It has a free grammar school, founded in the reign of Queen Elizabeth.

CUCUTA (formerly *Rosario*, or *San Jose de Cucuta*), an inl. town of New Granada, prov. Pamplona, near the border of Venezuela, 28 m. NNE. Pamplona; lat. 70° 37′ N., long. 72° 14′ W. Its situation is extremely pleasant; it is well-built, neat, and clean; streets paved, with currents of water running through them. The par. church is celebrated as the place in which the first congress was held, and the constitution of Colombia formed, in 1820. It is of Moorish architecture, and contains a respectable copy of one of Raphael's Madonnas, by a Mexican artist.

CUDDALORE, a marit. town of Hindostan, Carnatic, S. div. Arcot, and one of the most extensive and populous towns in the S. of India, 86 m. SSE. Madras; lat. 11° 43′ 24″ N., long. 79° 49′ E. It is naturally strong, being enclosed between two arms of the Pannaur. Streets broad, and it contains many houses of the better class. N. the Pannaur is a suburb called the New Town, with a large Portuguese church, and some handsome European dwelling-houses and other buildings; and beyond this is a large and beautifully situated edifice, formerly the residence of the chief-governor of the British settlements on this coast. Some English looms have been established in this town, and a paper manufactory. Cuddalore was taken by the British in 1760, but obliged to surrender to the French in 1782. It was restored to the British in 1795.

CUDDAPAH (*Cripa*, mercy), an inl. town of Hindostan, presid. Madras, on the banks of the Cuddapah river, 507 ft. above the sea, 120 m. NW.

Madras. It has a mud fort, containing the palace of the former nabobs, now converted into a court of justice, and a prison for both debtors and felons. Cuddapah is not a place of much trade; it was the cap. of an indep. Patan state, which survived the destruction of the other Deccany kingdoms: a great deal of sugar and jaghery is made in its vicinity.

CUENCA, a city of Spain, cap. prov. same name, on a high mountain, between two others higher still, and separated from them by the deep beds of the Jucar and the Huecar rivers, near their confluence; 86 m. ESE. Madrid, 136 m. SW. Saragossa. Pop. 7,610 in 1857. The town is surrounded by high walls, and its streets are extremely steep, crooked, and narrow. It has seven gates; six bridges over the Huecar, and two over the Jucar, one of the latter being of very superior construction. Cuença is the see of a bishop, and the residence of the principal authorities of the prov., and contains a vast cathedral built by Alphonso IX. in the 12th century; a fine episcopal palace; 14 parish churches; 13 convents, some of them built on precipices overhanging the river, and containing paintings of great merit; 3 colleges, and an ecclesiastical seminary; 2 hospitals for the sick, and 1 for foundlings; a public granary, and several public fountains. It has some fabrics of paper and wool. The latter were formerly much more considerable than at present; and the town was also much more populous and important. It is the native country of the painter Salmeron, and of the famous Jesuit Molina. Cuença was given in dowry by the Moorish king of Seville, Ben Abut, with his daughter Zaida, to Alphonzo VI., king of Castile, when he left the cloisters to succeed his brother in 1072. The Moors again retook it, but it was finally wrested from them in 1176.

CUENCA, an inl. town of Ecuador, cap. prov. same name, in a spacious plain, nearly 9,000 ft. above the level of the sea, 186 m. S. Quito; lat. 2° 56′ S., long. 79° 12′ W. Pop. estimated at 30,000, of whom about 3,000 are Indians. Its streets are broad and straight; but the houses are low, and built of unburnt brick. It contains a cathedral, two par. churches, several monasteries, a college, and a hospital; has manufactories of confectionery, cheese, and hats; and some trade in these, together with grain, cinchona, bark, and other productions of its vicinity. Its climate is temperate as to heat, but it is subject to violent storms. A little to the S. is the Mountain of Farqui, chosen by the French astronomers for their meridian in 1742. In its neighbourhood there are several remains of the works of the Peruvian incas.

CUEVAS, a town of Spain, prov. Castellon, 51 m. NE. Almeria. Pop. 3,096 in 1857. The town is almost surrounded by the river Almanzor, and there are between the town and the Mediterranean, about 8 m. distant, a number of very deep caverns in the mountains, supposed to have been opened by the Moors, in search of minerals or water; from these the town takes its name. It contains a church, a convent, and a public granary. There is a castle on the coast, and a small island belonging to the town.

CULIACAN (an. *Hueicolhuacan*, Mex.), an inl. town of Mexico, state of Sonora, on the right bank of the river of the same name; 105 m. ESE. Cinaloa, and 170 SE. El Fuerte. Pop. 10,925 in 1858. It is a depôt for goods passing to and from the port of Guaymas, on the Gulf of California. During the Spanish rule it was the cap. of a prov. The country around is well watered and highly productive.

CULLEN, a marit. royal, and parl. bor. of Scotland, co. Banff, on an eminence at the mouth of a little rivulet, 12 m. W. Banff. Pop. 3,543 in 1861. Though an ancient burgh, the present town is comparatively new, the old town having been superseded, and the site on which it stood enclosed within the park of Cullen House, the mansion of the Earl of Seafield. The linen manufacture, so common on all the E. coast of Scotland, N. of Dundee, has found its way to Cullen, but is carried on to an inconsiderable extent. The inhab. engage in the herring fishery, and in that of cod, skate, ling, and haddock, which abound on their shores; so that dried or cured fish form their chief export. The harbour is bad, and the town, on the whole, not flourishing.

Cullen unites with Banff, Inverury, Kintore, and Peterhead, in returning a mem. to the H. of C. Registered electors, 44 in 1864.

CULLERA, a sea-port town of Spain, Valencia. It lies on the Jucar, near its mouth, and to the S. of the mountain and cape of the same name, on the Mediterranean coast, 25 m. S. Valentia. Pop. 9,814 in 1857. The town has a church, a convent, a hospital, a public granary, and barracks for troops on their march, being on the shortest and most frequented road from the coast to the capital. It carries on a considerable coasting trade, as many as forty or fifty vessels being sometimes seen at a time, principally about 30 tons burden, taking in fruit for France, rice for the Balearic Islands, and the coasts of the Peninsula. The neighbourhood produces rice, wheat, maize, muscatel raisins, wine, oil, and garden stuff.

CULPEE, an inland town of Hindostan, prov. Bengal, in a jungly and unhealthy situation, on the left bank of the Hooghly river, about 30 m. SSW. Calcutta; lat. 22° 6′ N., long. 88° 25′ E.

CULROSS, a royal and parl. bor. and marit. town of Scotland, in a detached corner, co. Perth, on a steep acclivity on the N. shore of the Frith of Forth, about 16 m. NE. Edinburgh. Pop. 517 in 1861. Culross was made a royal burgh by James VI. in 1588; and though it had once a considerable trade in salt and coal, the latter of which was wrought at a very remote period, trade of every kind has now entirely left it, except, perhaps, a little traffic in fish caught in the Forth, and a little damask weaving for manufacturers in Dunfermline. There are vestiges of an old harbour; but the smallest yawls can now approach the town only at high water. But though of no modern importance, Culross can boast of many remains of antiquity, which throw an air of interest over a place otherwise mean and decayed. At the E. end of the town once stood a chapel dedicated to St. Mungo or Kentigern, said to have been born here. A monastery, dedicated to the Virgin and St. Serf, was founded here in 1217, by Malcolm earl of Fife, for Cistercian monks; of which considerable remains are extant, a part of it serving as the parish church. Culross Abbey, occupying a magnificent terrace overlooking the sea, and successively the seat of the Bruces and the noble family of Dundonald, is now the property of the heirs of the late Sir Robert Preston, Bart. The present parish church is collegiate, having two clergymen.

Culross unites with Queensferry, Inverkeithing, Dunfermline, and Stirling, in sending a mem. to the H. of C. Registered electors, 23 in 1864.

CUMANA, a city of Venezuela, cap. of the dép. and prov. Cumaña, in an arid and sandy plain on the E. bank of the Manzanares, and near the mouth of the Gulf of Cariaco, about 1 m. from the sea-shore, and 180 m. E. Caracas; lat. 10° 28′ N., long. 64° 16′ W. Pop. 8,500 in 1858. The city is commanded by Fort St. Antonio, built on the extremity of a hill immediately to the E.: the Manzanares encompasses the town on the S. and

W., dividing it from its principal suburbs. It has two parish churches, two convents, and a theatre. Having suffered greatly at different times from earthquakes, its buildings are generally low: but in the early part of the present century great improvements were introduced into the buildings, and its prosperity was much augmented by the judicious conduct of its governor. It has a roadstead capable of receiving all the navies of Europe, with excellent anchorage for large ships. It is protected by a shoal and the battery of Boca at its entrance. Exports—mules, cattle, smoked meat, salted fish, cacao, and other provisions; fish, wild fowl, and other necessaries, are obtained here in great plenty, and very cheap. Climate intensely hot, from June to October the temperature being usually 90° or 95° F. during the day, and seldom so low even as 80° in the night. The inhab. are distinguished for their assiduity in business, and their polished manners. This is the oldest European city in the New Continent, having been built by Diego Castellon in 1523. It was totally destroyed by the earthquake of 1766.

CUMANACOA, an inl. town of Venezuela, prov. Cumana, in a valley surrounded by lofty heights, 21 m. SE. Cumana, and noted for the prodigious difference between its climate and that of the latter city; lat. 10° 15′ N., long. 64° 5′ W. Pop. 2,470 in 1858. Cumanacoa has seven months of wintry weather, though only 730 ft. above the level of the sea. It is small, ill-built, with houses mostly of wood.

CUMBERLAND, a marit. co. of England, having N. Scotland and the Solway Frith, E. Northumberland and Durham, S. Westmoreland and Lancashire, and W. the Irish Sea. Area 1,565 sq. m., or 1,001,273 acres, of which about 300,000 acres are mountain and lake. The co. has some of the highest mountains in the kingdom: on its E. border, adjoining Northumberland and Durham, these consist of a portion of the Pennine or great central chain; while the W. group has received the name of the Cambrian range, from their being principally in this co.; the two ranges are divided by the plain of the Eden (see ENGLAND for an account of these mountains, and of the lakes interspersed among them). Principal rivers, Eden, Esk, Irthing, Derwent, and Caldew. Soil in the lower districts, and in parts of the W. mountains, light, and well adapted to the turnip husbandry; but there is also a good deal of wet loam on a clay bottom. The soil of the E. or central moors and mountains is mostly peat earth, and they are bleak, heathy, and extremely barren. Climate rather humid. Principal crops, wheat and oats. Agriculture is much improved; a judicious rotation is observed; and turnips are extensively cultivated according to the most approved principles of the drill-husbandry. Property is much divided. There are a few large estates, but by far the greatest portion of the co. is divided into small properties, worth from 10*l.* or 20*l.* to 200*l.* a year, belonging to 'statesmen,' or 'lairds,' formerly distinguished by their attachment to routine practices, their supplying themselves with all sorts of domestic manufactures, and their economy and independence. But their habits have materially changed during the present century: domestic manufactures have been wholly abandoned, and their habits approach much more nearly than before to the common level of cultivators. There are valuable coal mines near Whitehaven, and in other places; plumbago, or black lead, is found in the greatest perfection in Borrowdale in this co.; and limestone and slate are abundant. The cotton manufacture is extensively carried on at Carlisle and Penrith; and cordage and canvas are made, and ships built, at Whitehaven and other places. Principal towns, Carlisle, Whitehaven, Workington, and Cockermouth.

Cumberland is divided into 5 wards and 106 pars. It returns 9 mem. to the H. of C., viz. 4 for the co., 2 each for Carlisle and Cockermouth, and 1 for Whitehaven. Registered electors for the co. 10,164 in 1865; of which number the E. division had 5,441, and the W. division 4,723. Pop. 205,276 in 1861, inhabiting 40,532 houses. Annual value of real property assessed to income tax: in E. division 462,574*l.* in 1857, and 479,563*l.* in 1862; and in W. division 420,296*l.* in 1857, and 511,272*l.* in 1862.

CUMBERNAULD, a manufacturing village of Scotland, co. Dumbarton, 13 m. E. Glasgow, on the highway leading from that city to Falkirk and Stirling. Pop. 1,561 in 1861. The chief employment of the people is cotton weaving. The Forth and Clyde canal runs within a ¼ m. of the town; and the Edinburgh and Glasgow railroad has a station here. Cumbernauld was erected into a burgh of barony in 1649; and has for five centuries been the property of the family of Fleming, whose seat is in its immediate vicinity.

CUMNOCK, or OLD CUMNOCK, a village of Scotland, co. Ayr, on the Lugar water, 12 m. E. Ayr. Pop. 2,316 in 1861. This place has been famous for above 30 years for the manufacture of what are known by the name of Cumnock, or Lawrencekirk, snuff-boxes. An artist of the name of Crawford caught the first idea of them from a box made at Lawrencekirk, which had been sent him to repair. The excellence of the Cumnock snuff-boxes lies in the hinge, which is both ingenious in point of contrivance and delicate in point of execution; so that it is styled the 'invisible wooden hinge.' The wood used in the manufacture is plane, by reason of its peculiarly close texture. One set of artists make the boxes; another set paint those designs that embellish the lids; while women and children are employed in varnishing and polishing. The principle on which the hinge is formed, as well as the instruments employed in making it, were for many years kept secret. The manufacture exists also in the neighbouring village of Mauchline, as also, to a less degree, in Lawrencekirk, Montrose, and one or two other places.

CUPAR-ANGUS, a burgh of barony of Scotland, partly in co. Perth, and partly in Angus, on the Isla, a tributary of the Tay, on the high road between Perth and Aberdeen, about 12½ m. from the former. Pop. 3,694 in 1861. The place is neatly built, well paved, and lighted; has a townhouse and jail, an elegant parish church, two chapels belonging to Presbyterian dissenters, and an episcopal chapel; a weekly cattle-market, and five annual fairs. The town enjoys its share of the weaving of the coarser kinds of linen fabrics, for the manufacture of which the various towns and villages of Angus are distinguished. The webs are generally obtained from Dundee. It has also extensive bleach-fields and tan-pits; but weaving is the staple employment of the place.

CUPAR-FIFE (so called to distinguish it from Cupar-Angus), a royal and parl. bor. of Scotland, co. Fife, of which it is the cap., 25 ft. above the level of the sea, in the centre of the *Howe* of Fife, and on the l. bank of the Eden, 10 m. W. St. Andrew's. Pop. 5,029 in 1861. Though ancient, Cupar has all the characteristic appearances of a modern town. The streets seem as if they had been recently built; and are wide, well built, lighted with gas, and partially paved. The county-hall is a handsome modern structure. The manufacture of the coarser fabrics of linen form

the staple trade of the town. There are also corn, barley, and flour mills, reckoned the best in the co., a snuff-mill which manufactures 60,000 lbs. of snuff a year, a washing or fulling mill, a glue manufactory, three breweries, two tan-works, a tile and brick work, at which coarse earthenware is made, and a rope-work. Cupar has long had a flourishing joint-stock academy, with numerous other schools; there is a bequest by Dr. Bell of 10,000*l.* for educational purposes according to the Madras system. Besides the par. church, there are Presbyterian dissenting chapels, one Episcopal and one Glassite chapel. Cupar is associated with St. Andrew's, the two Anstruthers, Crail, Kilrenny, and Pittenweem, in returning a mem. to the H. of C. Registered electors 224 in 1865. Corporation revenue, 150*l.* The borough is governed by a provost, 3 bailies, and 23 counsellors. Cupar was a royal bor. so far back, at least, as the reign of David II. On a mound at the E. end of the town, called the Castle-hill, formerly stood a castellated fortress, the chief residence of the family of Macduff, the feudal thanes or earls of Fife. At the foot of this mound was a convent of Dominican or Black Friars, founded by the Macduffs, and afterwards annexed to St. Monance in the same co. (Keith's Scot. Bishops, ed. 1824, p. 445); but of these two buildings no traces are now extant. The patrimonial estate of the famous Scottish poet, Sir David Lindsay of the Mount, was within a short distance of Cupar; and on a verdant esplanade, still called the Play Field, in front of Macduff castle, was acted, in 1555, his witty drama of the 'Three Estates,' a popular satire on the priesthood, and which is thought to have had no mean effect in hastening the Reformation.

CURACOA, or CURASSAO, an isl. in the Caribbean Sea, belonging to the Netherlands, off the N. coast of Venezuela; between lat. 12° and 12° 13′ N., and long. 68° 44′ and 69° 13′ W. Length, NW. to SE., about 43 m.; average breadth about 14 m.; area, 600 sq. m. Pop. 19,596 in 1861, of whom about one-third slaves. The shores of the island are bold, and its interior is in parts hilly. It has several harbours, the chief of which is that of Santa Anna, in the SW., where its principal town is built. The soil is in general poor and rocky, and there is a great deficiency of water; but by the industry of the inhab., some tobacco, sugar in considerable quantities, and indigo are grown; and a good deal of salt is obtained from the marshes. Maize, cassava, figs, oranges, citrons, and most European culinary vegetables, are cultivated; but provisions are not produced on the island in sufficient quantity for its inhab. The government is conducted by a *stadtholder*, assisted by a civil and military council. Wilhelmstadt, the cap. and seat of government, is one of the neatest cities in the W. Indies; its public buildings are magnificent, the private houses commodious, and the clean streets remind the traveller of those in the Dutch towns. The port of Curaçoa, St. Barbara, has a narrow entrance, but is large and safe. It is protected by the fort of Amsterdam and other batteries; but was taken by a squadron of four English frigates in 1807. Two smaller islands, one on either side, Buen Ayre and Oruba, also belong to the Dutch. Their inhab. are chiefly cattle-breeders. Curaçoa was discovered by the Spaniards, but taken from them by the Dutch in 1632. Great Britain took possession of it in 1798, but returned it to Holland in 1814.

CUSTRIN, or KUSTRIN, a strongly fortified town of Prussia, prov. Brandenburg, on the Oder, where it is joined by the Warta, 52 m. E. Berlin, on the railway from Berlin to Königsberg. Pop. 9,037 in 1861, excl. of garrison of 1,661. The Oder is here crossed by a bridge nearly 900 ft. in length, uniting the citadel with the town; being surrounded by marshes, it is strong as well by nature as by art. The Russians burnt the town without, however, taking the fort in 1758. It was soon after rebuilt on a greatly improved plan. The fortifications have been much improved since the peace of 1815.

CUTCH-GUNDAVA, an inl. prov. of Beloochistan, differing in some important respects from all the others, being by far the most valuable portion of that country, and its only prov. E. the Brahooick mountains. It lies between lat. 27° 40′ and 29° 15′ N., and long. 67° 20′ and 69° 30′ E. Length N. to S. about 120 m.; breadth of its habitable and fertile part a little more than 60 m.; having N. Sewestan (Caubul), E. and S. Sinde, and W. the prov. Thalawan. It is for the most part a plain, bounded by deserts on the N., S., and E.; and watered by several rivulets communicating by numerous aqueducts. Soil rich and loamy, and so exceedingly productive that it is said, were it all cultivated, the crops would be more than sufficient to supply all Beloochistan; as it is, considerable quantities of grain, besides cotton, indigo, and oil, are exported. It is alleged, but probably without foundation, that rice will not grow in Cutch-Gundava, notwithstanding the luxuriance of all other crops, and the plentiful supply of water. Climate oppressively hot throughout the summer, when the simoom is frequently experienced; during winter it is so mild that the chiefs and principal inhabitants of the adjoining W. provinces resort thither. The bulk of the pop. are Juts; there are a few Hindoos in the towns and villages, who live by barter, and transporting grain Villages extremely numerous. The chief towns are Gundava, the cap., Dadur, Bhag, and Lheree.

CUTTACK, a large marit. dist. of Hindostan, prov. Orissa, presid. Bengal, between lat. 19° 30′ and 21° 40′ N., and long. 84° 30′ and 87° E.; having N. the dist. Midnapore and the Berar ceded districts, W. the latter, S. Ganjam, and E. the Bay of Bengal. Area 9,000 sq. m. Pop. 1,984,600. It consists of three different tracts of country,—the marshy coast, the dry central region, and the hilly country to the W. The latter abounds with trees, valuable either for cabinet-work, dyeing, or varnish-making. Rivers numerous; the chief are the Mahanuddy, Brahminy, Coyle, and Subunreeka; all these are of considerable size, and even the minor streams swell, during the rains, to an enormous magnitude, rendering the construction of extensive and solid embankments necessary in many parts of the dist. The periodical rains are not so early here as in Bengal; the summer heats are very oppressive, and the forests of Cuttack are generally highly insalubrious. They are also much infested with ferocious wild animals, especially leopards; and reptiles, many of which are venomous. Rice of different qualities, wheat and maize, in the hilly tracts, the sugar-cane, pulse, aromatic roots, spices, and dyeing drugs are the chief articles of culture. Several kinds of granite, slate, and iron ore are found, and gold dust in the beds of the mountain torrents. The land is not assessed under the permanent settlement, as is the case in the adjoining prov. of Bengal; but an agreement is usually made between the government and the land-holders for a certain term, the amount of the land-tax being by no means fixed. A considerable proportion of the territory in the W. or mountainous region is in the possession of a number of nearly independent zemindars, each of whom maintains a kind of sovereign state, and pays but a light tribute. A more valuable source

of revenue to the government than the land-tax has been the monopoly of salt, much of which, remarkable for whiteness and purity, is made on the coast of this district. The chief towns are Cuttack the cap., Balasore, and Juggernaut, the seat of the celebrated temple of that name. (See JUGGERNAUT.) Cuttack was acquired by the British, on the expulsion of the Mahrattas, and the reduction of the Juggernaut rajah in 1803–4. In 1817, the too rapid introduction of the revenue and judicial systems established in Bengal amongst the rude and barbarous inhabitants of Cuttack, together with the evils of over-assessment and mismanagement, excited a rebellion in this dist., which was subdued in the ensuing year, but at the expense of much treasure, and the loss of many lives.

CUTTACK (*Catak*, a royal residence), a town of Hindostan, cap. of the above dist., seat of its principal judicial court, &c., on the Mahanuddy, and in the rainy season insulated by two of its branches, 220 m. SW. Calcutta; lat. 20° 27′ N., long. 86° 5′ E. Pop. estimated at 40,000. Its principal street is well built, and it has many houses two and three stories high, a spacious market-place, some handsome Mohammedan structures, and some military cantonments. The dwellings of the civil establishment are dispersed over the environs. This town is secured from inundation by large and solid embankments along the river: the value of these was sufficiently proved in 1817, when during the heavy rains the waters of the river rose in one night 18 ft., or 6 ft. above the general level of the town, which was only preserved by their means. Cuttack is believed to have been a capital as early as the 10th century.

CUXHAVEN (Germ. *Cuxhafen*), a sea-port town of N. Germany, immediately within the estuary of the Elbe, on its SW. side, in a detached portion of territory belonging to Hamburgh, from which it is distant 55 m. WNW.; lat. 53° 52′ 21″ N., long. 8° 43′ E. Pop. 1,410 in 1861. The town has a good harbour, with deep water, a lighthouse, and is a quarantine station. It was formerly the rendezvous of most passengers to and from England and the Elbe; but since the establishment of steam-packets, they are conveyed direct to and from Hamburgh. Vessels entering the Elbe generally heave to opposite Cuxhaven for pilots, by whom it is mostly inhabited. In summer it is resorted to by sea-bathers.

CUZCO, an inland city of Peru, formerly the cap. of the empire of the incas, at the foot of some hills, having an extensive valley opening to the SE., 11,380 ft. above the level of the sea, about 400 m. ESE. Lima; lat. 13° 30′ 55″ S., long. 72° 4′ 10″ W. Pop. 45,231 in 1858, mostly Indians. The cathedral and convent of St. Augustine are said to rank amongst the finest religious edifices in the New World; and it has besides six churches, eight convents, four well-endowed hospitals, three monasteries, a university, and three collegiate schools. But Cuzco derives most part of its interest from the historical associations connected with it, and from its remains of the architecture of the incas. Even a great number of the private houses belong to that era; and by the size of the stones, and the fineness and peculiarity of the buildings, give to the city an imposing air. The Dominican convent, a magnificent structure, is raised on walls that formed part of the famous temple of the sun, destroyed by the fanatical zeal of the Spaniards. Ulloa (Voyage d'Amerique, i. 507) says that the high altar stands on the very spot formerly occupied by the golden image of the sun. Upon a hill to the N. of the city are the ruins of a very extensive fortress, the work of the incas, the walls of which are of the species named Cyclopean, and have a striking analogy to the so-called structures found in various parts of Greece and Italy. Some of the stones, which are all of angular shapes, are of such an enormous size that their weight is said to exceed 150 tons, and, though no cement be used in the building, they are so admirably jointed and fitted together, that the interstices are hardly perceptible. It is very difficult to imagine how such vast blocks could have been conveyed from the quarries and placed on the walls without the aid of powerful machinery. In the plain to the S. of the city are extensive remains of ancient edifices in the same style; and it is said by Alcedo that a subterranean passage led from the palace of the incas to the fortress, and that a road was constructed from the city to Lima.

The inhabitants are industrious, and excelling in embroidery, painting, and sculpture. There are manufactures of cotton, linen, and woollen stuffs, and of leather and parchment. A considerable trade is carried on in these and in the products of the adjacent district.

Cuzco is the most ancient of the Peruvian cities, its origin dating from the era of Manco Capac, the founder of the empire of the incas, probably in the 12th century. Pizarro took possession of it in 1554, and was shortly after besieged in it by the whole Peruvian force. During this siege a great part of the town was destroyed. The city, as well as the province, of Cuzco, after being torn from the Spanish dominion, formed part of Peru from 1821 to 1836; it then fell to Bolivia, but was subsequently again united to Peru.

CYPRUS, or KIBRIS, a famous and considerable island, in the NE. angle of the Mediterranean, between Asia Minor and Syria, at present belonging to Turkey, 44 m. S. Cape Anamour in the former, 65 m. W. Latakia in the latter, and 330 m. E. Crete; between lat. 34° 34′ and 35° 42′ N., and long. 32° 18′ and 34° 37′ E. Shape somewhat oval, with a considerable promontory projecting ENE. from the main body of the island: greatest length 132 m.; average breadth from 30 to 35 m. Pop. estimated at 110,000, of whom about one-half are Greeks. The island is intersected lengthways, or from E. to W., by a range of mountains, the highest point of which, St. Croce (an. *M. Olympus*), is about 15 m. S. Nicosia. The principal river, Pedia (an. *Pedæus*), consists of two main branches: it flows E. through the centre of the island, having its embouchure near the ruins of Constantia, on the E. coast; but this, like most of the other rivers, is but of limited dimensions, and is nearly dried up in summer. Cyprus is also otherwise ill supplied with water, that obtained from most of the wells being brackish. The principal plains lie along the banks of the Pedia, and the S. coast of the island. The climate differs in different parts: along the N. shore it is comparatively temperate; the winds coming from the cold mountainous districts of Asia Minor temper the heat in summer, and in winter produce piercing colds on the mountains, which are covered with snow for several months. But it is otherwise in the plains along the S. and E. coasts: these consist, for the most part, of a whitish soil which has an offensive glare, and being defended from the N. and NW. winds by the mountains, at the same time that they are exposed to the full sweep of the E., SE., and S. winds from the Syrian, Arabian, and Lybian deserts, they have a higher temperature than any other place in the Levant. During the summer heats *malaria* is frequently generated; and long droughts, combined with the want of industry and the neglect of irrigation, not unfre-

quently destroy the crops. The soil is naturally fruitful, and, in antiquity, Cyprus was famous for its fertility, and the variety and excellence of its products. Even now, though only a very small portion of the land be cultivated, and that in the most wretched manner, the merchants of Larnica annually export several cargoes of excellent wheat to Spain and Portugal. The best as well as the most agreeable parts of the island are in the vicinity of Cerina and Baffa, the ancient Paphos. (See BAFFA.)

Cotton of a superior quality is produced in the island. The cultivation was much extended after the outbreak of the American civil war, and in 1863 the total produce amounted to 8,000 bales of 2½ cwt., or 2,016,000 pounds. (Report of Mr. Vice-Consul White on the Trade of Cyprus, dated May 10, 1864.) Cyprus was formerly famous for its cotton, and, under the Venetians, the island annually exported about 30,000 bales. It then also exported considerable quantities of sugar, produced from plantations of canes in the vicinity of Limasol and Baffa. There are extensive forests of oak, beech, and pines; groves of olives and plantations of mulberries. It is remarkable for the fineness of its fruits, and its rich sweet wine, oil, and silk. The latter is of two kinds, yellow and white, but the former is preferred. The wheat is of a superior quality, affording excellent bread; and rice, madder, and an endless variety of other valuable products, might be cultivated in several parts of the island.

The wines of Cyprus, particularly those produced from the vineyard called the Commandery, from its having belonged to the knights of Malta, were formerly more highly prized for desserts than even those of Crete. In the earlier part of last century, the total produce of the vintage was supposed to amount to above 2,000,000 gallons, of which nearly half was exported; but now, the wine grown and exported does not amount to a tenth part of these quantities. 'Perhaps,' says Dr. Clarke, 'there is no part of the world where the vine yields such redundant and luscious fruit: the juice of the Cyprian grape resembles a concentrated essence. The wine of the island is famous all over the Levant. Englishmen, however, do not consider it as a favourite beverage; it requires nearly a century of age to deprive it of that sickly sweetness which renders it repugnant to their palates. Its powerful aperient quality is also not likely to recommend it. When it has remained in bottles for 10 or 12 years, it acquires a slight degree of fermentation upon exposure to the air; and this, added to its sweetness and high colour, causes it to resemble Tokay more than any other wine. It will keep in casks, to which the air has access, for any number of years. If the inhabitants were industrious, and capable of turning their vintage to the best account, the red wine of the island might be rendered as famous as the white, and, perhaps, better suited for exportation. (Travels, iv. 19.)

Cyprus was formerly far more densely populated than it is at present. In antiquity, the pop. probably fell little short of 1,000,000; and in 1571, when it was conquered by the Turks, it had a pop. of about 400,000, or nearly four times its present amount. 'Nowhere,' as Mr. Kinneir states (Journey through Asia Minor, pp. 176, &c.), 'is the baleful influence of the Ottoman dominion more conspicuous than in Cyprus, where it has literally turned cities into miserable villages, and cultivated fields into arid deserts.' In describing his journey from Larnica to Nicosia, Dr. Clarke (Travels, iv. 55) observes, 'The soil everywhere exhibited a white marly clay, said to be exceedingly rich in its nature, although neglected. The Greeks are so oppressed by their Turkish masters, that they dare not cultivate the land: the harvest would instantly be taken from them if they did. Their whole aim seems to be to scrape together sufficient, in the course of the year, to pay their tax to the governor. The omission of this is punished by torture or by death; and, in cases of their inability to supply the impost, the inhab. fly from the island. So many emigrations of this sort happen during the year, that the pop. of all Cyprus scarcely exceeds 60,000 persons, a number formerly insufficient to have peopled one of its many cities. The governor resides at Nicosia. His appointment is annual, and as it is obtained by purchase, the highest bidder succeeds; each striving, after his arrival, to surpass his predecessor in the enormity of his exactions. From this terrible oppression, the consuls and a few other families are free, in consequence of a protection granted by their respective nations.'

Mr. Kinneir (Journey, pp. 182–3) states, that 'the governor and the archbishop deal more largely in corn than all the other people of the island put together: they frequently seize upon the whole yearly produce, at their own valuation, and either export or retail it at an advanced price; nay, it happened more than once, during the war in Spain, that the whole of the corn was purchased in this manner by the merchants of Malta, and exported without leaving the lower orders a morsel of bread.' More recently, the condition of the people seems to have somewhat improved, to judge from consular and other reports. The exports of produce are also steadily increasing. The total amount of exports for 1863 was 276,700*l.*, being an increase of 88,565*l.* upon the preceding year, chiefly due to augmented culture of cotton. The total amount of imports in 1863 was 120,000*l.*, exceeding that of the year 1862 by 20,000*l.* Greece is the chief importing country, next Austria and then France. (Report of Mr. Vice-Consul White on the Trade of Cyprus, dated May 10, 1864.)

Sheep and cattle are bred in considerable numbers. There is abundance of game, such as partridges, quails, woodcocks, and snipes: there are no wild quadrupeds, excepting foxes and hares, but many kinds of serpents, and the tarantula. Clouds of locusts sometimes devastate the country. The ancient mines of Cyprus now wholly neglected, afforded large quantities of the finest copper (*Æs Cyprium*), whence, though that be very doubtful, the name of the island has been supposed to be derived. It is also said to contain ores of gold, silver, and other metals, and has a species of rock-crystal called Paphos diamond. Amianthus, or asbestos, of a very superior quality, is found near Baffa; it is flexible as silk, white, and more delicately fibrous than that of any other country. Mariti states that a village, called Amianthus, existed in Cyprus in his time; and it was most probably the spot where the Amianthus or incombustible cloth, used by the ancients to wrap up the bodies of distinguished persons when laid on the funereal pile, was principally produced. (Travels, i. 177.) Salt is obtained by evaporation at various places on the S. coast. The inhab. manufacture small carpets, some silk and cotton fabrics, and excellent Turkey leather. Under the Turks this island was divided into three sanjiacks —those of Baffa, Cerina, and Nicosia. Nicosia, in the centre of the island, is the cap. The other principal towns are Larnica, on the site of the ancient Citium, Limasol, Famagusta on the E. Cerina (an. *Cerinia*) on the N., and Baffa (*Paphos*) on the W. coast. Even the ruins of most of the

ancient cities mentioned by Strabo have disappeared; but at Constantia, near Famagusta, Kinneir traced the circ. of the ancient walls, and the foundations of some buildings; and at Larnica medals and other antiquities are frequently dug up. The remains of a monastery, built by a princess of the house of Lusignan, stand about 4 m. SE. Cerina. Cyprus was originally peopled by the Phœnicians. It was colonised by the Greeks, and successively possessed by the Egyptians, Persians, Greeks, and Romans. In antiquity, it was as famous for the worship of Venus as Delos for that of Apollo and Diana. This, in fact, was the favourite seat of the goddess, '*diva potens Cypri.*' Divine honours are supposed to have been first paid to her at Paphos (See BAFFA), where she had a magnificent temple—

'ubi templum illi, centumque Sabæo
Thure calent aræ, sertisque recentibus halant.'
Æneid, i. 416.

But the whole island was sacred to Venus; and, besides Paphos, other three cities were celebrated for her worship.

'Est Amathus, est celsa mihi Paphos, atque Cythera,
Idaliaeque domus.' Æneid, x. 51.

Hence the epithets Cyprian, Paphian, and Idalian, applied to Venus. It is alleged that the ladies of the island are still devotedly attached to the worship of the goddess.

After the fall of the Western empire, Cyprus formed part of the Byzantine empire, from which it was taken by the Saracens. Isaac, a prince of the Comneni family, having usurped the sovereignty, was dethroned, in 1191, by Richard I., king of England. The latter having conferred the island on Guy de Lusignan, to indemnify him for the loss of Jerusalem, it continued in possession of his family for three centuries, or till 1480, when, on default of heirs, it fell to the Venetians. The Turks took it from them in 1571. Bregadino, the gallant defender of Famagusta, after exhausting every resource, at last capitulated on honourable terms. No sooner, however, had the place been delivered up than the capitulation was disregarded, and Bregadino himself was skinned alive and impaled—a dreadful augury of what the population was to suffer under the dominion of the warlike followers of Mahomet. However, it seems probable that the better government of Turkey, inaugurated in recent years by the influence of the Western powers, will also make itself felt before long in this magnificent island.

CZEGLED, a large market town of Hungary, between the Danube and Theiss, co. Pesth, on the high road between that city and Debreczin, 39 m. SE. the former, and 84 m. WSW. the latter. Pop. 19,150 in 1857. The inhabitants are chiefly Protestants. A great deal of ordinary red wine is made here, as well as beer.

D

DACCA, or DHAKA, an inl. city of Hindostan, prov. Bengal, formerly very extensive, populous, and rich, and still one of the principal cities of the Bengal presidency, and the seat of a court of circuit and appeal for the seven E. distr. of Bengal. It extends, with its suburbs, for 6 m. along a river which, uniting with the Ganges on the one hand and the Brahmaputra on the other, affords the greatest facilities to commerce: lat. 23° 42′ N., long. 90° 17′ E., 127 m. NE. Calcutta, with which it is connected by the East Bengal railway. Pop. estimated at 70,000. Like other native towns, it is a mixture of brick, thatch, and mud houses, with narrow and crooked streets. The bulk of the houses are so very combustible, that they are usually burned down once a year. According to Heber, Dacca is like the worst part of Calcutta, near Chitpoor, but with some really fine ruins intermingled with the huts, which cover three-fourths of its area. There are few European houses, and these mostly small and mean, compared with those of Calcutta. Some Greek buildings, which were the favourite residence of the late nabob, were ruined by the encroachments of the river. In the 17th century Islam Khan built a palace and fort here, the ruins of which form an imposing object; and toward the end of the same century a grandson of Aurungzebe commenced and finished a magnificent palace, now also in ruins. The pagodas are few and small, owing to the ascendancy of Mohammedanism, and almost every brick building has its Persian or Arabic inscription. There is a small but pretty Gothic English church; and a burial ground about a mile from the city, containing some handsome tombs, both Christian and Mussulman. There are several obelisks in and around the city; and about 4 m. off is a beautiful Gothic bridge, said to have been constructed by a Frenchman, but, like most of the other public edifices, in a state of ruin. All the buildings beyond the inhabited portion of the city are surrounded by ruins and rank vegetation; and the castle, factories, and churches, of the Dutch, French, and Portuguese, have all fallen into decay. English goods and manufactures, or imitations of them, are to be met with in the bazaars; but no vessels larger than small country-built brigs come up the river. The trade of the city, however, has greatly improved in recent years by the establishment of the Eastern Bengal railway, a line running from Calcutta to Dacca, *via* Pubna, with a branch to Jessore. The total length of this railway is 110 m., and it was opened throughout on the 15th November, 1862. The striped and flowered muslins of Dacca were formerly regarded as inimitable, and were in great request at the Mogul court, and other native Indian courts, as well as at the old court of France. The manufacture was hereditary in several families, but has been annihilated by the destruction of the native courts and the wealthy native nobles. Its loss has been very generally ascribed to the importation of the cheaper muslins of England, but this is a mistake: it was wholly suppressed before a yard of British muslin or calico found its way to India. The manufacture, in fact, was never carried on upon a large scale; and being one of luxury only, it fell with the fall of the wealthy class, who alone purchased its products. The cotton grown in the district is now mostly exported to England. There are some respectable Greek, Portuguese, and Armenian merchants. The country round Dacca being always covered with verdure during the dry months, it is comparatively free from violent heats, and is reckoned one of the healthiest stations in Bengal.

Dacca is comparatively modern: it is not mentioned by Abul Fazel. From 1608 to 1639 it was the metropolis of Bengal, and again attained to that dignity in 1657, the commencement of the æra of its greatest splendour, when, judging from

its ruins, it must have vied in extent and wealth with the largest cities of India. Its decline began with the disorders consequent to the invasions of Nadir Shah.

DACCA, and DACCA JELALPORE, two districts of Hindostan, prov. Bengal, chiefly between lat. 23° and 24° N., and long. 89° 30′ and 91° E.; having N. the distr. Mymunsing, E. Tipperah, S. Backergunge, and W. Jessore and Rajishave. The area of Dacca is 1,870, and of Dacca Jelalpore 2,585 sq. m.; pop. of both districts 1,237,000 in 1860. The country is almost a dead flat, studded with lakes, and intersected by the two great rivers, Brahmaputra and Ganges. During the rainy season it exhibits the appearance of an inland sea, over which the villages, raised on artificial embankments, are scattered like so many islands. The land fertilised by such extensive inundations is extremely productive; but a large proportion of it is covered with jungle, and infested with elephants, tigers, and other wild animals, which do considerable damage to cultivation. These, however, are much less numerous now than formerly; and a great deal of the land that had been overspread with jungle has lattterly been cleared, and brought into cultivation. The banks of the Comercolly river, one of the arms of the Ganges, are populous and well cultivated, producing rice, sugar, cotton, and indigo: a species of cotton called banga, though not of a superior quality, very well adapted for the fine striped muslins, for which this prov. was long famous, used to be grown in large quantities. The land is subdivided into extremely small estates, and the constant shifting of the river-courses alters their extent and boundaries so much, that the assessment and collection of the revenue have always been matters of much difficulty. Dimities, cloths resembling diaper, and damask linen, are now the chief manufactures. About half the pop. are Hindoos, and half Mohammedans. Slavery is pretty prevalent. These districts had formerly an unenviable notoriety, from the number and enormity of the crimes committed in them, but in this respect they have lately very much improved. There are numerous Hindoo schools, for instruction in the Bengalee language, religion, and laws. Chief towns, Dacca, Narraingunge, Soonergong, and Rajanagur.

DAHOMEY, a country of Africa, on the Guinea coast, of which the boundaries are far from being well defined, but which is supposed to extend between about 6° and 8° or 9° N. lat., and from 1° to perhaps 3° E., long., having W. Ashantee, E. Yarriba and Benin, and S. the Atlantic Ocean. As far as has been hitherto discovered, this country is destitute of any considerable hills, and consists of an immense plain rising gradually from the sea to the Kong Mountains, which are here from 150 to 200 m. inland. The Volta and Loka rivers bound it on the W., but excepting these, there seems to be no stream of any considerable importance. The country is, however, well watered, and interspersed with small marshes. The soil is wholly alluvial; not a stone is to be met with; the surface is covered with a vegetation of unbounded luxuriance; and the beauty and excellence of the country are spoken of in terms of the highest admiration. (See the statements of Bosman and Phillips, in the Histoire Générale des Voyages, iv. 274, &c.) Oranges, limes, guavas, and other tropical fruits, melons, pine-apples, and yams, grow wild; and maize, millet, and other grains, potatoes, indigo, cotton, sugar, tobacco, and spices are successfully cultivated. In some parts the country is covered with dense forests, the retreat of lions, hyenas, leopards, elephants, and overgrown serpents. Deer and domestic animals are plentiful. Previously to the early part of last century this country was divided into a number of petty states, and is represented as having been populous and well cultivated. The Dahomans, by whom it was overrun and laid waste, came from the interior of the Continent. They are said to be hospitable to strangers, brave and resolute; and these, if they exist, would appear to make up the whole amount of their good qualities. Their disposition seems, from their conduct, to be a compound of that of the tiger and the spaniel, exhibiting the utmost ferocity and thirst for blood with the most abject servility. All the most arbitrary forms of eastern despotism seem to be mild and free, when compared with that established in this wretched country. It is singular, too, that this despotism is not founded upon force and terror, nor is it connected with anything timid or effeminate in the character of the people. It rests on a blind and idolatrous veneration for the person of the sovereign, as for that of a superior being. He is the absolute master of the lives and properties of his subjects, and disposes of them at pleasure. It is a crime in the latter to suppose that the king eats, drinks, sleeps, or performs any of the functions of an ordinary mortal. A sovereign of the name of Bossa having succeeded to the throne, caused all the persons of the same name in his dominions to be put to death, conceiving it to be an unpardonable presumption that any subject should bear the same name with his master. The greatest lords can only approach the king lying flat on their faces, and rolling their heads in the dust. The attempts thus made to inspire the people with reverence for their monarch, seem to have been completely successful. The Dahoman rushes to battle in obedience to the orders of his king with a blind, unthinking, brute confidence. Norris having asked a Dahoman before battle if he did not think the enemy too numerous: the latter replied, 'I think of my king, and then I dare engage five of the enemy myself.' He declared his indifference whether he survived or not; adding, 'It is not material; my head belongs to the king, not to myself; if he pleases to send for it I am ready to resign it; or if it is shot through in battle, it is no difference to me, I am satisfied.' It is not surprising, therefore, to learn that human skulls form the favourite ornament in the construction of the palaces and temples. The king's sleeping chamber has the floor paved with the skulls, and the roof ornamented with the jaw-bones of chiefs whom he has overcome in battle. Every year a grand festival is held, which lasts for several weeks, and during which the king waters the graves of his ancestors with the blood of hosts of human victims. The bodies of those unhappy men are not even interred, but are suspended by the feet to the walls, and left hanging till they putrefy. The ceremony is known as the 'grand custom.'

Perhaps the most extraordinary fact connected with this barbarous horde is, that all the women are monopolised by the sovereign; and that no individual can possess himself of either a wife or a concubine except by gift of, or purchase from, the king; and whether the lady be young or old, handsome or the reverse, she must be equally acceptable to the slave to whom she is given or sold. The king keeps a vast seraglio for himself: and at his death his wives and concubines fall to murdering each other, till the carnage be stopped by the interference of the new king. After these statements, it will only appear consistent and natural that the *tiger* should be the principal *fetiche*, or object of worship, among the Dahomans.

Late reports state that, despite their ferocity, this most detestable of barbarian hordes has been checked in its devastating course. A number of the petty states it had subdued have emancipated themselves; and it appears probable that the sovereign of Dahomey is now tributary to the sovereign of Yarriba. Next to Abomey, the cap. and residence of the king, about 80 m. inland, Whydah, Ardrah, Aoona, and Calmina, are the chief towns or villages. (For further accounts of Dahomey, many of them greatly contradictory, see F. E. Forbes, 'Dahomey and the Dahomans, being the Journals of Two Missions to the King of Dahomey in the Years 1849–50,' 2 vols. Lond. 1851; T. H. Freeman, 'Journal of various Visits to the Kingdoms of Ashanti, Aku, and Dahomey,' Lond. 1841; Mollien, G., 'Voyage dans l'Intérieur de l'Afrique,' Paris 1820; Leod, J. M., 'Voyage to Africa, with some Account of the Manners and Customs of the Dahomian People,' Lond. 1820; and Dalzel, A., 'History of Dahomey,' Lond. 1795. Some of the more recent books about Dahomey are chiefly compilations from these older works, spiced with a good deal of romance.)

DALECARLIA, a prov. of Sweden, which see.

DALKEITH, a bor. of barony and market-town of Scotland, co. Mid-Lothian, on the road from Edinburgh to Coldstream, 5½ m. SE. Edinburgh, on the Edinburgh and Hawick railway. Pop. 3,159 in 1861. The town is situated on a peninsular neck of land between the N. and S. Esks, which unite about a mile E., and fall into the Frith of Forth at Musselburgh. It is a clean, well-built town; the principal street, which is wide and handsome, runs from E. to W., and there are several subordinate streets. Its public buildings are,—a parish church (an old Gothic edifice, used as a collegiate church before the Reformation), three chapels belonging to Presbyterian dissenters, and one belonging to the Independents, A new parish church was erected in 1839. Dalkeith has long been eminent for its educational institutions, particularly its classical school. This town, like other burghs of barony, was originally under the exclusive management of the baron or superior and his bailie; but, in 1759, an act of parliament was obtained, appointing certain trustees to superintend the paving, cleaning, and lighting the streets, to supply the burgh with water, and to provide a revenue for these purposes by imposing a small tax on the ale, porter, and beer consumed in the parish. Dalkeith is chiefly celebrated for its grain market, which is held every Thursday, and is reckoned the largest market of the kind in Scotland. The Dalkeith and Edinburgh railroad, which connects these towns, was commenced as early as 1827, and opened for goods and passengers in 1831. The Duke of Buccleuch at his own expense, brought the Dalkeith line into the centre of the burgh, prolonging it, by a viaduct over the N. Esk, so as to communicate with coal mines in that quarter. Coal abounds throughout the whole neighbourhood of Dalkeith. Dalkeith Palace, the principal residence of the Duke of Buccleuch in Scotland, is within 300 yards of the E. termination of the town. This palace, which formerly belonged to the Douglasses earls of Morton, was acquired, in 1642, by the family of Buccleuch, who still retain it, and are superiors of the burgh. Anne, heiress of Buccleuch, was married to the Duke of Monmouth, a natural son of Charles II., beheaded for rebellion in 1685. George IV., on his visit to Scotland in 1822, resided in Dalkeith House. The parliamentary electors of the burgh unite with the county constituency in returning a member to the H. of C.

DALMATIA (an. part of *Illyricum*), a marit. country of Europe, being the most S. prov. of the Austrian empire, comprising a long and narrow territory lying along the NE. shore of the Adriatic, and numerous islands in that sea, between lat. 42° 8′ and 44° 55′ N., and long. 14° 30′ and 19′ E., having N. Hungarian Croatia; E. Turkish Croatia, Herzegovina, and Montenegro; and S. and W. the Adriatic: length of the continental portion, NW. to SE., 240 m.: breadth greatest towards the N., where it averages nearly 40 m.; but it tapers thence gradually to its S. extremity, and in its lower half is never more than 15 m. in width. Area 220 Austrian, or about 5,800 Engl. sq. miles. Pop. 404,499 in 1857. Dalmatia is generally mountainous. The Dinaric Alps bound it on the E., and the whole country is intersected in a direction parallel to the coast by some of their subordinate ranges, the highest point of which, Mount Biocova, near lat. 43° 30′, is 4,856 ft. in elevation. Here, as elsewhere, the Dinaric Alps are chiefly of calcareous formation, and full of clefts and ravines; they are rugged, and often destitute of soil, in consequence of which the country has in most parts a sterile and desolate aspect. Narrow valleys are abundant, but plains of any extent few. There are numerous small lakes, and one of a tolerable size, near Zará; but, generally speaking, Dalmatia is ill watered. The principal river, the Narenta, in the S., has not a course of more than 15 m. in the Austrian territory; the other chief rivers are, the Zermagna, Kerka, and Cettina, but none is of any great size. The Cettina is remarkable for a fine cascade, 170 ft. in altitude. The coast is indented with numerous harbours, of which those of Cattaro, Sebenico, and Ragusa are the best; it has also numerous headlands, and is fenced by a great number of elongated islands, lying in a direction parallel to the shore. The principal are, Arbe, Pago, Jsola Grossa, Brazza, Lesina, Curzola, Lissa, Meleda, &c.; they are mountainous, and present the same general aspect as Continental Dalmatia. The climate is warmer than in any other part of the Austrian dominions. In the S. the date-palm flourishes in the open air, and the olive grows in the lowlands everywhere throughout the country. Frost and snow are almost unknown in the plains and valleys, and are of very short duration in the mountains: the mean temp. of the year at Ragusa is 57° 3′ Fahrenheit. The winter is limited to six weeks of pretty constant rain; yet, on the whole, less rain falls in Dalmatia than in any other prov. of the empire, and the country often suffers from excess of drought. Except in the marshy tracts along the shore, the air is pure and salubrious. The arable land of Dalmatia is not more than 24·4 Austr. sq. miles in extent, or 11 per cent. of the whole area. (Arenstein, Dr. Jos., Oesterreich in der Weltausstellung, Vienna, 1862.) Agriculture is in every respect extremely backward. Maize and barley are the principal kinds of grain cultivated; but not two-thirds of the corn necessary for home consumption is grown: the rest of the quantity required comes mostly from Turkey and Hungary. The Dalmatian wines are strong and deep-coloured, but are apt to acquire a taste from the leathern flasks in which they are kept. They, however, bear transport well, and considerable quantities are sent to Fiume, Trieste, and Venice. The total quantity produced annually is officially estimated at 8,328,000 gallons. Fruits are abundant and excellent. Figs may be considered the chief staple of Dalmatia; they grow without culture all along the coast, but the best are those of Lesina. During their period of maturity, figs make a large part of the food of the village pop., and about 845,000 *libbre* are annually

exported. The climate is highly suitable for the olive, and the oil is better than that produced in most parts of Italy. Nearly 17,000 cwt. are annually obtained. Cattle breeding is pursued to a great extent, but the breeds are mostly inferior. According to an official return published in 1863, there were in Dalmatia, at that period, 22,006 horses; 114,775 cattle; 815,632 sheep; 424,087 goats; and 42,218 swine. The wolf, wild dog, fox, and lynx are amongst the wild animals; game (excepting deer) abounds, as do waterfowl and birds of prey. The anchovy and tunny fisheries are important, though not so much so as during the last century; they furnish employment to about 8,000 inhab. Dried and salted fish form an important article of commerce. There are some coral fisheries, of which that near Sebenico is the chief. The fish caught in the lakes, &c. form a chief part of the subsistence of many of the inhab. Excellent timber for ship-building and other purposes abounds in the interior; but is next to useless from the absolute want of roads, canals, or navigable rivers, to convey it to the sea. The large forests which formerly existed on the coast have been cut down, and that part of the country is now almost bare of wood. The attention of the Austrian government is now, however, directed to the forest economy of the prov., in the view of supplying the dockyards at Fiume and Venice with Dalmatian timber. Coal is found in several parts, and considerable quantities are exported to Trieste. Ship-building, and the distillation of *maraschino* and *rosoglio*, are the chief branches of manufacturing industry. Maraschino is extensively consumed at Vienna, and it is well known in this and most other countries. Besides these, a few articles of primary necessity only are manufactured; for all others, the inhab. are obliged to have recourse to the neighbouring countries. This prov. enjoys the important advantage of being placed without the Austrian customs line, the duty on foreign goods imported being only 3½ per cent. *ad valorem*. But the strictness with which quarantine regulations are enforced have gone far to nullify the important benefits that would otherwise have resulted from this valuable privilege. The Dalmatians are amongst the best sailors of the Adriatic. There entered the port of Zara, in 1863, 1,636 vessels, of a burthen of 89,352 tons, while at the next important port, Spalatro, there entered 2,504 vessels, of 75,347 tons burthen. The province is divided into four circles, named after their respective capitals, Zara, Spalatro, Ragusa, and Cattaro: the last two circles are separated from the rest of Dalmatia, and from each other, by two narrow slips of land belonging to Turkey, which stretch down to the sea coast. The other chief towns are Sebenico, Trau, and Macarsca. Zara is the cap., and seat of the governor and council of the prov.

The inhab. of Dalmatia are Slavonians of the same race with the Croatians, Servians, and Bosnians. The names of the rivers and mountains are all Slavonic. The vicinity of, and constant intercourse with, the Italian harbours, has however introduced the use of the Italian language amongst the commercial part of the inhab., as German is the principal tongue heard amongst the civil and military official circles. Some descendants of Hungarian families are found amongst the nobility of the N. circles, and the Jews, who are not very numerous, are said to descend from the exiles of that nation driven from Spain in 1502. Near Verlika and in other parts, *zinzari*, or gipsies, are found. Even amongst the Slavonic inhabitants different tribes are distinguishable. The most backward, in point of civilisation, are the Morlacchi, the mountaineers of the circles of Zara and Spalatro. They are addicted to a nomadic life, and wander about as shepherds, sleeping in summer in the open air. The comforts of the agriculturist and fishermen are few, as is usually the case in warm climates: their houses are small and badly built, and furniture is mostly dispensed with. Fish and vegetables are the chief articles of nourishment, and both are abundant. The dress of the inhab. of the coast consists in blue tight pantaloons, a blue waistcoat, and in winter a spencer, with a coarse brown cloak shaped like that of the Italian boatmen. The mountaineers wear a linen dress in summer, and in winter throw their sheep-skins about their shoulders, which are proof against all the vicissitudes of the weather. The inhab. are generally active, courageous, and of quick perception; but, until they came under the Austrian sceptre, were not only neglected, but living on terms of constant warfare with their Mussulman neighbours, from which state of things the recent border feuds are an inheritance. The large knife and pistols which the Morlacchi still wear in their girdles, and the gun which the shepherd slings over his shoulder from custom, remind the stranger no less strongly than the shaven heads of some of the mountaineers, of the affinity, in descent and in manners, existing between the Slavonic tribes that inhabit both sides of the mountains. The inhab. are Rom. Cath., except about one-fifth part who belong to the Greek church, and a few Jews and gipsies.

Dalmatia, like the other provs. of the Austrian empire, has a provincial diet or representative assembly, instituted by imperial diploma of Oct. 20, 1860, followed by the 'Patent' of Feb. 26, 1861. (See AUSTRIA.) Besides, certain of its towns and some districts, especially that of Poglizza near Spalatro, retain their own jurisdiction, and the same privileges they possessed before their union with Austria. The highest authority in Dalmatia is the governor, who resides at Zara, the seat of the *Gubernium*. In this city the court of appeals and the highest criminal court are established, with dependent courts in the four circle towns, Zara, Spalatro, Ragusa, and Cattaro. Each circle has several districts, the chief magistrate in which is named prætor, and takes cognisance of judicial and police affairs, besides directing the rural economy of the district. The districts divide into greater and lesser parishes or *communes* under headboroughs (*Capi villa* and *Podesta*), who receive no salary, but are exempted from taxation, as are also the *Sardari* a description of *gens-d'armes*, formed by the government out of the peasantry. The guarding of the frontiers towards Turkey is an important charge in Dalmatia, and a strict watch is also kept along the coast. For purposes of trade, 6 bazaars or markets are held on the frontier, and 7 rastells, or parlatoria, at intervening stations. Lazarets are established at Zara, Spalatro, Ragusa, and Castelmono.

Dalmatia formed, from the commencement of the 12th century down to 1419, a portion of the kingdom of Hungary: at the last-named epoch it passed under the sway of the Venetians, who had made themselves masters of Ragusa nearly 100 years previously. During the 16th and 17th centuries this country was the constant seat of wars between the Venetians and Turks, until it was finally conquered by the latter, who held it till 1797, when it was ceded to Austria. In 1805, Austria gave up Dalmatia to the French, who incorporated it into the kingdom of Italy. Napoleon I. made it a duchy, and conferred the title of duke of Dalmatia on Marshal Soult. On the downfall of Napoleon it reverted to Austria.

DAMASCUS (called by the natives *Es-Sham* an. *Dimeshk*, Heb. *Damasck*, Greek Δαμασκός), a city of Syria, cap. of an important pachalic of the same name, and the virtual metropolis of Syria, in a plain at the E. foot of the Anti-Libanus, about 180 m. S. by W. Aleppo; lat. 33° 27′ N., long. 36° 25′ E. Pop. from 120,000 to 150,000, of whom 12,000 are Christians, and as many Jews. A splendid mosque of great antiquity, the construction of which is disputed by Christians and Mussulmans, is the chief architectural ornament. The form of the building (a cross), with a similarity in arrangement to the sacred edifices of Italy, seems to evince its Christian origin, while the abundance of Saracenic ornaments prove that the Arabs, if not its founders, have contributed extensively to its decoration. It is 650 ft. in length, by 150 in width; a fountain plays in the midst of a magnificent court, and the pillars and other ornaments are superb. A skull, said to be that of the Baptist, and his sepulchre, give such sanctity to this mosque, that it is death for even a Mohammedan to enter the room where the relics are kept. A Christian was formerly liable to the bastinado for merely looking into the court; and the western world is indebted for its knowledge of the interior of the building to the works of Ali Bey and Buckingham, who, in their character of Mussulmans, were allowed to inspect what no *known* Christian is permitted to approach. There are many other mosques. According to Ali Bey (ii. 266) and Addison (ii. 151), they are unworthy of notice; but Robinson (ii. 224) says they are only less splendid than those of Constantinople. The bazaars are extremely numerous, and well supplied with merchandise: but the private residences of the gentry are, after all, the most striking objects to a stranger, not for their exterior appearance, which presents nothing but a gloomy wall of mud, or sun-dried bricks, but for the combination of convenience, magnificence, and taste, which mark the interior arrangements, and realise all that can be imagined of eastern splendour. 200,000 piastres (2,000*l.*) is sometimes expended on the fittings up of a single apartment. There are 31 khans, or establishments for the reception of merchandise, and that of Hussein Pacha, built of alternate layers of black and white marble, with its fountain, arcades, and corridors, is a very beautiful and imposing object. A mosque of dancing dervishes deserves notice, less as one of the principal edifices of the town, than from the singular contrast in the occupations of its inmates, who, every Friday (the Mohammedan Sunday), pirouette and twirl themselves about from morning till night, while, during the other six days, they are industrious silk weavers. There are also Greek, Maronite, Syrian, and Armenian churches, 3 convents of Franciscan monks, and 8 Jewish synagogues. Hospitals numerous; the principal, in which great numbers of sick and lame poor are lodged and fed gratuitously, is a fine building, with a mosque belonging to it. There are about 20 large schools for children, a great number of smaller ones, besides which public lectures are given daily in the great mosque, and in some others, but education is confined to the religion and laws of Mohammed. The *serai*, or palace of the pacha, is a large fortified building in the centre of the city. The latter is surrounded by walls and towers, but they are in a half ruinous state, and pressed upon by extensive suburbs on every side.

Damascus is essentially a commercial town; some hundred merchants are permanently settled in it; and there are great numbers of tanners, painters, printers, dyers of various stuffs, silk-winders, dealers in damask cloth, grocers, saddlers, tent-sellers, coppersmiths, ironmongers, farriers, furriers, bakers, millers, and other artisans and traders. There are also a certain number of armourers, and though the ancient celebrity of Damascus sabres has very much declined, they still bear a good name. Saddlery, cabinet-work, jewellery, and silk, are now the staple manufactures. Foreign trade is carried on, by the great Mecca caravan, which, in peaceable times, departs once a year; the Bagdad caravan, which usually performs two or three journeys a year; the Aleppo caravan, two or three times a month; and by several small caravans to Beirout, Tripoli, Acre, &c., which arrive and depart daily. Beirout is reckoned the port of Damascus. This city is watered by two rivers, the Barrada and Fichee, which, after uniting, divide again into seven branches, again reunite, and finally deposit their waters in a lake (Lake of the Meadow), which has no outlet. This abundant supply and natural diffusion of water has rendered the neighbourhood of Damascus very fertile. The inhabitants do not remember a year of scarcity; wheat, barley, hemp, with every kind and variety of fruit, are produced in almost unlimited abundance, and the gardens, or enclosures, form a forest of trees, and a labyrinth of hedges, walls, and ditches, of more than 21 m. in circ. The natives speak with delight of the beauty of their home, especially as seen from the hills behind Salahieh, a large village on the N.; but, according to Dr. Richardson (ii. 481), the scenery is inferior to that seen from the summits of Highgate, Hampstead, and Richmond hills. The climate of Damascus is mild; the summits of the Anti-Libanus are covered with perpetual snow, which sometimes falls in the city. The people are said to enjoy good health, but blindness is frightfully prevalent, and leprosy, fever, and dropsy, are common. The plague, however, is almost unknown, and the ordinary duration of life is said to be from seventy to eighty years, but that, no doubt, is exaggerated.

Damascus is very ancient: it is mentioned in Gen. xiv. 15, as existing 1913 years B.C., and was then, as subsequently, probably the capital of an independent Syrian kingdom. It was subdued by David (2 Sam. viii. 6), but recovered its independence, if not earlier, at least during the reign of Solomon. (1 Kings xi. 24.) It then became the capital of the kingdom of Ben-hadad and his successors (1 Kings xv. 18), and remained so till its subjugation by Tiglath-Pileser, about 742 B.C., a little before the downfall of its rival Samaria. (2 Kings xvi. 9.) From this time it followed the fortunes of the rest of Syria, falling successively under the power of the Persians, Greeks, and Romans. As a Roman city it attained great eminence, and figures very conspicuously in the history of the apostle Paul. (Acts ix.)

Damascus was taken by the Saracens in 632, after a siege of seven months, and was for many years the cap. of the khalifate. It was unsuccessfully besieged by the Crusaders in 1148, captured by Timour Bec or Tamerlane in 1400, and destroyed by an accidental fire in the following year. In 1516 it fell into the hands of the Turks, who retained it till 1832, when it was captured by Ibrahim Pacha of Egypt.

Damascus is remarkable as being the only city of the East which has not dwindled from its former greatness. Its pop. seems to be as great now as ever; while Babylon, Nineveh, and Palmyra have wholly vanished, and Antioch and Aleppo are but the shadows of their ancient glory.

Damascus is one of the sacred cities of the Mohammedans, and its inhab. had formerly the character of being the most intolerant and fanatical of all the prophet's followers. Till within the last

thirty years, the appearance of a Frank costume was the signal for a riot. Christians and Jews were alike prohibited from riding any beast but an ass (in 1807 even this was forbidden); and the appointment of an English consul in 1831 caused an insurrection, which lasted several months. The conquests of Ibrahim Pacha, however, produced a great change, if not in the feelings of the people, at least in their mode of exhibiting them. Christians of all sects and Jews now walk in procession, openly rejoicing in the avowed protection of the present government, exposed only to the impotent threats of those who, retaining the will, have lost the power to annoy them. In spite, however, of their general intolerance, most travellers bear honourable testimony to the hospitality of the Damascenes. (For further accounts of Damascus, see William of Tyre; Adrichomius, Ter. Sanc.; Abul-Feda, Tab. Syr.; Maundrell, and Volney.)

DAMAUN, a marit. town of Hindostan, prov. Gujerat, belonging to the Portuguese, 82 m. N. Bombay, and 45 m. SSW. Surat; lat. 20° 25′ N., long. 72° 58′ E. Pop. estimated at 7,000. The town stands on the banks of a small river, which in spring tides, during the SW. monsoon, has from 18 to 20 ft. water. The buildings are mostly whitened, and give it a handsome appearance from the sea: its walls are incapable of defence, and its streets narrow and dirty. It contains several churches and convents, and a Parsee temple, in which it is affirmed a sacred flame brought from Persia has been kept up for 1,200 years. It has a roadstead, where vessels lie 3 m. off shore in 8 fathoms water. Damaun is most celebrated for its docks and ship-building: its ships wear well, and sail well before the wind, but some time since they were too short for their breadth, so that they laboured in a head sea. Damaun was taken by the Portuguese in 1531, and has belonged to them ever since.

DAMAUN, a large distr. of Affghanistan, now subordinate to the Maharajah of the Punjab, but formerly belonging to Caubul; between lat. 31° and 34° N., and long. 69° 30′ and 72° E., bounded S. by Sungur, in Sinde, W. by the Solimaun Mountains, N. by the salt range diverging from the latter, and E. by the Indus. Along the banks of the latter the country is a plain bare of grass, the soil apparently composed of the slime deposited by the river, by which it is regularly inundated; in the S. parts, especially, a good deal of this flat ground is overspread with low, thick tamarisk jungles, abounding in wild boars, hog, deer, and game of all sorts. Round the villages large woods of date trees are often seen, but no other trees of any size: where there is cultivation the country is rich, but by far the greater part of it is waste. The central parts are composed of arid sandy plains, divided by hill-ranges, and depending entirely upon rain for cultivation: the more uneven country skirting the W. mountains is more fertile, and produces wheat, bajree, jowaree, and other Indian grains. The winter in Damaun is cooler than in Hindostan, but the heat of summer is extreme. This distr. is inhabited by various turbulent clans, principally Juts and Beloochees, living in perpetual contention with each other, and who, having been at a distance from the seat of government, had never rendered much more than a nominal obedience to the Caubul sovereign. Some of the Damaun tribes are nomadic, others fixed agriculturists, and many are shepherds, the country in many parts yielding good pasture land.

DAMIETTA, a town of Lower Egypt, the third in rank, pop., and importance in the country, on the E. bank of the branch of the Nile bearing its name, 6 m. S. from its mouth (the anc. *Phatniticum Ostium*), 80 m. E. Rosetta, and 97 m. NNE. Cairo. Lat. 31° 25′ 43″ N., long. 31° 49′ 30″ E. Pop. estimated at 30,000; but this is probably much overrated. The inhab. are principally natives of Egypt, with a few Syrians and Levant Greeks. A bend in the river gives to the town a somewhat crescent shape. It is irregularly and ill built; though there are some good mosques, several bazaars, and some marble baths. Some of the better sort of houses, which are of brick, have terraces and pavilions; and such as are near the Nile, have little ports, whence to embark on the water; but there are no open spaces, nor buildings, worthy of much notice, and, generally speaking, it is but a collection of miserable mud hovels. There is a school for infantry officers, with 400 pupils; as well as an extensive collection of buildings for drying, husking, and cleaning rice, some mills, and a cotton factory. The latter supplies a great deal of coarse cotton cloth, which forms the wear of the labouring classes. The bar at the mouth of this branch of the Nile prevents the access of any large vessels to the town; so that merchant ships have to lie outside the bar, and load and unload by means of small Greek craft, Egyptian *djerms*, and other vessels of from 30 to 60 tons burthen. But, despite these difficulties, Damietta has a considerable trade. Its chief article of export is the rice grown in its neighbourhood, which is the best in Egypt. Dried fish of the Lake Menzaleh, dates from the numerous plantations round the town, with coffee, beans, and linen, are the other principal articles of export. Most European nations have vice-consuls here. It has a governor, and a municipal administration similar to that of Cairo and Alexandria.

DANTZIC (Germ. *Danzig*; Pol. *Gdansk*), an important commercial city, sea-port, and stronghold of the Prussian states, prov. Prussia Proper, cap. reg. and circ. of same name, on the left bank of the Vistula, about 3 m. from its mouth on a branch of the railway from Berlin to Königsberg. Pop. 82,765 in 1861, excl. garrison of 10,485. The city is traversed by the small rivers Motlau and Rodaune, and is very strongly fortified. It is ill built, and the streets are narrow, irregular, and gloomy. The cathedral church of St. Mary is the principal public building; it was finished in 1503, and has a fine brass font and a magnificent picture of the last judgment. The town-house, arsenal, and the *Arthushof* or exchange, also deserve notice. There are 16 Lutheran churches and chapels, 4 Catholic churches, and a chapel, 2 synagogues, and an English church, with several monasteries and convents. The town has also a gymnasium, two grammar-schools, and many inferior schools, with schools of navigation, midwifery, and commerce; a school of arts and trades, a good public library, an observatory, a museum, a society of natural philosophy, an orphan and foundling hospital, a large workhouse, and various hospitals.

Dantzic is the seat of the provincial authorities, of a court of appeal for the circle, a council of admiralty, and a tribunal of commerce. It has a vast number of distilleries and breweries, the latter of which produce the black-beer in such general demand; it has also large establishments for grinding flour, with dye-works, sugar-refineries, and manufactures of fire-arms, tobacco, silks, vitriol, &c., and some jewellery business. The harbour, called *Neufahrwasser*, is at the mouth of the river; but vessels drawing 8 or 9 ft. come up to the city. Being the emporium of the extensive and fruitful countries traversed by the Vistula and its affluents, Dantzic has a very extensive commerce; and is, after Odessa, at the head of all the corn-shipping ports, not of Europe only, but of the world. Wheat forms the principal article of export; it is of the

best quality, and very large quantities are exported, as many as 500,000 quarters having been shipped in a single year. There is also a large exportation of flour, rye, barley, pease, and oats, with timber inferior only to that of Memel, linseed and rape-seed, staves, pearl ashes, bones, zinc, flax and hemp, linens, feathers, beer and spirits. The subjoined table—compiled from the official report of Mr. Lowther, H. M.'s secretary of embassy, dated Berlin, July 28, 1864—shows the exports of Dantzig during the year 1863, the first column giving the total exports, and the second the exports to the United Kingdom :—

Soda	,,	21,864	—
Coal	,,	188,517	14,012

The principal articles of import consist of woollens, cottons, and other manufactured goods, colonial produce, dye-stuffs, wine, oil, spice, fruit, salt, and coals. The importation of the last-named article from Great Britain is increasing from year to year. In 1863, the imports of coal from this country amounted to 2,185,848 centner, or about 110,000 tons.

The harbour accommodation of Dantzig is very good. The usual depth of water at the river's mouth is from 13 to 14 ft.; but in the roads, which are protected by the long, low, narrow tongue of land called the Heel, there is good anchorage for ships of any burden. The greater part of the trade of Dantzic is in the hands of foreigners, particularly English. The granaries for storing the corn brought down the Vistula are generally seven stories high; and these, with the warehouses for linens, ashes, hemp, &c., are all situated on a small island surrounded by the Motlau.

Dantzic was founded in the 10th century. It was occupied by the knights of the Teutonic order in 1310, and was held by them till 1454, when it emancipated itself from their yoke, and became a free independent state, under the protection of Poland. For a lengthened period Dantzic was a principal member of the Hanseatic Confederacy, and had under it several other cities. During its independence, the citizens were engaged in frequent contests with the Poles, Swedes, and Russians; and notwithstanding the protection of England, Holland, and Prussia, Peter the Great exacted from them considerable contributions. The pretension of Dantzic to the exclusive navigation of the Vistula, or to demand a toll from such ships as passed in and out of the river, was at all times submitted to with reluctance. After the first partition of Poland in 1771, Frederick the Great, having acquired a large accession of territory on the Vistula, approaching almost to the gates of Dantzic, claimed for his subjects the right of free navigation on the river. This having been refused by the citizens, gave rise to some acts of hostility, and to lengthened negotiations. These, however, were cut short in 1793 by the second partition of Poland, when Dantzic was assigned to Prussia. During the invasion of France, the city was occupied for several years by a French garrison and suffered much from the hostilities and exactions to which she was exposed; but since the peace of 1815 she has recovered much of her ancient prosperity. The fortifications have been also greatly strengthened and improved, and magnificent works have been constructed, by which the whole adjacent territory may be laid under water.

During the independence of Dantzic, there were attached to it the *Werder*, an alluvial island formed by the Vistula and the Motlau, and the *Frische Nahrung*, a long narrow tongue of land between the Frische Haff and the sea. The former is very fertile, but the latter consists principally of sand.

DANUBE (an. *Danubius*, and in the lower part of its course *Ister*, Germ. *Donau*, Hung. *Duna*), a celebrated river of Central and SE. Europe, being, though inferior in point of size to the Wolga, in every other respect the first among European rivers. Its general course is from W. to E.; it extends between long. 8° 10′ and 29° 40′ E., its extreme N. point of lat. being 49° 2′, and its extreme S. point 43° 38′ N. Its total course from its source to its mouths, on the W. shore of the Black Sea, is from 1,750 to 1,800 m.; during which it passes through the territories of Baden, Wirtemberg, Bavaria, and the Austrian empire, and divides Turkey from Wallachia, Moldavia, and Russia. It receives above 30 navigable and a vast number of inferior tributaries, the principal being the Isar, Inn, Drave, Save, Theiss, Morava, Sereth, and Pruth. The cities of Ulm, Ratisbon, Passau, Linz, Vienna, Presburg, Comorn, Gran, Waitzen, Buda, Pesth, Peterwardein, Neusatz, Semlin, Belgrade, Semendria, Widin, Nicopoli, Sistow, Rustchuk, Silistria, Brahilov, and Galacz, are situated upon its banks.

The basin of the Danube and its tributaries has been estimated to comprise about 1-13th part of the entire surface of Europe. It is bounded S. by the Alps and the Balkhan; and on the N. at first by the Black Forest and some minor Alpine ranges, and afterwards by the Bohemian Forest and Carpathian Mountains. It includes the plains of Bavaria, Hungary, and Turkey in Europe; and the course of the Danube has been generally considered under three grand divisions, each embracing one of these plains. As this division is not only natural but convenient, we shall adhere to it in the following statements.

The Danube originates in two streams, the Bregach and the Bregé, which have their sources on the E. declivity of the Black Forest, in the grand duchy of Baden, in about 48° 10′ N. lat., and 8° 15′ E. long. These streams having united at Donaueschingen, where they are augmented by a spring sometimes regarded as the head of the river, the united stream takes the name of the Danube. It thence proceeds at first SE., but afterwards in a NE. direction as far as Ratisbon, near which city it attains its extreme N. lat. It then runs again in a SE. direction to about long. 15°, and from that point mostly E. to Vienna, where the first division of its course may be said to terminate. Within this division it receives on the right hand the streams of the Iller, Gunz, Mindel, Lech, Isar, Inn, Traun, Ens, &c.; many of which are navigable for a considerable distance. Its affluents on the opposite side are, on the contrary,

generally small; and indeed, throughout the whole upper half of its course, the principal tributaries of the Danube (excepting the Theiss) are from the S. or right side, while, in the lower division, those from the N. or left side are by far the most considerable. It receives, however, from the N. in the first division of its course, the Sulz, Altmühl, Naab, and Regen, all of which are navigable streams. At its source the Danube is 2,178 ft. above the level of the sea, and runs through an alpine country to Ulm, where its elevation is 1,532 ft. From Donauwörth to Passau it traverses the Bavarian plain; its height above the sea being at the former 1,125 ft., and at the latter 836 ft. At Passau it leaves the Bavarian dom., and thence to Vienna, intersects a second mountainous region. At Linz its elevation is 735 ft., and at Vienna 512 ft. At Ulm, the Danube first becomes navigable for flat-bottomed vessels of from 60 to 100 tons burden, though its depth there measures little more than 7 ft., and its breadth little more than 100 ft. Through the Bavarian plain its average depth is 10 ft. This increases considerably when it becomes again enclosed between the mountains at Passau; but above Vienna its navigation is rendered difficult, not only by its general shallowness, but by its rapidity, and the frequent rocks, shoals, and whirlpools in its channel.

In the second division of its course, the Danube at first runs generally E. to Presburg, next through the lesser Hungarian plain SE. to its confluence with the Raab, and then E. to Waitzen. At this point it turns S. through the great Hungarian plain, and runs parallel with the Theiss for nearly 2½° of lat. to its junction with the Drave, about lat. 45° 30′. Here it turns SE., in which general direction it continues to Orsova, where it leaves the Austriam dom.; the second division of its course terminating at the cataract or pass called the 'Iron Gate,' about 4 m. lower down. It is within this division that the Danube receives its largest and most important tributaries, including the Raab, Drave, Save, and Morava on its right, and the March, Waag, and Theiss on its left side. At Presburg, its waters are 331 ft., at Buda, 230 ft., and at Belgrade, 203 ft. above the level of the sea. From Vienna to the mouth of the Drave, the Danube runs through an expanse of plain country broken only in a few places, as at Presburg, Buda, and Waitzen. Near the latter it passes through a ravine formed in a chain of mountains, separating the two Hungarian plains. From its union with the Drave, its S. banks in Slavonia and Servia are usually mountainous, while its N. continue low and marshy as far as Moldova. Previously to its reaching Buda, it is about 700 yards wide; soon after passing that city it attains a width of upwards of 1,000 yards; and by the time it has arrived at Belgrade it is considerably more than ¾ of a mile across. (Dict. Geog.) From Vienna to Pesth, its bed is sprinkled with rocks, but they are not such impediments to navigation as in the upper portion of its course. Shifting sand banks, which prevail all down the river as far as Moldova, are greater obstacles; but when the water is tolerably high, they may generally be avoided by good pilotage. (Austria and the Austrians, i. 327.) At Gönyö, 70 m. above Pesth, the Danube first becomes navigable for vessels drawing more than from 2 to 2½ ft. water. Near Moldova, a mountain range from the Balkhan, and another from the Carpathians, begin to confine the river on either side as far as Gladova in Servia. Throughout this distance, about 80 m., it is greatly contracted in width, abounds with rapids, and is beset with rocks. Near the termination of this defile, a short distance below Orsova, is the famous pass of the 'Iron Gate' (Turk. *Demi-Kapi*), already alluded to. This is a gorge about 2,000 yards in length, enclosed on either side by a mountain of micaceous slate, a material very difficult to break or blast, through which the river rushes with great velocity, over an inclined plane, with a fall of about 15 ft. a mile. The rocks here divide it into three channels. The centre one is of considerable width, and vessels of 400 tons may pass down it, when the river is very full; the two others are but shallow; and that on the Wallachian or E. side is never used. According to Strabo (vii. 212), it was here that the *Danubius* ended, and the *Ister* commenced; but there is a great discrepancy as to this point among the ancient authorities.

In the third division of its course, the Danube runs at first generally S. by E. to Widin; thence its direction is mostly E. by S. to near Sistow, where it attains its most S. lat.; and from this point ENE. to Rassova. It then turns N. to Galacz, and finally runs from this town generally E. to its efflux in the Black Sea, about lat. 45°. As far as Galacz, it forms the boundary between Turkey and Wallachia and Moldavia; and between Galacz and the sea it is the boundary between Russia and Turkey, its principal N. and central mouths being included within the Russian territory. While the Danube is running S. by E., its right bank is mountainous, but the elevated lands soon afterwards recede from its banks, and throughout the rest of its course the river flows through a low plain, which E. of Silistria becomes marshy. In this division it receives on its left side the Schyl, Aluta, Vode, Argis, Jalomnitza, Sereth, and Pruth. Its affluents on the opposite side are much less considerable; the principal are the Isker, Osma, Taban, &c. In its progress through Turkey, the Danube varies in breadth from 1,400 to 2,100 yards; and its average depth is upwards of 20 ft. Ships of large size ascend as far as Silistria. About 50 m. from the Black Sea, it divides into three principal arms, besides giving origin to a considerable lake (Rassein) on its S. side, from which several minor arms proceed. The delta of the Danube is a vast swampy flat, interspersed with lagoons covered with bulrushes, the resort of vast flocks of water fowl. The N. principal arm of the river (*Kilia*) and the S. (*Edrillis*), which forms the boundary between the Russian and Turkish dominions, are shallow and of little value; but the middle one (*Sulineh*) has from 10 to 12 ft. water over the bar at its mouth. This is said, however, to be gradually filling up from the deposit of mud brought down by the river, which the current has not sufficient strength to clear away, its fall and rapidity being very much diminished during the last 200 m. of its course.

Were it not for the rapids between Moldova and Gladova, the Danube would be at all times navigable from Ulm to its mouth. Great efforts have been made at various periods to overcome this interruption. The Roman emperor Trajan constructed, with great labour and sagacity, a road along the edge of the Servian side of the river, to facilitate the towing of ships against the current. Some remains of this extraordinary work still exist, with part of an inscription in honour of Trajan. In more recent times, attempts have been made to deepen the channel of the river, and to cut lateral canals in the most dangerous places; but these, owing to the almost insuperable obstacles to be overcome, have had but little success. Looking at the map, the best way would appear to be to cut a navigable canal from opposite Moldova to Berza Palanka, below the 'Iron Gate,' which would not only avoid the

rapids, but shorten the distance, by avoiding the great bend of the river by Orsova. But the nature of the ground is said to oppose insurmountable obstacles to such a project, though probably it would admit of the construction of a road, or, better still, a railway. The Hungarian government has constructed an excellent and very expensive road from Moldova to Orsova, along the left bank of the river. Unfortunately it terminates above the 'Iron Gate;' and passengers going down the river, unless when it is sufficiently high to admit of flat-bottomed boats going through the 'gate,' have to be ferried over to the Servian side of the river, where, after a land journey of about 8 m., they re-embark. Those ascending the river have also to cross at Orsova.

The Danube abounds with islands. They are especially numerous and large in the middle part of its course. The Great Schütt island extends between two arms of the river, from Presburg to Comorn, a distance of 64 m. The Czepel and Marguta islands, below Buda, formed in a similar way, are also of considerable size. The Danube has been said to wind more than other European rivers; this is peculiarly the case in its progress S. through the great Hungarian plain. It is also one of the swiftest rivers in Europe; its rapidity is such as in some places to render any navigation against its current impossible, except by the agency of steam. According to Mr. Quin (Steam Navigation, i. 210) it rushes through the 'Iron Gate,' at the rate of not less than 8 m. an hour; but it is clear that the velocity must vary materially with the volume of water. This rapidity for a long time prevented the erection of any stone bridge on the Danube below Ratisbon; nor was there a permanent bridge of any other kind below Linz previously to the commencement of that constructed at Buda. There are flying bridges at Presburg and Comorn, and bridges of boats at Pesth and Peterwardein: beyond the latter place no direct communication between the opposite banks exists. In antiquity, however, it was very different. About 3 m. below Gladova, Trajan constructed his famous bridge, the remains of which are still visible, and form one of the most interesting and remarkable monuments of the most brilliant æra of imperial Rome. This great structure consisted of 20 or 22 stone piers, with wooden arches. The greatest depth of the river is here 18 ft., and the length of the bridge between the pillars or buttresses that still remain on either bank was about 3,100 English feet. But the breadth of the river is less than this; and at present does not exceed 2,800 feet. This neighbourhood of Gladova is one of the widest parts of the river; and was no doubt selected for the site of the bridge partly on account of the ample channel that was thus afforded to carry off the sudden floods to which the river is subject: its bed is here also sound, and its depth less than in most other parts. When lowest, the heads of some of the piers are seen above the surface of the water. The noble work was destroyed by Adrian, the successor of Trajan, lest the barbarians should overpower the Roman troops in Dacia, and make use of the bridge to invade the empire. (Eutrop. in Adrian.) But it was not Adrian, but Aurelian, who abandoned Dacia.

The steam navigation of the Danube is of paramount importance. This undertaking was first actively commenced by Count Szechenyi, who, in 1830, established a joint stock company for the purpose, of which he was the managing director. The Austrian government soon afterwards took up the scheme, greatly enlarged the plans of the company, granted it a charter for the exclusive navigation of the river for a number of years, and accorded it the privilege of drawing, gratuitously, the necessary supplies of coal from the imperial mines of Moldova, on the banks of the river. The first steamboat was launched on the Danube, at Vienna, in 1830. The enterprise proved most successful, and led to the formation of several other establishments of the same nature after the monopoly of the first company had ceased. The barges and ordinary packet-boats on the Danube are unwieldy flat-bottomed boats, covered with sheds of rough planks; the rafts in use are large and clumsy fabrics of the rudest kind; sails are unknown on the Upper Danube; and the boats are steered only by paddles.

So far back as the 8th century Charlemagne contemplated uniting the Danube and the Rhine by means of a canal; and the remains of a work commenced with that view are still visible at Wessenberg. After the lapse of more than 1,000 years, an undertaking of a similar kind was commenced under the auspices of the Bavarian government, and completed in the reign of King Ludwig I., after whom it was named the Ludwig's Canal. The canal commences at Bamberg, on the Maine, and runs in a slight curve, by way of Forchheim and Erlangen to Nuremberg, and from thence, in a larger curve, to Dietfurt, on the river Altmühl, where it ends, the Altmühl being a tributary of the Danube. The canal is from 34 to 54 ft. broad, and 5 ft. deep throughout. It has 69 locks and on its highest point it is 630 ft. above the river Maine at Bamberg, and 270 ft. above the junction of the Altmühl and the Danube.

DARABJERD, a town of Persia, prov. Fars, 155 m. SE. by E. Shiraz. It is finely situated on the banks of a river, and in an extensive plain, surrounded with groves of orange and lemon trees, which yield such an abundance of fruit that the juice is exported to all parts of Persia. Though much fallen off from its former splendour, and partially in ruins, it has still a pop. of from 15,000 to 20,000. The culture of tobacco is here carried to a great extent.

DARDANELLES (an. *Hellespontus*), the narrow strait

'Longus in angustum qua clauditur Hellespontus.'

connecting the Sea of Marmora with the Ægean, and separating part of the SE. coast of Europe from the most W. part of Asia. Its modern name is derived from the castles, called the Dardanelles, built on its banks. Its general direction is NE. and SW. Length about 40 m.; breadth unequal, but where least, not more than ¾ m. across. Being, as it were, the key to Constantinople and the Black Sea from the W., this strait is pretty strongly fortified. The entrance is 2 m. wide, and defended by a fort on either side; that of the Asiatic coast (*Koum Kalessi*) mounting 80 guns and 4 mortars, and that on the European side (*Sertil Bahr Kalessi*) mounting 70 large guns and 4 mortars. The adjacent heights are also crowned with batteries, and about 3 m. above the New Castle of Europe there is one mounting 12 guns. Proceeding onward 12 m. above the New Castles, are the Dardanelles, or Old Castles of Europe and Asia; these defend the narrowest part of the strait, which is here only ⅔ m. wide. The *Sultanieh Kalessi*, or Asiatic castle, is the strongest, and is the residence of the seraskier pacha, whose authority extends over the forts on both sides. It has 2 connected forts, and 192 guns, 18 of which are of the largest calibre. The European castle is built in the form of a crescent, and in 1832 was furnished with 64 guns; it has 2 collateral batteries recently built; the most S. of

which mounts 48, and the N. 30 guns. 1¾ m further on the Asiatic side is a battery of 46 guns; and 3 m. above the European castle is a battery called *Kiamleh Bouroun*, with 30 guns, near the small town of Maito, supposed to occupy the site of the ancient *Madytus*. The last forts on both sides are *Bovalli Kalessi*, on the site of the ancient *Sestos*, and *Nagara*, near *Abydos*, which see. The direct distance between them is about 1¼ m. A strong current runs always from the Sea of Marmora, through the Dardanelles, at the rate of from 2 to 4 m. an hour, according to circumstances. The wind also generally sets in the same direction. There are shoals in some places; but deep water is everywhere to be found in some part of the channel. The Asiatic shore presents the most beautiful scenery; that of Europe is, on the contrary, generally steep and rugged. To each of the Dardanelles a town is attached: the Asiatic is the larger, and contains 2,000 houses; but the streets are narrow, ill paved, and dirty, and almost all the buildings are of wood. It has manufactures of pottery. Gallipoli is the principal town on this strait, which see. This strait has been famous from the remotest period. It derives its name from Helle, daughter of Athamas, king of Thebes, drowned in it. (Hygin., Poet. Astron., lib. ii. § 20.) It is also memorable as the scene of the death of Leander, and of the impotent rage of Xerxes, whose ill-fated host crossed over it on a bridge of boats between Sestos and Abydos.

DARFUR, a country of Central Africa, between 11° and 16° N. lat., and 26° and 30° E. long. It lies between Bornou and Abyssinia; almost due S. from Egypt, and W. of Sennaar, whence it is separated by Kordofan. Standing, however, like an oasis in the midst of the Great Sahara desert, Darfûr is situated at a great distance from all the above-named territories. The country is of the most dreary character, without rivers, lakes, or much cultivable land, with a few mountains rising from its sandy plains.

Of the *topography* and real extent of Darfûr we possess but limited information. The principal town appears to be Cobbé, in lat. 14° 11′, and long. 28° 8′, which is 2 m. in length, from N. to S., but very narrow, each house being separated from the others by a cultivated enclosure. The inhab. are supplied with water from shallow wells dug, in most instances, beside their houses, but so unskilfully that the soil often collapses, and the same well is seldom of use longer than four months at a time. This place is chiefly inhabited by merchants, and from it a caravan starts at irregular intervals to Cairo. 6,000 persons are said to reside at Cobbé. A neighbouring village, called El Fashar, is the residence of the sultan and his court. Sweini, another Fûrian town, lies almost N. of Cobbé, at the distance of about two days' diligent travelling, and in the direct road to Egypt; hence it is principally resorted to by merchants. Its environs are more fertile than those of Cobbé, and when the *jelabs* (traders) remain there, it boasts of a daily market. Cubcabia, due W. from Cobbé, at a distance of 2½ days, is a more considerable place, being the depôt of merchandise brought from the W. It has also a manufactory for leather and of *tobeas*, a coarse cotton cloth from 5 to 8 yards long, and about 22 in. wide, which form the covering of all the lower class of both sexes. The other towns are Ril, Cours, Shoba, Gidid, and Gellé. (Browne's Travels, pp. 266–276.)

The inhab. of Darfûr, which have been generally estimated not to exceed 200,000 in number—Dr. Henry Barth says (Journal of Royal Geographical Society, 1860, xiii. p. 123), 'not more than 1,000,000 inhabitants, and perhaps much less'—are a mixture of Arabs and Negroes. They are governed by a sultan, whose power is not altogether absolute, he being, in some degree, amenable to the *kukara*, or ecclesiastics, and frequently standing in some awe of his own troops. His power is delegated in the provs. to governors, called *meleks*. Though the Fûrians are bigoted Mohammedans, they do not abstain from intoxicating liquors; the crime of drunkenness, committed by means of a decoction of hemp, is frequent among them. Snuff and tobacco appear to be almost necessaries of their existence; but for the endurance of hunger and thirst they are unequalled even by the inhab. of surrounding arid regions, among whom such a qualification is so essential. They are not remarkably cleanly in their persons; and, having no baths, rub their bodies with a kind of farinaceous paste as a substitute. The Fûrians are, unlike other Moslems, jovial, and even licentious, in their manners, and are particularly fond of dancing, each tribe having a dance peculiar to itself. At Cobbé education is in some degree provided for by four or five *mectebs* (schools), where reading and writing are taught. A kukara also lectures occasionally on the Koran, and what they call *elm*, philosophy. The language is a dialect of the Arabic peculiar to the Fûrians.

Agriculture in Darfûr is at a very low ebb; indeed, the soil which was presented to Mr. Browne's observation, consisting of bare rocks, sand, a small portion of clay, and a still smaller part of vegetable mould, seemed to offer no encouragement in that respect. Entirely devoid of rivers or lakes, the country solely derives irrigation from heavy periodical rains, which are preserved in numerous water-courses. At the commencement the farmer digs innumerable holes in his fields, into which he throws the seed, and covering it over with his foot, leaves it without further care until the grain becomes ripe. (Ibid. p. 291.) The harvest is gathered by women and slaves, who break off the ears with their hands; so that the farming implements of the Fûrians are few and rude. The grains chiefly raised are wheat *dokn* (*Holcus dochna*, Forskäal), *kassob*, and *sesamum* (*simsin*, Arabic term); the pulse consists of kidney-beans, a bean called *fût*, and another denominated *shûh*, together with other leguminous plants peculiar to that part of Africa. The occasional drought is not favourable to water-melons, though many are grown. Tamarinds, dates of an inferior quality, the *Rhamnus nabecca* of Forskäal, and tobacco, which is said to be indigenous, are all cultivated in Darfûr. (Browne, pp. 306–313.)

Commerce.—Although the Fûrians have but a limited variety of articles to exchange for those necessaries of life which their own country does not produce, yet commerce, from their central situation, affords the chief means of support to the nation. Many of their towns are entirely peopled by merchants. The caravans from Egypt, Sennaar, &c. are laden with jewellery, swords, firearms, coffee, raw and manufactured silks, shoes, writing paper, Syrian soap, French and Egyptian cloths, with Indian muslins and cottons, wire, brass, silver, &c. For these the Fûrians give in exchange slaves, camels, ivory, ostrich feathers, gum, pimento, tamarinds, leather sacks for water (*ray*), others for dry articles (*geraub*), parroquets, monkeys, and guinea fowls. (Browne, pp. 346, 349.)

The *climate* of Darfûr is chiefly influenced by the perennial rains, which fall from the middle of June till September with frequency and violence, and suddenly invest the face of the country, till then dry and sterile, with a delightful verdure. July appears to be the hottest month, for, according to Browne's meteorological journal, kept during

the years 1794–5, the thermometer never sunk below 90° at 3 P.M., but more frequently rose to 98°. In the April of 1794, however, it ranged from 94° to 101°, while the same month of the succeeding year exhibits an average far below that of either of the July months. The thermometer seldom sunk, according to Browne's register, lower at 3 P.M. than 70°, or at 7 A.M. below 58°, which happened most frequently in February: December and January, also, exhibit low degrees. N. and NW. winds are those which blow with the greatest frequency over Darfûr. (Appendix to Browne's Travels, pp. 581–588.)

Among the animals to be found in Darfûr are horses, of which there are not many; sheep, which also are scarce, yield meat of a poor quality; goats are more numerous; but horned cattle form the chief wealth of the Fûrians, as in the more S. African nations. The milk of the cows is not very palatable; but the beef is good. Camels of every variety of breed are exceedingly numerous: but the *Gerab* camel is much subject to the mange; the males are sometimes castrated. Dogs are employed both in hunting the antelope and for guarding sheep; the household cat is also met with. The wild animals are the lion, leopard, wolf, jackal, wild buffalo, &c. Elephants assemble in large herds of four or five hundred: though they are much smaller than the Asiatic elephant, the animal is a source of great profit to the Fûrians, who make a lucrative sale of his tusks, hold his flesh in great esteem as food, and manufacture the fat into a much-used unguent. Several sorts of monkeys, and the civet-cat, are also mentioned by Browne. Ostriches, vultures, parroquets, partridges, pigeons, and quails, were also seen by him. Locusts, hooded serpents, musquitos, and white ants, infest the country in large numbers. (Travels, pp. 293–304.) Of the minerals found in Darfûr, the best is copper; but iron is produced in the greatest abundance, and is formed into domestic utensils and arms. All the silver, lead, and tin is brought from Egypt. The other geological features of Darfûr are scarcely known.

DARIEN. See PANAMA (ISTHMUS OF).

DARLINGTON, a market-town and bor. of England, co. Durham, Darlington Ward, S. div., on the Skerne, an affluent of the Tees, 215 m. N. by W. London by road, and 236 m. by Great Northern railway, *viâ* York. Pop. 15,789 in 1861. The town consists of several well-built and well-lighted streets, which branch out from a spacious market square. The river is crossed by a bridge of three arches. The church, formerly collegiate and dedicated to St. Cuthbert, was built about 1160; it has a fine tower and spire 180 ft. high. The Prim. and Wesl. Methodists, Independents, R. Catholics, and Soc. of Friends, have places of worship. A grammar-school was founded by Q. Eliz. in 1567, and a blue coat school by Lady Calverley in 1715. There are also Lancastrian, national, and Sunday schools, a dispensary, lying-in charity, and two alms-houses It is a bor. by prescription, governed by a bailiff, who holds a court twice a year for the manor of Bondgate, and a bor. court also twice a year, at both of which debts under 40s. are recoverable. Petty sessions are held on alternate Mondays in the town-hall, a neat building having a house of correction connected with it. The election for members for the S. division of the county is held here. The manufacture of linen, which was formerly carried on to such an extent as to give employment to 500 looms, has declined, but it is still pretty considerable. A good many persons are also employed in wool-combing; and there are several tan-yards, rope-walks, breweries, and iron and brass works. The Stockton and Darlington railway, one of the first constructed in the kingdom, commences at Witton Park Colliery, near W. Auckland, and proceeds by Darlington and Yarm to Stockton, a distance of 24½ m. (For an interesting account of this railway, see Smiles, Samuel, 'Lives of the Engineers.') Darlington has cattle markets, on alternate Mondays. Fairs on the 1st Monday in March, Easter and Whit-Monday, and 10th Oct.; statute fairs on 13th May and 23rd Nov.

DARMSTADT, a town of W. Germany, cap. of the grand duchy of Hesse-Darmstadt, seat of the gov. and residence of the sovereign, prov. Starkenberg, in the great Rhenish plain near the NW. extremity of the Odenwald, and on the *Bergstrasse*, or high road between Frankfurt-on-the-Maine and Heidelberg (see HESSE-DARMSTADT); 17 m. S. the former city, 58 m. N. by E. Carlsruhe, and 8 m. E. by N. the Rhine, on the railway from Frankfort to Heidelberg. Pop. 28,526 in 1861. The town is rather dull, has little trade, nor, for a capital, does it present much deserving of notice. It consists of an old and a new town; both encircled by walls: the former is ill built, and its streets are narrow and dark; while the latter has broad, straight, and handsome streets, and good houses, many of which stand singly. The town is well lighted at night. It has four suburbs, six entrance-gates, three of which are handsome structures, and about sixty public edifices. Amongst the latter are the opera-house, built in the Italian style, and 230 (Rhenish) ft. in length, by 158 ft. broad. The riding-school, converted into a depôt for artillery, 319 ft. in length, by 157 ft. in breadth, is another conspicuous object. The grand-duke resides in a new palace of no great architectural pretensions. The old ducal palace, surrounded by a dry ditch, which has been changed into a shrubbery and garden, is a structure of the various ages from the 16th to the 18th century, and contains a picture-gallery with about 600 paintings, mostly second-rate, a museum of natural history with some valuable fossils, a museum of ancient and modern sculpture, a hall of antiquities, a collection of cork models, armoury, and a library of 120,000 vols. open to the public. The remaining principal public buildings are—the palaces of the hereditary prince and the Landgrave Christian; the Catholic church, a brick edifice, the interior of which is an elegant and imposing rotunda, 173 ft. in diameter, 123 ft. in height, and surrounded by pillars 50 ft. high; the *Casino*, in which the chambers of the duchy meet; the military hospital, royal stables, and orphan asylum.

Darmstadt is the seat of the high court of appeal for the grand duchy, and various other judicial tribunals and government offices. It has a gymnasium, a teachers' academy, a practical school of arts and sciences (*Realschule*), schools of artillery and military duty, and of sculpture and drawing. It has manufactures of tobacco, wax-candles, carpets, silver articles, coloured paper, cards, and starch. The majority of the inhab. depend, however, for subsistence on the presence and expenditure of the court. Scarcely any but military garments are seen in the streets, even the teachers of the public schools being obliged to dress in uniform, or court livery.

DARTFORD, a town and par. of England, co. Kent, lathe Sutton-at-Hone, hund. Axton, Dartford, and Wilmington; on the Darent, about 4 m. from its embouchure in the Thames, 15 m. ESE. London by road, and 17 m. by North Kent, or South Eastern railway. Pop. of town, 5,311, and of par., 6,597 in 1861. The town, situated in a narrow valley, consists chiefly of one main street, along the ancient high road from London to Dover,

and of two smaller ones branching from it. The river is crossed, at the E. end of the town, by a bridge of the era of Edw. III., widened and repaired in the last century. The church is a large structure, with two burial-yards, one surrounding it, the other on the summit overlooking its tower. There are several dissenting chapels; a free grammar-school, founded in 1576, for eight boys; a national school, and two sets of almshouses. There is a co. bridewell near the town, and sessions for the upper div. of the lathe are held in it. During the reign of Elizabeth, the co. assizes were frequently held here; and at present a court of requests for debts under 5*l.*, whose jurisdiction extends over the town of Gravesend and four adjoining hundreds. Market, Saturday; fair, August 2, for horses and cattle. The chief business of the town is caused by the numerous large gunpowder, paper, oil, and flour mills on the Darent: there is also a large steam-engine manufactory, and a foundry connected with it. The river is navigable for boats to the town, where there is a small wharf, used chiefly by the colliers which supply the neighbouring factories. The Roman Watling Street is traceable near the town. In one of the chalk hills between which it stands are several ancient excavations, supposed to have been scooped out for granaries during the Saxon period. There are some remains of an Augustine nunnery, subsequently made a royal residence by Henry VIII. and by Elizabeth. Dartford was the source of the insurrection headed by Wat Tyler, who, being a blacksmith in the town, killed the poll-tax collector by a blow of his hammer, for an insult offered to his daughter.

DARTMOOR. (See ENGLAND.)

DARTMOUTH, a parl. bor., town, and sea-port of England, co. Devon, hund. Coleridge; 170 m. WSW. London by road, and 225 m. by Great Western railway, *viâ* Brixham Road station. Pop. 4,444 in 1861. The town is situated on the W. bank of the estuary of the Dart, near its embouchure in the English Channel, where it forms a spacious harbour, capable of containing several hundred sail of vessels of the largest size. The entrance to the harbour is narrow, and protected by a battery on its W. side, on the site of an ancient castle, from which to a castle on the opposite bank (now in ruins) a chain used to be extended for the purpose of defence. The streets, which are narrow and irregular, rise from the margin of the river, and parallel with it, one over another, along a steep acclivity, being mostly connected by flights of steps; houses mostly antique, with projecting upper stories; the whole is paved, well supplied with water, and partially lighted with gas. There are three principal churches—St. Saviour's, built 1372, a curious old structure, usually called the Mayor's Chapel; Town-hall Chapel, on the summit beyond the town, with a tower forming a sea-mark; and St. Petovex's, adjoining the battery at the entrance to the harbour. There are also several dissenting chapels; two sets of almshouses, one of which, founded 1671, is for decayed mariners; and several minor charities. There are large tide-docks, adapted for the repair and building of vessels, and some activity in shipbuilding. There are also establishments for sail and rope-making, a spacious quay, and several private wharfs. The exports consist chiefly of woollen goods and cider, sent thither from the interior, and shipped coast-wise; and of various articles of general supply for the Labrador fisheries, in which several vessels belonging to the port are directly engaged, though this trade has greatly declined from its ancient importance. There are regular steamers up the river to Totness. There belonged to the port on the 1st of Jan. 1864, 166 sailing vessels of under 50, and 262 sailing vessels of above 50 tons. There were also belonging to the port, at the same period, six small steamers, of a total burden of 154 tons. In ancient times, however, its mercantile marine was comparatively much more considerable, as is evident from the fact of its having furnished 31 vessels and 757 seamen to the fleet of Edward III. against Calais. The port is a bonding one, its jurisdiction extending about 40 m. along the coast (from the Teign to the Erme), and up the Dart to Totness bridge (10 m.). The Dart is navigable thus far for vessels of 150 tons, the channel having been deepened and improved.

Dartmouth claims to be a bor. by prescription, under the name of Clifton-Dartmouth. It regularly sent two members to the H. of C. from the 14th Edw. III. down to the Reform Act, which deprived it of one member. The elective franchise had been previously vested in the corporation and in the freemen made by them, the inhab. of the bor. not being entitled to their freedom in right of birth, servitude, or residence. But the Reform Act, besides giving the franchise to the 10*l.* householders, extended the limits of the bor. to the dimensions already stated. Registered electors, 255 in 1865. The municipal bor. is governed by a mayor, four aldermen, and twelve councillors. The income of the corporation, chiefly derived from lands and houses, is about 1,100*l.* a year. The scenery around Dartmouth is extremely picturesque. Flavel, an eminent Calvinistic writer, and Newcomen, the inventor of the atmospheric engine, were natives of this town; which also gives the title of earl to the Legge family.

DAVENTRY, a bor. and par. of England, co. Northampton, hund. Fawsley, 68 m. NW. London by road, and 73 m. by London and North Western railway, *viâ* Weedon station, from which it is distant 4 m. Pop. 4,124 in 1861. The town is situated on the high road from London to Birmingham, near the source of the Nen. It has a good modern church, a free school, founded in 1576; five boys are also educated by means of a legacy of Lord Crew, bishop of Durham, and twelve at the expense of the corporation. The remains of a priory, founded in 1090, are now occupied as dwellings by the poor. Though incorporated at an early date, the bor. does not appear ever to have been represented in the H. of C. On a neighbouring lofty eminence, called Brough Hill, is an encampment occupying the whole of the summit. A spring rises in the outer ditch of the encampment, which, according to Dr. Stukeley, is one of the highest in England. (Stukeley's Itinerarium Curiosum, ii. 18.)

DAVID'S (ST.), a small decayed city of Wales, co. Pembroke, hund. Dewisland, near the extreme W. point of the principality, on a small stream called the Allan, about 1 m. from the sea, and 16 m. NW. Milford Haven. The par., an extensive one, had in 1861 a pop. of 2,199, of which the 'cathedral close' had 37. A bishopric was established here at a very early period; and to that circumstance the place is most probably indebted for its origin. The cathedral, the bishop's palace, St. Mary's college, and other buildings appropriated to purposes connected with the establishment and the residence of the clergy, are enclosed within a lofty wall above 1,200 yards in circ. The cathedral, which occupies the site of one more ancient destroyed by the Danes, was completed in the reign of King John. It is a cruciform structure, 307 ft. in length within the walls, with a square tower at the W. end; it has many interesting monuments, but is, in great part, in ruins. The bishop's palace, reckoned one of the most magni-

ficent edifices of the kind in the kingdom, is also in ruins; as is St. Mary's college, founded by John of Gaunt in 1365. The cathedral contains the tombs of St. David, the patron saint of Wales, of Giraldus Cambrensis, and Bishop Anselm; and these, and the great antiquity of the place, conferred on it a peculiar sanctity, which in the middle ages made it be resorted to by crowds of pilgrims. The bishop now resides at Abergwilly, near Caermarthen. The town is at present inhabited by the few clergy who perform the duties at the cathedral, and by the farmers and others who hold land in the immediate vicinity. There is very little trade, and the place may be said to be neither increasing nor falling off. The country round is poor and unimproved, and the access to it is very bad. The poor's rate is high, but house rent is extremely low. The inhab. elect a mayor annually, whose duty it is to see that no encroachments be made on a common held under lease from the bishop and chapter, and to collect a rate for payment of its rent.

DAVIS'S STRAITS, the sea stretching NNW. and SSE., and uniting Baffin's Bay with the N. Atlantic ocean, having Greenland on its E. and Cumberland Island on its W. side. Where narrowest, under the Arctic circle, it is from 150 to 160 m. across; but its length is not accurately determined. It derives its name from Davis, by whom it was discovered between 1585 and 1587. Strong currents set towards the S. from this strait, which is also much encumbered with ice and icebergs. It has been for many years past the principal resort of the ships engaged in the N. whale fishery; the whales having been nearly exterminated in the seas round Spitzbergen, the original seat of the fishery. (See art. BAFFIN'S BAY.)

DAUPHINE', one of the provs. into which France was divided previously to the revolution. It is now distributed among the déps. of Isère, Drome, and Hautes Alpes.

DAX, AX, or AGS, a town of France, dép. Landes, cap. arrond., in a fertile plain on the Adour, 29 m. SW. Mont-de-Marsan, on the railway from Bordeaux to Bayonne. Pop. 9,856 in 1861. The town is well built, is surrounded by walls of Roman construction, and has an ancient episcopal palace, cathedral, hall of justice, and prison. Dax is, however, chiefly celebrated for its numerous hot saline springs, accounted efficacious in rheumatism and paralysis; and which being known to the Romans, they gave it the name of *Aquæ Augustæ*. The principal of these springs pours its waters into a large basin in the centre of the place, and the evaporation from it is so great, that in cool mornings the whole town is sometimes involved in a fog. There are several bathing establishments contiguous to the town. Dax communicates by a bridge across the Adour, with a suburb on the opposite side of the river. It has a tribunal of primary jurisdiction, a chamber of commerce, a communal college, and a theatre. Manufactures of earthenware, pitch, oil, thread, vinegar, leather, and some trade in corn, wine, brandy, and wood.

DEAD SEA (Lat. *Lacus Asphaltites*, Arab. *Bahr-el-Lout*), a lake of Palestine, celebrated in scripture history, in about 31½° N. lat., and 35° 40′ E. long. Its dimensions have been variously stated, but it is probably about 40 m. in length, and 13 in extreme width. On the E. and W. it is bounded by lofty mountains; on the N. it opens to the plain of Jericho and the valley of the Jordan; on the S. the valley of El-Ghor extends, as if it were a continuation of its bed, though with a gradual rise, to the Gulf of Akabah. (See JORDAN.)

Nothing can be more dreary than the scenery around this famous lake; the temperature is very high; the soil, impregnated with salt, is without vegetation, the air is loaded with saline particles, and the bare crags of the surrounding mountains furnish no food for either beast or bird. Hence its neighbourhood is generally deserted by animated beings, and the dreary stillness of the place is increased by the nature of the lake itself. Intensely salt, its waters are not moved by a gentle breeze and, owing to the hollowness of its basin, being seldom affected by a strong one, its usual appearance is that of stagnation, agreeing well with the death-like stillness and desolation around.

This absence of life has given to the lake its popular designation of Dead Sea, and is the source of the common tradition that its waters are fatal to fish, and its exhalations to birds and other animals. This is, however, incorrect; birds fly over its surface uninjured; and Maundrell found upon its shores some shells, which seemed to imply that it was not *altogether* tenantless. The water is very limpid, but extremely bitter and nauseous, the substances held in solution amounting to a fourth part of its whole weight:—

In 100 parts, as follow:—

Muriate of Lime . . .	0·920
Magnesia . . .	10·246
Soda	13·360
Sulphate of Lime . .	0·054
	24·580

It has also a strong petrifying quality, which accounts for the want of any great variety of fish; and it is peculiarly buoyant, though the assertion that nothing sinks within its bosom is wholly fabulous. Asphaltum (whence its classical name) floats in great quantities on its surface; and a bituminous stone, very inflammable, and capable of receiving a high polish, is found upon its shores.

The valley of the Jordan has been long known to be considerably depressed below the level of the ocean. This depression is, however, much greater than was formerly supposed. The Dead Sea is the lowest part of the valley; and its surface has recently been ascertained to be sunk above 1,300 ft. under the surface of the Mediterranean, being by far the greatest depression below the sea-level of which we have any authentic account. It consequently belongs to that class of lakes that have no visible outlets; it receives six streams besides the Jordan, but gives forth none; the surplus water being carried off by evaporation. Its depth, which varies in the dry and rainy seasons, exceeds, in some places, 350 fathoms; but towards its S. extremity it is so shallow as to be in parts fordable.

Its Arabic name, *Bahr-el-Lout* (Sea of Lot), refers to the connection between the history of this lake and that of the nephew of Abraham, in whose days its bed, or a portion thereof, the fertile valley of Siddim, contained, according to the sacred writer, 5 cities (Gen. xiv. 2); and according to Stephen of Byzantium (art. Σοδομα) 10, and Strabo (xvi. cap. 2, 764), 13. In the visitation by which they were all destroyed, with the exception of Zoar, the neighbouring country underwent an extraordinary change; and is said by Moses (Deut. xxix. 23) to have become 'a land of brimstone, and salt, and burning,' characteristics by which it still continues to be marked. In Scripture this collection of water is called the Salt Sea (Gen. xiv. 3; Deut. iii. 17; Josh. xv. 5): the Sea of the Plain (Deut. iii. 17): and the East Sea. (The best, as well as the most recent account of the Dead Sea, its geological formation and other

features, is in a work by the Rev. H. B. Tristram, 'The Land of Israel; a Journal of Travels in Palestine, undertaken with special reference to its Physical Character,' p. 672. Lond. 1865.)

DEAL, a parl. bor. and sea-port town of England, co. Kent, lathe St. Augustine, hund. Bewsborough, 66 m. ESE. London by road, and 102 m. by South Eastern railway. Pop. 7,531 in 1861. The town is situated on the E. coast of Kent, opposite the Goodwin Sands, and about half way between Ramsgate and the S. Foreland. It consists of Upper, Middle, and Lower Deal. The latter, containing the great bulk of the pop., is built, principally in three parallel streets, close to the shingly beach, extending along the roadstead called the Downs. Streets mostly narrow and irregular, but paved and lighted. A row of houses connecting the lower with the upper village, constitutes Middle Deal: in these last the houses are detached, and are mostly occupied by the wealthier class. The par. church is in Upper Deal: there is a chapel of ease in the lower town, several dissenting chapels, and a national school. Walmer forms a continuation of Lower Deal, and owes its rise to the naval arsenal, hospital, and barracks, formed there during the last war. Since the Municipal Reform Act, it has been included in the bor. of Deal (of which it forms a ward); and the Reform Act conferred on both parishes, in conjunction with Sandwich, the privilege of returning two mems. to the H. of C. Registered electors, 1,011 in 1862. Deal was annexed to the Cinque Ports soon after the Conquest; a decree exempting it from co. taxation shows it to have been so in 1229: a charter of 11th Wm. III. made it a bor. independent of Sandwich, Walmer included. It is now divided into three wards, governed by six aldermen and eighteen common-councilmen. There are no manufactures, the inhabitants being mostly shopkeepers, pilots, fishermen, and boatmen, mainly dependent on the resort of shipping to its famous roadstead, the Downs. The latter is a spacious and convenient anchorage, bounded seaward by the Goodwin Sands, and tolerably safe, except in heavy gales from the N. and E. Most outward and homeward-bound vessels touch here to take or land pilots, letters, and passengers. This business, however, has greatly fallen off since the last war with France, when the Downs was much resorted to by men-of-war and merchantmen waiting for convoy. The shipping belonging to the port of Deal consisted, on Jan. 1, 1864, of eight sailing vessels under 20, and three vessels over 20 tons; the total tonnage of the former being 132, and of the latter 309 tons. There were no steamers. Coals form almost the only article of import. Of late years, Walmer has been resorted to as a sea-bathing place, and there are several good lodging-houses for the reception of visitors during the season. Deal Castle, on the W. side of the town, is a round tower, built by Hen. VIII., with a moat and drawbridge. Deal is supposed to be the spot where Cæsar effected a landing on invading Great Britain.

DEBRECZIN, a town of Hungary, and, next to Pesth, the largest in the kingdom, cap. co. Bihar, in a flat, sandy, and arid plain, 114 m. E. Pesth, and 110 m. NW. Clausenburg, on the railway from Pesth to Kaschau. Pop. 37,850 in 1857. Debreczin is one of the most singular places in Europe. Notwithstanding its size, its general appearance is rather that of a large village than a town; and notwithstanding its manufactures and trade, both of which are considerable, none of the advantages ordinarily met with in large commercial cities are here to be found. Its streets are broad, unpaved, and in rainy weather a mass of liquid mud. Scarcely any of the houses are above one story in height, and few are built on any regular plan. The greater part are thatched, which has rendered Debreczin subject at various times to severe ravages from fire. In the spring of 1811, not fewer than 2,000 habitations were reduced to ashes in the course of six hours. There are, however, five churches, three hospitals, two infirmaries, an orphan asylum, and a town-hall. The principal college of the Calvinists in Hungary, with a library of 20,000 vols., and upwards of 1,000 students, is at Debreczin. It has also a Piarist college, a Catholic high school, and a monastery. Shoes are manufactured in large quantities, as also tobacco-pipes, prepared sheep-skins, coarse woollen cloth, a spongy kind of soap greatly esteemed throughout the Austrian empire, with leather, furs, combs, coopers' and turnery wares. There is an extensive market for all these articles, as well as for oxen, sheep, horses, hogs, wheat, millet, wine, tobacco, water-melons, lard, wax, honey, and various other kinds of produce, especially at the fairs held at Debreczin every three months. On these occasions the country round the town is covered to an extent to which the eye can scarcely reach, with flocks and waggons, bales and cases, tents and huts, round which thousands of people are constantly gathered; presenting, in fact, all the appearance of an immense herd of nomades. A great deal of business is transacted at these fairs. Debreczin is, indeed, the great mart for the produce of the N. and E. parts of Hungary. By far the greater part of the pop. are Magyars; and it is here that the true Magyar character may be most advantageously studied. During the revolution of 1848–9, Debreczin became the last seat of the Hungarian parliament, but being an entirely open place, it was taken without resistance by the Austrian troops.

DECCAN (Daks-hina, *the South*), a term of Sanscrit origin, and formerly applied to the country comprising all that part of India to the S. of the Nerbudda river; but since the Mohammedan invasion, the term has been restricted so as to apply only to the countries between the Nerbudda and Krishna, that is, between the parallels of lat. 16° and 23° N., extending from the Arabian Sea to the Bay of Bengal, and including the provs. Candeish, Aurungabad, Beeder, Hyderabad, Bejapoor, Berar, Gundwanah, Orissa, and the N. Circars. British Deccan comprises the collectorates of Candeish, Ahmednuggur, Poonah, and Darwar, under the presidency of Bombay; and the ceded districts on the Nerbudda under the presidency of Bengal. The remainder of this region is mostly comprised within the dominions of the rajah of Berar, the nizam, the rajah of Sattarah, the Guicowar, and Scindia. (For farther particulars, see the various provs., districts, and states referred to under their respective heads.)

DEE, a river of England, which has its source in Bala Lake, co. Merioneth, N. Wales. At first it pursues an easterly course through the beautiful vale of Llangollen, till it passes Wynnestay. It then takes a northerly direction, and forms the line of demarcation between the cos. of Denbigh and Flint in Wales, and Cheshire in England. It nearly encompasses the ancient city of Chester, and is thence conveyed by an artificial channel, about 8 m. in length, to its spacious estuary on the Irish Sea. Its principal tributary is the Alwyn, which unites with it at Holt. Its estuary is much encumbered with sand banks.

The Dee is also the name of two considerable Scotch rivers, one of which falls into the N. Sea at

Aberdeen, and the other into the Irish Sea at the Little Ross, about 6 m. below Kirkcudbright. The latter is navigable as far as Tongland-bridge, 2 m. above Kirkcudbright, for vessels of large burden.

DELAWARE, one of the U. S. of America, and, excepting Rhode Island, the smallest of the Union. It occupies a part of the peninsula, lying between the bays of Chesapeake and Delaware; extending from lat. 38° 30′ to 39° 50′ N., and long. 74° 55′ to 75° 47′ W.; having N. Pennsylvania, W. and S. Maryland, and E. Delaware bay and river. Length, N. to S., 95 m.; average breadth about 22 m. Area, 2,120 sq. m. Pop. 112,216 in 1860. Surface hilly in the N., more level in the S., and low alluvial, and marshy along the coast. One of the most elevated ridges in the peninsula passes through this state, dividing the waters that flow into either bay. The chief river, the Delaware, rises in New York, runs mostly S., and, after dividing that state and New Jersey from Pennsylvania, falls into the Bay of Delaware, near the N. extremity of the state, after a course of about 310 m. It receives several tributaries, and is navigable for ships of the greatest burden to Philadelphia, 55 m. from its mouth; and for small steam-vessels and boats, to nearly 135 m. higher. The other rivers are inconsiderable. There are no harbours on the sea-coast; the only one in the state is that of Newcastle, 5 m. above the mouth of the Delaware river. The climate is healthy; but the degree of cold experienced in the N. is much greater, compared with that of the S., than could be expected from a difference in lat. of only 1° 20′. The soil in the N. is a rich clay; in other parts, and especially along the shore, it is sandy, and of inferior fertility; but it is everywhere well cultivated, at least for America. Principal crops, wheat, Indian corn, rye, barley, oats, flax, and buckwheat. The flour is of superior quality, and much esteemed for its softness and whiteness. The Cypress Swamp, a tract 12 m. in length and 6 in breadth, in the S. part of the state, has supplied a great deal of fine timber. Few minerals are met with, excepting large masses of bog iron along the banks of the smaller streams. Manufactures have made considerable progress. The mills situated on Brandywine Creek are considered the finest in the U. States; vessels are built, and there are iron-foundries and other extensive works at Wilmington. Wheat and flour are the principal articles of export.

The state is divided into three cos., and eight judicial circuits. Dover is the cap., but yields to Wilmington and Newcastle in size, trade, and pop. There is no college in the state; one planned in 1803 at Wilmington has not come into operation; but there are good academies in this and in several of the other towns. The state has a fund for the support of free schools, which in 1864 had a capital of 411,392 dollars; and the objects of which are assisted by voluntary contributions from the different districts. The total taxation in 1863 amounted to 116,104 dollars, the largest item, the county tax, producing 85,652 dollars. A canal 14 m. in length, and navigable for small sea-vessels, unites the Delaware river near its mouth with the head of Chesapeake Bay.

The legislature consists of a senate and house of representatives, each co. sending three senators and seven representatives; the former are elected for four, and the latter for two years, by all the male citizens above twenty-one years of age who have resided in the state for a year, and paid taxes for six months preceding the election. The executive power is exercised by a governor chosen by the citizens, who retains office for four years, but is not re-eligible. Judges retain office during 'approved conduct.' Most of the pop. are Presbyterians and Methodists.

Delaware was colonised by the Swedes in 1627. In 1655 it was acquired by the Dutch; and in 1664 came into the possession of the British. In 1704, when under the proprietorship of the celebrated W. Penn, it became a separate colonial establishment, and as such remained until the independence of the states. Its constitution, formed in 1776, was amended in 1831. It sends 1 rep. to the Congress of the United States.

DELAWARE BAY is an arm of the sea between the states of Delaware and New Jersey, 65 m. in length, and about 30 m. wide in its centre, and 18 at its mouth, between Cape Henlopen, lat. 38° 47′ N., long. 75° 6′ W., and Cape May, lat. 38° 57′ N., long. 74° 52′ W. It has deep water throughout, and a line-of-battle ship may ascend the river Delaware to Philadelphia, 55 m. above the head of the bay, and 120 m. from the ocean. There is a magnificent breakwater at the entrance of Delaware Bay, near Cape Henlopen, forming an artificial harbour for the protection of vessels from the winds from the E. to the NW., round by the N., and from the floating ice descending the bay from the NW. The breakwater consists of two parts, one 1,200, and the other 500 yards in length. It was formed like the Admiralty pier at Dover, and the breakwaters of Plymouth and Cherbourg, by sinking blocks of granite in the sea.

DELFT, a town of S. Holland, on the Schie and on the canal between Rotterdam and the Hague, 4 m. SSE. the former, and 8 m. NW. the latter town, on the line of railway between Rotterdam and Amsterdam. Pop. 19,806 in 1861. Delft is an old-fashioned brick town, as Dutch as possible in its appearance, with old gateways, and lines of trees and havens in the middle of the streets. The chief building, not ecclesiastical, is the palace, in which William I., the most illustrious of all the princes of the house of Orange, and the founder of the independence of his country, was assassinated, July 10, 1584; it is a plain brick building within a court-yard, and is now used as a barrack. The new church, at the E. end of the market-place, is a fine old Gothic edifice, with a conspicuous lofty tower, and one of the best peals of bells in Europe. This church contains the tomb of William I., considered one of the most magnificent objects of art in Holland. It consists of a highly ornamented canopy, supported by a number of black and white marble pillars. In the centre, on a sarcophagus, lies the figure of the prince, in his robes, sculptured in white marble; and at his feet is his faithful dog, celebrated for having on one occasion saved his master's life in a midnight attack. There are several good figures in bronze round the tomb: that which is most admired is a figure of Fame blowing a trumpet, and resting lightly on one toe, as if about to take its flight. Beneath is the burial vault of the present royal family of Holland. Adjacent to this monument is that of the most illustrious individual Delft ever produced, Hugo Grotius, born here on the 10th of April, 1583. The Oude Kirke, or old church of Delft, is a structure remarkable for its extreme antiquity and huge size. It is situated in a mean street, and on approaching it the stranger is amazed at the enormous mass of brick, grey with age, which meets his eye. It is some 700 or 800 years old, and seems indebted for its protracted existence to the clusters of parasitical houses and shops built within the recesses of its buttressed walls. It contains the tombs of the famous Admiral Van Tromp; of Hein, another admiral who fell in battle at Tromp's side; and of the naturalist Leewenhoek, a native of this town.

Delft was in former times the great seat of the manufacture of the common kind of earthenware, known by its name. England, however, has long since acquired a decided ascendancy in this branch of industry, and but very few persons are at present engaged in it in Delft. In fact, nearly all the 'Delft ware' in use in Holland, and over the greater part of the Continent, is exported from England. Delft, however, has a large woollen cloth factory, and others of carpets, coverlets, and soap, besides several distilleries and breweries. Its trade, however, is languishing, and it has little intercourse, except with Rotterdam and Delftshaven, a little town—with a pop. of 4,189 in 1861—on the Maese, at the mouth of the canal which connects it with the Hague.

Delft was founded in 1074; it suffered severely from fire in 1536. Besides the eminent natives who have been already mentioned, it has produced many painters of celebrity, amongst whom was Beck, a pupil of Vandyke.

DELHI, a prov. of Hindostan, presid. Bengal; chiefly between lat. 28° and 31° N., and long. 75° and 80° E.; having N. the prov. of Lahore, and Gurwal, E. Gurwal and Inde, S. Agra, and W. Rajpootana. Like the other Mohammedan soubahs of India, this prov. is not a modern subdivision under the British rule: the collectorates which have been formed out of it are subordinate to the court of Bareilly, the judicial capital in the Upper or W. provinces. The jurisdiction of Delhi at present extends only over the country W. the Jumna. Most of this prov. is flat; but at Wuzeerabad, near Delhi city, begins the long range of hills that extends through the Macherry dom. towards Jyepoor. The chief rivers are the Ganges, Jumna, Caggur, Chittung, and, in the NW., the almost extinct Sereswati, formerly a distinguished stream: the principal of these run through the prov. in a SE. direction. The land is mostly arid and sandy, and in the W. suffers greatly from drought in the hot season, when the water, which is of a brackish quality, from the natron and other salts with which the ground is impregnated, can be procured only at from 120 to 200 ft. below the surface. Still, however, no part of Hindostan is susceptible of greater improvement by irrigation. The British government has latterly directed much attention to the restoration of ancient canals and the construction of new ones in this prov. The canal of Ali Merdan Khan, which had been previously choked up for 100 m., was reopened in 1820, at an expense of 22,280*l.*; and, as its waters gradually advanced, the country for 5 or 6 m. on either side became fertilised in a most astonishing manner, and numerous wells, previously thought useless, became again serviceable. The canal of Sultan Feroze Shah, the bed of which passes from the former W. through Hurriana to the frontiers of Bicanere, has been also surveyed preparatory to its restoration. A considerable tract between the Jumna and the Ganges, though now sterile and waste, was formerly highly cultivated and populous, having been fertilised by the great Doab canal. Between the Jumna and Sutlege mango trees are numerous, and the soil produces wheat, barley, and other dry grains; but the periodical rains are not sufficient to insure a crop. During the rainy season the temporary streams overflow, after which the pasture is good, and the climate tolerably healthy and temperate; but in the hot season the heat becomes so oppressive that the natives are often obliged to seek refuge from it in underground habitations. The land is assessed under a modification of the village system; but the *mocuddim*, or head man, is not responsible for the payment, but is merely the agent for the rest of the village, removable at their pleasure, and not holding his office by any kind of hereditary tenure. Neither does he derive apparently any emolument from his office, nor is he analogous to the *zemindar* in the lower provinces, or the *potail* in other parts; there being here no middle man to enjoy any portion of the land-tax, standing between the people and the government, which last receives from one-fourth part to a half perhaps of the produce of the land, according to circumstances, after the shares of the village functionaries, and certain other village expenses, have been deducted. The *punchayet* system of arbitration is in common use. In the zillah courts the European judges are assisted by both Mohammedan and Hindoo law officers, but the people in this prov. do not seem so disposed to litigation as in some others; they are, on the contrary, contented, orderly, and prosperous. At the commencement of the British rule, in 1803, there were about 600 villages deserted, the inhabitants of most of which had, before 1821, returned, and claimed and cultivated the lands they formerly possessed; and both the pop. and revenue had at that period very considerably increased. Mohammedans are most numerous in Delhi city, but Hindoos everywhere else, except in the NW., where the Seik religion is predominant, and the country is almost entirely occupied by petty Seik states. The chief towns are Delhi, Bareilly, Pillibheet, Shahjehanpoor, Rampoor, Moradabad, Anopshehr, and Meerat.

DELHI (Sanscrit, *Indraprast'ha*), a celebrated city of Hindostan, presid. Bengal, lieutenancy of Agra, cap. of the above prov., and anciently the metropolis of the Patan and Mogul empires, on the Jumna; 112 m. NNW. Agra, 425 m. NW. Benares, and 830 m. in the same direction from Calcutta, with which it is connected by the East Indian railway. Estimated pop. 160,000. That Delhi, in its period of splendour, was a city of vast extent and magnificence is sufficiently evinced by its ruins, which are supposed to cover nearly as large a surface as London, Westminster, and Southwark. The present inhabited city, E. and N. the ruins, built by the emperor Shah Jehan, and called by him Shahjehanbad, about 7 m. in circuit, is situated on a rocky range of hills, and is surrounded by an embattled wall, with many bastions and intervening martello towers, faced along its whole extent with substantial masonry, and recently strengthened with a moat and glacis by the British government. It has many good houses, chiefly of brick: the streets are in general narrow, but the principal are wide, handsome, and, for an Asiatic city, remarkably clean; the bazaars have a good appearance. There were formerly two very noble streets; but houses have been built down their centre and across, so as to spoil them: along one of these, running from the palace S. to the Agra gate, is the aqueduct of Ali Merdan Khan, reopened by Captain Blane in 1820. The principal public buildings are the palace, the *Jumma Musjeed*, or chief mosque, many other mosques, the tombs of the emperor Humayoon and of Sefdar Jung, and the Cuttub Minar; and, within the new city, the remains of many splendid palaces belonging formerly to the great dignitaries of the Mogul empire. Almost all these structures are of red granite, inlaid in some of the ornamental parts with white marble: the general style of building is simple, yet elegant; those of Patan architecture are never overdone with ornaments so as to interfere with their generally severe and solemn character. The palace, as seen from a distance, is a very high and extensive cluster of Gothic towers and battlements, towering above the other buildings. It was built by Shah Jehan,

is surrounded by a moat and an embattled wall, which, toward the street in which it stands, is 60 ft. high, and has several small round towers and two noble gateways. Some of the apartments are magnificent, even in the ruinous state in which they now are. There are rooms lined with white marble, inlaid with flowers and leaves of green serpentine, lapis lazuli, and porphyry, and also pavilions of marble, with many mosaic paintings, of birds, animals, and flowers. The Shalimar gardens (so highly extolled in 'Lalla Rookh') were also formed by Shah Jehan, and are said to have cost a million sterling; but 'laughing Ceres has reassumed her reign,' the gardens having been reconverted to agricultural purposes. The *Jumma Musjeed*, the largest and handsomest place of Mussulman worship in India, was built in six years by Shah Jehan, at an expense of ten lacs of rupees. It stands on a small rocky eminence, scarped for the purpose; the ascent to it is by a flight of 35 stone steps, through a handsome gateway of red stone, the doors of which are covered with wrought brass. The terrace on which it is built is about 1,400 yards square, and surrounded by an arched colonnade, with octagon pavilions at convenient distances. In the centre is a large marble reservoir, supplied by machinery from the canal. On the W. side is the mosque itself, of an oblong form, 261 ft. in length; its whole front coated with large slabs of white marble, and compartments in the cornice inlaid with Arabic inscriptions in black. It is approached by another flight of steps, and entered by three Gothic arches, each surmounted by a marble dome. At the flanks are two minarets, 130 ft. high, of black marble and red stone alternately, each having three projecting galleries, and their summits crowned with light pavilions of white marble, the ascent to which is by a winding staircase of 180 steps of red stone. This noble structure is in tolerably good repair, being maintained by a grant from the British government. Not far from the palace is a mosque of red stone, surmounted with three gilt domes, in which Nadir Shah sat and witnessed the massacre of the unfortunate inhabitants. There are above forty other mosques; one, erected by the daughter of Aurungzebe, contains the tomb in which she was interred in 1710: some bear the marks of great antiquity, especially the *Kala Musjeed*, or black mosque, built of dark-coloured granite by the first Patan conquerors. It is exactly on the plan of the original Arabian mosques. The prospect S. the Shalimar gardens, as far as the eye can reach, is covered with the remains of extensive gardens, pavilions, mosques, and sepulchres, connecting the village of Cuttub with the new city of Delhi, from which it is nearly 10 m. distant SW., and exhibiting one of the most striking scenes of desolation to be anywhere met with. The celebrated Cuttub Minar is a very handsome round tower rising from a polygon of 27 sides, in 5 stages, gradually diminishing in circumference, to the height of 242 ft.: its summit, which is crowned by a majestic cupola rising from 4 arcades of red granite, is ascended by a spiral staircase of 384 steps, and between each stage a balcony runs round the pillar. The old Patan palace, a mass of ruin larger than the others, has been a solid fortress in a plain and unornamented style of architecture: it contains a high black pillar of cast metal of Hindoo construction, and originally covered with Hindoo characters, but which Feroze Shah afterwards enclosed within the court of his palace, covering it with Arabic and Persian inscriptions. The tomb of Humayoon is of Gothic architecture, surrounded by a large garden with terraces and fountains, nearly all of which are now gone to decay. The garden is surrounded by an embattled wall and cloister, and in its centre, on a platform ascended by four flights of granite steps, is the tomb itself, a square building, with a circular apartment within about as large as the Radcliffe library at Oxford, surmounted by a dome of white marble. From the top of this building, the desolation is seen to extend to the W., in which direction Indraput stood, apparently to a range of barren hills, 7 or 8 m. off.

The soil in the neighbourhood of Delhi is singularly destitute of vegetation; the Jumna annually overflows its banks during the rains; but its waters in this part of its course are so much impregnated with natron, that the ground is thereby rendered barren rather than fertile. In order to supply water to the royal gardens, the aqueduct of Ali Merdan Khan was constructed, by which the waters of the Jumna, while pure and wholesome, are conducted for 120 m. to Delhi, immediately after the river leaves the mountains. During the troubles that followed the decline of the Mogul power, the channel was neglected; and when the English took possession of the city, it was found choked up in most parts with rubbish. It is the sole source of vegetation to the gardens of Delhi, and of drinkable water to its inhab.; and, when re-opened in 1820, the whole pop. went out in jubilee to meet the stream as it flowed slowly onwards, throwing flowers, ghee, sweatmeats, and other offerings into the water, and calling down all manner of blessings on the British government. The deficiency of water is the greatest drawback upon the city and its prov., since Delhi is otherwise well fitted to become a great inland mart for the interchange of commodities between India and the countries to the N. and W. Cotton cloths and indigo are manufactured, and a shawl factory, with weavers from Cashmere, has of late been established here. Shawls, fruits, and horses, are brought from Cashmere and Caubul; precious stones and jewellery are good and plentiful; and there are perhaps few, if any, of the ancient cities of Hindostan which at the present time will be found to rival modern Delhi in the wealth of its bazaars or the activity of its pop. At the SW. extremity of the city stands the famous observatory, built, like that of Benares, by Jye Singh, rajah of Jyepoor, and formerly containing similar astronomical instruments; but which, together with the building itself, have been since partially destroyed. Near the Ajmeer gate is the *Medressa*, or college of Ghazee-ud-Deen-Khan, an edifice of great beauty, for the repair of which, and the revival of its functions, the government has very liberally contributed. The Delhi college is now divided into the Oriental and the English departments; astronomy and mathematics are taught on European principles; and, in 1830, there were 287 students. According to Abul Fazel, no less than seven successive cities have stood on the ground occupied by Delhi and its ruins. Indraprast'ha or Indraput was the first, and the residence of the Hindoo rajahs before 1193, when the Afghans or Patans conquered it: it was the seat also of the first eight sovereigns of that dynasty. Sultan Baleen built another fortified palace; Moaz-uddeen another, on the banks of the Jumna; and others were built in different parts by succeeding sovereigns, one of which was near Cuttub; and lastly, Shah Jehan, towards the middle of the 17th century, chose the present spot for its site, which is certainly more advantageous than that of any of the preceding cities. In 1011 Delhi was taken and plundered by Mahmoud of Ghiznee; in 1398 by Timour; in 1525 by Baber, who overturned the Patan dynasty, and commenced that

of the Moguls; in 1736 the Maharattas burned the suburbs; and in 1739 Delhi was entered and pillaged by Nadir Shah, who did not retain possession of it. Since 1803, together with its territory, it has virtually belonged to the British, and from that time until 1857, was the seat of a 'Resident,' who took charge of the emperor and royal family, to whom the liberal stipend of 150,000*l.* a year was allowed. The Indian mutiny, however, in which the people of Delhi took a leading part, changed this state of things. On May 12, 1857, the king of Delhi was proclaimed emperor by the insurgents, and retained his nominal power till the 21st of September of the same year, when the British forces, under General Wilson, stormed the city, and made him a prisoner. On the 22nd of September, the hiding places of the king's son and grandson were discovered, and they were slain on the spot. They had both been participators in the massacre of Englishmen, as well as instigators of the mutiny; their bodies were therefore brought into the city, and exposed to the view of the public. Thus ended all hope of the restoration of the Mogul dynasty, the once all-powerful rulers of Delhi.

DELOS, a small, and now barren and deserted but once famous island of Greece, in the strait between Mycone and Rhenea, or the greater Delos, almost in the centre of the Cyclades; lat. 37° 25′ N., long. 25° 15′ E. This island was regarded in antiquity with peculiar veneration, from its being supposed to be the birth-place of Apollo and Diana, to whom it was sacred. Magnificent temples were erected in honour of these deities. The temple of Apollo, of which the ruins still remain, raised at the joint expense of the Grecian states, is celebrated as having been one of the most splendid in the ancient world: and his oracle here was second only to that of Delphi. Pursuant to a practice begun by Theseus, a vessel sailed annually from Athens to Delos with offerings, conveying at the same time deputations appointed to perform sacrifices in honour of Apollo and Diana, and choruses of youths and virgins, who danced and sung hymns in their praise. Quinquennial games were also celebrated with great pomp, and were attended by deputations from all the Grecian states and islands. Delos was repeatedly purified; and to keep it from all pollution, neither births nor deaths were allowed to take place within its sacred precincts; but all women about to be confined, and all sick persons, were conveyed to the greater Delos. Such was its character for sanctity, that it commanded the respect even of barbarians; and the Persian admirals, who laid waste the other islands, would not touch at Delos. After the Persian war, the Athenians made it the treasury of the Greeks, and all meetings relative to the affairs of the confederacy were held in it.

Its sacred character, the security which it consequently enjoyed, its good harbour, and central position, made Delos a favourite seat of commerce as well as of religion and pleasure. Its festivals were attended by the merchants of Greece, Asia Minor, Phœnicia, Egypt, and Italy, who brought thither the products of their respective countries. On the destruction of Corinth, many of its principal merchants sought an asylum in Delos, which acquired a large portion of the traffic that had been driven from the former. It was a principal seat of the ancient slave trade; and Strabo states that thousands of slaves were brought thither from Cilicia, and sold in its markets. Cicero says of it, '*Insula Delos, tam procul a nobis in Ægeo mari posita, quo omnes undique cum mercibus atque omeribus commeabant, referta divitiis, parva, sine muro, nihil timebat.*' (Pro Lege Manil., c. 18.) A hill in the centre of the island was called *Mons Cynthus*, and hence the epithets *Cynthius* and *Cynthia* so frequently applied to Apollo and Diana. The heaps of marble, and the fragments of columns, architrayes, &c., which are everywhere met with, attest the ancient grandeur of this famous island. But it has been long since deserted; and Tournefort states that, in the early part of last century, the inhab. of Mycone were in the habit of holding the greater Delos for the purpose of pasturage, paying for it to the grand seignior a rent of 20 crowns a year. (Tournefort's Voyage du Levant, i. 290–325.)

DELPHI, DELPHOS, or PYTHO (at present *Castri*), a famous city of ancient Greece, the cap. of Phocis, and the seat of by far the most celebrated oracle of the ancient world ('*commune humani generis oraculum*,' Liv. lib. 38, § 48), at the S. foot of Mount Parnassus, 45 m. NW. Corinth, and 8½ m. NE. from the nearest point of the Crissean Sea (Gulf of Lepanto). Delphi had every attribute that could invest it with interest and inspire awe. It was supposed to be situated in the centre of the world, was built on the declivity of the mountain on successive terraces formed of Cyclopean masonry, and rising above each other like the seats in a theatre. Overhanging the city on the N. rose the two famous peaks of Parnassus, the chasm between them affording an outlet for the waters of the *Castalian* spring, the source of poetical inspiration. If we add to these natural advantages, the fact that Delphi was the chosen abode and principal oracle of Apollo; that she was the seat of the council of the Amphictyons, and the place where the Pythian games were celebrated, we need not wonder at the extraordinary respect and veneration in which she was held. She was not fortified by walls, but by precipices, and the especial protection of Apollo; so that the ancients reckoned it doubtful '*utrum munimentum loci, an majestas dei plus hic admirationis habeat.*' (Justin., lib. 24, § 6.)

The origin of this famous city, and of the oracle to which it owed all its glory, are buried in impenetrable obscurity. The most probable account seems to be, that a mephitic vapour, similar in some degree, perhaps, to that of the *Grotto del Cane* at Naples, having issued from one of the clefts of the rock, violently affected those by whom it was inhaled, making them utter strange incoherent sayings On this narrow foundation was built one of the most extraordinary fabrics ever raised by superstition, fraud, and imposture. The ravings of those affected by the vapour were believed to be indications of future events; they were said to be inspired; and the ejaculations which they uttered were affirmed to have been owing to their being filled with the breath or spirit (*divinus afflatus*) of Apollo, the guardian god of the place: the fame of the oracle rapidly increased, and it was soon seen how rich a harvest might be derived from it. The sacred cavern was forthwith enclosed; a tripod was placed over the chasm whence the vapour issued; priests and priestesses were appointed for the service of the god; and a series of temples, each more magnificent than its predecessor, were erected in his honour. States and princes were anxious to learn their fate, or the success of any contemplated enterprise, from the responses of the oracle; and private individuals crowded to the city for the same purpose. The answers of the god were not gratuitous; and it would seem that an opinion had early gained ground, that the nature of the responses was to a considerable extent dependent upon the value of the offerings! Hence there arose a kind of competition among those consult-

ing the oracle who should be most liberal; and the wealth accumulated at Delphi came, in the course of time, to be prodigiously great. The responses were, apparently at least, delivered by a priestess. After being purified by bathing in the Castalian spring, she mounted the tripod, and having inhaled the intoxicating or stupifying vapour, she became violently convulsed—

'Subitò non vultus, non color unus,
Non comtæ mansêre comæ; sed pectus anhelum,
Et rabie fera corda tument; majorque videri,
Nec mortale sonans; afflata est numine quando
Jam propiore dei.' Æneid, vi. line 47, &c.

The incoherent scraps of sentences which the Pythia uttered during this paroxysm having been collected and arranged in verses by the priests, formed the desired response.

The responses of the Pythia were said to be comparatively precise; and she was sometimes resorted to in order to clear away the mystery in which those of other oracles were involved. It may, indeed, be reasonably enough supposed; that superior address and information on the part of the Delphic priests might enable them in many instances to give pretty distinct responses, that could not fail frequently to square with the event. But, even if no evidence of the thing had come down to us, we might have been assured that, speaking generally, their responses would be ambiguous, and so contrived that, however the event might turn out, the credit of the oracle would be preserved: and this, in point of fact, was the case. The answer of the oracle to Crœsus, that in making war upon the Persians he should destroy a great empire (Herod, i. § 53), is an instance of this; as it is plain the credit of the oracle would be equally secured whether Crœsus conquered or was himself conquered by the Persians. The answer of the oracle to Pyrrhus is another instance of this sort of ambiguity—

'Aio te, Æacida, Romanos vincere posse,'

as it might either be interpreted in favour of or against Pyrrhus. This equivocation was not, however, the worst feature of the imposture carried on at Delphi. The oracle was at once ambiguous and venal. A rich or a powerful individual seldom found much difficulty in obtaining a response favourable to his projects, how unjust or objectionable soever. Herodotus states distinctly that the Alcmeonidæ, who rebuilt the temple at Delphi, bribed the Pythia to recommend the Spartans to assist in delivering Athens from the tyranny of the Pisistratidæ (v. § 60, 90); and such were the base motives that made the oracle falsely pronounce Demaratus, king of Sparta, to be illegitimate, and obtained responses favourable to Lysander when he endeavoured to change the succession to the Spartan throne. This also was, no doubt, the sort of inspiration that dictated the responses favourable to Philip, which made Demosthenes declare that the Pythia *philippised!* But such and so powerful is the influence of superstition, that this threadbare system of fraud and quackery maintained a lengthened ascendancy; and that the responses of frantic girls, interpreted by venal priests, frequently sufficed to excite bloody wars, and to spread desolation through extensive states.

The credit of the oracle had been materially impaired before Christianity obtained an ascendancy in the ancient world; and the triumph of the latter was destructive of this as well as other oracles. Constantine carried off some of the finest and most costly ornaments of the Delphian temple to decorate his new capital. And there is still to be seen in Constantinople the brazen pillar, formed of three serpents twisted together, that supported the golden tripod which, after the defeat of Xerxes, was consecrated in the temple of Delphi by the victorious Greeks: (See CONSTANTINOPLE; Gibbon, cap. 17, &c.)

The vast wealth of the temple of Delphi exposed it to many attacks. A party sent by Xerxes to plunder the sacred edifice are said to have been defeated by the manifest interposition of Apollo himself. (Herod., viii. § 37.) But, on other occasions, the god was less vigilant or less successful. The fane was successively plundered by the Phocians under Philomelus, by the Gauls under Brennus, by Sylla, &c.; and Nero is reported to have deprived it of no fewer than 500 bronze statues! and yet, despite all these deductions from its ancient stores, it had, when visited and described by Pausanias, a vast number of statues and ornaments of all sorts. But its treasure had disappeared long previously; and the rich offerings of Gyges, Alyattes, Crœsus, and Midas were no longer to be seen.

Except its grand natural features, every thing at Delphi has undergone a total change. Not a vestige remains of the great temple, by which to form even a satisfactory conjecture as to its position. The prophetic cavern is searched for in vain: '*antraque mœsta silent, inconsultique recessus.*' The village of Castri, that occupies a part at least of the site of the ancient city, is poor and miserable, and does not contain above 400 or 500 inhab.:—

'Tantum ævi longinqua valet mutare vetustas!'

DELVINO, a town of Turkey in Europe, prov. Albania, cap. of a *sunjiack* or distr., 43 m. WNW. Yanina. Estimated pop. 10,000. The vicinity contains some orange plantations; but is chiefly noted for its olive cultivation. The trade of the town is chiefly in oil, and other agricultural produce.

DEMERARA. See GUIANA (BRITISH).

DEMONTE, an inl. town of N. Italy, prov. Cuneo, cap. mand., on the Stura, 13 m. SW. Coni. Pop. 6,166 in 1861. The town is commanded by a fortress placed on an isolated height, and contains three churches and a hospital. It was formerly fortified, but its works were demolished by the French in 1801.

DEMOTICA, or DIMOTIKA, a town of Turkey in Europe, prov. Roumelia, on the Maritza, at the foot of a conical hill, crowned by a citadel, containing a palace, occasionally occupied by the Turkish emperors during the period that Adrianople was the cap. of the empire, from which city Demotica is distant 24 m. S. by W. Pop. about 8,000. The town is tolerably well built; it contains a mosque, and several Greek churches, schools, and public baths. The citadel is supplied with water by an aqueduct. It is the residence of a Greek archbishop, and has manufactures of silk and woollen stuffs, and earthenware. Charles XII. of Sweden resided in this town for more than a year subsequently to the battle of Pultawa.

DENAIN, a village of France, dép. du Nord, in the cant. of Bouchain, 6 m. SW. Valenciennes, on the Northern railway. Pop. 10,254 in 1861. The place has numerous forges, and beet-root factories, and there are extensive coal mines in the neighbourhood. Denain is famous in modern history as the scene of the decisive victory gained in 1712 by the French under Marshal Villars over the allies under Prince Eugene. This victory, which is partly to be ascribed to the improvidence of the allies, and partly to the skilful combinations of Villars, saved Louis XIV. from the disgrace of having the terms of peace dictated to him in his

own capital. It changed, in fact, the whole aspect of public affairs; and brought the negotiations at Utrecht to a speedy conclusion.

DENBIGH, a marit. co. of N. Wales, having N. the Irish Sea, E. the cos. of Flint and Cheshire, S. Salop, Montgomery, and Merioneth, and W. Caernarvon. Shape very irregular. Area 603 sq. m., or 386,052 acres. Surface and soil much diversified; for the most part, however, it is rugged, wild, and mountainous: but it has some very fertile tracts, particularly in the far-famed vale of Clwyd, on both sides the river of that name, lying mostly in this co., and which is eminently beautiful and fertile, producing the necessaries of life not only in abundance for the inhab., but in ample sufficiency to spare to supply the wants of their neighbours. The vale of Llangollen, in the E. part of the co., though inferior in point of richness to that of Clwyd, is notwithstanding pretty fertile, and there is a considerable extent of good land in the vicinity of Wrexham. The climate in the valleys is remarkably mild, but rain is very prevalent, and considerable damage is sometimes done by the overflowing of the rivers. Agriculture, though a good deal improved, is still very backward. Barley, oats, and potatoes are the principal crops; wheat, beans, and pease being also raised in some of the more fertile districts. There is no regular rotation of crops; whichever grain happens to be most in demand is sown. It is also a frequent practice to burn the surface both of fresh enclosed lands and old clover leys; but this, though at the time it yields good crops of oats and turnips, impoverishes and ultimately exhausts the land. Farms are usually very small; and being let only by the year, and without any conditions as to management, we need not wonder at the low state of agriculture. Average rent of land, in 1810, 9s. an acre. The hills are depastured by large flocks of sheep, and large herds of cattle are found in the valleys. The dairy husbandry is carried on to a considerable extent, particularly in the E. parts of the co., adjacent to Cheshire. The minerals are valuable, coal, lead, and iron-mines being wrought in different parts of the co.; it also furnishes slate and mill-stones. The woollen manufacture is carried on to some extent, and gloves and shoes are produced in considerable quantities in Denbigh. It is bounded E. by the Dee, and W. by the Conway, and is traversed by the Clwyd and Ebwy. Denbigh is divided into six cantreffs or hundreds, and sixty-four parishes. It returns three mems. to the H. of C., viz. two for the co., and one for Denbigh and its contributory bors.: county constituency, 4,306 in 1865. According to the census of 1861, the co. had a pop. of 100,778, inhabiting 21,310 houses. Gross annual value of real property assessed to income tax, 473,355*l.* in 1857, and 486,779*l.* in 1862.

DENBIGH, a town and parl. bor. of N. Wales, cap. of the above co., hund. Yule, near the middle of the vale of Clwyd, at the base and on the side of a steep hill, crowned with the magnificent ruins of its old castle; 22 m. W. Chester, and 180 m. NW. London, on a branch line of the London and North Western railway. Pop. of parl. bor. 5,946, and of par. 4,054 in 1861. The town consists of three principal and some smaller streets and lanes; it is well paved and lighted, but many of the houses have a dilapidated appearance. The par. church, 1 m. E. from the town, has many interesting monuments; there are two other churches, besides a Catholic and four dissenting chapels. Other public buildings are, a town-hall, free grammar-school, with a small endowment, a blue-coat school, a national school, and several Sunday schools supported by the various sects; a reading-room, and a literary society. There is also a dispensary for the poor of the town and neighbourhood. The old staple trades of the town are shoe-making, glove-making, and tanning, particularly the first. The limits of the parl. bor. were the subject of much dispute till they were definitively fixed in 1826. Denbigh, with Ruthin and Holt, has returned one mem. to the H. of C. since the 27th of Henry VIII., the right of voting being in the resident burgesses. The Reform Act added Wrexham to the contributory bors. Registered electors in the Denbigh parl. district, 845 in 1862. The present municipal bor. is restricted to the space immediately contiguous to the town; and the governing body consists of four aldermen and twelve counsellors. The waste lands of the par. belong to the corporation, whose annual average revenue from these and other sources was 442*l.* in 1862. The Easter and Michaelmas quarter sessions of the co. are held in the town, which is a polling place for the co. The castle, both from its situation and structure, was anciently of great importance. It was founded in the 2nd of Edward I. by Henry Lacey, earl of Lincoln. A magnificent pointed archway, with a statue of the founder, is still in tolerable preservation; but the rest is entirely ruinous. There is a bowling-green and several cottages within the enclosure. The prospect from the castle is extensive and magnificent. In the last civil war the castle withstood a siege by the parliamentary forces in 1645; and thither the king retreated from Chester. It was taken in the following year, and soon after dismantled.

DENDERAH (the *Tentyra* of the Greeks), a ruined town of Upper Egypt, celebrated for its temple, the best-preserved of all the remains of antiquity with which Egypt, particularly the Said, abounds; near the W. bank of the Nile, 31 m. N. Thebes, lat. 26° 10′ 20″ N., long. 32° 40′ 27″ E. The town, 1½ m. E. from the temple, stands in an extensive and well-cultivated plain, which expands on both sides the Nile, and is surrounded by mountains, so as to give it the appearance of a beautiful circular basin, shaded by thick groves of palm trees. The temple stands on the very verge of the Lybian desert, the encroachments of which have buried a large portion of the buildings under heaps of sand; but enough is still visible to indicate its magnitude and magnificence, and to impress the spectator with the deepest sense of the wealth, power, and civilisation of the illustrious but long extinct people by whom so noble a fabric was raised. The temple and the buildings appertaining to it, with the exception of one propylon, are enclosed within a square wall of sun-dried bricks, each side measuring 1,000 ft., and in some parts 35 ft. high, and 15 ft. thick. After passing a small stone-building, and a gateway or propylon entirely covered with well-executed sculptures and hieroglyphics, the spectator, proceeding through the *dromos* (avenue lined on each side with sphynxes) arrives at the temple. It is nearly in the form of the letter T; and its simplicity, vastness, the durability of its structure, and its ornaments and sculptures, in perfect preservation, though no longer intelligible, excite the strongest feelings of awe and astonishment. The front of the *pronaos*, or portico, is adorned with a beautiful cornice, supported by six square columns, with capitals formed of colossal heads of Isis. Within, twenty-four cylindrical columns, ranged in six rows of four deep, support the roof: the capitals of these columns are quadrangular, and exhibit on each face the representation of a temple with a divinity under the portico of the sanctuary; between the capital and the shaft, heads of Isis

again appear; including their base and capitals, the height of the columns is about 46 ft.: the shafts are sculptured with hieroglyphics and figures in basso-relievo, as are the front and ceiling; the designs on which last have been supposed to be intended to represent a zodiac. Indeed there is no where in the whole apartment a space of 2 ft. that is not covered with sculptures, in low relief, of human beings, animals, plants, emblems of agriculture or of religious ceremony. The temple, which is equally enriched with sculptures, consists of several apartments, partially lighted by circular holes cut in the ceiling. The sanctuary is, however, quite dark. Access is provided to the roof by means of a staircase, with steps so low that priests might convey up and down the weighty paraphernalia of sacrifice. But the most remarkable object, in the estimation of Europeans, belonging to the temple, was the ceiling of an upper chamber, exhibiting in twelve compartments, like that of the pronaos, a variety of mythological figures, which correspond very closely with the Greek signs of the zodiac: it was enclosed within three concentric circles, and supported by eight male figures kneeling, and four females standing, most harmoniously grouped. The remains of a smaller temple stand to the right of the propylon, supposed to have been dedicated to the malignant deity, Typhon.

A great deal of curious and learned discussion has taken place with respect to the antiquity of the zodiac of Denderah. (Notice sur le Zodiaque de Denderah, par. M. St. Martin, Paris, 1822.) Dupuis, Fourier, and other writers, concluded, from the places of the figures of the constellations on it, compared with their present places, and the precession of the equinoxes, that it had been constructed about 5,000 years ago. But Littrow, Playfair, and some other learned astronomers, inferred from the same data, and with infinitely more of probability, that the age of the zodiac did not exceed 3,228 years. Subsequent researches by Visconti, Letronne, St. Martin, and others, have, however, gone far to show that the calculations referred to had no real foundation, and that the figures on the so-called zodiac are probably astrological or mythological representations, and have nothing of an astronomical or scientific character. At the same time, however, it must be admitted, that the purpose of the supposed zodiac, and its antiquity, are still involved in the greatest uncertainty. With respect to the temple itself, it would seem, from its being one of the most perfect and beautiful in the country, to belong to the period of the later Egyptian kings, when the arts had attained to their highest perfection; but there are not, perhaps, any really good grounds for the notion that it is of so late a date as the era of the Ptolemies, though alterations may then have been effected in it. The zodiac, or planisphere, that gave rise to these discussions, is now in Paris. The pacha having consented to the desecration of the temple, this extraordinary monument was skilfully cut out, and conveyed to France, in 1822, by a M. Lelorain. It was subsequently purchased by the French government for 15,000 fr., and placed in the Louvre.

DENDERMONDE (Belg. *Termonae*), a fortified town of Belgium, prov. E. Flanders, cap. arrond., on the Scheldt, at the point where it is joined by the Dendre, 15½ m. E. Ghent, on the railway from Ghent to Malines. Pop. 9,530 in 1856. The town has 4 churches, 5 chapels, a town-hall, a hospital, lunatic and orphan asylums, 2 convents, a college, 14 schools, and a prison. It is defended by a citadel constructed under the Duke of Parma in 1584; is the seat of a court of original jurisdiction; and has manufactures of woollen stuffs, cotton yarn, hats, lace, tobacco, soap, oil, and earthenware; bleaching and dye-houses, breweries, distilleries, and flour and other mills, with a considerable trade in corn, hemp, flax, and oil. It is believed to have been founded no earlier than the 8th century, though many Roman antiquities have been dug up in it at different periods. It was unsuccessfully besieged by Louis XIV. in 1667, but fell into the hands of the French in 1745. It suffered severely from an inundation in 1825.

DENHOLM, a manufacturing village of Scotland, co. Roxburgh, 4 m. NE. Hawick, on a rising ground 1 m. S. from the river Teviot. Pop. 766 in 1861. The inhab. are almost entirely engaged in the weaving of woollen stockings, on account of the Hawick manufacturers. There is a flour-mill here; as also a dissenting chapel, and a subscription library. Dr. John Leyden, the celebrated poet and linguist, was a native of this place.

DENIS (ST.), a town of France, dép. Seine, cap. arrond., in a fertile plain near the Seine, and on the canal which unites that river with the canal of Ourq, 5 m. N. Paris on the Northern railway. Pop. 22,052 in 1861. The town is chiefly remarkable for its abbey-church, built in the 7th century by Dagobert I., who was buried within its walls; since which time it has been the customary burial-place of the kings of France. It was materially improved by Suger, abbot of St. Denis, in 1130, and has been further enlarged by different sovereigns in succeeding ages, so that it has a great variety of architectural style. It is an imposing Gothic edifice, in the form of a cross, 415½ ft. in length, by 106½ ft. broad, and 85 ft. high. Its front has two towers, one of which is surmounted by a spire. Most of the tombs of the kings of the first, second, and third races are in a subterranean vault. In 1793, during the revolution, many of these tombs were destroyed, and the remains they enclosed, not excepting even those of Henry IV., were thrown together and buried under a heap of earth in the environs of Paris. The demolition of the building itself was subsequently ordered, but this was not effected. The town has some good infantry barracks, an establishment for the education of 500 girls, orphans of members of the Legion of Honour, founded by Napoleon, which occupies the celebrated abbey of St. Denis, founded by Dagobert I. in 613; a public library, and theatre. St. Denis is well built: it is the seat of a sub-prefect; has manufactures of woollens, cottons, and leather; and a brisk trade in flour, wine, vinegar, wool, and timber.

DENMARK, one of the secondary European kingdoms, on the south side of the entrance to the Baltic, between 53° and 58° N. lat., and 8° and 13° E. long. It consists partly of the peninsula, stretching from the river Königsaue, or Kongeaae, the northern frontier of Schleswig, to the Skaw or Skagen, and comprising the prov. of Jutland; and partly of the Danish Archipelago, or of the islands of Zealand, Funen, Laland, Falster, &c., between the Baltic and the Cattegat, and the island of Bornholm, in the Baltic. Except on the S., where it is bounded by the duchy of Schleswig, continental Denmark is everywhere surrounded by the sea, having E. the Baltic, the Little Belt, and the Cattegat; N. the Skagerac; and W. the North Sea. Iceland, the Feroe Isles, part of Greenland, and some possessions in the E. and W. Indies, belong to Denmark. Exclusive of these, the kingdom contains an area of 14,493 sq. m., with a pop. of 1,600,551, according to the census of 1860.

Surface and Soil.—There are no mountains in

Denmark, and the few hills by which it is marked are little more than undulations. It is generally low and level, the coasts being seldom elevated much above the sea. In parts of the W. coast of Jutland, the country, which has partly been wrested from the sea, is defended, as in Holland, against its irruptions by immense mounds or dikes, managed by a government board. Soil various. In extensive dists., particularly in the SW. part of Jutland, it is exceeding fertile, being very rich marsh-land, producing the finest pasture and excellent crops. In other parts, more especially in central and NW. Jutland, the soil is arid, sandy, and barren, large tracts being heath. The soil of the islands consists of clay mixed with sand and lime.

Rivers and Lakes.—Denmark having no mountains, and every part of it being within a short distance of the sea, has no rivers of any magnitude. Fresh water lakes numerous, but not large. The most remarkable feature in the physical geography of Denmark is the number and extent of the inlets of the sea, or rather lagoons, by which the continental part of the country is intersected. The principal of these lagoons, the Lymfiord, formerly communicated only by a narrow channel with the Cattegat, stretching thence in a W. direction, with long windings, and expanding in various places into immense sheets of water, encompassing large islands, across the peninsula of Jutland almost to the North Sea. In 1825, however, during a violent storm, the isthmus between the North Sea and the Lymfiord was broken down in two places, so that it now isolates the N. portion of Jutland; but the newly opened channel is too shallow to be of much use for the purposes of navigation, and the depth of the opening to the Cattegat has also decreased, so as only to admit vessels of comparatively small burden. There are other fiords, but none so extensive as this. They, as well as the bays and rivers, are well stocked with fish, the fishery being a principal business and dependence of the inhab.

Animal and Vegetable Products.—These are almost the same in Denmark as in Great Britain. The horses and cattle of W. Jutland are amongst the best that are anywhere to be met with; those that belong to the islands and N. Jutland are of a smaller breed, but strong and active. The wool of the sheep is short and coarse; but latterly it has been a good deal improved by crossing with merinos. The feeding of pigs is prosecuted to a great extent, and quantities of bacon are yearly exported. Poultry is so abundant that their feathers alone make an article of export. All the common grasses, with potatoes, flax and hemp, madder, and tobacco, are raised in Denmark. The forests are not very extensive. They lie principally along the eastern shores of Jutland, and in Zealand and Funen; consisting principally of birch, but also of ash, alder, and oak. Pine and fir are rare.

Mineral Products, in Denmark, are but of little value. The subsoil chiefly consists of sand and clay, and no metals have been discovered that would repay the expense of working. There is a brine spring near Oldersloe; but it does not furnish salt sufficient for the consumption of the kingdom. The want of coal is in part compensated by the abundance of turf.

Climate.—Being almost everywhere surrounded by the sea, the climate is humid, and in its principal features approaches pretty closely to that of Scotland. The transition from winter to summer, and from summer to winter, is, however, a good deal more abrupt, so much so, indeed, that spring and autumn, particularly the first, are but faintly marked; the heat of the summer is, at the same time, greater than in Scotland, and the cold of the winter more severe. These differences arise from the greater proximity of Denmark to the continent. The winds not being broken by any mountains, often sweep along with great violence. The NW. wind, called *Skai*, which is especially felt in May and June, is so severe on the W. coast o Jutland, as to wither the tops of the trees. The Sound is sometimes frozen over; but this is said to arise more frequently from the drifting of ice formed in higher latitudes than from the intensity of the cold at the place. In 1659, the Swedes marched an army on the ice across the Sound to besiege Copenhagen. Fogs are very prevalent.

Agriculture.—In Denmark, as in most other European countries, the peasantry or occupiers of the soil were at no very distant period in the most depressed state imaginable. 'In Zealand,' says Lord Molesworth, and the same observations then applied to the rest of the kingdom, 'they are all as absolute slaves as the negroes are in Barbadoes; but with this difference, that their fare is not so good. Neither they, nor their posterity to all generations, can leave the land to which they belong; the gentlemen counting riches by their stocks of boors, as here with us by our stocks of cattle, and the more they have of them the richer they are. In case of purchase, they are sold as belonging to the freehold, just as timber trees are with us. There is no computing there by numbers of acres, but by numbers of boors: who, with all that belongs to them, appertain to the proprietor of the land. Yeomanry, which is the strength of England, is a state not known nor heard of in Denmark; but these poor drudges, after they have laboured with all their might to raise the king's taxes, must pay the overplus of the profits of the lands and their own toil to the landlords, who are almost as poor as themselves. If any of these poor wretches prove to be of a diligent and improving temper, who endeavours to do a little better than his fellows, and to that end has repaired his farm-house, making it convenient, neat, and pleasant, it is forty to one but he is presently transplanted from thence to a naked and uncomfortable habitation, to the end that his griping landlord may get more rent by placing another on the land that is thus improved: so that in some years 'tis likely there will be few or no farm-houses, when those already built are fallen through age or neglect.' (Account of Denmark in 1692, 4th ed. p. 54.) In 1761, the queen Sophia Magdalen had the honour of being the first to set a better example to the Danish proprietors, by publicly enfranchising the peasantry on her estates; and the example was soon after followed by Count Bernstorff and others. At this period about a sixth part of the land was supposed to belong to the crown; but the crown estates were soon after divided into farms of a moderate size, and a large portion of them disposed of to any one who chose to become a purchaser. Previously to this period very few peasants were proprietors; but their number now began speedily to increase, partly in consequence of the sale and division of the crown estates, and partly of their purchasing up their leases from their lords. In 1788, the peasantry of Denmark, that is of Jutland and the islands, were finally emancipated from all political bondage; and a commission was at the same time appointed to regulate the rents and services to be paid by those tenants holding hereditary leases, or leases for lives, where the parties could not come to an agreement. In 1791 and 1799 fresh ordinances were issued on the same subject, having for their object to reduce the number of such tenants, by converting them, under equitable con-

ditions, into proprietors, and for restraining the right of free way.

In consequence of these measures a very great change has taken place in the distribution of property in Denmark. Large estates have been so much broken down, that at this moment at least one-half of the soil of the kingdom belongs to petty proprietors. The division of property has been going on at an increasing rate since the year 1850, when the last privileges attaching to the possession of landed estates were taken away. From an official return of the year 1861, it appears that at that time there were in the whole kingdom little more than a thousand *hovedgaarde*, that is, estates taxed at above 12 tons of hartkorn, against nearly 80,000 *bondergaarde*, or cottage-farms, taxed under 12 tons of hartkorn. The ton of hartkorn represents an area of no definite size, varying according to the nature of the soil and its fertility, the ton, or barrel, of grain being equal to 3·8 imperial bushels. On the average, the ton of hardcorn may be said to be equivalent to 5½ acres. It will thus be seen that the parcelling out of the land has gone very far, and, indeed, it is generally admitted that the principal drawbacks upon agriculture in Denmark are the great division of property and the consequent want of capital. (As regards the taxation of land, see *Finances* below.)

The average earnings of ordinary agricultural labourers in Denmark may vary from 15*l.* to 20*l.* a year. Their situation is decidedly comfortable. Mr. Macgregor, British consul at Elsineur, an intelligent and careful observer, gives the following details illustrative of their command over necessaries and comforts:—'The Danes are great eaters, and they eat at all times of the day. The following quantities of food are usually allowed to male farm servants per month: bread, 60 lbs.; potatoes, half a bushel; groats, half a bushel; butter, 4 lb.; bacon, 10 lb.; meat, 4 lb.; salted herrings, 30 lb.; salt fish, 2 lbs.; beer, 60 quarts; milk, *ad libitum*. The Danish peasants make 5 meals a day in summer. Early in the morning they have, 1st, breakfast, consisting sometimes of coffee, but generally of warm milk and bread; 2d, at 9 o'clock, follows bread and butter and a dram; 3d, at 12 o'clock, dinner, the introduction to which consists of spoon-meat, such as milk porridge, beer soup, curds with warm milk or beer, or of fish, boiled groats, cheese, greens or dried peas, after which follows fresh or dried fish, bacon or meat, with potatoes or other vegetables, or boiled or poached eggs, or pancakes; 4th, at 5 o'clock, bread and butter and a dram or two, especially in harvest time; 5th, supper after sunset, sour groats, curds, with milk or buttermilk. In winter, when they get up later, they have one breakfast, and consequently, they only make 4 meals a day. The poorer families seldom boil their kale upon meat, but upon a piece of hog's lard or bacon. In most of the cottages a sheep or a lamb is killed before the winter. The more substantial peasants kill a pig, a cow, or an ox, and they dispose of what they do not require themselves to their neighbours. They also kill a certain number of geese and ducks, salting them down for the winter, and using the feathers for their beds. This mode of living applies chiefly to peasants in districts of a middling soil, but where it is richer, they have more of bacon, meat, and fish, in lieu of other dishes; also is the beer they drink of greater strength. Fish is almost their diurnal food in villages adjacent to the sea, and they often use dried fish instead of bread, especially where the rye crops have failed, when their rye bread is often found mixed with barley. Amongst the poorer cottagers who have no land, it would sometimes happen that they must content themselves with a crust of dry bread, and milk and water in lieu of beer; but such cases are not of frequent occurrence; at least, all the reports on the agricultural state of the country which have been published these later years, concur in stating that the generality of peasants are well off, and that there is plenty of employment in the country for all labourers that choose to work.

'I shall conclude these observations by stating the annual expenditure of a labourer with a wife and three children in this neighbourhood (Elsineur), the several items reduced into sterling:—

	£	s.	d.
House Rent and Taxes	0	10	0
Turf for Fuel	0	12	0
Rye for Bread, 3½ quarters, at 13*s.* 6*d.*	2	6	6
Barley for Bread and Groats, 4½ qrs., at 10*s.* 6*d.*	2	7	3
Meat and Bacon, 30 stone, at 1*s.* 9*d.*	2	12	6
Potatoes, 12 quarters, at 2*s.* 3*d.*	1	7	0
Coffee, ½ lb.; sugar, ½ lb. per week	2	2	0
Butter, 1½ firkin; cheese, 120 lb.	2	6	0
Milk, 8 quarts per week, at ½*d.*	0	17	4
Soap, Candles, and Groceries	0	18	0
Clothing, Brandy, and Lottery Tickets	3	2	0
School Rate, 5*d.*; Books, 2*s.* 2*d.*	0	2	7
Religious Teaching	0	3	4
	£19	6	6

'This is nearly what the amount of their joint labour would produce, provided they be employed during an average number of days in the year. At a certain distance from the large towns, the items of coffee, sugar, and brandy must in a great measure be omitted, by which the whole expenditure would be reduced to about 15*l.* sterling per annum.'

Barley, oats, and wheat are largely cultivated in Denmark. Wheat, though plump, is coarse and damp; the barley is heavy; oats of a medium quality; rye, being the principal bread corn of the country, especially of Jutland, is grown in large quantities; this also is the case with rape, beans, tares, buck-wheat, and potatoes, particularly the first, which is a leading article of export to Holland and England. But the principal attention of all the more extensive and intelligent Danish farmers is directed to grazing, fatting, and the dairy. The pastures in many parts are little, if at all, inferior to those of Lincolnshire. Horses, cattle, salted pork and beef, butter, wool (which has been much improved), and other animal products are, in fact, in ordinary years, the principal article of export from the country. It appears from an official return ('Statistical Tables relating to Foreign Countries, part ix.') that there were at the end of 1861, in the whole of the kingdom, 324,550 horses; 1,118,774 cattle; 1,751,950 sheep; and 300,928 swine. The dwelling-houses of the farmers and their office houses are generally contiguous in the same building, but they are notwithstanding sufficiently distinct; and the houses of the better class of farmers are neatly and comfortably furnished.

Manufactures in Denmark are not prosecuted on a considerable scale, nor is their condition at all prosperous. The peasantry in most parts of the kingdom spin and weave linens and woollens, and knit stockings for their own use. Woollens, silks, cottons, and linens are manufactured at Copenhagen and other towns; but the business is languishing and unprofitable. Distillation and brewing are prosecuted to a great extent, and with more success than any other branch of industry, in the capital. Coarse earthenware is made in various places, and a porcelain manufacture is carried on upon account of the crown, and, as might be expected, to its loss. There are also

sugar refineries, paper mills, soap works, tanneries, and hat manufactories. With the exception of the manufacture of cannon and arms at Frederickswerk and Hellebeck, the iron and hardware works are quite unimportant. Within recent years numbers of flour mills have been constructed, and large quantities of flour are now exported from Copenhagen and Flensborg.

The low state of manufacturing industry is ascribable partly and principally to natural, and partly to political causes. Denmark is essentially an agricultural country. Being nearly destitute of coal, of water power, and of the useful minerals, she has no natural facilities for the successful prosecution of manufactures; and, in addition to this, she has little capital, and is deprived of the indispensable stimulus of domestic competition. All, or nearly all, the branches of industry carried on in the kingdom are subjected to the government of guilds or corporations. No person can engage in any business until he has been authorised by its particular guild; and as this is rarely obtained without a considerable sacrifice, the real effect of the system is to fetter competition and improvement. However, the education of mechanics is beginning to be improved by the formation of mechanics' institutes and similar establishments.

Trade and Commerce.—Subjoined is an account of the quantity of the principal articles, the produce of Denmark, exported from that kingdom in each of the years 1861 and 1862:—

Exports		1861	1862
Animals:—			
Horned Cattle	No.	446	453
„ Calves	„	12	8
Horses	„	186	202
Swine	„	1,091	12,435
Corn, Meal, and Flour	Tönder	2,621,463	2,225,437
Horse Beans	„	—	—
Corn & Potatoe Brandy	Viertels	215,945	188,068
Rape Seed	Tönder	50,381	55,715
Oil Cakes	Lbs.	9,758,028	8,037,651
Potatoes	Tönder	4,352	1,188
Oil	Lbs.	196,074	180,547
Oil, Train	Tönder	10,201	9,526
Meat	Lbs.	1,126,768	1,433,774
Fish	„	1,361,427	469,168
Butter	Tönder	20,846	26,045
Bacon and Lard	Lbs.	2,193,795	2,036,248
Milk	Pott	—	—
Hides and Skins	Lbs.	1,848,362	1,695,660
Boots and Shoes	„	811	1,330
Turf	Fuder	—	—
Wool	Lbs.	2,565,908	3,406,820
Wax	„	7,501	14,104
Tallow	„	204,906	167,860
Sugar and Molasses	„	644,430	689,874

The commerce of Denmark is less than what might be expected from its insular position, surrounded by excellent harbours on every side. But from the earliest times the people, notwithstanding their advantageous situation, could hardly, having but little native produce to export, engage extensively in any branch of foreign trade, except as carriers for others, and in this department they were far surpassed, first by the Hanse Towns, and afterwards by the Dutch. However, since the peace of Stockholm, in 1720, the commerce and navigation of Denmark have gradually improved. During the war between France and Great Britain, down to 1807, the neutrality enjoyed by the Danes gave them great advantages, and occasioned a considerable increase of their mercantile navy. But the attack on Copenhagen by the English in the last-mentioned year, and the hostilities in which the Danes were consequently involved, deprived them of these advantages, and materially depressed their trade. The loss of Norway, at the general peace of 1815, though it detracted little, if any thing, from the real strength of the monarchy, greatly diminished the importance of Denmark as a naval power, which was again much depressed by the loss of the duchies in 1864. In fact, since the latter period, the commerce of the kingdom has been anything but progressive. At the end of 1862, the mercantile navy comprised 2,763 sailing vessels, of a total burthen of 68,603 lasts (of two tons each), and 44 steamers, of 2,001 lasts, and 2,512 horse power.

Colonies.—In the West Indies, the Danes possess the small but well-cultivated island of St. Croix, producing annually about 25,000,000 lbs. of sugar, and 1,400,000 galls. of rum. Previously to 1803, when the Danes, much to their honour, suppressed the slave trade, they had a considerable intercourse with Africa. But this has since nearly ceased. The trade with the East was formerly in the hands of a company, which was dissolved in 1838. The actual colonial possessions of Denmark consist of the islands of Faroë, Iceland, and Greenland in Europe; the first-named—17 in number—having a population of 8,651; Iceland of 64,603; and Greenland of 9,892 souls. The West India possessions, St. Croix, St. Thomas, and St. John, with a number of smaller islands, have a population of 37,137, according to the census of 1860. The establishments on the coast of Guinea, forts Christianborg, Fredensborg, and various other places, were ceded to Great Britain, by purchase, in 1850. The town of Tranquebar with the surrounding district, on the Coromandel coast, ceded to Denmark by the rajah of Tanjore, in 1620, and the small territory of Serampore—Danish Fredericksnagor—in Bengal, founded by the Danish East India Company in 1755, were transferred to Great Britain in 1846. The Nicobar Islands, in the Bay of Bengal, were taken possession of by the Danish government in 1756, and for some time were in a flourishing state, the population amounting to above 6,000 in the year 1840. Eight years later, however, in 1848, they were abandoned as useless, nominally on account of their insalubrity.

Races.—Population.—The prov. of Jutland received in antiquity the name of *Cimbrica Chersonesus*, from the earliest inhabitants being Cimbri or Celts, the ancestors of the Welsh. The Goths, in their progress from the N. and E., took possession of the country of the Cimbri; and the expatriated inhabitants having been joined by some other displaced tribes, were wandering in quest of settlements, when they were met and entirely defeated by Marius in two great engagements, about 100 years before the Christian æra. After the expulsion of the Cimbri, the peninsula was parcelled among several Gothic tribes, who also took possession of the islands, now forming the principal part of the kingdom of Denmark.

The increase of population has been very considerable for a long time past, and particularly since the beginning of the present century. During the latter period, it was owing, no doubt, to the emancipation of the peasantry; the breaking down of large estates, and the consequent increase of small properties and farms; the enclosure of commons and the progress made in agriculture; the introduction of vaccination; and the improved condition of the bulk of the people. The increase of pop. in the townships has exceeded that in the merely rural districts; but the town pop. is not very considerable; in fact, if we except Copenhagen and Odense, no town in the kingdom

has 12,000 inhabitants, and but very few approach nearly to that amount.

The proportionate increase in the population of Denmark for the last ten years has been larger in the towns than in the country districts. In Copenhagen it has been 8·05 per cent., in the other commercial towns together 10·29 per cent., whilst in the country districts it has only been 5·99 per cent.

The titles of nobility in the kingdom of Denmark are only two, count, or earl, and baron; but there is a large untitled *noblesse*, consisting of the most ancient families in the country, which rank higher in public estimation than many of the modern houses ennobled by the crown.

The occupations of the people are stated as follows in the census of 1860. Out of an average of 1,000 people, 395 live exclusively by agriculture; 228 by manufactures and trades; 187 are day labourers; 53 are commercial men; 29 mariners; 20 paupers; 16 ministers and schoolmasters, or connected with education; 15 pensioners, or people living on 'aftagt' (an allowance to those who cede their farms from old age, &c.); 13 servants; between 11 and 12 hold appointments in the civil offices; 9 are commissioned and non-commissioned officers in the army and navy; 9 capitalists; 7 follow scientific and literary pursuits (including students at the Universities); about 5 have no fixed means of living; and a little over 1 are in prison for crimes or misdemeanours. The increase in the population by births has, on an average, been at the rate of 165 children to every 1,000 women between 20 and 50 years of age. Out of the above number of children, 1 in every 10 or 11 has been illegitimate, and between 4 and 5 per cent. still-born.

Government.—Previously to 1660, the crown of Denmark was elective. The supreme legislative authority was vested in a diet, or assembly, composed of deputies chosen by the nobility, clergy, and commons. But the influence of the nobles predominated very much in this assembly; and they also shared the executive power with the king and enjoyed many immunities. The dissatisfaction of the people with this distribution of power, and still more with the oppressions they too frequently suffered at the hands of the nobles, was greatly inflamed, at the period referred to, by the humiliating treaty concluded in the course of the year with Sweden, and by the refusal of the nobles to submit to bear an equal share of the burdens required by the state of public affairs. In this crisis the partisans of the crown prevailed on the deputies of the clergy and the commons to make a voluntary surrender of their rights, and as the only way of putting an end to the existing dissensions, and of rescuing themselves from the tyranny of the nobles, to confer absolute hereditary power on the sovereign. The nobility, taken by surprise, and unable to make any effectual opposition, were reluctantly compelled to concur with the clergy and the commons.

It is due to the sovereigns of Denmark to state that they exercised these great powers with singular moderation, and there can be no question that the mass of the people were gainers by the revolution of 1660, the results of which were embodied in all subsequent charters and forms of constitutions. The changes in these forms were many; the last of them, sanctioned June 5, 1849, with modifications adopted in January, 1865, containing the constitution now in force. According to this charter, the executive power is in the king and his responsible ministers, and the right of making and amending laws in the *Rigsdag*, or diet, acting in conjunction with the sovereign. The king must be a member of the evangelical Lutheran church, which is declared to be the religion of the state. The *Rigsdag* consists of the *Landsthing* and the *Folksthing*, the former being a senate or upper house, and the latter a house of commons. The *Landsthing* consists of 59 members. Of these, 19 are nominated by the crown for the term of 12 years, and the rest are elected. To the *Landsthing* any male subject is eligible who is forty-one years of age, who does not labour under mental incapacity, and who either pays 200 rixdollars, or 22*l.* 14*s.* 2*d.* direct taxes, or has a yearly income of 1,200 rixdollars, or 136*l.* 5*s.* To the *Folksthing*, consisting of 101 members, any householder twenty-five years of age is eligible, provided he does not labour under any incapacity which would deprive him of the right of voting. This right belongs to every citizen who has reached his thirtieth year, who is not in the actual receipt of public charity, or who, if he has at any former time been in receipt of it, has repaid the sums so received, and who does not labour under mental incapacity. The elected members of the *Landsthing* hold their seats for eight, and those of the *Folksthing* for three years.

At the side of these two houses of parliament—the lords and commons of Denmark—is placed a third body, called the *Rigsraad*, or supreme council of the nation. It consists of 47 members, appointed as follows:—

Nominated by the crown . . .	12
Elected by the Landsthing . . .	6
Elected by the Folksthing . . .	12
Elected by the qualified voters in different districts	17
Total . . .	47

The *Rigsraad* sits every second year for two months. It may be prorogued once in two years for a period not exceeding four months; and the king can dissolve it at his pleasure. If dissolved it must be reassembled within four months, and more than two dissolutions cannot take place within a period of two years. The qualifications for a seat in this council are—complete citizenship (that is, the possession of all rights and privileges to which a native-born subject is, as such, entitled), an unblemished personal character, and the absence of any legal claim upon such property as the candidate may possess. The qualification for the direct electoral franchise is, in addition to the first above-named condition—thirty years of age, and the annual payment of 200 rixdollars, or about 25*l.* in direct taxes; or, an annual income of 1,200 rixdollars, equal to 135*l.* Private members of the Rigsraad cannot introduce bills, but can petition the crown for their introduction. The ministers take part in the debates of this body in virtue of their office, but cannot vote unless they are members.

The executive government is conducted, under the king, by a privy council, and by departments or colleges, each having a minister at its head, in which the public business is transacted. The provinces are all divided into *stifters* or dioceses, and these again into *amter* or bailiwicks; but in the first the government and the administration of justice is committed to different parties, whereas the bailie, *amtman* (prefect), or chief of the administration in the duchies, is also chief judge in their civil and criminal courts. The lowest courts consist of a judge and a secretary, chosen by the proprietors of the district, and confirmed by the king. From these an appeal may be made to the provincial courts, and thence to the supreme court of

appeal at Copenhagen. But in order to diminish the expense of justice, all civil cases must in the first instance be carried before a *commission of conciliation*, composed of the most intelligent and respectable men of the vicinage. Its sittings are private. If both parties agree to abide by the decision of this commission, it is registered, and has the effect of law; if not, either is at full liberty to proceed in a court of justice. The proceedings of the commission are upon unstamped paper, and must be concluded within fifteen days.

The Lutheran is the established religion, and though the most perfect toleration be practised, the numbers attached to other sects is quite inconsiderable. The bishops are nominated by the crown.

Education in Denmark is very widely diffused, there being very few persons, even among the lowest classes, unable to read and write. Besides the university of Copenhagen, there are grammar schools and academies in all the considerable towns. Parochial schools are almost everywhere established; and here, as in Prussia, attendance at school is not optional; for, by a law, all children from the age of seven to fourteen years must attend some public school. Children whose parents are unable to pay the usual school fees are educated at the public expense. The instruction in these schools includes, besides reading, writing, and arithmetic, history, geography, and natural history. The grammar and parish schools are under the superintendence of a royal college or commission, consisting of three assessors and a president. This commission regulates the course of study, and appoints all professors in the university of Copenhagen as well as the masters in the grammar schools. The university of Copenhagen was founded in 1479, by Christian I., and has been augmented and amply endowed by his successors. It is divided into theological, medical, juridical, and philosophical faculties. The professors are either ordinary or extraordinary, their total number being generally about thirty. The examinations are strict, and the proficiency of the pupils very considerable. It is attended by about 600 students.

There is also an asylum for the education of the deaf and dumb in Copenhagen, with two seminaries for the education of schoolmasters, and two for cadets.

Army and Navy.—The army consists partly of regular troops, and partly of a militia or *landwehr* that is only occasionally called out to be exercised. The peasantry are all, with few exceptions, liable to compulsory service in the army for six years, during two of which they are constantly on duty; while during the other four they are only on duty for a month each year. At the end of the six years they may be enrolled in the militia. A certain number of soldiers are annually chosen by lot, in each district, according to its population, and the exigencies of the state. At present the regular army nominally amounts to 25,000 men; but latterly it has been much more considerable. During the war with Austria and Prussia, 1863–4, there were in the field 49,300 infantry, 10,600 cavalry, and 9,000 artillery, with 144 guns.

The navy consisted in September, 1864, of 19 sailing vessels, carrying 704 guns, and of 28 steamers, with 340 guns. It was manned by very nearly 2,000 men. Since then, however, great reductions have been made in the naval establishment.

Finances.—Previously to the late war, the revenue of Denmark, inc. that derived from the duchies, amounted to about 1,850,000*l.* a year. It consisted of excise and customs duties, a land-tax which produced nearly 400,000*l.* a year, a house-tax, the Sound dues amounting of late years to about 217,000*l.*, and other items. But the serious falling off in the amount of the public revenue caused by the loss of the duchies, and the increased charge the crown has had to sustain on account of the war, have occasioned considerable financial embarrassment, and the addition of large sums to the national debt. The financial estimates for the year commencing April 1, 1865, and ending March 31, 1866, which were laid before the *Folksthing* October 8, 1864, give the calculated revenue at 8,722,301 rixdollars, or 969,144*l.*, and the expenditure at 6,161,281 rixdollars, or 684,587*l.* The loss of Schleswig-Holstein and Lauenburg, it appears from these estimates, brought down the revenue of Denmark to one-half of the former amount. The annual budgets of Denmark show large deficits, amounting, in 1849, to 10,235,911 rixdollars; in 1850, to 9,888,817 rixdollars, and little less in the following years. The kingdom was saved from financial disorder by the payment, in 1856, of the sum of 30,476,325 rixdollars, or 3,324,632*l.*, given in purchase of the Sound dues. To this sum Great Britain contributed the principal share, amounting to exactly one-third. The capital was chiefly employed to pay off a part of the national debt. There still remained, on March 31, 1862, a debt of 98,261,793 rixdollars, or 10,726,179*l.*, to which was added, in January, 1864, a new loan of 1,200,000*l.*, to cover the cost of the war.

As already stated, from 1–5th to 1–4th part of the public revenue is derived from a land-tax, which is charged according to the quantity and quality of the land which each cultivator possesses, and which is measured in *tons of hardcorn*. The Danish acre, or ton of land, is equivalent to 56,000 sq. Danish ft., and 4 such acres are equal to a standard ton of hardcorn, one of the latter being consequently equal to $5\frac{1}{2}$ English acres. But as the same amount of tax is laid on each ton of hardcorn, the size of the latter varies according to the fertility of the land, from 224,000 ft. to 2,240,000 ft. The ton of hardcorn is therefore, in fact, an imaginary measure, which contracts as the quality of the land to which it is applied improves, and expands as it deteriorates.

Provision for the Poor.—A compulsory provision for the support of the destitute poor was introduced into Denmark early in the present century. Each market-town, of which there are 65, and each parish, forms a separate poor district, the affairs relating to the poor of which are managed by a particular board. Every man residing for three years in a parish acquires a settlement in it, and a right to be supported in the event of his becoming unable to support himself; but the principle of the law is, that the pauper shall be supplied only with those things that are absolutely necessary for his support. All begging is strictly prohibited. Opinions differ as to the influence of this law. It took effect in 1803, and the rate is said to have since progressively augmented. The too great multiplication of cottages has been specified as one of the principal causes of the multiplication of the poor. But the probability seems to be, now that the feudal system has been subverted, and that a large portion of the country has got into the hands of small proprietors, that the increase of cottages would have been greater had there not been an assessment for the support of the poor. Savings' banks were introduced into Denmark in 1816; and since then upwards of ten millions of dollars, or above one million sterling, has been lodged in them. It very rarely happens that any one of the petty proprietors either solicits or obtains parish relief.

History.—The early history of Denmark is ob-

scure and uninteresting. In 1385, Margaret, daughter of Waldemar king of Denmark, and wife of Haquin king of Norway, ascended the throne of these kingdoms: in 1389 she was chosen by the Swedes their sovereign; the three crowns being united, it was supposed, for ever, in 1397, by the treaty of Calmar. This great princess, who has been styled the Semiramis of the North, and whose reign is the most glorious in the annals of Denmark, died in 1412. After her death the Swedes began to evince their discontent with the union with Denmark; and, after a lengthened struggle, finally emancipated themselves from the Danish yoke in 1523. In 1448 the race of the ancient kings of Denmark having become extinct, Christian I., of the house of Oldenburg, was raised to the throne, which his posterity still possess; and by this means the valuable provinces of Sleswick and Holstein have been united to the crown, the first immediately, and the latter in 1761 and 1773. The reformed faith was established in Denmark with little difficulty. Lutheranism having been introduced in 1523, Catholicism was suppressed in 1537, the church lands being at the same time annexed to the crown. We have already noticed the memorable revolution of 1660, which had been preceded by a disastrous war, and the loss of the provinces previously held by the Danes in the south of Sweden. From thence down to a late period, there is little of interest in Danish history, other than the introduction of the reforms already alluded to, and the events of the last war. The attack on Copenhagen by the British in 1807, which ended in the capture of the Danish fleet, was an act of very questionable policy on our part, and of which no sufficient justification either has been or perhaps can be made. From this period down to the general pacification in 1815, the Danes were amongst our bitterest enemies. At the conclusion of the war Norway, which had been so long united with Denmark, was assigned to Sweden; the former obtaining in exchange the duchy of Lauenburg and a sum of money. The Danes felt this sacrifice very acutely; but it was one of apparent rather than of real power. A loss certainly greater was that of the duchies of Schleswig-Holstein and Lauenburg, attached to the crown of Denmark for centuries. Unwise legislation on the part of the government, and particularly interference with the language of the majority of the population—a matter on which all subject nationalities are more or less sensitive—brought about a rising in these German provinces in the revolutionary year 1848. But though Prussia took the part of the duchies, the matter was satisfactorily settled in 1852. Eleven years after, however, on the 15th of September, 1863, occurred the death of king Frederick VII., last of the direct line of the house of Oldenburg. Then a new rising took place in the duchies, and Prussia and Austria sending large armies to aid the insurgents, both Schleswig-Holstein and Lauenburg were wrested, after a sanguinary struggle, from the crown of Denmark. The cession of these provinces was legally confirmed by the treaty of Vienna of Oct. 30, 1864, followed by a proclamation of the king of Denmark, of Nov. 17, releasing the inhabitants of the duchies from their allegiance.

DENNY, a market town of Scotland, co. Stirling, 7 m. S. Stirling, and 14 m. NE. Glasgow, on the S. bank of the river Carron, which falls into the Frith of Forth at Grangemouth. Pop. 1,191 in 1861. It is irregularly built. The only public buildings are, a parish church and a dissenting chapel; but it is eminent for the various manufactures carried on either within its bounds or in its vicinity, viz. paper-mills, print-fields, mills for spinning wool, one for preparing dye-stuffs, and collieries. Handloom weaving, in connection with the Glasgow market, is also carried on to a considerable extent.

DEPTFORD, a town and naval arsenal of England, mostly in co. Kent, lathe Sütton-at-Hone, hund. Blackheath, a part being in co. Surrey, hund. Brixton, on the Ravensbourne, at its confluence with the Thames, 4 m. ESE. London, on the railway to Greenwich. Pop. of the par. of Deptford, St. Nicholas, in Kent, 8,139, and of Deptford, St. Paul, in Surrey, 37,834 in 1861. Deptford is contiguous to Greenwich, the two appearing to make only one large town. The lower town, next the river, has narrow irregular streets, and is meanly built, but the upper town is much superior in these respects, and has many handsome modern houses; the whole is lighted by gas, is paved, and supplied with water from the Kent water-works. The old church of St. Nicholas was rebuilt in 1697; that of St. Paul, a handsome structure in the Grecian style, was built in 1730, at which period Deptford was divided into 2 pars. There are also several dissenting chapels, two charity schools, a dispensary for the poor of the town and neighbourhood; a savings' bank; a mechanics' institute; and two sets of almshouses for decayed pilots and masters, or their widows; one founded in the reign of Henry VIII., with 26 dwellings; the other at the end of the 17th century, with 56. This society was incorporated by charter in 4th Henry VIII., when the ancient rights and privileges of the company of the mariners of England was confirmed to them, and they were styled the master, wardens, and assistants of the guild of the Holy Trinity, in St. Clement's, in Deptford Strond. Other charters were granted them by Eliz. and Chas. II. They are now governed by a master, 4 wardens, and 18 other elder brethren; the master and 2 wardens being chosen annually from among the elder brethren, who are elected for life. The number of younger brethren is unlimited, any master or mate sufficiently skilled in navigation being admissible; but they take no part in the business of the corporation, though, like the elders, they enjoy certain immunities, such as exemption from serving on juries, &c. The principal chartered functions of the society are—the examination of the mathematical students of Christchurch, and of masters in the royal navy; the appointment of pilots for king's ships, as well as for piloting merchant vessels on the several coasts and ports of England, except such as are specially placed under other jurisdiction (such as those of the Cinque Ports and the Bristol Channel), and of fixing the rates of pilotage; the erection and maintenance of lighthouses, beacons, buoys, and other sea-marks (with the exceptions previously stated); and the hearing and determining complaints between merchant officers and seamen, the appeal from them being to the Admiralty Court. They have also the power, under certain circumstances, of licensing seamen to ply on the Thames. Their revenue is derived from ancient endowments, contingent benefactions, and lighthouse and other dues, and the surplus, after defraying the expense of maintaining these and other sea-marks, and other necessary expenses, is, by their charters, to be appropriated exclusively to the relief of decayed seamen and their widows. Between 2,000 and 3,000 is the usual number annually receiving periodical or casual relief, to various amounts. Their affairs were conducted at Deptford till 1787, when the Old Trinity House was pulled down, and they removed to the present structure on Tower-hill. The government dockyard is an enclosed area of 31 acres, with a double and single

tide dock, 3 building slips, 2 mast-ponds, a mast-house, smithy for forging anchors, several ranges of storehouses, and dwellings for the officers. The victualling office is close to the Thames, and has extensive buildings annexed for baking, brewing, slaughtering cattle, curing meat, and cooperage. During the war, 1,500 artificers and other workmen were employed in the dockyard, but this and the other establishments have since been somewhat reduced. There are a number of private docks, in the largest of which several line-of-battle ships were built during the war. The Ravensbourne forms a small æstuary at its entrance, called Deptford Creek, over which is a bridge connecting the lower town with Greenwich. The Surrey Canal locks into the Thames at the north end of Deptford, whence a branch extends from it to Croydon. A railway, raised on brick arches, and extending from Charing Cross to Greenwich, crosses the upper town. There is an earthenware manufactory, a foundry for gun-barrels, and a large establishment, with a laboratory, and several furnaces, for refining the precious metals, and making sulphuric and other acids. The Reform Act included Deptford in a parliamentary borough, comprising also Greenwich, Woolwich, and part of Charlton, which returns 2 members to the House of Commons. It had 8,662 registered electors in 1865. Deptford was anciently called West Greenwich, and after Deep-ford Strand, and was a small fishing village previously to the establishment of the dockyard in the 4th Henry VIII. At Save's Court (the site of the present workhouse), Evelyn, the author of the 'Sylva,' &c., resided, who lent it to Peter the Great in 1698, when that monarch passed some time in Deptford dockyard.

DERA ISMAEL KHAN, an inland town of Afghanistan, cap. dist. Damaun, now belonging to the Maharajah of the Punjab, about 100 yards from the W. bank of the Indus, and 200 m. W. Lahore; lat. 31° 50′ N., long. 70° 33′ E. It stands in a large wood of date trees, and, when Mr. Elphinstone visited it, was surrounded by a ruined wall of unburnt bricks about 1½ m. in circ. Its inhab. are mostly Beloochees, but some are Afghans and Hindoos.

DERBY, one of the central cos. of England, having N. Yorkshire and a part of Cheshire: E. the cos. of Nottingham and Leicester; S. the latter, Stafford, and a small part of Warwick; and W. Chester and Stafford. Length, from N. to S., about 55 m.; breadth very various. Area, 1,029 sq. m., or 658,803 acres, of which 500,000 are arable, meadow, or pasture. The Pennine mountain chain (see ENGLAND) terminates in this co., and occupies great part of its N. and E. districts. The hund. of *High Peak*, comprising the NW. angle of the co., is one of the most celebrated mountain districts in England; for though its hills do not soar to the height of those of Cumberland, Westmorland, and Wales, nor afford the romantic beauties of lakes, cascades, and hanging woods, yet its situation in a more central part of the island, and its extraordinary caverns, perforations, and other curiosities, have made it an object of the greatest interest and attraction. The S. parts of the co. are comparatively flat, and consist generally of strong, heavy land. The climate varies with the elevation of the land and the nature of the soil; but, speaking generally, it is rather cold and bleak. Agriculture is in rather a backward state; farms generally small, and mostly held at will: there are no restrictions on the mode or frequency of cropping. In the N. and some of the W. parts of the co., the dairy is the principal dependence of the farmer. Oats is the principal crop in the High Peak, and wheat and beans in the S. The drill is but rarely used, and there is a great waste of horse power in ploughing. No particular breed of cattle is preferred. Derby is famous for its minerals and manufactures. The coal-field is of great extent and value; and both lead and iron mines are wrought to a considerable extent. Zinc and copper are also obtained, though in no great quantity; and the spars, which are very elegant, are wrought into a variety of ornamental articles. Silk and cotton manufactures are extensively carried on at Derby, Belper, Chesterfield, Hope, Glossop, and other places. The flax and woollen manufactures are inconsiderable. Porcelain, of a superior quality, is made at Derby; and nails, hats, &c. in various parts of the co. Principal river the Derwent, which traverses nearly the whole extent of the co. from N. to S., dividing it into two pretty equal parts. The Trent crosses the S. angle of the co., and the Dove forms, for a lengthened distance, the line of demarcation between it and Stafford. Derbyshire is divided into 6 hund. and 139 parishes: it returns six members to the H. of C., viz. four for the co., and two for the bor. of Derby. Registered electors for the co., 12,067 in 1865, of whom 5,213 for the northern and 6,854 for the southern division. Pop. 339,327 in 1861, living in 69,262 houses. Gross annual value of real property assessed to income tax—in northern division 524,662*l.* in 1857, and 679,939*l.* in 1862; in southern division 1,541,024*l.* in 1857, and 1,991,185*l.* in 1862. Principal towns, Derby, Belper, and Chesterfield.

DERBY, a town and bor. of England, in the above co., of which it is the cap., being locally in the hund. of Morliston, but possessing separate jurisdiction, on the Derwent, in a fine valley; 48 m. SSE. Manchester, 119 m. NNW. London by road, and 127 m. by Midland railway, Pop. of bor. 43,091 in 1861. Besides the Derwent, the town is traversed by the Markeaton brook, both of them being crossed by several handsome bridges. It is a very thriving place, and has of late years been much improved. The streets in the older parts are narrow and crooked; but all of them are clean, well paved, and well lighted with gas. There is here a county-hall, a town-hall, assembly rooms, a co. gaol, which is one of the best in the kingdom, an infirmary, and theatre. The most extensive, and one of the finest, buildings in Derby is the Athenæum, also containing the Post Office. It stands in the centre of the town, is of Grecian architecture, has two fronts, one of 98, and one of 185 ft. The market place is a large open space in the centre of the town, and there is also a good covered market. There are fourteen churches. All Saints' Church is a Roman Doric edifice; the tower, erected about the time of Henry VIII., is in the perpendicular English style, 178 ft. high. The original church of St. Werburgh is supposed to have been built prior to the Conquest. The church of St. John's is a fine Gothic building; and notable also are St. Alkmund's, rebuilt 1844, with a spire 205 ft. high; and St. Michael's, opened 1858. There are chapels for most classes of Protestant dissenters, and the Catholics have a chapel with a fine Gothic tower. Derby has received many charters; the first from John; its last and (prior to the passing of the Municipal Reform Act) governing charter, from Charles II. It claims to be a bor. by prescription. Under the new municipal act, it is divided into 6 wards, and has 12 aldermen and 36 councilmen. Corp. revenue, 9,125*l.* in 1862. Annual value of real property assessed to income tax, 145,340*l.* in 1857, and 168,133*l.* in 1862. Derby has sent two members to the H. of C. since the 23rd Edward I. Previously to the Reform Act, the right of voting was

vested in the freemen and sworn burgesses. Registered electors, 2,564 in 1865. Derby is also the place appointed for the election of the members for the S. div. of the co.

The town has many excellent charitable, educational, literary, scientific, and other institutions. Amongst them are the infirmary, a fine structure, erected by subscription at a cost of about 18,000*l.*, and is replete with every convenience; the self-supporting charitable and parochial dispensary; a lady's charity, for assisting poor women during their confinement; several friendly societies and benefit clubs; almshouses, some of which were founded by the Countess of Shrewsbury, in 1599, for eight men and four women; others by R. Wilmot, in 1638, for six men and four women, now four of each; Large's Hospital, founded 1709, by Edward Large, for five clergymen's widows, subsequently enriched by sundry donations; and 13 neat and substantial almshouses, erected from the fund of a charity bequeathed 300 years ago by Robert Liversage to the par. of St. Peter; with various benefactions for different purposes. There are, also, national, infant, Sunday, and other schools, furnishing instruction to great numbers of children. A free school, founded in the reign of Henry II., is supposed to be one of the most ancient endowments of the kind in England. It was formerly in a very flourishing state; subsequently, however, it fell off very much; but it has latterly been getting into somewhat better repute. The literary and scientific institutions are the Philosophical Society (originally held in the house of Dr. Darwin), with a good library, a collection of fossils, and mathematical and philosophical apparatus; the Town and Country Library, which has been much enlarged, and has a public news-room and museum attached to it; and the Mechanics' Institute.

The town is remarkably well situated for manufactures, having an extensive command both of water power and coal; and mills for the manufacture of silk and cotton have been established either in it or its immediate vicinity. Early in the beginning of last century, Mr. John Lombe, who had, at considerable risk, and by dint of great ingenuity and application, made himself acquainted with the machinery in Italy, erected at Derby a mill for throwing silk on a very large scale; and the town has ever since continued to be a principal seat of the silk-throwing business. The other manufactures comprise stocking, lace, tape, pottery, nails, needles, paper, and railway carriages. The cotton manufacture is not carried on to nearly the same extent as that of silk; but of late years it has been increasing very rapidly in the co.

The town was formerly a great wool mart, and the art of dyeing woollen cloth was supposed to be practised here with peculiar advantage, in consequence of the water of the Derwent being specially adapted for that purpose. Hosiery has long been an important business in Derby. There are also large manufactures of bobbin net; and the weaving of silks and velvets has been introduced of late years. The manufacture of porcelain was originally established here about the year 1750. The ware is not, perhaps, of equal fineness with the French and Saxon, but its workmanship and ornaments are at least equal. The manufacture of figures and ornaments, in what is termed *biscuit*, is extensively carried on. The fluor spar, or 'blue John,' of the vicinity, is wrought into vases and other ornaments; and the black marble of Ashford into vases, columns, and chimney-pieces. Various other factories, besides those specified, are conducted here on a large scale, such as for patent shot, for the construction of steam-engines, for slitting and rolling iron, for smelting copper ore, for making tin plates. There are also red lead, colour, and varnish works; bleaching-grounds, in which the processes are performed by chemistry; tanneries; soaperies; extensive malting concerns, and corn mills.

Derby communicates by railways and canals with all parts of England. The river was, several years since, made navigable from the town to its junction with the Trent; but, since the opening of the Derby canal, the navigation has been disused. This canal branches from the Trent and Mersey canal at Swarkestone, a few miles S. of Derby, runs N., and intersects the Derwent at Derby, a towing bridge being thrown across that river. The Derby canal supplies the town with coals, building stone, gypsum, and other things. Three railways meet at Derby:—1. The Derby and Birmingham; 2. The Midland Counties railway, which connects Derby and Nottingham with each other, and both with the London and North-Western railway at Rugby; 3. The North Midland railway, which connects Derby with Leeds, York, &c. Derby, in fact, is one of the centres of railway communication in England.

Many learned persons have either been natives or inhabitants of this town; among whom may be specified Dr. Thos. Linacre, a learned physician in the reign of Henry VIII.; Joseph Wright, an eminent painter; William Hutton, an industrious antiquary and topographer; Flamstead, the celebrated astronomer, said to have been educated in the free school; the first Earl of Macclesfield, who, after practising here as an attorney, rose to the highest rank in his profession, having been lord chancellor; John Whitehurst, a scientific mechanist; and the celebrated Dr. Darwin.

DEREHAM (EAST), or MARKET DEREHAM, a town and par. of England, co. Norfolk, hund. Mitford, 15 m. NW. from Norwich, and 125½ NEN. London by Great Eastern railway. Area of par. 5,550 acres. Pop. of do. 4,368 in 1861. The town having suffered much from fires at different periods, has been rebuilt on an improved plan, and is neat and clean. The church, a very ancient structure, with a tower in the centre, has some interesting relics; and in it were deposited, in 1800, the remains of Cowper the poet. There are two annual fairs.

DERG (LOUGH), a lake of Ireland in the SE. angle of the co. Donegal, about 9 m. in circ. This lake, or rather a small island in it, is famous in the history of Irish superstition. In this island there was formerly a cave, called St. Patrick's Purgatory, a pilgrimage to which was long held to be of the greatest efficacy. The cave was, however, shut up in 1630, by order of government, the chapel on the island demolished, and the monks dispersed. It was supposed that this rough treatment had put an end to the delusion; and Boate, writing soon after, says that 'the pilgrimage to purgatory has quite come to nothing, and never hath been since undertaken.' (Boate's Nat. Hist. of Ireland, p. 75, ed. 1652.) But if so, the practice revived at no distant period, and the island continues, down even to the present day, to be annually visited by crowds of pilgrims. Pope Benedict XIV. wrote a sermon recommending the pilgrimage; and, in 1830, the Catholic bishop of the diocese publicly notified that he would hold a 'station' here. The 'station,' or period for the resort of pilgrims, begins on the 1st of June, and terminates on the 15th of August. The average annual number of pilgrims are estimated at from 18,000 to 20,000. At present the rites are not performed in a cave, but in a chapel. A river called Derg falls into this lake.

DESSAU, a town of N. Germany, cap. of the duchy of Anhalt-Dessau, residence of the duke and seat of government, on the left bank of the Mulda, near its confluence with the Elbe, 67 m. SW. Berlin, and 33 m. N. by W. Leipzig, on a branch of the railway from Berlin to Leipzig. Pop. 15,608 in 1861. The town is walled round, except on the side next the river, which is here crossed by a fine bridge. Dessau is divided into the Old and New Towns, the Sand, and three other suburbs, one of which is on the opposite side of the Mulda. It is one of the best built cities of Germany, and contains five public squares, and upwards of thirty good streets, which are well lighted at night. The ducal palace, a part of which was built in 1340, contains a theatre, a good collection of paintings, and other works of art; the palace of the dowager-duchess, the high school, Amelia asylum, riding-school, Catholic church, three Lutheran churches, and the synagogue, are the other public edifices most worthy of notice. Dessau is the seat of the high court of appeal for the duchy and other judicial courts. Its public schools are numerous, and include a gymnasium, teachers' seminary, citizens' primary and female schools, academies of music and singing, the Louisa school of industry, a high female school, and a celebrated Jewish commercial school with which a Jewish classical seminary is united. There are many public charities. The inhab., among whom there are a large number of Jews, long settled here, mostly derive their subsistence from employments connected with the court; but they also manufacture woollens and hats, and have tanneries, distilleries, and an extensive trade in corn. The public cemetery of Dessau is very handsomely laid out, and in the vicinity of the town are the ducal country residences, *Luisium* and *Georgium*, surrounded by extensive gardens. Dessau was the birthplace of the philosopher Moses Mendelssohn, born in 1729, deceased in 1784.

DETMOLD. See LIPPE-DETMOLD.

DETROIT, a city of the U. S. of America, cap. Michigan; on the W. side of the strait or channel uniting lakes Erie, St. Clair, and Huron, and consequently in one of the best positions for commanding a large share of the internal navigation of America, 18 m. above the W. extremity of lake Erie; lat. 42° 19′ 53″ N., long. 82° 58′ W. Pop. 45,620 in 1860. The town is irregularly built; but there are some fine edifices. Three of the streets are each 200 ft. wide, the others vary from 60 to 120 ft. in width, and cross each other generally at right angles. There are several squares, and some good private mansions. The R. Catholic cathedral, finished in 1848, is an imposing edifice. Among the other public buildings are the state-house, city hall, banks, markets, a theatre, museum, state penitentiary, co. gaol, mechanics' hall, and various public offices. There are several extensive manufactories, including iron-foundries, a brass-foundry, and breweries. Ship building and the sawing of timber are the most important branches of industry. The city is the great commercial mart and emporium for the state, and the centre of a vast network of railways. The markets are usually well supplied; the fish-market, especially, is one of the best in the W. states. Among numerous charitable institutions there are two orphan asylums, several free schools, a hospital, and a poorhouse. There are scientific and literary societies, and good male and female academies. The first steamboat visited Detroit in 1818; in 1862, the city had above a thousand steamers. Among the inhab. are many French, by whom the city was founded in 1670. The Detroit river, or strait, between lakes Erie and St. Clair, is 25 m. long, and upwards of a mile broad. The French settlements extend for a considerable distance along its banks, which are fertile and well cultivated.

DETTINGEN, a small village of Bavaria, on the Mayne, 8 m. NW. Aschaffenburg. Pop. 620 in 1861. Here, on the 26th June, 1743, the allied British and Hanoverian army, under George II. and the Earl of Stair, defeated a very superior French force under Marshal Noailles. The latter lost above 5,000 men killed and wounded; the allies about 2,000. It was the last time a king of England drew his sword in battle.

DEUX-PONTS (Germ. *Zwei-brücken*), a town of Rhenish Bavaria, formerly the cap. of the duchy of the same name, and at present of the Bavarian circle of the palatinate, on the Erbach, near its confluence with the Serre, 42 m. W. by N. Landau, and 47½ m. SSE. Strasburg, on a branch line of the railway from Metz to Mayence. Pop. 8,235 in 1861. The town is pleasantly situated and well built. Here are the ruins of the ancient palace of the dukes of Zweibrücken, formerly one of the most magnificent residences in Germany, but which was for the most part destroyed by the French. What remains of it has been converted into a Catholic church. The cathedral and Lutheran church are amongst the other chief edifices. There are here two bridges across the Erbach, whence the town derives its name. Deux-Ponts is the seat of the high court of appeal for the circle, and contains a lyceum and a gymnasium. It has manufactories of woollen cloth, leather, cotton twist, and tobacco. Here, in 1779, was commenced the publication of the series of editions of the classics, known by the name of the Bipont edition. The undertaking was not, however, completed here, but at Strasburg.

Deux-Ponts and its duchy successively belonged to its own counts, of a branch line of the house of Bavaria, and then to Sweden and Bavaria, previously to the French revolution. It was afterwards taken by the French, and formed a portion of the dép. of Mont Tonnerre; but since 1814 it has again belonged to Bavaria.

DEVENTER, a fortified town of Holland, prov. Overyssel, cap. arrond. on the Yssel, 18 m. S. Zwoll. Pop. 16,342 in 1861. A cathedral, 6 other churches, and a town-hall, are amongst its chief public buildings. It is the seat of a court of assize, a tribunal of primary jurisdiction, and several associations of public utility, and the residence of a military commandant. It has manufactures of stockings, carpets and linen fabrics, an iron foundry, and considerable trade in cattle, corn, butter, and other goods; and sends 7 members to the states of the prov. Deventer has sustained numerous sieges, and been several times taken.

DEVIZES, a parl. bor. and town of England, co. Wilts, hund. Potterne and Cannings, on an eminence near the N. limit of Salisbury Plain, on the principal road from London to Bath, and nearly in the centre of the co.; 85 m. W. by S. London by road, and 86 m. by Great Western railway. Pop. 6,638 in 1861. The town consists of several wide streets, branching from a large market-place. The houses are mostly well built. There are two ancient churches, affording specimens of the Norman and pointed styles, with some curious monuments. There are also 5 dissenting chapels; a charity school, educating and apprenticing 40 boys; Lancastrian, national and infant schools; a town-hall, with a circular front and Ionic columns; and a handsome cross, erected in 1815, by Lord Sidmouth. Among the other

notable public buildings are the corn exchange, completed in 1857, in the Grecian style, 142 ft. long, and the county lunatic asylum, built 1851, on a site of 65 acres. The markets are Monday and Thurs., the latter for corn, and one of the largest in the W. of England. Malting is extensively carried on. The woollen business, formerly important, has wholly declined. The Kennet and Avon canal passes the town, giving it a water communication with Bristol and London. Devizes claims to be a bor. by prescription, but has several charters. It has returned 2 mems. to the H. of C. since the 4th of Edward III. Previously to the Reform Act, the elective franchise was vested in 36 burgesses and an unlimited number of free burgesses; but of these few were made. The Boundary Act extended the limits of the parl. bor., which had 322 registered electors in 1862. The present municipal coincides with the parl. bor. It is divided into 2 wards, and has 3 aldermen and 18 common-councilmen. Revenue of the corporation, 966*l.* in 1862. Annual value of real property, 23,629*l.* in 1857, and 22,732*l.* in 1862. Petty sessions for the division are held in the town, and quarter sessions for the co., alternately with Salisbury, Warminster, and Marlborough. The origin of the name (in old records, *Divisæ* and *Divisis*) is supposed to be from the division of the place between the king and the bishop of Salisbury. The town owes its rise to an important castle or fortress built here in the reign of Stephen, of which nothing but the mound remains.

DEVON, a marit. co. of England, forming part of its SW. peninsula, and having E. the cos. of Dorset and Somerset, N. the Bristol Channel, W. Cornwall, and S. the English Channel. It is of a rhomboidal shape; area 2,589 sq. m., or 1,657,180 acres, of which about 1,200,000 are arable, meadow, and pasture. Surface and soil various. A great portion of the W. district of the co., from Okehampton on the N. to Ugborough on the S., and from Ilsington on the E. to near Tavistock on the W., is occupied by Dartmoor, one of the most barren tracts in the kingdom. It includes a space of above 250,000 acres, and is said to have a mean elevation of more than 1,700 ft. above the level of the sea, but we suspect this to be an exaggeration. Its surface is, in most places, extremely rugged: the soil, where it is not encumbered with broken fragments of rock, is thin and poor; and in the most elevated part of the moor there is an immense morass, covering about 80,000 acres, and which is, in parts, incapable of supporting even the lightest animals. That part of the moor, called the Forest, is parcel of the duchy of Cornwall; and on this, and some other of the less barren portions, some improvements have been effected, particularly in the way of planting. But, with the exception of this and a few other districts of very inferior dimensions, the country is alike beautiful and fertile. The vale of Exeter, comprising from 120,000 to 130,000 acres, is one of the richest in the kingdom; and the district called the *South Hams*, extending from Torbay round to Plymouth Sound, is frequently called the garden of Devonshire, and is finely diversified, and very productive. Climate mild, but moist, though not so much so as in Cornwall. Agriculture, though much improved, is still backward; there is throughout the co. a great want of any regular system of cultivation, and the crops are inferior. Potatoes are extensively cultivated; cyder is largely produced, especially on the W. parts of the co., and is a common beverage; but it is harsh and acid; and these qualities, and the freedom with which it is drunk, are said to occasion the colic prevalent among the natives. Devon is principally a grazing and dairy co. The breed of cattle is excellent: they are of a high red colour, fatten easily, and yield capital beef; are well adapted for field labour, being, though rather light, docile, and ready to exert themselves to the utmost. The dairy farmers not unfrequently let their cows to dairymen at so much a head. Stock of sheep estimated at between 600,000 and 700,000 head. Property much divided. Farms of all sizes from 10*l.* to 500*l.* a year; but the great majority small. Minerals important and valuable; copper and tin mines are wrought to a considerable extent; and lead, iron ore, and manganese are met with. About 28,000 tons of fine clay, raised near Kingsteignton, Bovey, and other places in that part of the co., are annually shipped for Staffordshire and other seats of the china-ware manufacture. The woollen manufacture, though a good deal fallen off, is still carried on to a considerable extent. Principal rivers Exe, Dart, Tamar, Taw, and Torridge. Principal towns, Plymouth, Devonport, Exeter, Tiverton, and Tavistock. Devonshire is divided into 33 hund. and 465 par.: it returns 22 mems. to the H. of C., viz. 4 for the co.; 2 for the city of Exeter; 2 each for the bors. of Plymouth, Devonport, Tiverton, Barnstaple, Honiton, Tavistock, and Totness; and 1 each for the bors. of Ashburton and Dartmouth. Registered electors for the co. 18,215 in 1862, of whom 8,774 for the northern, and 9,441 for the southern division. Pop. 584,373 in 1861, inhabiting 101,253 houses. Annual value of real property assessed to income tax, in northern division 766,648*l.* in 1857, and 875,033*l.* in 1862; in southern division, 1,129,729*l.* in 1857, and 1,262,180*l.* in 1862.

DEVONPORT, a sea-port town and parl. bor. of England, co. Devon, par. of Stoke Damerell, formerly called Plymouth Dock. Pop. of munic. bor. 50,440, and of parl. bor. 64,783 in 1861. The borough adjoins that portion of Plymouth called Stonehouse on the W.; but though it received its present distinctive appellation in 1824, has a separate municipal government, and returns 2 mems. to the H. of C., it is quite as much a part of Plymouth as the bor. of Marylebone is of London. It will, therefore, be described with the dockyard, breakwater, &c., under the head PLYMOUTH.

DEWSBURY, a manufacturing town, par. and township of England, W. riding co. York, 216¾ m. N. London, by London and North Western railway, *viâ* Stockport. The par., which contains 9,620 acres, is situated principally in the wapentake of Aybrigg, but partly also in that of Morley: the town of Dewsbury, however, which contains 1,330 acres, is wholly in the former. Pop. of township 18,148 in 1861. The town, situated at the foot of a hill, on the Calder, is 8 m. SSW. Leeds, 9 m. SE. Bradford, and 9 m. NE. Huddersfield; in the very centre, in fact, of the clothing district. The approach to the town by the London road, cut through a deep chasm, has a fine effect: the town lies low, and the smoke of the factories in the distance give it an enlarged appearance. It has a good market-place, with some good streets; and is well lighted with gas and supplied with water. All Saints, the principal church, is of great antiquity: it was rebuilt in 1766, but a good deal of the interior was preserved. Churches have been erected at Dewsbury Moor, Earls Heaton, and Hanging Heaton, and there are several Dissenting chapels. A charity school was founded here in 1760; it has an endowment of about 108*l.* a year, and about 80 boys are educated as free scholars. Wheelwright's free school, conducted on the national system, was founded in 1727, and is attended by 100 boys, and as many

girls. There are here 3 almshouses; but, excepting these, the other charities are of little importance.

Dewsbury is at the head of what is called the *Shoddy* trade. Here refuse woollen rags are collected in vast quantities from all parts of the kingdom; and, after undergoing certain preparations, are torn to pieces, and reduced to their original state of wool, by the aid of powerful machinery; and this wool, being re-spun, is again made into cloth. Formerly, shoddy cloth was used only for padding, and such like purposes; but now blankets, flushings, druggets, carpets and table covers, cloth for pilot and Petersham great coats, &c., are either wholly or partly made of shoddy. The clothing of the army, and the greater part of that of the navy, consists principally of the same material, which, in fact, is occasionally worn by everybody. Large quantities of shoddy cloth are exported. Great improvements have recently been effected, not only in the fabric of the cloth, but also in the dyes; this is especially seen in the cloth for soldiers' uniforms, which is no longer of a brick dust colour, but makes a much nearer approach to scarlet. The beautiful woollen table cloths are made wholly of shoddy, being printed by *aquafortis* from designs drawn in London and Manchester, and cut on holly and other blocks on the spot. The trade is of comparatively recent origin, and is rapidly extending itself. About 1,500 men, and as many women and boys, are employed in the mills, and in the manufactures of shoddy in Dewsbury.

DEZPHOUL, a town of Persia, in Kuzistan, in a fine plain, on the Abzal, 28 m. W. by N. Shuster. Pop. estimated at 14,000 or 15,000. Its only ornament is a noble bridge of 22 arches, constructed by command of Sapor. The piers are of stone, and the arches and upper parts brick. It is 450 paces in length, 20 in breadth, and about 40 in height.

DHAR, or DHARANUGGUR, an ancient inl. town of Hindostan, prov. Malwah, cap. of a small Maharatta state under British protection; 28 m. WSW. Indore, and 1,908 ft. above the level of the sea; lat. 22° 35′ N., long. 75° 24′ E. At one period it is said to have contained 20,000 houses; in 1820 there were less than 5,000, but the pop. was then increasing. It is surrounded by a mud wall, and contains some good buildings and several tanks. The fort, detached from the town, is surrounded by walls about 36 ft. high, with round and square towers. This town is of great antiquity; its rajahs are of a most distinguished Maharatta family, and formerly had precedence of both Scindia and Holcar.

DHOLPOOR, an inl. town of Hindostan, prov. Agra, cap. of a small Hindoo principality under British protection; 34 m. SSW. Agra, 25 m. NNE. Gwalior, and 1 m. N. the Chumbul river; lat. 26° 42′ N., long. 77° 44′ E. It is frequently mentioned by the Emperor Baber in his memoirs, and is still of considerable size; its environs are rich and productive.

DIAMOND HARBOUR, a harbour in the river Hooghly, Hindostan, 34 m. below Calcutta, where the Company's ships usually unload their outward, and receive on board the greater part of their homeward cargoes. Here are government warehouses for ships' stores and rigging, protected by an embankment from inundation; and about thirty years ago an excellent brick road was constructed from hence to Calcutta. The place is very unhealthy; but the adjacent rice lands are in a high state of cultivation.

DIARBEKR, a city of Turkey in Asia (Armenia), cap. pachalik of same name, on the Tigris, by which it is nearly encircled, in a noble plain or table-land, 160 m. SSW. Erzeroum; lat. 37° 55′ 30″ N., long. 39° 52′ E. Pop. estimated 30,000 in 1864. The city 'is surrounded by a prodigious wall of black stone, which, for height and solidity, is far superior to anything of the kind I have seen, either in Europe or Asia: it has, however, been much neglected, and is now in a ruinous condition. The houses are of stone, and have a good appearance, but the streets, though paved, are narrow and filthy. The castle is on the N. side of the town; it is also surrounded by a strong wall, and divided into many courts and handsome buildings. The bazaar is well supplied with corn and provisions, and the adjoining country is fruitful and well cultivated: cotton, silk, copper, and iron are manufactured, and sent to Bagdad and Constantinople. When viewed from a distance, it has a fine appearance. The elevation of the surrounding mountains, the windings of the Tigris, and height of the walls and towers, with the cupolas of the mosques, give it an air of grandeur far above that of any city which I have visited in this quarter of the world. The river is generally crossed on a bridge of twelve arches, about ½ m. below the town. (Kinneir, Memoir of Persian Empire, p. 334.) The city, formerly very important, fell subsequently into complete decay, but is now arising from its ruins. According to the estimate of former writers, the ratio of decline took place on the following scale:—

Sestini . .	in 1757,	gives Diarbekr	400,000	souls
Ives . .	1758	,,	100,000	,,
Niebuhr .	1766	,,	90,000	,,
Sestini . .	1782	,,	50,000	,,
Gardanne .	1808	,,	80,000	,,
Duprè . .	1808	,,	75,000	,,
Kinneir . .	1810	,,	30,000	,,
Buckingham .	1815	,,	50,000	,,
Hende . .	1817	,,	55,000	,,
Brant . .	1835	,,	45,000	,,
Southgate .	1837	,,	15,000	,,
Moltke & Mühlback	1838	,,	20,000	,,
Holmes . .	1857	,,	29,460	,,
Taylor (Consul)	1864	,,	30,000	,,

According to a report of Mr. Consul Taylor, addressed to the Foreign Office, in 1864, Diarbekr has entered upon a new prosperous career. The city was founded, or, more probably, restored, by the emperor Constans, anno 349. It is sometimes called *Amid* or *Emid*, and is described under this name by Abul-Feda.

DIE (an. *Dea Vocontiorum*), a town of France, dép. Drôme, cap. arrond., on the Drôme, 26 m. SE. Valence. Pop. 3,885 in 1861. It is surrounded by a wall flanked with numerous towers; is clean and well built; has a cathedral, an ancient episcopal palace, many Roman remains, and silk fabrics, tanneries, rope-walks, and paper-mills. In the 16th century the Calvinists were very numerous, and had a university here.

DIE′ (SAINT), a town of France, dép. Vosges, cap. arrond., on the Meurthe, 24 m. ENE. Epinal. Pop. 8,793 in 1861. It is well situated and well built; is surrounded by an ancient wall; and has a communal college, and a public library with 9,500 vols. It is the seat of a sub-prefecture, court of original jurisdiction, and a bishopric, of which the dép. Vosges forms the diocese. There are some fabrics of cottons, handkerchiefs, stockings, and potash.

DIEPPE, a marit. town of France, dép. Seine-Inférieure, cap. arrond.; at the mouth of the Arques, on the British Channel, nearly opposite Beachy Head, from which it is distant 67 m. SSE., 31 m. N. Rouen, and 92 m. NW. Paris, on a branch line of the railway from Paris to Le Havre. Pop. 20,187 in 1861. The town is well built; streets broad, regular, and one of them 3-4ths m. in length; houses mostly of brick, and ornamented with bal-

conies. It consists of two parts,—the town properly so called, and its suburb of *Le Pollet*, separated from it by the port, but communicating with the town by a bridge. Dieppe is well supplied with water, which is conveyed by an aqueduct excavated in solid rock for 3 m., and distributed to 68 public, and above 200 private, fountains. Its port, enclosed by two jetties, and surrounded by quays, is capable of accommodating a great number of vessels of from 60 to 600 tons; but it dries at low water, is with difficulty kept from filling up, and is rather of dangerous access from its narrowness and the rapidity of the current both inwards and outwards. It is protected by an old castle on a cliff to the W. of the town, and by some batteries. The town has two churches, from the steeple of one of which, St. Jacques, the English coast may be seen. Since 1822, when a handsome establishment for sea-bathing was formed, Dieppe has become a favourite watering-place, and the number of visitors has continued to increase. It is the seat of a court of original jurisdiction; has a communal college with a public library containing 4,000 vols., a school of navigation, a hospital, and a theatre. Ivory articles are made here in greater perfection perhaps than in any other part of Europe; and there are some sugar-refineries, tanneries, rope-walks, and building docks for trading vessels. The manufacture of lace, for which this town was once distinguished, has now much diminished. Dieppe is an entrepôt for salt and colonial produce, and has considerable trade: but by far the greatest portion of the inhab. depend for support on the fisheries, especially those of mackerel and herrings, for the supply of the capital. Vessels are also fitted out for the cod and whale fisheries. There are two oyster-banks, whence about 12,000,000 oysters are annually sent to Paris. A regular intercourse is kept up by steam-boats between Newhaven, near Brighton, and Dieppe; and as the journey to Paris by land is much shorter by this than by Calais or Boulogne, it is preferred by many travellers. Dieppe was bombarded and all but destroyed by the English and Dutch in 1694. The inhab. have been distinguished by their enterprise. They discovered Canada, founded Quebec, and explored the coasts of Africa to some distance a century previously to Vasco de Gama. Bruzen de la Martinière, the author of the Grand Dictionnaire Géographique, was a native of Dieppe.

DIEST, a town of Belgium, prov. S. Brabant, cap. cant., on the Demer, and on the railway from Antwerp to Liège, 32 m. ENE. Brussels. Pop. 8,521 in 1856. The town is about a league in circ., but this space is in great part occupied with fields and gardens. It has a college, manufactures of stockings, woollens, &c., and some excellent breweries. It was taken by the Duke of Marlborough in 1705, but retaken and dismantled by the French in the same year.

DIGNE (an. *Dina* or *Dinia*), a town of France, dép. Alpes-Basses, of which it is the cap.; at the foot and on the declivity of a hill, on the Bléone, 55 m. NE. Aix, 78 m. SSW. Grenoble, and 373 m. SE. Paris. Pop. 5,344 in 1861. The town is encircled by ancient walls flanked with square towers. Streets generally narrow, and the houses mean. In its vicinity are some saline baths, serviceable in rheumatic, paralytic, and cutaneous affections and gunshot wounds. One of the avenues to the town is planted with trees and bordered with handsome houses. Digne is the seat of a court of primary jurisdiction, a court of assize, a tribunal of commerce, a communal college, and a bishopric; but neither its principal church nor episcopal palace deserve notice. It has a public library with 3,000 vols., a society of agriculture, departmental nurseries grounds, tanneries, and some trade in prunes, almonds, corn, hemp, cloth, cattle, and leather.

DIJON (an. *Divio*), a celebrated town of France, dép. Côte d'Or, of which it is the cap., as it was formerly of the duchy and prov. of Burgundy, in a fertile plain at the foot of the Côte d'Or Mountains, on the Ouche, at the confluence of the Suzon; 105 m. N. Lyons, and 160 m. SE. Paris, on the railway from Paris to Lyons and the Mediterranean. Pop. 37,054 in 1861. It is surrounded by ramparts planted with trees, and is for the most part well built. Its streets are broad, well paved, and clean; and it contains several large and fine squares. Its environs are extremely beautiful, and few towns in France possess such fine public walks. The Suzon, running in various subterranean channels through different quarters, contributes to the cleanliness for which Dijon is conspicuous. In the *Place Royale*, constructed in the form of a horse-shoe, is the palace which has succeeded to the ancient castle of the dukes of Burgundy, the greater part of which was destroyed by fire in 1502. A large square tower formerly belonging to this castle, and called *La Terrasse*, now serves as an observatory: the palace, which was finished in 1784, was destined for the reception of the states of the province, and for the residence of the Princes of Condé, who, under the old *régime*, were its hereditary governors; its magnificent suite of apartments is now occupied by the museums of painting and sculpture. The castle of Dijon, commenced by Louis XI., and terminated under Louis XII. in 1513, became in the 18th century a state-prison, in which the Duchess of Maine, Mirabeau, and other distinguished persons were confined; it now serves for the quarters of the *gens-d'armes*. Several of the churches are well worthy of notice. That of St. Bénigne, in which the installation of the dukes of Burgundy took place, was founded in the 5th century, and rebuilt in 1106. It suffered materially during the revolution; but its spire is still standing, and reaches to the height of 98 mètres, or 321½ ft. above ground. The churches of Notre Dame and St. Michael are remarkable alike for their antiquity, the beauty of their architecture, and the magnificence of their ornaments. The church of St. Anne is an elegant modern structure, with a fine dome. The hall of justice is a large ancient edifice, and the theatre is, next to that of Bordeaux, the handsomest in France out of Paris. There are two public libraries, one of which has 40,000 printed vols., and 500 or 600 MSS.; a cabinet of natural history, and a botanic garden, 2 hospitals, an orphan asylum, 2 prisons, a town-hall, hotels of the prefecture and academy, and many private residences built during the independence of the duchy, which give to the city a venerable and interesting appearance. Dijon is the seat of an imperial court for the dépts. Côte d'Ore, Haute Marne, and Saone et Loire, a court of assize, tribunals of primary jurisdiction and of commerce, and of a bishopric; and is the head-quarters of a military division. It has an *académie universitaire*, with faculties of law, science, and literature, a royal and 7 other colleges, a superior school of the fine arts, a secondary school of medicine, a primary normal school, and numerous learned societies. It has some fabrics of linen, cotton, and woollen stuffs, vinegar, mustard, for which it is famous, wax-candles, hats, earthenware, soap, &c., besides sugar and wax refineries, tanneries, and breweries: but its principal dependence is on its wine trade, it being the principal depôt and market for the sale of Burgundy. This town existed previously to the period of Roman domination; it was fortified, and, according to some, rebuilt by Marcus

Aurelius; and enlarged and embellished by Aurelian, anno 274. In 1137 it was burnt down, but soon rose from its ashes: it was annexed to France, with the rest of Burgundy, in 1447. It has produced many very distinguished men; among others may be specified Bossuet, the glory of the Gallican church, born here on the 27th Sept., 1627; Crebillon, Piron, Longepierre, Daubenton, and Guyton de Morveau.

DINAGEPOOR, an inl. distr. of Hindostan, prov. Bengal; between lat. 24° 48′ and 26° 18′ N., and long. 88° 1′ and 89° 11′ E.; having W. and N. the distr. Purneah, E. Rungpoor, and S. Rajishaye; length N. to S. 105 m., breadth 82 m.; area, 5,374 sq. m.; pop. estimated at 2,500,000, nearly two-thirds of whom are Mohammedans. The district contains no mountains, nor even hills; but its surface is undulating: it is everywhere intersected by rivers, the principal of which are the Mohanonda, Atreyi, and other tributaries of the Ganges. There are no lakes, but in the rainy season some of the rivers swell out into extensive marshes; and as they are constantly changing their courses, their deserted channels often contain a considerable expanse of stagnant water. The winds are more variable here than in any other part of India, but for the most part E. The rainy season commonly lasts from the middle of June to the middle of Oct. Towards the end of this season the nights are hot and oppressive, but the maximum heat is not so great as at Calcutta. From Nov. to Feb. the natives often suffer much from cold, and fires are agreeable to Europeans. The E. winds are accounted very unhealthy; and intermittent and other fevers annually destroy a great many of the pop. The soil is in some parts a red and stiff clay, unusual in Bengal; but by far the larger portion is light and ash-coloured. Nitre was formerly made in this district, but the soil is not peculiarly adapted for it, and its manufacture has been removed to more favourable situations. The banyan, mango, areca, &c. flourish; palms, generally do not thrive. There are some small saul forests; but, generally speaking, timber is inferior, and useless for boat-building. There are few tigers or leopards, no wolves or hyenas, and the wild elephant or rhinoceros is very rarely seen. Deer, hares, porcupines, ichneumons, otters, &c., are very plentiful; and wild hogs and buffalos do much damage to the crops. Birds are abundant, and so are fish; the last form by far the greater part of the animal food consumed. Crocodiles are not uncommon, but are little dreaded; tortoises, and some lizards, are eagerly sought for as articles of diet; insects are not very troublesome. About two-thirds of the land is fully occupied and cultivated; rice is the principal article of culture, but is inferior to that of Patna; wheat, barley, millet, legumes, and oily seeds are successively the produce next in importance. The cotton raised in the N. is very bad, but that of the S. is finer than that imported from the W. of India; the sugar-cane is largely cultivated, and is of a good quality; indigo and tobacco are also raised, but the latter not in sufficient quantity for home consumption. The husbandry of the district is deplorable; the plough is without a coulter or mould-board, and in some parts wants even the share; all the other farm implements are nearly as bad; and 6s. will buy all that are deemed necessary for the culture of five acres of land. Both the oxen and horses are wretched, except a breed of ponies from Bootan; all cattle are, however, ill fed, and on none but natural pastures. There are very few carts or conveyances of any kind in the district. The farms are generally small; about one farmer only in sixteen may rent from 30 to 100 acres; estates are also generally small; most of the land belongs to Hindoos. There are, however, very few individuals in a state of beggary, and such as are so are readily relieved, the disposition of the people generally being charitable. Except those of Europeans, and some Mohammedans, no houses have any other than a thatched roof: mud walls are most common; but, in some instances, the huts are wholly constructed of straw and reeds. The furniture of both Mohammedans and Hindoos is nearly alike, and the whole, amongst the labouring classes, not worth more than a rupee. Most of these classes sleep on sackcloth or mats on the ground. They are generally very ill-clothed, but both Hindoos and Mohammedans wear many ornaments; the women of both races colour their eyelids with lamp-black. For food, the people are generally better off than for lodging, furniture, or clothing; and few are distressed by hunger, although their food is seldom very nourishing; the lower classes are obliged to use the ashes of the plantain root, &c. for salt, and often want for tobacco, their favourite and almost only stimulus. Slaves are few, and servants, especially female ones, scarce; for early marriages are so universal, that nearly every woman is married by the period of puberty, or is else subject to a stigma. The inhab., as might be expected from their poverty, are feeble, sickly, and subject to various diseases; and are also ignorant, mendacious, and occasionally rapacious. Dacoity was formerly a very prevalent crime. Education has proceeded to very little more than rudimental instruction among about 1 in 16 of the male sex. Christianity has made but little progress.

DINAGEPOOR (*Dinajpur, the abode of beggars*), an inl. town of Hindostan; cap. of the above distr.; seat of the British judicial and revenue courts; between two tributaries of the Ganges; 65 m. ESE. Purneah, and 86 m. NNE. Moorshedabad: lat. 25° 37′ N., long. 88° 43′ E. Pop. estimat. at 30,000, chiefly Mohammedans. It is, as its name implies, a very poor place; its houses are chiefly thatched huts, there being, according to the latest accounts, but eight brick dwellings out of 5,000, exclusive of the European residences and public offices, which are built in the worst Anglo-Indian style. Its most densely peopled portion has near its centre a square surrounded with shops; in the English quarter, and other portions, the houses are detached from each other, and intermixed with gardens and pasture lands. What may be considered the port of the town, on the bank of the Punabhoba, is occupied by merchants and warehouses. It is clean and well watched, but not lighted; the roads round it are kept in good repair by convicts, but bridges are wanted. It contains no public building of any importance, excepting the house of the late rajah, built in 1780, a strange mixture of European, Moorish, and Hindoo styles, surrounded by a ditch and rampart; but now in great measure gone to decay. The vicinity of Dinagepoor has a sandy soil, is ill supplied with water, and chiefly occupied by pastures.

DINAN, a town of France, dép. Côtes-du-Nord, cap. arrond., beautifully situated on a height on the left bank of the Rance, 13 m. E. St. Brieuc, on the Northern railway. Pop. 8,089 in 1861. The town is surrounded by walls of extraordinary height and thickness, the works outside of which are now converted into gardens, and laid out as public walks. Streets mostly ill built, narrow, and dirty; though of late years some parts of the town have been much improved. The principal public buildings are,—a castle, built about 1300, now used as a prison, two churches of Gothic architecture, the town-hall, clock-tower, hospital, and concert-hall. Vessels of from 70 to 90 tons come up to Dinan at

high water: it communicates with Rennes by the canal of Ille and Rance, the river being navigable only as far as this town. Dinan is the seat of a tribunal of primary jurisdiction, and of a communal college: it has a school of design, a public library, and a society of agriculture, with manufactures of sail-cloth, cotton stuffs, flannels, shoes, and hats for the troops and colonies, leather, beet-root sugar-factories; and has some trade in butter, hemp, and thread.

DINANT, a town of Belgium, prov. Namur, cap. arrond., on the Meuse, 14 m. S. by E. Namur, on the railway from Namur to Luxembourg. Pop. 7,210 in 1856. The town is built on the declivity of a rocky hill, on the summit of which is its castle. It is divided into the 'Town-proper' and the 'Island,' and has a suburb, a Gothic cathedral, seven other churches, two hospitals, and a Latin school. Its manufactures are chiefly woollens, hats, cutlery, cards, verjuice, mead, gingerbread, paper, and glass; but it has several oil, flour, and hemp mills, with mills for cutting and polishing marble, and numerous salt-refineries, tanneries, and breweries. It is the seat of a court of primary jurisdiction, and the residence of a military commandant. Dinant is very ancient. In the 14th century it was a prosperous commercial town; in 1466 it was sacked and burnt by Duke Philip of Burgundy; and again sacked in 1554 by the Duke of Nevers.

DINAPOOR, an inl. town, and British military station in Hindostan, prov. Bahar, on the S. side of the Ganges, 14 m. W. Patna; lat. 25° 37′ N., long. 85° 5′ E. The cantonments are large and handsome, with a fine quay, three extensive squares of barracks for the European troops, uniformly built, of one lofty ground story, well raised, stuccoed, and furnished with arcades; there are also large barracks for the native troops. The garrison consists of about 6,000 men, one-fourth of them Europeans. The town is well supplied with European goods; and in its neighbourhood potatoes are largely cultivated by both Europeans and natives.

DINGLE, a marit. town of Ireland, co. Kerry, prov. Munster, on a slope at the bottom of Dingle Harbour, on the N. side of Dingle Bay, 26 m. W. by S. Tralee. Pop. 4,327 in 1831, and 2,260 in 1861. Many of the houses are built in the Spanish fashion, it having formerly maintained an intimate communication with Spain. The par. church and Rom. Cath. chapel are modern buildings; a second chapel is attached to a nunnery; and a large national school-house has been erected. It has a dispensary, and is a constabulary and coast-guard station; and is frequented during summer as a bathing-place. The harbour is fit only for small vessels, which lie aground on mud at low water. The corporation, under a charter of Jas. I., in 1607, consists of a sovereign, 12 burgesses, and a commonalty. It has jurisdiction over a district of land extending 2 Irish m. in every direction from the par. church; and that of the sovereign, as admiral of the harbour, is determined by the flight of an arrow discharged from the harbours of Dingle, Ventry, Smerwick, and Ferriter's Creek. It returned 2 mems. to the Irish H. of C. till the Union, when it was disfranchised. General sessions are held twice a year, and petty sessions on alternate Fridays. The linen manufacture, which formerly flourished here to a considerable extent, is now confined to that of coarse cloth in small quantities: grain and butter are the chief articles of trade. The fishery, also, which had been very productive, large numbers of herring, flat and round fish, having been taken, is in a very depressed state, so much so, that the town is supplied with cured fish from foreign markets.

DINGWALL, a royal and parl. bor. and seaport town of Scotland, co. Ross, on the W. extremity of the Cromarty Frith, 19 m. NNW. Inverness, on the railway from Inverness to Invergordon. Pop. 1,739 in 1841, and 2,084 in 1861. The town is built in the Dutch fashion, and is rather neat, consisting of one leading street, with several inferior ones branching from it. The harbour was originally at an inconvenient distance; but in 1815–17, a canal was formed (at an expense of 4,365*l.*), by which vessels of considerable burden are now brought to the immediate vicinity of the burgh. The annual revenue derived from the canal is about 130*l.*, which is not more than sufficient to keep it in repair. The beautiful valley of Strathpeffer, at the head of which is a famous mineral spring, stretches W. 5 m. from Dingwall. The town-house is a venerable edifice, with a spire and clock: a plain parish church and a gaol are the only other buildings worth notice. Dingwall is a place of little or no trade. There are but few vessels belonging to it; and its exports consist exclusively of wheat and other country produce, and its imports of lime and coals. The charter of its erection into a royal burgh was granted in 1227, by Alexander II. On the E. of the town may still be seen the remains of the Castle of Dingwall, a fortified place, long the chief residence of the noble family of Ross. Near the church, on an artificial mound, stands an obelisk 57 ft. high, erected as a family burial-place by George, first earl of Cromarty, secretary of state for Scotland, in the reign of Queen Anne. Dingwall unites with Wick, Cromarty, Dornoch, Kirkwall, and Tain, in sending a member to the H. of C., and had 112 registered voters in 1864.

DIOS, NOMBRE DE, a town of Mexico, state Durango, on the road between Durango and Sombrerete, 40 m. SE. the former city. Pop. estim. at 6,000. Its chief source of wealth is an extensive trade in *Vino Mescal*, a spirit obtained from the American aloe.

DIZIER (ST.), a town of France, dép. Haute Marne, cap. cant., on the Marne, at the point where it becomes navigable, 47 m. NNW. Chaumont, on the railway from Vitry to Chaumont. Pop. 8,077 in 1861. The town was formerly well fortified, and in 1544 sustained a memorable siege by the emperor Charles V.; but its ramparts have been converted into agreeable promenades. It is a handsome town, with broad streets, and houses mostly of stone. The town-hall, of recent construction, is much admired. It has a hospital, the ruins of an ancient castle, with cotton fabrics, iron-foundries, and a considerable trade in wood. Many vessels are built here for the navigation of the Marne, the town being environed by a forest, whence the materials are easily procured. A part of the allied army which invaded France in 1814, was defeated with great loss at St. Dizier on the 27th Jan. and the 27th March by Napoleon. It was here also, after the breaking up of the congress of Chatillon, that the Duc de Vicenza (Caulaincourt) announced to Napoleon that he must abandon all hope of treating with the allied sovereigns.

DJEBAIL, or GIBYLE (an. *Byblus*, Βύβλος), a coast town of Syria, S. by W. Tripoli; lat. 34° 7′ N., long. 35° 37′ E. Pop., according to Volney, 6,000, but this is probably exaggerated; the inhab., according to the older Maundrell, and more recent Robinson, being *few*. They are chiefly Maronite Christians. An old castle on the S., built with stones of an enormous size, and the wreck of a very handsome church of great antiquity, are the principal remains; but shafts, columns, and other ruins are scattered about in great profusion. The walls are 1½ m. in circ., with square towers at in-

tervals; an artificial harbour formerly existed, but has been long destroyed; and the town is evidently in a state of gradual, if not rapid decay. At a few m. distance on the S. flows the Nahr Ibrahim (an. *Adonis*), a short, but deep and rapid stream, over which is a well-built stone bridge of one arch. The surrounding soil is fertile, and peculiarly favourable to the growth of tobacco, The land of the Giblites (Βύβλιοι) is mentioned in Josh. xiii. 5, and this town was evidently a place of considerable importance in the mercantile and maritime kingdom of Tyre. (Ezek. xxvii. 9.) Byblus occupies a distinguished place in Syrian mythology, from its being the scene of the death of Adonis or Thammuz, and a principal seat of the religious rites connected therewith. It may be mentioned, in reference to this subject, that wild boars are still very common in the surrounding mountains, and that the phenomenon mentioned by Lucian, of the river acquiring a reddish colour at certain seasons of the year, has been observed by Maundrell and other travellers, and is occasioned by the washing down of particles of red earth during heavy rains. Milton has beautifully alluded to this legend :—

> 'Thammuz came next behind,
> Whose annual wound in Lebanon allur'd
> The Syrian damsels to lament his fate
> In amorous ditties all a summer's day,
> While smooth Adonis, from his native rock,
> Ran purple to the sea, suppos'd with blood
> Of Thammuz yearly wounded.'

Byblus was a considerable sea-port under the Greek kings of Syria, but the existing remains are mostly of the Roman period. It was a favourite with the emperor Adrian, who appears to have been peculiarly attached to the worship of Adonis (see BETHLEHEM), and to whom an inscription near the land-gate still exists in good preservation. At an early period of the Crusades, it was captured by the Christians, who built its present walls; but in the furious wars of that fanatical age, the port and trade of Djebail shared the ruin of the other cities of the coast. Still, in its decay, it is the cap. of the Kesraouan (the coast between Tripoli and Beirout) and the see of a Maronite bishop. (Strabo, xvi. 755; Lucian, De Deâ Syriâ, 2; William of Tyre, xi. caps. 9 and 14; Maundrell, 44–46; Volney, ii. 148; Burckhardt's Trav. Syr., 179; Robinson, ii. 49–52.)

DJIDDA, or JIDDA, a marit. city of Arabia, in El-Hedjaz, being the port of Mecca, and one of the chief entrepôts for foreign commerce in the peninsula. Lat. 21° 32′ 42″ N., long. 39° 6′ E. Resident pop., according to Ali Bey, 5,000, but this number is often much increased by the influx of strangers. The inhab. are nearly all foreigners, or settlers from other parts of Arabia; the only natives being a few sheriff families attached exclusively to the offices of religion and law. Five mosques, poor and mean, the governor's house, and a small castle, mounting nine or ten guns, are the only public buildings, except the khans, which are numerous and handsome. The houses in the town, built of stone and madrepore, are, from the perishable nature of the material, not very lasting; but in the suburbs they are mere huts, constructed of reeds and brushwood, inhabited principally by Bedouins. The streets are unpaved; but Dijdda is, notwithstanding, cleaner, and in other respects superior to most Eastern cities of equal size. It is one of the holy places of Mohammedanism, and its sanctity is increased by the neighbourhood of the reputed tomb of Eve, a rude stone structure, about 2 m. to the N. The surrounding country is a bare desert, destitute of running streams; and though well water is easily procurable, it is generally bad. The inhab. collect the rain in cisterns, and the commonest necessaries are brought from a distance. Corn, rice, butter, sugar, tobacco, oil, clothing, &c., are imported in very large quantities from Egypt, the Abyssinian coast, and (excepting butter) even from Persia and India. Djidda depends, therefore, for its existence upon its trade, which is very extensive, and wholly of the transit kind. From the interior dates, and the celebrated balm of Mecca, are brought for shipment westward; musk, civet, and incense are procured from Abyssinia; muslins, cloths, cambrics, teak timber, cocoa-nuts, cocoa-nut oil, pepper, ginger, turmeric, shawls, and tissue, are brought from India; the Malay Islands send spices and female slaves for sale at the Mecca market. The coffee trade, which, next to that of grain, was formerly the most important, has much declined of late, partly owing to the free admission of American produce to the Mediterranean, but principally to the impolitic exactions of the pacha of Egypt upon this branch of commerce. A trade in slaves is carried on with the Mozambique coast; and, altogether, it is calculated that the port of Djidda employs 250 vessels, great and small. The imported articles are conveyed by ships to Suez, whence they find their way to the Mediterranean ports, or by caravans to Mecca and Medina, from which cities they are again dispersed to Syria, Asia Minor, and Turkey. The caravans to Mecca start daily, those to Medina every forty or fifty days; but, besides these, Djidda carries on no land trade, except occasionally with N. Yemen for corn. The duties upon coffee were formerly 7½ per cent., they are now double that amount; those upon Indian goods are from 6 to 10 per cent. according to quality; the trade in grain is monopolised by the Egyptian government. Twice at least in every year Djidda is crowded with strangers, viz. on the arrival of the Indian fleet (about May), when merchants from all quarters pour in to purchase at the first hand; and during the hadj, when pilgrims come from all the African ports in vast numbers. In some years above 20,000 pilgrims land either at Djidda or Yembo, but mostly at the former. There is no manufacture in the town; everything, for use as well as for consumption, is imported, and the occupations of the poorer as of the richer inhab. consist almost exclusively of barter.

Abul-Feda (Ar. Des., 60), supposes Djidda and its neighbourhood to be the *Badeo Regium* (Βαδεῶ βασίλειον) of Ptolemy (vi. 7, viii. 6); but Niebuhr with more reason believes the ground on which the city stands, to have been recovered from the sea within a short period. At some distance from the shore, he describes high sand hills, full of shells and corals; and the general appearance of the coast makes it impossible, in his mind, that the modern town can occupy the same site with its namesake, in the days of Mohammed. 'Djidda,' he says, 's'avancera de plus en plus vers l'ouest;' and in fact, although a city of this name has been, for ages, the port of Mecca, yet the town now existing is evidently of modern origin. The sultan sheriff of Mecca, as sovereign of the Beled-el-Harem (Holy Land), has possessed Djidda since the first days of Islamism; a pacha, first appointed by the caliphs, and then by the grand signior, as head of the Mohammedan faith, was indeed the nominal governor; and, professedly, the customs were to be divided equally between him and the sultan sheriff. The latter, however, in the declining days of Turkish power, paid little regard to this arrangement, and in the end expelled the Turks entirely from El-Hedjaz. Scarcely was this effected when the growing power of the Wahabees

became more formidable than that of the porte. Mecca and Medina were taken, and the sheriff, shut up in Djidda, made a public but doubtful profession of the Wahabee faith. In 1811, Mehemet Ali established his power in El-Hedjaz, the reigning sheriff was carried to Cairo, and his successor, appointed by the Egyptian pacha, retained only a shadow of authority, with a monthly stipend in lieu of the port dues. (Abul-Feda, Ar. Des., 59, 60; Niebuhr, Des. de l'Ar., 303–309; Voy. Ar., i. 217–228; Lord Valentia, iii. 301–332; Ali Bey, ii. 40–46; Burckhardt, i. 1–100; Wellstedt, ii. 268–289.)

DNIEPR (the *Borysthenis* of the ancients), a large river of European Russia. It has its source near the village of Dnieproosk, in the government of Smolensk, and, pursuing a S. course past Sindensk, where it becomes navigable, Mogheleff, Kieff, Ekaterinoslaff, and Kherson, unites with the Black Sea about 60 m. below the latter, after a course of above 1,200 m. Its principal affluents are the Pripet, Beresina, and Desna. It is broad and deep, and may be navigated with ease and safety, from Smolensk as far as Ekaterinoslaff; but from the latter to Alexandrofsk it is interrupted by cataracts, which cannot be passed by any sort of craft, except in spring after the *débacle*, and in the latter part of autumn. Works were begun in 1833 for obviating these obstructions, an object of vast importance to S. Russia; but we have not learned what has been their success. What is called the bar of the Dniepr lies about 15 m. below Kherson, and between it and the town the water is shallow, and the channel encumbered with shifting sands. There are valuable fisheries below Kherson, and in other parts of the river. (See KHERSON; see, also, Hagemeister's Report on the Black Sea, p. 69, English trans.)

DNIESTR (the *Tyras*, or *Danaster*, of the ancients), a large river of SE. Europe. It has its source in the Carpathian mountains in Galicia, and flowing in a SSE. direction along the E. frontier of Bessarabia, falls into the Black Sea between Ovidiopol and Akerman, after a course of about 500 m. It has no very considerable affluents, and being in most parts shallow and rapid, it is of little service to internal navigation, except during spring and autumn.

DODONA, a town of Epirus, famous in antiquity for its being the seat of an oracle of Jupiter, the most ancient in Greece, and second only to that of Delphi in celebrity and importance. It appears to have been instituted by emigrants from Egypt; at least this is the opinion of Herodotus, and seems to carry with it the greatest probability. (Lib. ii. §§ 52–58.) The temple was enriched by vast numbers of costly statues and other offerings, presented by the states and individuals who had consulted the oracle. Adjoining the temple was a grove sacred to Jupiter; and in it was a divine or prophetic oak, by which the responses of the god were sometimes manifested! The imposture carried on here was, in fact, even more gross and glaring than at Delphi. There the priests framed a response from the ravings of the Pythia; but at Dodona the priestess went into the sacred forest, and listening to the cooing of the doves, or the rustling of the leaves or branches of the sacred tree, drew thence her auguries! Sometimes she deduced them from the sounds emitted by the clashing of copper basins hung round the temple, and from those emitted by a brazen vessel placed on the top of a column, and struck by the figure of a child put in motion by the wind! The responses, in ordinary cases, were, of course, characterised by the usual ambiguity, so that, let the event be what it might, the credit of the oracle should be preserved; but here, as at Delphi and elsewhere, a rich or powerful individual had little difficulty in getting such an answer as he wished for. (See Ancient Universal History, x. 67, 8vo. ed.; Voyage d'Anacharsis, cap. 36, &c.) The site of this famous oracle is now matter of dispute among the learned. It is fixed by some at Protopapas, near the lake Labchistas, 12 m. NNW. Yannina; but others place it a good deal nearer the coast.

DOHUD (*two frontiers*), an inl. town of Hindostan, on the boundary of Malwah and Gujerat; Holcar's dom.; lat. 22° 55′ N., long. 74° 20′ E. It is of some size, well-built and well supplied with grain and water; is much frequented by traders, being on the high road between Upper Hindostan and the Gulf of Cambay; and commands the principal pass into Gujerat from the NE. It has a fort said to have been built by Aurungzebe.

DOL, a town of France, dép. Ille-et-Vilaine, cap. cant., on an eminence among marshes which have been dried, and are very fertile; 13 m. SE. St. Malo, and 30 N. Rennes, on the railway from St. Malo to Rennes. Pop. 4,191 in 1861. The town is surrounded by walls and ditches, the remains of its old fortifications; it having formerly been a bulwark of Brittany against the invasions of the Normans. The glacis of the ramparts has been converted into a fine promenade. It is ill built, and has but one tolerable street; but its cathedral is one of the largest and finest in the prov. Dol was a bishopric as early as the 6th century.

DOLE, a town of France, dép. Jura, cap. arrond., finely situated at the foot of a hill planted with vines, on the Doubs, and on the canal between the Rhone and Rhine; 28 m. N. Lons-le-Saulnier, on the railway from Paris to Besançon. Pop. 10,605 in 1861. The town was formerly fortified, but its defences have been long since destroyed. Its chief public buildings are the cathedral, with a large square tower and three lofty naves, supported by enormous columns; the new prison, *Hôtel Dieu*, general hospital, tower of Vergy, hall of justice, barracks, the old college of the Jesuits, and theatre. The bridge over the Doubs, and the port on the canal, are also worthy of notice. Dôle has several Roman remains, including those of an amphitheatre, some aqueducts, and part of the superb Roman road leading from Lyons to the banks of the Rhine. It is the seat of tribunals of primary jurisdiction and of commerce; has a *dépôt de mendicité*, an orphan asylum, a communal college, a gratuitous school of design, painting, schools of geometry and music, a public library with 6,000 vols., and a society of agriculture: it has, also, manufactures of straw-hats, leather, chemical products, and agricultural implements; and a considerable trade in agricultural produce. Dôle is very ancient: in the 12th century it became the occasional residence of the emperor Frederick Barbarossa, and in 1422 had a parl. and university of its own. In 1479 it was taken by the troops of Louis XI., when most of its buildings were destroyed or damaged, and many of the inhab. put to the sword. It subsequently came into the possession of the Spaniards, and being rebuilt by Charles V., many of its houses preserve the Spanish style of architecture. Ultimately it was united to France, in the reign of Louis XIV.

DOLGELLY, or DOLGELLEU, a town of North Wales, co. Merioneth, on the Mynach, at the foot of Cader-Idris, 46 m. W. Shrewsbury. The par. of Dolgelly comprises 870 acres, and had, in 1861, a pop. of 3,457, of which the town had 2,217. It is very irregularly built, but has some

good houses; a bridge over the river, built in 1638; a co. hall, erected in 1825, and a church with a handsome tower and large nave. The co. gaol, situated outside the town, was built in 1811, at an expense of 5,000*l*. The town has long been noted for the manufacture of a coarse woollen fabric, called *webs*, principally shipped for America. Webs were formerly made in different parts of Montgomeryshire, but the manufacture is now entirely confined to this town and neighbourhood. The name of the town is derived from its situation in a dale, abundant in hazels.

DOLLAR, a village of Scotland, co. Clackmannan, 12 m. E. by N. Stirling, on the Scottish Central railway. Pop. 1,540 in 1861. The village is noteworthy as the seat of an academy, established by Mr. M'Nab a native of the place, who appropriated nearly 100,000*l*. for its foundation. The academy, a beautiful Grecian building, was erected in 1819. The branches taught in it, in addition to English, writing, arithmetic, and geography, are drawing, mathematics, and natural philosophy, French, Italian, and German, Latin, Greek, and the Oriental languages. An infant and a female school are attached to the institution, and a library. The session commences on Oct. 1., and terminates on the third Wednesday of August. The academy is governed—under 10 & 11 Vict. c. 16—by a body of trustees, comprising the lord-lieutenant of the county and other eminent men.

DOMINGO (ST.). See HAYTI.

DOMINICA, one of the Windward Islands in the W. Indies, belonging to Great Britain, situated between the islands of Guadaloupe and Martinique, 28 m. from either; in lat. 15° 12′ to 15° 36′ N., and long. 61° 17′ to 61° 32′ W. Length N. to S., about 29 m.; greatest breadth 16 m.: area 186,436 acres. Pop. 25,065 in 1861. The island is the most elevated of the lesser Antilles, and contains many high and rugged hills, interspersed with fertile and well-watered valleys. The soil is, however, generally very light, and more fitted for the growth of coffee than of sugar. Maize, cotton, cocoa, and tobacco, are amongst the other staples. The higher parts produce abundance of rose and other woods used in cabinet-making. Hogs, poultry, and game are plentiful: the fisheries on the coast are very productive: and bees, supposed to have been introduced from Europe, abound in a wild state. The island bears unequivocal marks of volcanic action, and sulphur is found in great plenty. The principal exports are sugar, rum, molasses, coffee and cocoa. The total value of exports, in the year 1863, amounted to 72,726*l*., and of imports to 47,755*l*. The public revenue, in 1863, amounted to 12,787*l*., and the expenditure to 12,095*l*. The government is under a lieutenant-governor—subordinate to the governor-in-chief at Antigua—an executive council of seven members, appointed by the crown, and a representative assembly of nineteen members. The island is deficient in good harbours; that of Roseau on the W., and Prince Rupert's Bay on the N. coast, are the only tolerable ones. Roseau and St. Joseph are the principal towns. Dominica was discovered by Columbus in 1493, ceded to England by France in 1763, retaken by the French in 1778, but restored at the peace of 1783.

DOMREMY LA PUCELLE, a small village of France, dép. Vosges, 7 m. N. Neufchâteau. Pop. 889 in 1861. Domremy is celebrated as the birthplace of the famous Joan of Arc, born here in 1412. The house once inhabited by the heroine is still extant. It has been purchased by government, and is preserved with a kind of religious care and veneration. Opposite to it, in 1820, a handsome monument, surmounted by a colossal bust of Joan, and bearing an appropriate inscription, was erected to her memory by the dép.; and, at the same time, a school of mutual instruction for young girls was founded in the village. This village also gave birth to a female of a very different character from Joan, Madame Dubarry, the mistress of Louis XV.

DON (the anc. *Tanais*), a large and celebrated river of Russia in Europe. It rises in the distr. of Epifan, in the government of Tula; and passing by the town of Lebedian, flows S. to Voronege and Kalitva; it then turns to the E., till, at Katchalinsk, it approaches within about 36 m. of the Wolga; here it takes a WSW. direction, which it pursues till it falls, by various mouths, into the NE. corner of the Sea of Azoff, a little below the town of the same name. Altogether, its course, which is very circuitous, may be about 1,000 m. Principal affluents, Donetz, Sosna, Vorona, Medveditza, &c. Its turbid and unwholesome waters are well stocked with fish. Its mouths are so encumbered with sand banks that they only admit of being entered by flat-bottomed vessels drawing from 5 to 6 ft. water; and in summer it is in most parts so very shallow that it is of little consequence as a channel of internal navigation, except during spring and autumn, when the products of the various provinces it traverses are brought down to Rostof, Nakhitchevan, and Taganrog. (Hagemeister on the Commerce of the Black Sea, p. 30. English trans.) Peter the Great projected a canal between the Don and the Wolga, where they approach nearest to each other; but, owing to the difficulty of the ground, it has not yet been accomplished. The former is, however, connected near its source by a canal with the Oka, an affluent of the Wolga, and, consequently, by a very circuitous course with the latter. Europe is now generally and properly extended, on the S., to the ridge of the Caucasus; but in antiquity the Don (*Tanais*) was held, during the latter part of its course, to be the line of demarcation between Europe and Asia. Lucan notices this circumstance, as follows:—

> '———— quà vertice lapsus
> Rhipæo Tanais diversi nomina mundi
> Imposuit ripis, Asiæque et terminus idem
> Europæ, mediæ dirimens confinia terræ,
> Nunc hunc, nunc illum, quà flectitur ampliat orbem.'
> Lib. iii. line 273.

DONAGHADEE, a sea-port town of Ireland, co. Down, prov. Ulster, on the nearest point of the coast to Portpatrick, in Scotland, from which it bears SW., distant 22 m. Pop. 2,986 in 1831, and 2,671 in 1861. The town, which is 19 m. E. Belfast by railway, is built like a crescent, on one side of the harbour, which has been much improved by a new pier carried out so as to have a depth of 16 ft. at low water, and having a light-house at its extremity. The par. church is an ancient cruciform structure; and there are two meeting-houses for Presbyterians, and one for Methodists, an infirmary, and a dispensary. A manor court, with jurisdiction to the amount of 20*l*., is held in the court-house, as are a court leet annually, and petty sessions every Wednesday. The constabulary and coast-guard have stations here. The embroidering of muslin is carried on to a considerable extent, and there are numerous flax-mills in the neighbourhood. The port is a creek to Belfast, and a station for the regular steamers to Portpatrick, the voyage being usually made in less than three hours.

DONCASTER, a handsome corporate and market town of England, W. riding co. York, on the

Don, which, including a branch called the Cheswold, is crossed by two fine stone bridges, 162 m. NNW. London by road, and 156¼ m. by Great Northern railway. Pop. 16,406 in 1861. The town, which is approached from the S. by a magnificent range of elm trees, is extremely well built, and the High Street, extending about a mile on the Great N. Road, has a remarkably fine appearance. It is a place of much importance both in its civil and ecclesiastical character, through the whole period of British history. At the point where the town now stands, one of the great Roman highways crossed the river. This road connected two great stations, Lincoln and York; and was an improved British track-way, used for a communication between Lincolnshire and the interior of the Brigantian territory. It is the station *Danum* in the 'Itinerary' of Antoninus. In the middle ages it had a convent of Carmelites and White Friars, and received the grant of a charter from Richard I. The property belonging to the corporation of Doncaster amounts to nearly 9,000*l.* a year. During the old corporation it was greater. But that body having incurred a debt of above 100,000*l.*, the new municipal body sold the Rossington estate to James Brown, esq., of Leeds, for the sum of 92,500*l.*, to pay off the debt; the purchase was completed in 1859. The income is principally expended on objects of public utility, as the paving, lighting, cleaning, and watching of the town, and supplying it with water; the support of educational and charitable institutions; with the erection of buildings for the purposes of public utility and amusement, and the attraction of visitors. The par. church, dedicated to St. George, is a large imposing structure, in part very ancient, with a beautiful square tower 140 ft. high. There is another church, built by bequest from John Jarratt, esq., a native of the town, at an expense of 13,000*l.* The Wesleyans, Primitive Methodists, Unitarians, Independents, Quakers, and Catholics have also places of worship. Exclusive of the churches and chapels, the principal public buildings are—the mansion-house, a handsome structure, erected in 1744, but improved in 1800; the town-hall, the theatre, gaol, public library, news-room, and lyceum, with the splendid betting-room, 90 ft. in length, which, except during the races, is used for concerts, lectures, and exhibitions. Among the educational institutions are a grammar-school for the sons of freemen, supported by the corporation; a national school, a British school, and Sunday schools, supported by subscription. Of the charitable institutions the principal are—St. Thomas's Hospital, founded in 1588, by Thos. Ellis, for decayed housekeepers, with a revenue of about 350*l.* a year; Kay's and Jarratt's charities; a dispensary, and sundry minor charities. The Yorkshire Institution for deaf and dumb, a flourishing charity, is situated adjoining the race-ground; and the workhouse for the Doncaster union is near the town. Under the Municipal Act the town is divided into three wards, and has two aldermen and six councillors for each.

Doncaster is not a manufacturing town, but it has some small iron-foundries; a large water corn-mill on the Don bridge, and a steam corn-mill on the opposite bank. It is in the centre of a rich and highly cultivated district, and has an extensive retail trade. The Don is navigable as far as Sheffield by vessels of 50 tons burden. Doncaster used to derive considerable advantage from its situation on the Great N. Road, and the number of travellers, by coaching and posting, passing through it But since the opening of the Great Northern railway the influx of travellers has greatly diminished. The iron roads, however, with which Doncaster is now connected, have given an additional impetus to trade, and more than compensate for the loss of the Great N. Road.

Doncaster is principally indebted for its celebrity to its races, and the high station which they hold in the sporting world. The races were established in 1703, and from a small beginning have become almost unrivalled: they are held in September, and have been zealously patronised by the corporation, the surrounding nobility and gentry, and the first names in turf annals. In 1776, the famous St. Leger stakes were established by Colonel St. Leger, who resided at Port Hill, near the town: hence their name. The first race was won by the Marquis of Rockingham; and the list of winners includes the finest horses that have been bred in England. The race-course, about 1 m. SE. from the town, adjoining the Great N. Road, is, in every respect, one of the finest in the kingdom. The course, nearly 2 m., is railed round: it is ornamented with a magnificent grand stand, for the accommodation of the principal company; the noblemen's stand, the stewards' or judge's stand, commodious booths, minor stands, and rubbing-houses. The interest excited by these races is quite extraordinary; they attract visitors from all parts of Great Britain and Ireland, and even from foreign countries.

DONEGAL, a co. of Ireland, prov. Ulster, of which it forms the NW. portion; having N. and W. the Atlantic, E. the counties of Tyrone and Londonderry, and S. Fermanagh and Donegal Bay. Area, 1,165,107 acres, of which 644,371 are mountainous and bog. It is deeply indented by bays and arms of the sea; and its surface is, in most parts, rugged, mountainous, and dreary. It has, however, some extensive tracts of good level land, which, under good management, would be exceedingly productive. Climate very wet, and unfavourable for the ripening of grain. Property in very large estates, but some of them are let on interminable leases; farms of various sizes, in the low grounds from 3 to 30 acres; in the mountainous districts from 30 to 500 do. Partnership leases common, but on the decline. Agriculture in the worst possible state. Potatoes, oats, and flax the principal crops, the first being the main dependence of the farmer. More work is done with the *loy* or spade than with the plough. Average rent of land 5*s.* an acre, being the lowest of any in Ireland. Bulk of the people very badly off: English little spoken in some districts. The linen manufacture was widely diffused, but it is on the decline. Fishing carried on to some extent in some of the bays along the coast. The barony of Innishowen, famous for its smuggled whisky, occupies the NE. portion of this co. between Lough Foyle and Lough Swilly. Donegal has five baronies, and forty-two parishes, and returns two members to the House of Commons, both for the county. Registered electors 4,307 in 1865. Pop. 296,540 in 1841; 255,237 in 1851; and 237,395 in 1861. Gross annual value of real property assessed to income-tax, 263,011*l.* in 1857, and 298,688*l.* in 1862.

DONERAILE, an inland town of Ireland, co. Cork, prov. Munster, on the Awbeg, an affluent of the Blackwater, 6½ m. NNE. Malone, and 23 m. N. by W. Cork. Pop. 2,652 in 1831, and 1,475 in 1861. The town consists of a long street, in which are the par. church, a spacious Rom. Cath. chapel, a nunnery, market-house, and dispensary. Kilcolman Castle, in the vicinity, was some time the residence of Spencer, the poet. The town, though not incorporated, sent two members to the Irish H. of C., but was disfranchised at the Union.

Markets on Saturdays, and fairs on Aug. 12 and Nov. 12. It is a constabulary station.

DONGOLA, a prov. of Upper Nubia, consisting of that portion of the valley of the Nile which lies between 18° and 19° 30′ N. lat., bounded on the N. by Mahass, and on the S. by the country of the Sheygya negroes; but, like all the fertile districts rescued from the surrounding deserts by the inundations of the Nile, Dongola is extremely narrow, only in one instance exceeding 3 m. in breadth.

The Nile, which enters this prov. at about 18° 15′, near Korti, flows at first in a S. direction, but, immediately taking a circular bend to the W. and N., traverses the rest of Dongola parallel to its former course, and with but trifling deviations continues to follow the same line down to the Egyptian delta. The widest portion is that nearest its first entrance into Dongola; and at 'high Nile,' the Rei, or low lands of the prov., are subject to inundations similar to those of Lower Egypt. The river makes its exit into the Nubian prov. of Mahass, at the island of Tumbos, whose rocky and rugged surface forms the third cataract, in lat. 19° 30′. (Waddington's Visit to some parts of Ethiopia, p. 40; Burckhardt's Nubia, p. 66; Map of Nubia in Arrowsmith's Atlas.) Navigation is exceedingly difficult in this part of the Nile, for, besides a strong current which the upward voyager has to contend against, the bed is shallow and bristles with rocks. (Narrative of Ismael Pacha's Expedition to Dongola and Senaar, by an American in the service of the Pacha, *passim*.)

The *mountains* of Dongola are a continuation of the same chains which, with slight interruptions, accompany both sides of the Nile during its whole course. Perhaps the most extensive of these intervals occurs here at the immense and fertile Dongolese plain, which forms the exception to the otherwise narrow breadth of the prov. A large solitary hill, about 4 m. E. of the river, called Mount Arambo (many-coloured, or chameleon), has from time immemorial marked the boundary between Mahass and Dongola. The great plain then intervenes, and the mountains recommence near New Dongola, and stretch beside the river without further interruption to the S. frontier; those on the E. bank being by far the most considerable. Here the mountains are two hours' journey in breadth, reach close to the river, and form a natural boundary to Sheygya. Granite and sandstone are the chief components of these hills. (Waddington and Hanbury, p. 61; Burckhardt's Journey in Nubia, p. 68.)

The *Valley of the Nile* lies for the most part in this district, on the W. bank; for the sands of the desert, encroaching close upon the water's opposite edge, render the E. side barren and unproductive, while the more favoured district has generally a harder surface. S. of the town of Hasinek commences the great plain of Dongola, called Wady Jarjar, which can hardly be exceeded in richness and fertility. At the period of the inundation it presents a watery surface of from 12 to 15 m. in breadth (Burckhardt, p. 66); while at low Nile, the river, bursting from its banks through small channels, seems as if it had divided itself into natural canals to irrigate as much ground as possible, and save man the trouble of cultivation. (Waddington, p. 43.) This plain is covered with acacia trees as far as the eye can reach. Further S. the mountains contract the valley, which to Wady Hennowah is fertile and separated into well-cultivated patches by rows of acacias. Ruins of towns and tombs of Moslem saints are frequently met with in this portion of the valley, which is much infested with hordes of the Nubian wolf (*Canis Anthus*, Rüppell). Wady Jebriah, situated towards the S. limit of Dongola, is overgrown with trees, amongst which cottages are thickly and irregularly strewed for some distance along the banks of the stream. Near Ambukol, about 8 m. W. of it, is a waste called Haagbarlak. The superficial stratum here is a coarse sandstone, curious and interesting from its containing many silicious fossil trees. 'I observed,' says Mr. Holroyd (Journal of the Royal Geog. Soc., ix. 164), 'five or six, the largest of which, situated twenty minutes' walk from the river, is 51 ft. in length, and 20 in. in diameter at its largest extremity. It is partially buried in the sand. The peasantry splinter off fragments, and use them for gun flints and to strike a light.'

None of the *islands* with which the river is studded in its course through Dongola is so celebrated as Argo, situated above the island of Tumbos, and a large granite rock called Hadjar-el-Dahab (the golden stone). Argo is upwards of 30 m. long, and is one of the most beautiful islands that spring up from the bed of the Nile. The scenery is highly picturesque, principally composed of small plains enclosed by rows of sycamore trees. Several remains of antiquity are strewed over the island, the most remarkable of which are two colossal statues cut in grey granite, the headless form of a female sculptured out of black granite, and the figures of four hippopotami standing side by side. The colossi are broken into fragments, lying close together, and 'really look as white and clear, and as free from the injuries of time, as if they were now fresh from the hand of the sculptor.' (Waddington, p. 46.) A peculiar breed of musquitoes, not so large nor so noisy as others, annoy the inhabitants of Argo. Several other islands occur at short intervals, among which may be enumerated Sodgàn, Tánger, and Gurák, as the most important and fertile. At the island of Gartooni, near Ambukol, the Dongolese country ceases.

The *towns and villages* are thickly scattered along the margins of the Nile, most frequently on the E. bank. The first of any consequence is the town of Hannek, opposite the isle of Tumbos, where the cotton plant is said to be productively cultivated. But by far the most important is Marákah, or New Dongola (situated, according to Linnant, in 19° 7′ 30″ N. lat., and 29° 54′ 35″ E. long.; but placed by Rüppell in lat. 19° 10′ 19″, and long. 30° 22′ 15″ E.), the present pop. of which has been estimated at 6,000, including 100 Copts. The bazaar is daily increasing, and is supplied from Cairo with shoes, printed cottons, calicoes, sugar, rice, cloth, hardware, &c.; but, on account of a heavy duty levied upon all articles of consumption, they are four times the price that they are in Cairo. Dongola boasts of a coffee-house and a manufactory for indigo; the government is also building baths. The thermometer on Christmas-day, 1836, stood, in the shade at 2 P.M., at 86°, and at 8 P.M. at 80°. (Journal Geog. Soc., ix. 164.) Property is valued according to the number of water-wheels an individual possesses, and he is taxed accordingly. (Burckhardt's Nubia, p. 66.) The chief places from New to Old Dongola are the dilapidated town of Handek, Basleyn, and Rodohol; between which numerous villages intervene, many of them in ruins. Tonga, or Old Dongola, the cap. of what was once a powerful Christian kingdom, is now a miserable ruin, situated on a rock which slopes down to the water's edge; it is covered with sand, a large mass of which has evidently buried the centre of the town, and divided the remains into two sections; the S. part only is inhabited by about 300 persons. The

sand is of a bright yellow colour, and has accumulated in such quantities that its surface is level with the roofs of many of the houses, the only entrance to which is through the ceilings of the rooms. (Geog. Journal, ix. 164.) There is a mosque, on rather an elevated site, which commands a good view of the surrounding country. This consists principally of drifted sand, with, at rare intervals, a few feet of cultivable soil. Ambukol, the last Dongolese town, is one of little importance.

Dongola is now an appendage to Egypt, together with Lower Nubia, which territories were conquered by the late celebrated ruler of Egypt, Mehemet Ali. It was formerly one of the numerous kingdoms divided between the Sheygya Arabs, amongst whom, at their expulsion from Egypt, the Mamelukes sought refuge. The fugitives, however, had scarcely been a month at Argo, when, upon some slight pretext, they murdered their benefactor, the Sheygya king, and spread themselves over the country, establishing a government of their own at New Dongola. The pacha of Egypt, upon pretence of punishing this breach of justice and hospitality, sent an expedition into the country, and, meeting with little resistance, took possession of it, which he has quietly retained ever since 1820. (Burckhardt's Nubia, p. 65; Quarterly Review, xxvii. 217.) The people possess the same characteristics as the rest of their countrymen (see NUBIA), except that they are unusually 'dirty, idle, and ferocious' (Narrative of Ismael Pacha's Expedition, p. 189); but they are also, in common with their neighbours, extremely hospitable. Mr. Waddington describes the women as ugly in person, and unfeminine in conversation and manners: they wear scarcely any clothing.

The *Dongolese horse* must not be passed over without particular notice, though the natural history of this region must be sought for in the art. NUBIA. This animal, so celebrated all over the East, possesses the beauty of the finest Arabian breeds, with greater size and more bone. The mares are seldom ridden, and the stallions fetch a high price; from five to ten slaves being the value usually given for them. Most of them are fed for ten months in the year on little else than straw, and in spring upon green crops of barley. (Burckhardt's Nubia, p. 67.)

DONOBEW, an inl. town of the Birmese empire, Pegu, on the E. arm of the Irrawadi, 50 m. NW. Rangoon; lat. 17° 8′ N., long. 95° 55′ E. In 1825, its stockade extended for nearly a mile along the bank of the river; in 1827, the British embassy found 'this place considerably enlarged and strengthened. It is noted for the action, in the first named year, in which Bundoola, the Birmese leader, was killed by a stray bomb.

DOONGURPOOR, an inl. town of Hindostan, prov. Gujerat, 82 m. NE. Ahmedabad; lat. 23° 54′ N., long. 73° 50′ E. Little is recorded respecting this town or its territory; the mounds enclosing the Doongurpoor lake are said to be built of solid blocks of marble. The rajahs are acknowledged to be the senior branch of the reigning sovereigns of Odeypoor; the majority of their subjects are Bheels. Bands of Arabs and Sindies, previously in the service of the rajah, harassed and laid waste this district, till a stop was put to their ravages by the British troops.

DOOSHAK, a town of Persia, prov. Seistan, of which it is the cap., near the Helmund, and about 50 m. E. from Zurrah; lat. 31° 8′ N., long. 63° 10′ E. The modern city is small and compact, but the ruins cover a vast extent of ground. It is populous, has a good bazaar, and the inhab., who dress in the Persian manner, have a more civilised appearance than the other natives of Seistan. The country in the vicinity is open, well-cultivated, and produces wheat and barley in sufficient quantities to be exported to Herat: the pasturage is also good and abundant. Its ruins show that it was formerly of much greater extent than at present; and is supposed to be identical with the Zaranga of Ptolemy.

DORCHESTER, a parl. bor. and town of England, cap. co. Dorset, div. Dorchester, hund. Uggescombe, on a gentle elevation adjoining the Frome, 125 m. SW. by W. London by road, and 140¼ m. by London and South Western railway. Pop. 6,823 in 1861. The town consists chiefly of three wide streets, diverging from a central area in the direction of the lines of road to London, Exeter, and Weymouth. It is well built, partially paved, and lighted with gas; and is very clean. It is more than two-thirds surroundsd by a fine avenue, commanding extensive and diversified views. Fordington Field, an unenclosed tract of fertile land, 7 m. in circ., adjoins the town on the S.: it is partly arable, partly pasture, and held on lives from the duchy of Cornwall. There are 3 churches—2 modern, on ancient sites, and 1 old, with many curious monuments, and a lofty pinnacled tower; 4 dissenting chapels; a free grammar school, founded in 1579, with 2 exhibitions to St. John's Coll., Cambridge, and one to either university; 3 sets of almshouses; a small theatre; a town-hall built in 1791, with a market-place under it; a shire hall, in which the county assizes and quarter sessions are held, and a county gaol and house of correction, built on Howard's plan, at an expense of above 16,000*l.*, and occupying the site of the ancient castle. There are large barracks in the vicinity. Market, Sat. and Wed. Fairs, Candlemas day, Trinity Monday, St. John's day, St. James's day. These are large sheep and lamb fairs; large flocks of a valuable breed, named from the place, being kept on the extensive sheep walks of the vicinity. Formerly the town was a considerable seat of the woollen manufacture; but at present its chief dependence is on commercial business. It has breweries noted for the superiority of their ale; and there are annual races in September. Dorchester has returned 2 mems. to the H. of C. from the 21st Edw. I. Previously to the Reform Act, the franchise was confined to inhabitants of the bor. paying to church and poor in respect of their personal estates, and to such persons as paid to church and poor in respect of their real estates within the bor. Registered electors 458 in 1865. Under the Municipal Act it is governed by 4 aldermen and 12 councillors: its municipal limits coincide with the parl. ones. Annual value of real property assessed to income tax, 23,314*l.* in 1857, and 25,515*l.* in 1862.

Dorchester was one of the principal stations of the Romans in England. It was called by them *Durnovaria* and *Dunium*, and has still to boast of many interesting relics of its Roman masters. They had surrounded it with a wall and a fosse; part of the former having been standing so late as 1802, and 'great part' of it was standing in 1775, when visited by Stukeley. (Itinerarium Curiosum, p. 163.) Maiden Castle, about 1 mile SW. of the town, is also supposed to have been constructed by the Romans as a summer camp, *castra æstiva*. It is an irregular ellipse, surrounded by double ditches and ramparts; the former of great depth and the latter high and steep. The inner area comprises about 44 acres. Poundbury Castle, nearer the town, on its NW. side, is also supposed to be a Roman work; but, though of the same character, it is of very inferior dimensions to Maiden Castle.

But the most interesting Roman remain near Dorchester is the amphitheatre, about ¼ m. SW. from the town, the most perfect structure of its kind in England. The arena, or inner floor of the amphitheatre, is level with the surrounding plain; while the sloping sides, on which were seats for the spectators, and which are formed of masses of chalk, rise 30 ft. above it. Its dimensions are very large; the length of the longest external diameter being 343½ ft., and that of the shortest external diameter 339½ do.: its longest internal diameter is 218, and its shortest 163 ft. When complete, it is supposed to have been capable of accommodating about 13,000 spectators. In modern times, it has been occasionally used as a place of punishment; and on one occasion, on a woman being burnt in the arena, 10,000 persons are reported to have been congregated within the amphitheatre, to witness the horrible spectacle. It is to be regretted that this classical remain has not been preserved with due care, and that its arena has been repeatedly profaned by the plough. The assizes held at Dorchester in September, 1685, are famous, or rather infamous, for the judicial murders of Judge Jeffries.

DORDOGNE, one of the largest déps. of France, comprising the ancient prov. of Perigord, and part of Guienne; between lat. 44° 35′ and 45° 42′ N., and long. 0° and 1° 27′ E.; having N. Charente and Haute Vienne, E. Corrèze and Lot, S. Lot-et-Garonne, and W. Gironde, Charente, and Charente-Inférieure. Greatest length and breadth, about 70 m. each. Area, 918,256 hectares; pop. 501,687 in 1861. Several hill-ranges intersect Dordogne, those in the N. belonging to the Limousin, and those in the S. to the Auvergne mountain chains. The principal summits are in the SE., but none is more than about 650 ft. high. Chief rivers, the Dordogne, Vizère, Isle, Dronne, &c., all of which have a SW. course. The Dordogne, resulting from the union of the rivulets Dor and Dogne, rises in the *Mont d'Or*, Puy-de-Dôme, flows at first SW., and afterwards due W. through Corrèze, Lot, Dordogne, and Gironde, and ultimately joins the Garonne, about 13 m. below Bordeaux, after a course of nearly 220 m., 167 of which are navigable. Climate rather damp, but upon the whole healthy: the winter and spring are rainy seasons; the summer is very dry: violent storms frequently occur. There are but 46,400 hectares of rich land, principally in the valleys of the Dordogne and the other larger streams; the smaller valleys are for the most part narrow and unproductive, and a large portion of the dép. consists of arid heaths and wastes, over which the traveller may journey for leagues without seeing a single hamlet. Sufficient corn is, however, grown for home consumption; principally rye, maize, and millet. The chestnut crops are important, and a good deal of walnut oil is made. The culture of the vine is pursued to a considerable extent, the average annual produce of wine being about 650,000 hectolitres. The white wine of Bergerac is greatly esteemed, though it is mostly on the left bank of the Dordogne that the best white wines of the dép. are grown; the right bank is more famous for its red wines. There are few meadows. Game is very plentiful. Iron, copper, lead, cadmium, manganese, coal, and lignite are mined; and marble, alabaster, granite, lithographic stone, &c., quarried. Working in metals, especially in iron and steel, and the manufacture of paper, are the chief branches of manufacturing industry. Coarse woollens, serges, leather, kid gloves, earthenware, good beer, liqueurs, brandy, and blue vitriol are, however, also made in the dép. The *pâtés* of Perigueux, and its truffled turkeys and other poultry, are held in the highest estimation both in France and other countries, and support a considerable trade. Dordogne is divided into 5 arrond., 47 cantons, and 583 communes. Chief towns, Perigueux, the cap., Bergerac and Sarlat. Perigord was from the 9th to the 15th century under the jurisdiction of its own counts: Henry IV., a part of whose patrimony it was, united it to the French crown.

DORKING, a market-town, and par. of England, co. Surrey, hund. Wotton, near the Mole, and on the high road from London to Brighton; 21 m. SSW. the former by road, and 29 m. by South Eastern railway. Pop. of town 4,061, and of par. 6,997 in 1861. Area of par. 10,150 acres. Dorking is finely situated on the side of a sandstone hill, many of the houses having cellars excavated in the rock; it has wide streets, and is a well-built, well-paved, neat country town. The country round is remarkably beautiful; it is well wooded, and presents a succession of fine bold hills and rich valleys, with a great number of fine seats. The church is a large ancient structure, and there is a good town-hall and some almshouses in the vicinity. Dorking has the finest breed of fowls in England; they have *six* claws, and the capons fatten to an immense size. The custom of *Borough English*, by which the youngest son succeeds to copyhold property, prevails in this manor.

DORNOCH, a market-town, and the only royal burgh in Sutherland, Scotland, on a low sandy beach, NE. coast of the Dornoch Frith, 53 m. N. Inverness. Pop. 483 in 1861. The sea approaches to about 150 yards of the town, yet does not confer on it the advantages of a sea-port, there being no harbour. It is a mean-looking town, with many marks of poverty and decay. It has no source of municipal revenue, except the customs levied at six annual fairs; but as these are on the decline, the income of the town is suffering accordingly. It was made a royal burgh by Charles I. in 1628. Dornoch is chiefly remarkable for its cathedral, and as having once been the seat of the bishop of Caithness. The cathedral is supposed to have been built by Richard Murray, bishop of the see, who died in 1245, and who was afterwards canonised. (Keith's Scottish Bishops, 1824, p. 209.) The remains of the buildings are extensive and magnificent. The present parish church consists of three aisles of the old cathedral; and underneath it is the burying-place of the noble family of Sutherland. A portion of the bishop's palace serves as the county court-room and gaol. A monastery of Red Friars was founded here by Sir Patrick Murray in 1271, of which the ruins have entirely disappeared. (Ib. 397.) Dornoch unites with Wick, Cromarty, Dingwall, Tain and Kirkwall, in sending a mem. to the H. of C.

DORPAT, or DERPT (Russ. *Jourief*), a town of Russia in Europe, gov. Riga, cap. distr., on the Embach, and on the high road between Riga and Petersburg, 150 m. NE. the former, and 170 m. SE. the latter city. Pop. 14,650 in 1858. The town, which is well built, is divided into three separate portions—Dorpat Proper, and the suburbs of Riga and Petersburg. It has a fine market-place, a stone bridge over the Embach, and a cathedral, now partly in ruins, but which formerly had a nave supported by 24 arches and surmounted by two towers. The old fortifications, with some of the ditches, have been converted into ornamental gardens, shrubberies, and public walks. It is surrounded by hills, which, as well as the banks of the river, offer many fine points of view.

Dorpat is the seat of a university, which in 1862 had 45 professors and above 700 students. This institution was originally founded by Gus-

tavus Adolphus of Sweden, in 1632. After suffering numerous vicissitudes during the wars between Sweden and Russia, and having been removed to Pernau, it was re-established in Dorpat in 1802 by the emperor Alexander I. The university possesses a library of 80,000 vols., a museum of arts, an observatory with some excellent instruments, cabinets of physical, chemical, mineralogical, zoological, and pathological subjects, an anatomical museum, a collection of agricultural models, and a botanical garden containing many rare plants: it has attached to it a hospital, theological and philological seminaries, and an institute for the education of professors. Though considered as especially belonging to this and the adjacent governments, it is much resorted to from many other parts of Russia. Dorpat also contains a gymnasium and a normal primary school.

The town is believed to have been founded in 1030. It was subsequently taken by the Teutonic knights, who erected it into a bishopric in 1224. Its commerce now began to flourish, and at one period it ranked as one of the Hanse Towns. It was afterwards alternately in the power of the Poles, Swedes, and Russians; the latter have retained possession of it since 1704.

DORSET, a marit. co. on the S. coast of England, having S. the British Channel, E. Hants, N. Wilts and Somerset, and W. Devonshire. Area, 987 square miles, or 632,025 acres, of which about 200,000 are arable, 400,000 are meadow and pasture, and the rest heath. Surface beautifully diversified; climate mild and salubrious, not being so rainy as in some districts more to the W. Soil principally chalk, sand, gravel, and loam. The vale of Blackmore, traversed by the Stour, containing 170,000 acres, and some other tracts in the W. part of the co. and along the coast, are eminently fertile and beautiful; but the distinguishing feature of the co. is the extent of its chalky downs, depastured by large flocks of sheep, and round Poole Harbour there are large tracts of heath. Agriculture in a medium state of advancement; but more improved in the E. than in the W. districts. Hemp and flax are a good deal grown, but less now than formerly. Water meadows extensive, and their management well understood. The greater part of the co. is in grass. There are some very large dairies; they are not generally looked after by the farmers, but let, at so much per cow, to dairymen, many of whom have made large fortunes. Stock of sheep estimated at between 600,000 and 700,000. Property in large estates. Farms of various sizes, but mostly large: they are let for 14 or 21 years, the rents, in most places, being paid once a year. St. Paul's Cathedral, Somerset House, and others of the principal buildings in London, as well as in the greater number of the towns in the S. of England, have been constructed of stone brought from the freestone quarries in the Isle of Portland in this co.; and the Isle of Purbeck supplies the potteries of Staffordshire with the clay used in the manufacture of the finer sorts of earthenware. There are considerable manufactures of flax and hemp at Beaminster, Netherbury, and Bridport. Shirt buttons are made at Shaftesbury and Blandford; silk is spun at Sherborne and Gillingham, and wool at Fordington and Lyme Regis. Principal rivers, Stour and Frome. Principal towns, Poole, Shaftesbury, Weymouth, and Melcombe Regis. Dorset has 34 hundreds and 271 parishes, and returns 13 mems. to the H. of C., viz. 3 for the co., 2 each for the bors. of Bridport, Dorchester, Poole, and Weymouth, and 1 each for Shaftesbury and Warcham. Registered electors for co. 6,221 in 1865. Pop. 188,789 in 1861, inhabiting 37,709 houses. Annual value of real property assessed to income tax, 863,715*l.* in 1857, and 840,371*l.* in 1862.

DORT, or DORDRECHT, a partially fortified town of S. Holland, on an island formed by the great inundation of 1421, on the S. side of the Waal, a branch of the Maese, 10 m. SE. Rotterdam, on the railway from Antwerp to Rotterdam. Pop. 25,260 in 1861. Dort is a dull, though a tolerably well-built town: its streets are lined with houses of an antique fashion, the gables of which are turned outwards. They rise with many grotesquely ornamented windows and crow-steps to a considerable altitude; while the practice of painting the bricks a bright red, and the ornamental stones and cornices a light colour, adds to their fantastic appearance. A number of the houses, as appears from the dates carved on their exterior, were erected during the period of Spanish occupation, previously to 1572. The principal public buildings are the town-hall, a fine edifice, and the church, an old Gothic structure, 300 ft. long by 150 broad, with a heavy square tower conspicuous from a great distance. The latter building is paved entirely with flat monumental stones, some of which are of great antiquity; and its walls are surrounded with monuments, which the Dutch ingeniously preserved during the occupation of the country by the French, by concealing them with a screen of plaster. The church also contains a marble pulpit, highly ornamented with elaborate and elegant carving. The hall in which the famous synod of Dort held its sittings is still in excellent preservation, but is now a theatre. Dort is surrounded on the land side with fortifications; on the side of the Waal it has several quays, and a good harbour, from which two canals lead into the middle of the town. It is the centre of a considerable trade in flax, which is grown in great quantities in its vicinity, and a good deal of which is shipped for England and Ireland. It has also a large trade in corn, salt-fish, train-oil, and timber; the latter article is floated down from the Upper Rhine in immense rafts, which, when sold, often realise from 25,000*l.* to 33,000*l.* There are many windmills for sawing deals in and near Dort, some sugar and salt refineries, linen-bleaching, tobacco, and white lead manufactories, and building docks. Dort is one of the oldest cities in the country; was the original residence of the counts of Holland, and, in 1752, the seat of the first meeting of the states at which the independence of the Seven United Provinces was declared; but the most memorable era in its history is that of the Synod of Dort, to which reference has been already made, held in consequence of a schism in the reformed church. James Arminius, professor of divinity in the university of Leyden, having rejected the doctrine of Calvin with respect to predestination and grace, obtained the support of Grotius, Barneveldt, and other learned and eminent persons, as well as of a considerable number of the middle and lower classes. His tenets were, however, opposed with extreme vehemence, and were represented as of the most dangerous description. The disputes that grew out of this controversy being not unfrequently attended with tumult and bloodshed, the States General at last agreed to refer the subject in dispute to a council or synod for its decision. This synod, which excited the greatest interest throughout Protestant Europe, assembled on the 13th of November, 1618, and continued its sittings till the 25th of May, 1619: it was attended not merely by all the most eminent divines of the United Provinces, but also by deputies from the reformed churches of England, Scotland, and Switzerland. The Calvinists having a decided majority in the

assembly, all its decisions were in conformity to their views. The distinctive doctrines of Arminianism were pronounced to be pestilential errors and corruptions of the true faith; and this was followed up by the excommunication of the Arminians, the suppression of their religious assemblies, and the deprivation of their ministers.

These unjust and violent proceedings, being aggravated by political animosities, led to the most deplorable results. In the persecution to which they gave rise, the eminent statesman Barneveldt, though at the age of seventy-two, lost his life on the scaffold; many distinguished Arminians were driven into exile; and even Grotius was condemned to a perpetual imprisonment, from which he was only extricated by the sagacity, courage, and devotion of his wife. But after the death of Prince Maurice, the great enemy of the Arminians, in 1625, this persecution relaxed; and most of the exiles were soon after allowed to return to Holland. The Arminian doctrine is now very widely diffused, even among those who profess to differ from it. (See Mosheim, iv. 439–466, 8vo. edit.)

DOUAI, a strongly fortified town of France, dép. du Nord, cap. arrond., situated very advantageously for commerce, on the Scarpe, 18 m. S. Lille, on the railway from Paris to Lille. Pop. 24,486 in 1861. The town is well built, and the principal square is large and handsome: it is surrounded with old irregular walls, flanked with towers, and is farther defended by a fort on the right bank of the river, about 2 m. N. Douai. The town contains large establishments of artillery, a superb arsenal, and one of the three royal cannon foundries in the kingdom. It is the seat of a subprefecture, of an imperial court for the dépts. du Nord and the Pas-de-Calais, a tribunal of primary jurisdiction, a royal college with 262 pupils, a royal school of artillery, an *Académie Universitaire*, which has replaced its celebrated university, founded in 1562; with schools of design and music, a primary normal school, a public library with 28,000 printed vols., and 600 MSS., museums of painting and antiquities, cabinets of natural history and medical science, a botanical garden, two hospitals, an orphan asylum, and a theatre. Industry and the arts are alike thriving in Douai. It has fabrics of lace, tulles, gauze, cotton stuffs, thread, and earthenware, glass and soap works, and salt and sugar refineries; with a considerable trade in flax, which is extensively cultivated in its neighbourhood. Douai is very ancient, having existed previously to the invasion of Julius Cæsar. Its possession was guaranteed to France by the treaty of Utrecht.

DOUBS, a frontier dép. of France, in the E. part of the kingdom, formerly comprised in Franche-Comté, having N. and NW. the déps. Haut-Rhin and Haute Saône, SW. that of Jura, and E. Switzerland. Length, NE. to SW., about 60 m.; breadth varying from 20 m. in the N. to 50 m. in the S.; area, 522,755 hectares. Pop. 296,280 in 1861. Four collateral mountain chains belonging to the Jura system intersect the dep. in nearly its entire length, decreasing in height from E. to W., and naturally dividing the surface into a mountain, hill, and plain region. The loftiest summit of the E. range, Mount Suchet, is 5,283 ft. above the level of the sea: the principal elevation of the W. range rises to only 953 ft. The plain country to the W. of the latter range is the most fertile, and well fitted for the growth of all kinds of corn, and of the vine; the rest of the country is not generally productive. The mountains are all of calcareous formation, and abound with narrow gorges, grottoes, and caverns: the more elevated ranges are covered with pine forests, and in many parts with ice and snow for six months of the year. Chief rivers Doubs, Loué, and Ognon. The former rises at the foot of Mount Rixon, and, after a very tortuous course through the dep., it proceeds SW. through that of Jura, and a part of Saône-et-Loire, and ultimately joins the Saône at Verdun. From Besançon to near Montbeliard, the Doubs forms a part of the navigable canal between the Rhine and the Rhone. There are many small rivers and some large marshes. Climate variable and rather cold, but generally healthy. Wheat, rye, maize, hemp, pulse, fruits, wines, &c., are grown in the valleys and low country, which the inhabs. exchange with those of the mountainous districts for barley, flax, cheese, drugs, and timber. Agriculture very backward: fallows are so common as usually to occupy nearly a third part of the cultivable land,—a waste that might be wholly, or almost wholly, avoided by the substitution of green crops, at the same time that a great additional supply of food for cattle and of manure would be obtained. According to official tables, 120,646 hectares of land are occupied with forests; and this is one of the few French deps. in which the planting of trees is actively going on. Meadow lands are extensive; in the arrond. of Montbeliard they are well irrigated. The rearing of cattle is pursued to a considerable extent, as well as the manufacture of cheese similar to that of Gruyère. This branch of industry is mostly conducted either by the proprietors of from 40 to 60 cows, or by associations of small proprietors, whose share of the cheese is in proportion to the quantity of milk they respectively furnish. The total annual product of cheese is estimated at 2,500,000 kilogrammes, worth 1,650,000 fr.; of butter, 260,000 kilogr., value 260,000 fr. Iron, coal, and lignite are mined, and gypsum, marble, and building-stone, quarried. There are about 20 iron-works in the dep., which supply yearly 1,700,000 kilogr. of bar iron, 7,030,000 kilogr. of cast do., 2,400,000 kilogr. of iron wire, 150,000 kilogr. of *pointes*, 640,000 kilogr. of iron plates, and 30,000 chests of tinned ware. The establishment at Audincourt alone yields 5,000,000 kilogr. of cast and forged iron. Watchmaking employs about 2,000 artisans, and about 60,000 watches are made annually in Besançon. Cutlery, copper wares, paper, leather, liqueurs, bottles, and a few fabrics of different kinds, are amongst the other principal manufactures. The exports of the dep. are chiefly cattle, cheese, butter, timber, iron, hardware, watches, and agricultural implements; its imports corn, wines, brandy, cotton, woollen, and other fabrics. Doubs is divided into 4 arrond., 27 cantons, and 640 communes. Chief towns, Besançon, the cap., Pontarlier, and Montebeliard. About 25,000 of the pop. are Protestants. This dep. formed a part of the circle of Burgundy under Charles V.; it was annexed to the French crown by Louis XIV. in 1660.

DOUGLASS, the principal town of the Isle of Man, on the E. coast of which it is situated, at the mouth of the Blackwater, on a circular bay, 80 m. NW. Liverpool; lat. 54° 12′ N., long 4° 25′ 47″ W. Pop. 9,894 in 1861. The town has some good streets and buildings; but, speaking generally, the former are narrow and dirty. It has, however, been a good deal improved of late years, in consequence of the influx of visitors from Liverpool and other places, in summer, attracted by the facilities for sea-bathing, and by the partial exemption from taxation enjoyed by residents in the island. (See MAN, ISLE OF.) The steam-packets to and from Liverpool, Belfast, and Glasgow frequently touch at Douglass. Castle Mona, near the beach, a little NE. from the town, formerly the property and

residence of the dukes of Athol, has been sold, and is now converted into a hotel. There is here a pier 520 ft. in length, with a light-house at its head. The harbour dries at low water; but vessels drawing 10 ft. water may enter it at high-water neaps, and those drawing 14 ft. at high water springs. The anchorage in stormy weather is but indifferent. The parish church is 2 m. from the town; but it has three other churches, one of which is a handsome structure, with chapels for Catholics, Methodists, and Independents. It has also assembly-rooms, a public library, a Lancastrian school, and several charitable foundations. The custom-house is one of its best buildings.

DOULENS, or DOULLENS, a town of France, dép. Somme, cap. arrond., on the Authie, 16 m. N. Amiens. Pop. 4,932 in 1861. Its citadel, formerly considered one of the bulwarks of Picardy, was repaired by Vauban, and is very strong. The church of St. Martin is remarkable for beauty and lightness of style: the town has two hospitals, a theatre, and a large cotton-spinning factory.

DOUNE, a market town of Scotland, co. Perth, on the N. bank of the Teith, a tributary of the Forth, 7 m. NW. Stirling. Pop. 1,256 in 1861. The town consists of three streets, radiating from a centre where the market-cross stands. Its only public building is the parish church, a Gothic edifice with a handsome tower. It is famous for its annual cattle, sheep, and horse fairs, six in number, one of them lasting three days. The cattle and sheep are from the highlands, and are lean, and purchased to be fattened either in the Lowlands of Scotland or in England. The cotton manufactory of Deanston is within less than a mile of the town, on the bank of the Teith, and is driven by water. It belongs to a Glasgow company, and gives employment to 700 individuals in spinning, weaving, and bleaching. Doune Castle, which is within a few hundred yards of the town, on an elevated peninsula formed by the junction of the Ardoch with the Teith, was one of the strongest Scottish fortresses. It was originally the seat of the earls of Menteith. It was occasionally the residence of Mary Queen of Scots. It was, for a while, in the hands of the rebels in 1745. It gives the second title to the noble family of Moray, whose property it has long been. It has a square tower 80 ft. high; the walls are 10 ft. thick. The bridge of Teith, in the immediate vicinity of the town, was built in 1535 by Robert Spittal, tailor to Margaret, wife of James IV. and daughter of Henry VII.

DOURO (Span. DUERO, an. *Durius*), one of the principal rivers of Spain and Portugal, through the N. part of both which it flows. It rises in the Sierra de Olbion, prov. Soria, Old Castile, about lat. 42° N. and long. 2° 50′ W. At first it runs SE. and then S. to near Soria, but thence onward its direction is generally W., through the kingdoms of Leon and Portugal to its mouth in the Atlantic: in lat. 41° 8′ N., long. 8° 38′ W., 2 m. W. Oporto. From near Miranda to beyond Torre de Moncorvo, however, it flows almost due SW., forming the boundary between the Spanish prov. of Salamanca and the Portuguese prov. of Tras-os-Montes. It afterwards separates the latter prov. and Minho from Beira. The length of its entire course is estimated at 500 m.; it receives the Pisuerga, Seguilla, Esla (its principal tributary), Sabor, Tua, and Tamega on the right, and the Grado, Eresma, Tormes, Agueda, Coa, Tavora, Paiva, &c., on the left side: its basin may be considered the most extensive in the whole peninsula. It runs for the most part through deep and narrow valleys; its bed is generally narrow, and its current very rapid. It is, however navigable as far as San Joào de Pesquiera, about 70 m. E. by N. Oporto; and since the Wine Company of the Upper Douro have partially removed some obstacles that existed at that point, it has been rendered available for flat-bottomed boats as high as Torre de Moncorvo, 100 m. from the ocean. It has a bar at its mouth, and its navigation is liable to be seriously affected by *freshes*, or sudden swellings, occasioned by rains, &c., to which it is very subject. (See ORORTO.) Soria, Aranda-de-Duero, Toro, and Zamora in Spain; and in Portugal Miranda, San Joào de Pesquiera, and Oporto, are situated on its banks. Sixteen stone bridges cross it at various points, besides which it presents numerous fords.

DOVER (vulgarly DOVOR), a Cinque Port, parl. borough, and town of England, co. Kent, lathe St. Augustine, hund. Bewsborough, 69 m. SE. London by road, and 88 m. by South Eastern railway. Pop. 25,325 in 1861. The town stands on the SE. shore of the co., on the straits of Dover, in a valley formed by the depression of the chalk strata, 27 m. NW. by W. Calais, and 21 m. from the nearest part of the French coast. It is traversed by a small stream, which empties itself into the harbour. The town consists of one principal street, extending upwards of a mile in the direction of the valley, shorter ones branching from it on each side, and ranges of houses on the shore. What may be called the New Town of Dover, built chiefly for the reception of occasional visitors during the bathing season, is under the castle cliffs on the E.: the old part of the town is irregular, and the streets narrow; but the whole is improving. In consequence of the increase of building, the villages of Charlton and Buckland have become continuous portions of the town. It has two ancient par. churches, St. Mary's and St. James's, the former rebuilt in 1844; another St. James, erected in 1862, at a cost of 10,000*l*., and twelve dissenting chapels. There is also a school, founded in 1789, for forty-five boys and thirty-four girls, now incorporated with a national school, which educates 400 children; a girl's school of industry, established 1819; an infant school; a savings' bank; a dispensary, and many minor charities; a town-hall and gaol; theatre and assembly rooms, built in 1790; public libraries, reading-rooms, and baths, on the Marine Parade. The harbour, formed by the mouth of the small stream which runs through the town, called the Dour or Plut, consists of an inner and outer harbour, of 6¼ and 7½ acres respectively. Vessels of 200 tons can come up to the quays, and those of 400 tons can enter the port. There is a great Harbour of Refuge outside the port, formed by a granite pier a mile in length, known as the Admiralty pier. The mail steamers to and from France land and discharge passengers at this pier, and the railway trains run along it, close to the boats. By a charter of James I., the lord warden of the Cinque Ports, and ten other commissioners, were appointed conservators of the harbour. On an eminence bounding the SE. side of the valley stands the castle, an immense collection of ancient and modern works, occupying an area of about thirty acres; it is approached by a bold ascent, but is itself commanded by the higher ground on the W. and SW. There are remains of ramparts, and of a temple, bath, and Pharos, supposed to be of Roman construction. Previously to the last French war, the works were much dilapidated, but they were then repaired, and greatly augmented. There are upper and lower courts, surrounded (except towards the sea) by curtains and large dry ditches; in the centre of the former is a spacious keep, built by Henry III., and now form-

ing a bomb-proof magazine; the curtain of the lower court is flanked, at irregular intervals. by ten towers of various construction—the oldest built by Earl Godwin, the others at different times during the Norman dynasty: with these, subterranean passages communicate from the ditch: there are also four or five ancient wells, excavated to the depth of 370 ft. The modern works consist of batteries with heavy artillery, casemates, covered ways, a large vault, excavated in the chalk, and barracks capable of lodging 2,000 troops. The lord warden of the Cinque Ports is always constable of the castle. The heights on the E. side the valley were also strongly fortified during the last war, and the fortifications have been greatly strengthened in recent years, annual grants of parliament being allowed for the purpose. The grant for the financial year 1864–5 amounted to 231,336*l*. These fortifications are garrisoned by 2,500 troops, under the command of a brigadier-general. There is a military hospital on the S. side of the town. Dover has a busy, thriving appearance, its chief traffic being derived from the influx of passengers to and from the Continent: of late years, also, its popularity, as a fashionable sea-bathing place, has considerably increased. There are large paper mills in the vicinity, and in the town a brewery and private docks, where ship-building is carried on to some extent, and rope, sail, and other establishments connected with the supply of shipping. The intercourse with Calais and other French ports, and also with London, is almost wholly carried on by steamers. The coasting trade consists chiefly of corn exported to London, and coals imported from the northern counties. The port comprises the creek of Folkestone, and the stations of Hythe and Romney. About ninety-five vessels, of the aggregate burden of 5,000 tons, belong to the port.

Dover, under the Municipal Reform Act, is divided into three wards, with six aldermen and eighteen councillors, and the parl. and municipal limits coincide. Previously to the act, the governing body consisted of a mayor, twelve jurats, and thirty-six common councilmen, who, like the magistrates of the other Cinque Ports, enjoyed several peculiar privileges in the trial of crimes, &c.; but these are now either wholly done away with, or greatly abridged. The constable of the castle has still, however, the jurisdiction of a sheriff within the Cinque Port limits; writs from the superior courts are directed to him, and his warrant is executed by an officer called *Bodar*; the debtors' prison being in the castle: a court of *Lodemanage* is also still held for licensing and regulating pilots.

Dover has returned two members to the H. of C. from the 18th Edw. I. Previously to the Reform Act, the right of voting was in the freemen; the right of freedom being acquired by birth, by marriage (during the wife's life), by the possession of a freehold within the town and port, by gift and purchase. Registered electors, 2,207 in 1865. Gross annual value of real property assessed to income-tax 121,015*l*. in 1857, and 117,502*l*. in 1862.

Dover was a station of the Romans, by whom it was called *Dubris*; and being situated nearer to the Continent than any other town in England, it was long regarded as of the highest importance, and as being, in fact, the key of the kingdom. At Swingfield, near the town, are the remains of a preceptory of the Knights Templars, where King John surrendered his crown, and received it back from the Pope's legate, in acknowledgment of superiority. In 1216, the castle was successfully defended against the Dauphin of France, by Hugh de Burgh, earl of Kent. In the civil war it was taken by stratagem, in 1642, by the Republicans.

Dover cliffs lie both on the E. and W. sides of the town. The noble description in Shakspeare is applicable to the latter; but the cliff to which the poet alluded having been undermined and thrown down, those that remain do not quite come up to the description.

DOWLETABAD (*The Fortunate City*; Hind. *Deoghir*), an inland town and fortress of Hindostan, proy. Aurungabad, and its original cap., dom. of the Nizam, 7 m. NW. Aurungabad; lat. 19° 57′ N., long. 75° 25′ E. The fortress stands upon an isolated conical granite rock, the summit of which is about 500 ft. above the plain below, and which has been scarped for one-third nearly of its height, so as to present all round the appearance of a perpendicular cliff. An outer wall of no strength surrounds the fort; but three other lines of walls and gates must be passed before arriving at the ditch, the causeway across which will admit of only two persons abreast, and which is defended by a building with battlements on the opposite side. The mode of access to this singular hill fortress is thus described by the Earl of Munster:—'The governor led the way through an excavation into the heart of the rock, so low that I was obliged to stoop nearly double. But after a few paces, a number of torches showed me I was in a high vault, and we began to ascend on a winding passage, cut through the interior of the body of the hill. . . . This passage was about 12 ft. high, and the same broad, and the rise regular. At certain distances from this dismal gallery are trap-doors with flights of small steep steps leading to the ditch below, only wide enough to admit a man to pass, also cut through the solid rock, to the water's edge, and unexposed to the fire of the assailants, unless they were on the very crest of the glacis. We might have been in all ten minutes mounting by torchlight, and came out in a sort of hollow in the rock about 20 ft. square. On one side, leaning against the cliff, was a large iron plate, nearly of the same size as the bottom of the hollow, with an immense iron poker. On the besiegers having gained the subterranean passage, this iron is intended to be laid down over the outlet, and a fire placed upon it.' Near it is a perforated hole in the rock, intended to act as a bellows to the fire. The road hence to the summit is very steep; in some places it is covered with brushwood, in others with small houses, towers, and gates: it passes through the governor's residence, a good building, surrounded by a verandah with 12 arches. On the peak the Nizam's flag flies, and a large brass 24-pounder is mounted; but, excepting this, in the whole fortress there are but a few 2 and 3 pounders. The pettah presents the remains of many buildings of a rough dark-coloured stone, but is now in great measure deserted: the interior of the lower fort is a similar collection of ruins, and contains a column of great diameter and perhaps 160 ft. high, deformed, however, by a huge gallery, which encompasses it at about a fourth part of its elevation from the ground. From its natural strength, and the labour that has been bestowed upon it, this fortress is looked upon as impregnable; and as there is plenty of water (one tank cut out of the rock is only about 100 yards from the summit), if properly defended, it could only be reduced by famine. Notwithstanding these advantages, it was one of the first fortresses that fell into the hands of the Mohammedans, who took it by surprise, and plundered it of immense riches, A.D.

1293. Early in the 14th century, Mohammed III., who made it his residence, nearly ruined Delhi by the absurd project of making its inhabitants remove to his new capital. It was afterwards successively possessed by the dynasties of Ahmed Nizam Shah, Malik Amber, Shah Jehan, and the French: since 1758 it has belonged to the Nizam's dom. The pagodas of Ellora (which see) are in the vicinity of Dowletabad.

DOWN, a marit. co. of Ireland, prov. Ulster, on its W. coast, having S. and E. the Irish Sea, and the N. Channel, N. Belfast, Lough, and Antrim, and W. Armagh and Louth. Area, 611,404 imp. acres, of which 108,569 are unimproved mountain and bog. The extent of arable land, in square miles, was 803 in 1841; 818 in 1851; and 821 in 1861 (census of Ireland for 1861). The mountains of Mourne, in the S. part of the co., are amongst the highest in Ireland; but, with this and a few other exceptions, the surface is abundantly level. Soil of a medium degree of fertility. There are some large estates; but there is also a fair proportion of those of medium size. Farms very small: those occupied by the better class of farmers run from 20 to 50, and a few to 100, acres; but the inferior holdings, which are the great mass, do not, perhaps, average 5 acres. The occupiers of the latter formerly depended, in a great degree, on the linen trade; but since its decline, or rather since the manufacture began to be principally carried on in factories, they have had nothing but the land to depend on, and the competition for the smallest patches is extreme. In this, as in most other parts of Ireland, a new tenant must not only pay the stipulated rent to the landlord, but he must also pay a sum to the previous occupier, whatever may have been the cause of his leaving the farm, to ensure his quiet possession. This latter sum is called the *tenant's right*; and in Down it frequently amounts to 10*l.* an acre! (Binn's Miseries and Beauties of Ireland, i. 85, &c.) Still, however, a good many improvements have been introduced of late years, though, where the holdings are so small, it would be absurd to suppose that agriculture can be far advanced. Potatoes, oats, and flax are the principal crops; turnips rare; potatoes mostly planted in 'lazy beds,' though drilling is now pretty common. Average rent of land, 16s. an acre. Cottages very generally whitewashed and neat. The condition of the cottiers or peasantry is much superior to what it is in most other Irish cos.; and would have been much more so but for that custom, the bane and curse of Ireland, of dividing and subdividing farms, which is nowhere more prevalent than here. Principal rivers, Bann, Lagan, and Newry. Principal towns, Newry, Ballymacarret, and Downpatrick. Down is divided into eight baronies and sixty parishes, and sends four members to the H. of C., two for the co., and one each for Newry and Downpatrick. Registered electors, 11,367 in 1865. Pop. 361,487 in 1841; 320,924 in 1851; and 299,302 in 1861. Gross annual value of real property assessed to income tax, 611,311*l.* in 1857, and 604,871*l.* in 1862.

DOWNHAM (MARKET), a town and par. of England, co. Norfolk, hund. Clackclose, 78 m. N. by E. London by road, and 87½ m. by Great Eastern railway. Pop. of town 2,458, and of par. 3,133 in 1861. Area of par., 2,380 acres. The town, on an acclivity near the E. bank of the Ouse, which is here crossed by a bridge, has three streets of well-built houses, and is paved and amply supplied with water. The church, on the summit of the acclivity, is an antique Gothic structure, with a low tower and spire, approached on the S. by a noble avenue, and on the N. by a flight of steps. There are also several dissenting chapels, a Lancastrian school for 65 boys, and a national school for 70 girls. Market, Sat., noted for the supply of fish and wild fowl from the fens. Fairs, March 8 for horses (one of the largest in the kingdom), May 8, cattle, and Nov. 13. There is an extensive bell foundry in the town, and in the immediate vicinity is a large mustard manufactory. It is chiefly a dairy parish, and has been long celebrated for its supply of butter; but its famous butter market, held on Monday, has been removed to Swaffham. Petty sessions are held weekly, and a court baron and leet quarterly, by the lord of the manor.

DOWNPATRICK, a marit. town and parl. bor. of Ireland, co. Down, of which it is the cap., prov. Ulster, near the Quoyle, a short distance from its embouchure, in the SW. angle of Lough Strangford, 21 m. S. by E. Belfast, with which it is connected by railway. Pop. 4,866 in 1841, and 3,840 in 1861. The town consists of four main streets, meeting in a confined valley, and extending up the declivities of the surrounding steep hills. Like other northern towns, it is divided into the English, Scotch, and Irish quarters. There is a quay about 1 m. from the town, on the river, accessible to vessels of 100 tons, and a new quay, about 1 m. nearer the Lough, is accessible to vessels of much larger burden. The town was formerly the seat of the bishopric of Down, but since the union of the see with that of Connor, the ecclesiastical business is transacted at Lisburn. The ruins of the ancient cathedral, and those of a neighbouring pillar tower, still remain. The new cathedral is built in the ancient style; besides which, there is a par. church, Rom. Cath. chapel, and meeting-houses for Presbyterians and for Methodists. The diocesan school for Down and Dromore dioceses is held here, as also a subscription school, the co. infirmary, fever hospital, dispensary, an almshouse with schools annexed, endowed by the Southwell family, an asylum for clergymen's widows, a mendicity institution, and large barracks. A constabulary force is stationed here. In the immediate vicinity is a remarkable *rath*, or artificial mound, 60 ft. high, and surrounded by three ramparts, the outermost of which is nearly 1 m. in circ. About 2 m. distant, at the foot of the hill of Sleibh-na-griddle, are the Struel wells, much frequented at midsummer by Rom. Cath. pilgrims for devotional purposes, and for the supposed miraculous efficacy of their waters. The corporation, which consisted of a mayor, bailiffs, and commonalty, no longer exists, its powers being vested in commissioners. The bor. returned two members to the Irish H. of C. till the Union, since which it has sent one member to the imperial H. of C. The parl. bor. extends over a space of 1,486 stat. acres. Registered electors, 208 in 1862. Manor courts, with jurisdiction to the amount of 10*l.*, are held every third Tuesday; courts leet in spring and at Michaelmas. The co. assizes are held here in the court-house, a modern building; as are also general sessions in March and October, and petty sessions on Thursdays. The co. gaol, a spacious building, contains 200 cells, and 16 other rooms for prisoners. The linen manufacture is carried on in the neighbourhood. Markets on Saturdays; fairs on the second Thursday in Jan., March 17, May 19, June 22, Oct. 29, and Nov. 19. This is a very old town, being formerly the residence of the kings of Ullagh or Ulster.

DOWNTON, a bor. town and par. of England, co. Wilts, near its S. border, hund. Downton, on the Upper Avon, which here divides into 3 branches, each crossed by a bridge; 78 m. SW. by W. London. Area of par., 11,420 acres. Pop. of

do., 3,566 in 1861. The town has one principal street, with a few respectable houses. Exclusive of the church—a large cruciform structure with a tower—there is a chapel of ease in the parish, and three dissenting chapels. A free school, founded in 1679, educates 12 boys; and another, founded in 1797, 6 girls. Market discontinued. Fairs April 23, for cattle, Oct. 2 for horses and sheep. The bor. returned two mems. to the H. of C. from the reign of Edw. I. down to the passing of the Reform Act, when it was disfranchised. This is a place of considerable antiquity. At its SE. end is a conical mount, on which stood an ancient castle, whose entrenchments are still visible. Stand'inch or Trafalgar House, a national gift to the heirs of Lord Nelson, is within 2 m. of Downton.

DRAGUIGNAN, an inl. town of France, dép. Var, of which it is the cap., in a fertile valley, on an affluent of the Artesby, 40 m. NE. Toulon, and 410 m. SE. Paris, on a branch line of the railway from Toulon to Nice. Pop. 10,062 in 1861. Its climate is temperate and salubrious, and being situated in a basin, surrounded by vine and olive clad hills, it offers a delightful place of residence. Though without any particular beauty, the town is sufficiently well built, and has numerous public fountains. Chief public buildings—the hall of justice, prison, clock-tower, and hospital. Draguignan has a public library with 15,000 vols., an excellent botanic garden, cabinets of natural history, and a society of agriculture and commerce; with tribunals of primary jurisdiction and commerce, a chamber of manufactures, and a communal college. There are fabrics of broad-cloth, thrown silks, stockings, and soap, and distilleries.

DRAMMEN, a sea-port town of Norway, distr. Buskerud, on both sides of the river of the same name, near its mouth in the Christiana-fiord, and 20 m. SW. Christiana. Pop. 10,122 in 1860. 'It is a long straggling place. Though to us it seemed to have little of the bustle of trade, it is said to export more timber, chiefly in logs, than any town in Norway. Its women are reckoned among the greatest beauties of the North; and we saw some who fully support its reputation in this respect. Most travellers, however, will recollect it better as the place in which is carried on the principal manufacture of the delightful little *carriole*.' (Bremner's Excursions, p. 86.)

DRAVE (Germ. *Drau*), a river of Europe, and one of the principal tributaries of the Danube. It lies wholly within the Austrian empire, extending between lat. 46° 50′ and 45° 30′ N., and long. 12° 20′ and 19° E. It rises on the Toblack-heath, near the E. extremity of the Tyrol, in what is called the *Puster-thal*, about 17 m. ESE. Brunsehen, and runs at first ENE. to Lienz, where it is augmented by the Isl. From this point its course generally is ESE. to its mouth in the Danube, near the castle of Erdödy, 12½ m. E. Essegg. It traverses Carinthia and Styria, and afterwards forms the boundary between Croatia and Slavonia on the S., and Hungary Proper on the N. It receives the Möhl, Gurk, Lavant, and Mur (its chief affluent) on the left; and the Gail, Dran, Bedyna and some other rivers of minor importance on its right side. Lienz, Greifenburg, Spital, Villach, Völkermarkt, Marburg, Pettau, Warasdin, and Essegg, are the chief towns situated on its banks. It runs through a mountainous country and narrow valleys, as far as Warasdin, but thence onward its course is through a plain country. Its entire length is estimated at 370 m. In its upper part the Drave is extremely rapid; its navigation in many parts is greatly impeded by the number of trees torn down by its violence, which afterwards block up the current. At present this river is made but little use of for commercial purposes; but in case of an extensive steam-navigation of the Danube, its value as a means of transit would be greatly enhanced. It is said that the Austrian government has in contemplation to form a communication between the Adriatic and one of the great tributaries of the Danube; and if so, this would probably be the one chosen, the country between the Upper Drave and the sea apparently presenting the fewest obstacles to such an undertaking. (Turnbull's Austria, ii. 376, 377.) The author of 'Germany and the Germans,' vol. ii., gives a spirited sketch and description of Hungarian peasants descending the Drave on rafts of empty barrels, after having disposed of their wine in the mountains of Carinthia.

DRESDEN, a city of Germany, cap. of the kingdom of Saxony, on both sides the Elbe; 61 m. ESE. Leipzig, 233 m. ENE. Frankfort on the Mayne, 220 m. NNE. Munich, 100 m. S. by E. Berlin, and 230 m. NW. Vienna, on the main line of railway from Berlin to Prague and Vienna. Pop. 61,227 in 1811, and 128,152 in 1861. The city is more than 400 feet above the level of the sea, and is delightfully situated in the midst of the Saxon wine district, occupying the most beautiful and richly-cultivated portion of the valley of the Elbe. The banks of the river have, however, a very different appearance. The right is abrupt, rocky, and woody, and, having a S. aspect, is in great part covered with vineyards. The left is more flat, presenting a succession of meadows, groves, gardens, and orchards, studded with numerous villages: the whole landscape gradually rising till it becomes united with the distant Erze-Gebirge mountains. The city itself has been termed the 'German Florence,' and is certainly, on the whole, very handsome.

Dresden is divided into the Old and New Towns,—the first on the right or S. bank of the river, and the latter on the N. bank; and has seven suburbs, extending all round the Old Town, of which that called Friedrickstadt, lying to the W. of the small river Weiseritz, near its confluence with the Elbe, is the best built and most important. Immediately adjoining the town, are the *Neue Anlagen*, consisting of public walks and gardens. The Old and New Towns are connected by two bridges. The first, a noble stone bridge of sixteen arches, 1,420 ft. in length, and 36 ft. in width, is considered the longest and finest structure of the kind in Germany. It has a foot pavement and an iron balustrade on each side, with a bronze crucifix on its centre pier, and an inscription commemorative of the destruction of part of the bridge by Marshal Davoust, to facilitate his retreat in 1813, and its restoration in the same year by the Emperor Alexander of Russia. The other bridge, forming a portion of the railway leading from Leipsic, through Dresden to Prague, was opened in 1850, and is also a fine structure. The Old Town was formerly provided with fortifications; but these were demolished by the French in 1810, and the place they occupied is now laid out in public walks. That portion of these walks facing the Elbe, is called the Brühl Terrace, and is approached from the foot of the bridge by a grand flight of broad steps. From its own beauty, and the grandeur and variety of the scenery it commands, it is at all times a favourite resort of the inhabitants. As in most other fortified towns, the streets in the Old Town are narrow, the houses lofty and gloomy looking, and the squares irregular. In the construction of the buildings, generally, which are chiefly of sandstone, strength has been more studied than elegance: the principal of the public edifices are, however, in this part of

Dresden. The Schloss (castle), or royal palace, opposite the bridge, is a large antique and ungainly looking building, having the appearance of a fortress rather than of a royal residence; but, internally, it is in every respect worthy of its destination. It has halls of audience, ceremony, and various other state rooms, a royal library, the hall in which the Saxon legislature is opened, and a Catholic chapel with a tower 378 ft. high. It contains the celebrated state treasury, or Green Vault (*Grune Gewölbe*), which occupies a suite of vaulted apartments on the ground floor. They contain an immense collection of precious stones, curiosities, and objects of *virtu*, and are reputed to be worth at least a million sterling. Adjoining the royal palace is the chamber of archives, and near it the palace of princes, containing a handsome chapel, gallery of portraits, and library. On the opposite side of the royal palace, and also communicating with it, is the far-famed gallery of paintings, the grand attraction of Dresden, being not only the finest collection in Germany, but the finest, taking it as a whole, to be found N. of the Alps. Amongst its valuable specimens of art, not one of which can be pronounced bad, few mediocre, numbers good, and several incomparable, are the celebrated *Madonna di San Sisto* of Raphael; the *Notte*, and five other works, by Correggio, in his best style; the *St. Cecilia* of Carlo Dolci; the *Christo della Moneta* and a *Venus*, by Titian; other paintings, by Paul Veronese, Annibal Caracci, Guido, &c.; altogether 356, by Italian artists. In the works of the later German and Flemish masters, this gallery is also extremely rich: it contains magnificent specimens of Rembrandt, Rubens, Vandyke, Teniers, Hans Holbein the younger, Ruysdael, Wouvermans, &c. Of the French school, there are several paintings by Claude, Nic. Poussin, &c.; and beneath the gallery there is a fine collection of plaster casts of the most famous statues, made under the superintendence of Raphael Mengs. This gallery, founded by the Elector Augustus II., has remained untouched and unharmed amid the innumerable revolutions that have, in the interval, convulsed Germany. When Frederick the Great bombarded Dresden, battered down its churches, and laid its streets in ruins, he ordered the artillery to keep clear of the picture gallery; and Napoleon treated Saxony with so much consideration, that not one of her pictures made the journey to Paris.

The Zwinger, erected in 1711, and originally designed as merely the vestibule to a new palace, intended to be built by Augustus II., is a fine group of buildings, surrounding an enclosure planted with orange trees, and forming a favourite promenade. It contains the armoury (second only to the Ambras collection at Vienna), cabinets of natural history, mineralogy, and mathematical and philosophical apparatus, and a gallery of engravings, which possesses at least 200,000 specimens of that art. Immediately contiguous to one of the wings of the Zwinger, is the grand opera-house, a building capable of accommodating 8,000 spectators. It communicates, by a covered way, with the palace of the princes, but is now only used for court festivities: theatrical performances take place in a smaller theatre, near the Catholic church; the latter, occupying a very prominent situation between the royal palace and the bridge, is a large structure in the Italian style. Externally it is profusely decorated, and generally considered deficient in taste; but internally it is chaste, elegant, and imposing. It contains an altarpiece by Raphael Mengs, and a fine organ by Silberman: the music in this church is celebrated throughout Germany. As a whole, however, it is inferior in elegance to the *Frauenkirche* (church of Our Lady, or St. Mary) in the new market, a beautiful stone building, adorned with a cupola, constructed on the model of that of St. Peter's at Rome, 388 German ft. high. The other churches do not demand particular notice. The remaining principal edifices in the Old Town are, the Brühl palace, with a collection of 50 landscapes by Canaletto; the mint, arsenal, medico-chirurgical school, house of assembly, royal guard-house—a beautiful specimen of Grecian architecture, new post-office, trades' hall, and hall for the annual exhibition and sale of the works of Saxon artists. The town hall is the chief ornament of the old market, and the only regular square in the Old Town. The New Town is altogether much better laid out, and contains fine squares, spacious streets, and elegant faubourgs. In this quarter stands the Japanese palace, now called the *Augusteum*, in honour of its founder, Augustus II. This magnificent palace, appropriated wholly to public purposes, is beautifully situated on the banks of the Elbe, amid pleasure grounds, which form a most agreeable promenade for the citizens. It contains the museum of antiquities and modern statuary, which occupies 10 saloons, and is enriched by some of the finest antique statues in Germany; a cabinet of coins; a public library with 250,000 volumes, 4,000 MSS., 100,000 pamphlets, and 20,000 maps; and the celebrated porcelain cabinet. The last is a collection of more than 60,000 pieces of China, including the finest Meissen, Chinese, Japanese, Italian, and Sèvres ware, and specimens of the manufacture of every country, altogether filling 18 apartments. Here are to be seen the three splendid China vases that Augustus II. purchased of the Elector of Brandenburg, at the price of a regiment of dragoons fully equipped!

Through the centre of the New Town runs a broad handsome street, planted with linden trees, near the upper end of which are some extensive infantry and cavalry barracks. The other chief public buildings are, the commandant's residence, several military academies, the town hall, and the church of the Trinity. The market place is embellished with an equestrian statue of Augustus II., in ancient Roman costume. The Friedrichstadt contains the Marcolini palace and the Roman Catholic cemetery, but this quarter is mostly inhabited by the working classes. The Pirna suburb boasts of Prince Anton's handsome villa and extensive gardens; and the Wilsdruf suburb has the palace, gardens, and observatory of Prince Maximilian. Dresden has a great number of literary and scientific institutions, and establishments devoted to education. Among these are an academy of arts, two colleges, a botanic garden: schools of medicine, surgery, and veterinary medicine; a high school, 2 normal schools, numerous free elementary schools, with schools for the reformation of depraved children, and the deaf and dumb, and blind; it has also many charitable institutions, including orphan asylums of various kinds, a foundling hospital, and 5 other hospitals. Amongst other conveniences, the city possesses excellent public baths of all kinds, the prices of admission to which being low, the poorest person is able to indulge in the use of what is found to contribute materially to the public health.

Dresden has no very considerable external trade. It has numerous painters, designers, sculptors, engravers, and other workers in the fine arts; and some manufactures of woollen and silk, leather, gold and silver articles, carpets, sealing wax, maccaroni, white lead, straw hats, arti-

ficial flowers, musical, mathematical, and philosophical instruments, with a bomb and cannon foundry, and a large sugar refinery. What is called Dresden china is not made in this city, but at Meissen, 14 m. distant. The greater proportion of its external commerce has hitherto consisted in its transit trade by railway and by the river Elbe; its general trade is, however, increasing. Since 1826, a wool market has been established.

Few European capitals have such pleasant environs as Dresden. Nearly all the roads leading out of it, and especially from the New Town and Friederickstadt, are planted with rows of trees. The Elbe to the NW. of the city is lined on either side with fine avenues for a considerable distance. SE. of the Pirna suburb is the *Grosse Garten*, a large park filled with fine trees, near which is the small village of Räcknitz, and the monument erected to Moreau on the spot where he received his death wound, 27th Aug. 1813. On the right bank of the Elbe is the *Linkbad*, a hotel surrounded by some beautiful gardens, containing a theatre, &c., about 1 m. from the New Town; and 2 m. beyond this is *Findlater's Vineyard*, a villa and grounds laid out with much taste by a deceased Scotch nobleman. To these different places people of all ranks delight to resort, which they do especially on Sunday afternoons, to take refreshments and dance, or listen to the excellent bands of music with which all the public places are provided.

Dresden and its environs have been the scene of some of the most important conflicts in modern warfare, particularly on the 26th and 27th August, 1813, when Napoleon defeated the allies under its walls. This city has been the favourite residence of many distinguished literary men; in its immediate neighbourhood, Körner lived, Schiller wrote great part of his 'Don Carlos,' and Weber composed his highly celebrated opera 'Der Freischütz.' Its inhabitants generally are great lovers of the fine arts, and devoted to music.

DREUX, a town of France, dép. Eure-et-Loire, cap. arrond., on the Blaise, a tributary of the Eure, which partly encircles it, 20 m. NNW. Chartres, on a branch line of the railway from Paris to Chartres. Pop. 6,940 in 1861. The town stands at the foot of a hill, on which are the ruins of an ancient castle, which belonged to the counts of Dreux: it is well built, and has a fine promenade along the river's bank, a hospital, public baths, a theatre, town-hall, and church. Louis Philippe, when Duke of Orleans, built in the castle a chapel, which he intended for his family burial-place. It is the seat of tribunals of primary jurisdiction and commerce, and of a communal college. Near it, in 1562, was fought the celebrated battle in which the Prince of Condé, then at the head of the Protestants, was taken prisoner. Dreux was the native place of Jean de Rotrou, the tragic poet, and of Philidor, the famous chess-player.

DRIFFIELD (GREAT), a market-town and township of England, E. Riding, co. York, near one of the sources of the Hull; 27 m. E. by N. York, on the Great Northern railway. Area of township, 4,910 acres. Pop. of do., 4,734 in 1861. The town, at the foot of the Wolds, consists chiefly of one long street, parallel to which flows the brook above noticed, which, at the S. extremity of the town, is enlarged into a navigable canal that joins the Hull below Frodingham Bridge. All Saints' church is an ancient structure in the Gothic style. The Independents, Wesleyan, and Primitive Methodists, and Baptists, have places of worship. There is a national school for 100 children, and a dispensary. The chief officer is a constable appointed annually: a court for the recovery of small debts is held here. The town is a station for receiving votes in elections of members for the E. Riding. Market-day, Thurs., and well attended cattle markets every fortnight.

DROGHEDA, a parl. bor. and sea-port town of Ireland, being a co. in itself, but locally in the cos. of Meath and Louth, prov. Leinster, on the Boyne, 4 m. above its embouchure in the Irish Sea, and 25 m. N. Dublin, on the railway from Dublin to Dundalk and Belfast. Pop. 17,365 in 1831, and 14,740 in 1861. From the time the English settled in Ireland, this town, formerly called Tredagh, was considered of great importance. Parliaments have been frequently held in it, and it was made the site of a university, but the privilege was not acted upon. In 1649 it was stormed by Cromwell, who put its inhabitants to the sword, with the exception of a few that were transported to the American settlements.

The Boyne divides the town into two unequal portions, the larger of which, on the N. bank of the river, is connected with the lesser by a bridge of three arches; part of the ancient walls, and the gate of St. Lawrence, still remain, but the buildings now extend considerably beyond them. The churches within the town are St. Peter's in the N. div., St. Mary's in the S., and a chapel of ease. The R. Cath. chapel of St. Peter, considered the cathedral of the archdiocese of Armagh, is a large and elegant building, as is also that of St. Mary. There are friaries of the Augustine, Dominican, and Franciscan orders, and convents of the Dominicans and the Presentation. The Presbyterians and Wesleyan Methodists have places of worship. There are here a classical school on the foundation of Erasmus Smith, and other public schools which give instruction to nearly a thousand pupils. It has also an infirmary, a workhouse for the accommodation of 940 inmates, a linen hall, a building for the widows of Protestant clergymen, and an almshouse. There is an infantry barrack in the town, and another in the vicinity of Richmond Fort. It is in general pretty well built: the streets are paved, lighted, and cleaned, by a committee of the corporation; but its appearance is unfavourable, and the streets swarm with beggars.

Drogheda originally consisted of two distinct corporations, one on the side of Meath, the other on that of Louth. These were united under Henry IV., who granted the newly formed bor. a charter, under which it is still regulated. Its jurisdiction extends over 5,780 acres. The corporation consists of 6 aldermen and 18 common-councilmen, elected by the three wards into which the town is divided. The assizes are held twice a year, and general sessions of the peace by the mayor and recorder in January, April, June, and October. Petty sessions are held every fortnight. The gaol is a well arranged building. It has 6 wards and 16 cells, for an average number of 26 prisoners. The bor. sent two mems. to the Irish H. of C.; and since the Union it has sent one mem. to the Imperial H. of C. Registered electors 639 in 1865. Gross annual value of real property assessed to income tax, 25,880*l.* in 1857, and 22,748*l.* in 1862.

An extensive manufacture of coarse linens was formerly carried on here, which gave way to that of cottons; but the latter is nearly extinct, while the former has revived. Flax spinning is at present the principal branch of industry carried on in the town. It has, also, an extensive foundry, where steam engines and other articles are made; with numerous corn-mills, salt-works, breweries, tanneries, and soap-works. Drogheda ale is in much demand both in England and in the foreign market.

The chief trade, which consists in the export of agricultural produce and of linens, is carried on with Great Britain by steamers, which ply regularly between the port and Liverpool. The cross-channel trade and coasting trade employ also many sailing-vessels. The greatest part of the foreign trade is with the British colonies in N. America: timber is the principal article of import. The harbour and river have undergone several improvements, by means of which vessels of 300 tons may now discharge at the bridge, and barges of 70 tons may proceed inland as far as Navan by means of the Boyne navigation. The customs' duties received at the port amounted to 12,304*l.* in 1859; to 9,796*l.* in 1861; and to 4,404*l.* in 1863. The railway from Drogheda to Dublin was opened in 1844. Fairs are held on March 10; April 11, May 10, June 22, Aug. 26, Oct. 29, Nov. 21, and Dec. 19. Horses and wool are the chief articles for sale. The shipping belonging to the port on the 1st of January, 1864, consisted of 3 sailing vessels under 50, 36 sailing vessels above 50 tons. There were, besides, 5 steamers, of a total burden of 1,579 tons.

DROITWICH, a parl. and munic. bor. of England, famous for its salt springs, co. Worcester, 7 m. NE. by N. Worcester, 118 m. NW. London by road, and 125½ m. by Great Western and West Midland railway. Pop. of munic. bor. 3,124, and of parl. bor. 7,086 in 1861. Though locally in the upper division of the hund. of Halfshire, it has exclusive jurisdiction, and is pleasantly situated on the side of a narrow valley, at the bottom of which runs the Salwarp, on the road from Birmingham to Worcester. It has three parishes and three churches, of which St. Andrew, rebuilt after being destroyed by fire, in 1293, is the most ancient and interesting. The town was originally incorporated by charter from John, confirmed by Henry III. and some of his successors, previously to the charter of *Inspexirnus*, granted by James I. It is governed by a mayor, four aldermen, and twelve councillors: bor. income, 567*l.* in 1862. Gross annual value of real property assessed to income tax, 56,416*l.* in 1857, and 64,238*l.* in 1862. The bor. returned two mems. to the H. of C. under Edward I., and to the parliaments held in the 2nd and 4th Edward II., from which period the privilege ceased until 1554, since which time it regularly returned two mems. until the passing of the Reform Act, which deprived it of one of its members. Its boundaries were at the same time considerably extended. Registered electors, 380 in 1865; the bailiffs are the returning officers. The election of members for the E. division of the co. is held here. There are three chapels: a chapel of ease, one for Independents, and one for Wesleyans: a hospital for thirty-eight aged men and women, founded by Henry Coventry, in 1686; and a charity school for forty boys and forty girls, who are educated and clothed, and on leaving school apprenticed. The salt trade is the main support of the place; malting and tanning are also carried on, and there are some mills for grinding corn.

Droitwich has been celebrated from a very remote period for its brine springs, or *wiches*, a name of Saxon origin, though its meaning be not well known. (Campbell's Political Survey, i. 76.) Reference is made to these springs in Domesday book, and it is certain that they were known, and that salt was obtained from them, long before its compilation, as is evinced by the grants by different Saxon kings to the church of Worcester, in all which the wiches are specially mentioned. (Camden's Britannica, Gibson's ed. i. 160.) Most probably indeed they had been known to, and wrought by, the Romans. The springs are in the middle of the town, and the salt is obtained by boiling and evaporating the brine. About a century ago the usual depth of the brine-pits was about 30 ft., but now they are generally sunk to a much greater depth, and a far more copious supply of brine is obtained. An ounce of brine is said to contain 140½ grains muriate of soda, 2¼ grains sulphate of lime, 2½ grains sulphate of soda, and a trace of muriate of magnesia. A canal from the Severn to Droitwich is used in the conveyance of the salt for shipment, and of the coals made use of in the works.

DROME, a dep. of France, in the SE. part of the kingdom, formerly a part of the prov. of Dauphiny, having N. and E. Isère, E. the Hautes and Basses Alpes, S. Vaucluse, and W. Ardèche, from which last it is separated by the Rhone. Length, N. to S., about 85 m.; greatest breadth, 50 m. Area, 652,155 hectares. Pop. 326,684 in 1861. This dep. is naturally divided into two portions, an easterly or mountainous, and a westerly or plain region. The former includes about 400,000 hectares, or nearly two-thirds of the total surface, and is intersected by ramifications of the Alps, with a mean elevation varying from 4,000 to 5,000 ft. The loftiest summits attain to about 5,750 ft. The chief rivers, after the Rhone, are the Isère and Drôme, but the latter is not navigable. There are a number of streams, which, though usually small, become during the melting of the mountain snows devastating torrents. In the elevated parts it is almost always cold, while along the banks of the Rhone the summer heats are very overpowering: the climate is, however, generally healthy. In the lower parts of the dep. there are about 100,000 hectares of rich land, the rest being generally of inferior fertility. The cultivable lands comprise about 259,100 hectares; vineyards, 23,986 do.; and forests, heaths, and wastes, 308,550 do. Wheat, maize, and oats are the chief kinds of grain cultivated; but the corn grown is insufficient for home consumption. The other articles of culture are very various, including pulse of different kinds, hemp, walnut, olives, chestnuts, almonds, madder, and other dyeing plants and fruits. The vine culture is the most important branch of rural industry, and about 150,000 hectolitres of wine of the best quality are exported annually. The finest growths are the red wines of *Hermitage*, *Crozes*, *Merceurol*, and *Gervant*, and the white wines of *Merceurol* and *Chanoscurson*, and the *Clairette de Die*. The genuine hermitage bears a comparison with the finest growths of the Bordelais and Upper Burgundy. The hills, called *Mas*, which produce it, have a S. aspect, and are mostly covered with a thin calcareous soil: they are so steep, that the mould has to be sustained by rows of low walls. The wine of the *Mas* of Besas, which differs in several respects from the others, is principally bought up by the Bordeaux merchants to give body and flavour to the secondary clarets. The rearing of silkworms is carried on to a great extent, and there is a greater number of mulberry trees in Drôme than in any other deps. of France, Gard alone excepted. A great many bees are kept, and the honey is of very good quality. The middle mountain region is covered with woods of oak, beech, fir, &c., supplying excellent timber; above these there are extensive pasture-lands, feeding in summer numerous flocks of sheep and goats, many of which come from Provence. Mines of iron, lead, and coal, and quarries of marble, granite, rock-crystal, and limestone, are wrought. Manufactures not very important; the chief are those of woollen cloths, serges, silks and silk-twist, coloured linens, stockings and gloves at Valence,

hats, paper, leather, brandy, oils, steel articles, chemical products, and earthenware. The trade is principally in the products of the soil, which include excellent truffles. Drôme is divided into 4 arrondissements, 28 cantons, and 359 communes. Chief towns, Valence, the cap., Montelimart, and Crest. Drôme was annexed to France in 1343.

DRONTHEIM. See TRONDYEM.

DUBHOY, or DUBBOI, an inl. town of Hindostan, prov. Gujerat, dom. of the Guicowar, cap. of a pergunnah containing 84 villages, 38 m. NE. Barroach: lat. 22° 9′ N., long. 73° 25′ E. Toward the end of the last century it contained 40,000 inhab., a few of whom were Mohammedans, and none Parsees. It is nearly an exact square, and has been elaborately fortified, though only a portion of its works remains in any degree of preservation. The ancient walls have been built entirely of large square stones: the city gates are all strong and beautiful, especially the E. portal, called the 'Gate of Diamonds;' which, together with the temple connected with it, present a most complete and elegant specimen of Hindoo taste. 'In proportion of architecture, and elegance of sculpture,' says Mr. Forbes (Mod. Trav., x. 162), 'it far exceeds any of their ancient structures I have met with, and the groups of warriors on horseback, on foot, and on fighting elephants, approach nearer to the classical bas-reliefs of Greece than any performances in the excavations of Elephanta.' Within the walls there was a magnificent tank, ¾ m. in circuit, lined with hewn stone, and with a flight of steps all round, and partly supplied with water by means of a stone aqueduct from receptacles without the walls. In the district around Dubhoy the soil is generally rich and loamy, producing fine crops of rice, jowaree, bajree, &c.; various legumes, cotton, sesamum, palma Christi, sugar-cane, hemp, flax, ginger, and plants for dyeing.

DUBLIN, the metropolitan co. of Ireland, on the E. coast of the island, having E. the Irish Sea, or St. George's Channel; S. Wicklow; W. Meath and Kildare; and N. Meath. Area, 248,631 acres, of which about 9,000 are unimproved, mountain, and bog. The extent of arable land, in square miles, was 306 in 1841; 304 in 1851; and 305 in 1861. (Census of Ireland of 1861.) Principal river, the Liffey, by which Dublin is intersected. Surface mostly flat or undulating; soil shallow, and naturally poor, the subsoil being a retentive clay. Agriculture is by no means in an improved state; there is a want of a proper rotation and drainage, and white crops still not unfrequently follow each other. A good deal of land in the vicinity of Dublin is appropriated to garden culture. Average rent of land, exclusive of that portion called the co. of the city of Dublin, and of country houses, 25s. an acre, being as high an average rent as is paid by any co. in Ireland. Property a good deal subdivided. Farms near the city small, but larger at a distance. In 1841 the co. of Dublin—excl. of the city—had a pop. of 142,695; in 1851, of 149,219; and in 1861, of 155,444. The census at the latter period showed 73,152 males and 82,292 females. The increase of pop. amounted to 4·57 between 1841 and 1851; and to 4·17 between 1851 and 1861.

DUBLIN, a city, the seat of a University, and sea-port of Ireland, of which it is the cap., co. Dublin, on the E. coast of the island, at the mouth of the Liffey, by which it is intersected; 292 m. WNW. London; 138 m. W. Liverpool; 65 m. W. Holyhead. The movement of the population of Dublin, unlike that of other towns of Ireland, has gone on increasing for nearly two centuries. An enumeration of the year 1682 showed 64,483 inhabitants, while in 1753 there were 128,750, and in 1798 there were 182,370 inhabitants. The pop. in 1821 had risen to 185,881; in 1831, to 203,650; in 1841, to 235,864; and in 1851, to 261,700. In the next ten years there was a decline, and the census of 1861 only showed 254,808 inhabitants. Of this number there were 118,283 males, and 136,525 females. The increase of pop. between 1841 and 1851 amounted to 10·95 per cent.; but the decrease between 1851 and 1861 was 2·63 per cent., leaving a net increase in the twenty years of 8·3 per cent. The city is supposed to be the *Eblana* of Ptolemy, and was called by the native Irish *Ballyath-cliath*, 'the town on the ford of hurdles;' and by the Danes *Divelin* or *Dubhlin*, 'the black pool,' from its vicinity to the muddy swamps at the mouth of the river. At the period of the English invasion under Strongbow, A.D. 1169, the city was of very limited extent; its buildings being confined to the summit and declivities of a hill on the S. side of the Liffey, and enclosed by a wall little more than 1 m. in circ. For many years afterwards its increase in extent and population was extremely slow. At the commencement of the 17th century its suburbs extended but a very short distance beyond its ancient walls. In the wars of 1641, the additional works thrown up for the defence of the place lay between the castle and the college, which was then considered as outside the city. After the Revolution, the progress of improvement was comparatively rapid: new lines of streets were opened, particularly to the N. and E.; many of the confined old avenues were enlarged; several squares were laid out, and the buildings, both public and private, were constructed with greater regard to architectural elegance as well as internal convenience. An avenue, called the Circular Road, which nearly surrounds the city, encloses an area of 1,264 acres; of which, 785 are on the S., and 478 on the N. side of the Liffey. The river is bordered on each side by broad and well-constructed quays.

The figure of the city is elliptical, its longer axis extending along the line of the river, from W. to E., 2½ m.; its shorter, from N. to S., nearly 2 m. Sackville Street, on the N. side, is remarkable for its great width and for its buildings; St. Stephen's Green, the largest of the squares, has in its centre an equestrian statue of George II.; College Green, an irregular and confined area near the centre of the city, where most of the main avenues meet, contains some of the finest public buildings, and has in its centre the equestrian statue of William III., so famous in Irish party history. The other public monuments of note are, Nelson's Pillar, in Sackville Street; the Wellington Memorial, a lofty obelisk in the Phœnix Park; an equestian statue of George I., and pedestrian statues of George III. and IV., Dr. Lucas, and Messrs. Grattan and Drummond.

To a traveller frequenting only the principal streets, Dublin appears to be one of the handsomest cities in Europe. The public buildings are all on a grand scale, and the principal streets and squares are capacious, handsome, and well laid out. But there is notwithstanding, especially in the older parts of the town, a vast number of crowded, dirty thoroughfares, with mean, wretched houses, destitute of all the elements of comfort and cleanliness. Wealth and poverty, comfort and misery, are brought into immediate and painful contrast; and Dublin may, in this respect, be taken as a fair representation of the island of which it is the capital.

Dublin Castle stands on the E. verge of the hill upon which the city was primarily built. It was originally a square fortress, with towers at the angles; it now consists of a quadrangle, 280 ft.

by 130, surrounded with buildings containing the state apartments of the lord-lieutenant, and accommodations for the meetings of the privy council and other public functionaries. Attached to it is the viceregal chapel, a small but elegant structure of Florid Gothic architecture. Offices for the ordnance and quartermaster-general's departments, and for the constabulary, are also attached to it. A guard of honour, of cavalry and infantry, is mounted here daily. The lord-lieutenant's usual place of residence is in the Phœnix Park, an enclosed tract of about 1,750 acres, of which about 1,300 acres are open to the public, and serving also as a place of exercise for the troops of the garrison. In it is a powder magazine, a barrack, the offices of the trigonometrical survey of Ireland, an institution for soldiers' orphans, a military infirmary, and residences for some of the inferior officers of the government. Near its centre is a pillar, surmounted by a phœnix rising out of the flames.

The head-quarters of the military establishment for Ireland are at the Royal Hospital, Kilmainham, originally a priory of the Knights Templars, which, after the suppression of that order, was granted to the Knights of St. John of Jerusalem; and, having become the property of the crown on the dissolution of the monasteries, was converted by Charles II. into an hospital for superannuated and disabled soldiers. The building is a large square, three sides of which contain the lodgings of the veterans, and the fourth a chapel, a dining hall, and a suite of apartments for the commander of the forces.

The principal barracks are on the N. side of the city, near the Phœnix Park. They consist of several large quadrangles, containing accommodations for a general officer and his staff; and for 2,000 men, cavalry and infantry. There are also barracks at Portobello, for cavalry; at Richmond Bridge, the recruiting depôt, and Gt. George's Street, for infantry; and at the Pigeon-house Fort and Island Bridge for artillery; having in all accommodation for 5,500 men. The military infirmary in the Phœnix Park, near its W. entrance, can receive 250 patients. The supreme courts of justice are held in a magnificent edifice on the N. Quay, consisting of a central circular hall, opening into the courts of Chancery, Rolls, Queen's Bench, Exchequer, Common Pleas, Nisi Prius, and Admiralty; and wings, in which are record repositories, and offices for the despatch of legal business. The King's Inns, or inns of court, which are at the N. extremity of the city, contain halls for meetings and dining; the courts, offices, and record repositories of the Prerogative and the Consistorial courts of the see of Dublin, and the Registry of Deeds: near the main building is the library, containing a large collection of books. The privilege granted it under the Copyright Act of receiving a copy of every work published in the United Kingdom has been commuted for an annual grant, applicable to the purchase of books, at the discretion of the benchers. The number of barristers on the rolls of the courts is about 800, and of solicitors and attorneys, 1,600; but many of those whose names are entered never practised, and many others have withdrawn from the active duties of their respective professions.

The municipal boundary of the city differs considerably from that of the police and electoral franchise. On the E. side it extends to the village of Blackrock, 5 m. from the centre of the city: while on the N., W., and S., several parts of parishes, in close contiguity with the rest of the city, are beyond it. The extent of the franchise, which was accurately laid down at a very remote period, is still ascertained by means of a triennial perambulation by the civic authorities. The limit on the sea side is determined by the place where a javelin, thrown by the lord mayor standing at low-water mark, falls into the water.

Under the new Municipal Act the city is divided into 15 wards, and the corporation consists of 15 aldermen, one of whom is elected lord mayor, and 45 councillors. The lord mayor is the civil and military governor of the city, in which he ranks next after the lord-lieutenant: he is admiral of the ports of Dublin and Baldoyle, and a justice of the peace; he presides at the court of city quarter sessions; sits on the bench at the commission of Oyer and Terminer; holds a separate court for trial of petty offences; is chief judge of the lord mayor and sheriffs' civil court; and has the regulation of the public markets, and the inspection of weights and measures. He is personally distinguished by wearing a gold chain, called 'the collar of S S,' and has a cap of dignity, and a sword and mace, borne before him on public occasions. He resides in a plain old-fashioned brick building; attached to which is a large circular hall, erected for the purpose of entertaining George IV. in 1821, but without any pretensions to exterior architectural beauty. The recorder, when elected by the aldermen and approved by the common council, retains his office during good behaviour. He is the legal adviser of the corporation, and presides in the city criminal court. The corporate meetings are held in the Assembly House, a plain building, originally erected for the exhibition of pictures.

The corporation holds a criminal court four times a year for minor offences, capital cases being referred to the superior judges. The court must be opened by the lord mayor and two aldermen; but, virtually, the recorder is the ruling judge. The lord mayor's court holds pleas of personal actions above 2*l.*; those under that amount are decided in the court of conscience, over which the lord mayor of the preceding year presides: its meetings take place in an apartment of the Assembly House. The recorder presides in the civil bill court, which is held four times a year, with power to decide by summary process in all cases of debt above 2*l.* arising within the city or liberties. The judicial business is transacted chiefly at the sessions-house; where also elections for the city representatives in parliament take place.

The city returns 2 and the university 2 mem. to the H. of C. City const. 10,371 in 1865. University const., consisting of Masters of Arts whose names are on the books, 1,700.

The prisons for criminal offences are—1. Newgate, or the city gaol, a massive square building, for untried prisoners, felons condemned to death, who are executed from a balcony in its front, and convicts sentenced to transportation; there is also a ward for debtors under coroner's process: 2. Richmond Bridewell, to the S. of the city, for adult males sentenced to imprisonment and hard labour: 3. Smithfield Penitentiary, for juvenile male offenders: and, 4. Grangegorman Penitentiary, N. of the city, for females under sentence of imprisonment by the civic courts, and for female convicts for transportation, from all parts, previously to their embarkation. The debtors' prisons are—1. the Sheriffs' Prison, near Newgate, for debtors not arrested under civic writs: 2. the Four-courts Marshalsea, for debtors under process of the superior courts: and, 3. the City Marshalsea, for those under process of the civic courts.

The supply of water was originally drawn from the Dodder; but in consequence of its insufficiency, arising from the enlarged demands of an increas-

ing population, additional supplies have been procured from the Grand and Royal Canal companies, at the rate of 12½ per cent. from the former, and of 15 per cent. from the latter, on the gross amount of the pipe-water revenue. The inhabitants have since received a copious supply of excellent water from three reservoirs, two S. and one N. of the river. In 1809 the corporation was empowered by act of parliament to levy an additional rate, in order to substitute cast-iron service-pipes in lieu of those of wood. The levy of the rate became the subject of legal dispute with the rate-payers, which was finally decided in favour of the latter, on an appeal to the House of Lords, the decree of which declared the corporation to be indebted to the inhabitants in the sum of 74,500*l.* on this account, and that the pipe-water rents are received and held by the corporation in trust for the benefit of the city.

The expenditure required for the erection and repair of public buildings; the formation and repair of roads, the salaries of civic officers, and public charities, are defrayed by assessments made by the city grand jury, selected by the sheriff, who is appointed by the crown. The amount of taxation thus levied was 228,118*l.* in 1865, distributed as follows:—police rate, 25,500*l.*; North Dublin poor rate, 24,515*l.*; South Dublin poor rate, 40,870*l.*; improvement rate, 54,759*l.*; district sewer rate, 8,860*l.*; Grand Jury cess, 31,470*l.*; vestry cess abolition rate, 2,215*l.*; domestic water rate, 29,947*l.*; and public water rate, 9,982*l.* The expenditure for public buildings, roads, salaries of officers, and public charities, formerly under the absolute control of the grand jury, is now vested in the corporation, to whom the functions of the paving and lighting commissioners have also been transferred.

Within or adjoining the civic bounds are five local jurisdictions mostly independent of the authority of the corporation. They are, 1. the manor of St. Sepulchre; 2. the liberty or manor of Thomas Court and Donore; 3. the liberty of the deanery of St. Patrick; 4. the manor of Grangegorman, which includes the liberty of Christ Church; and, 5. the manor of Kilmainham. The three first are popularly called the Liberties. The manor of St. Sepulchre lies to the SE. of the city, and enjoys extensive powers, granted and confirmed to it by a succession of charters from the reign of John. It holds courts-leet and baron, and a court of record. Its criminal jurisdiction extends to capital cases, but the right, as far as respects these, has fallen into desuetude. A small court-house and debtors' prison is attached to it. The archbishop of Dublin is lord of the manor. The liberty of Thomas Court and Donore lies SW. of the city; Thomas Court being within the county of the city, and Donore in the county at large, of which it forms one of the baronies. Its separate rights are secured by a series of charters, and it holds a court-leet, a court of civil bill, and a court of record for personal pleas to any amount. It has a court-house and small prison: the Earl of Meath is lord of the manor. The liberty of St. Patrick is a small district of about 5½ acres surrounding the cathedral of the same name. It holds its privileges by prescription, and had courts-leet, and a court for the recovery of small debts, both of which have fallen into desuetude; hence it has become a kind of sanctuary for debtors of small sums from the adjacent parishes. Attempts to abolish an exclusive jurisdiction, which interferes with the claims of the just creditor, have been successfully resisted by the corporation of the dean and chapter, which is lord of the manor. A seneschal appointed by it receives a trifling salary, but has no duties to perform. The pop. is small, and very poor; there are not more than 24 good houses in the deanery. The manor of Grangegorman or Glasnevin comprises the greater and wealthier portion of the houses in the N. city parishes, and extends in some directions 7 m. N. and 10 m. S. It claims under an ancient charter, confirmed by another of 1 Jac. I. The corporation of the dean and chapter is lord of the manor. The right of holding courts-leet and criminal courts has fallen into disuse. The seneschal holds a civil bill court on Friday morning for the N. part of the manor, and on every alternate Friday evening for the S.: its sittings are held in each case in an apartment in a tavern. There is no prison, debtors being sent to the county prison at Kilmainham. The liberty of Christ Church comprises the area in the centre of the city on which the cathedral is built. The manor of Kilmainham, in which the royal hospital is built, lies W. of the city, and extends 9 m. W.: Lord Cloncurry is lord of the manor. The seneschal holds a civil bill court six days in every quarter, with unlimited jurisdiction, but practically confined to actions under 5*l.*: the court sits in the county court-house at Kilmainham.

The police is vested, by an act passed in 1835, in 2 commissioners, under whom are 7 superintendents, 24 inspectors, 100 sergeants, 1,000 constables, and 20 supernumeraries. The city, with the liberty, is divided into the Castle, College, Rotunda, Barrack, Donnybrook, and Kingstown districts, in each of which there is an office, where an alderman and a barrister, both appointed by the lord lieutenant, sit daily. The police jurisdiction extends over a district of 8 m. round Dublin, in every direction. The expenses of the establishment are defrayed by a parliamentary grant, by a tax on the inhabitants, amounting, as before enumerated, to 25,500*l.* in 1865; by fines, and by carriage licenses.

The linen, woollen, silk, and cotton trades, which had been carried on to some extent in the city and its vicinity, have all declined. The sales of linen were chiefly effected in a large suite of buildings erected in 1728 by government, in the N. division, and rented to the factors: attached to it is a yarn-hall. The number of factors has decreased so much, in consequence of the decline of the trade, that most of the offices and stores are appropriated to other purposes. A pedestrian statue of George IV. was erected in one of the halls, in commemoration of his visit to the establishment in 1821. The woollen trade was long carried on to a considerable extent in the SW. liberties; a large building was erected there in 1814 by the late Thomas Pleasants, esq., for tentering the cloth, a process previously carried on in the open air, and therefore subject to interruption from changes of weather; but since the repeal of the protecting duties, the manufacture has been nearly extinguished. The silk trade was introduced by emigrants from France, who settled in Dublin in the beginning of last century. The favourite manufacture was a fabric of silken warp and woollen weft, called tabbinet or Irish poplin, which is still in demand. The other branches of the silk trade have been for several years in a very depressed or extinct state. The same may be said of the cotton trade. Beer is extensively produced; and large quantities of porter and stout are exported to Great Britain and foreign countries: there are also several distilleries. A few iron-foundries are employed chiefly in executing orders demanding immediate attention. Cabinet-making is largely carried on, as are the various trades required to meet the demands of a large and concentrated population.

Smithfield market, which is within the civic jurisdiction, is held on Mondays and Thursdays for cattle, and on Tuesdays and Saturdays for hay and straw. A new cattle market, opened in November, 1863, has been erected by the corporation on the North Circular Road, where ample accommodation is provided, at a cost of about 15,000*l.* Spitalfields and Kevin Street markets are in the manor of St. Sepulchre: the principal commodities sold in both are bacon, butter, and potatoes; and in the latter hay and straw. A wholesale fish-market is held in Boot Lane; one for potatoes, fowls, and eggs, and another for fruit in the neighbourhood. The corn-market, formerly held in Thomas Street, is now carried on by a joint stock company, in a building erected for the purpose on Burgh Quay, where the grain is sold by sample. The retail markets are all private property, but their management is under the control of the officers of the jurisdiction in which they are held; those in the city being under the lord mayor.

The inland trade of Dublin has been greatly promoted by the Grand and Royal canals, both of which terminate in the city, and communicate with the sea through the Liffey. Still more conducive to the increase of trade has been the establishment of a network of railways centering in Dublin and spreading all over Ireland. There are five railway termini in the city, which it is intended to connect by a girdle railroad.

Banking business is transacted by the Bank of Ireland, established in 1783; the Hibernian Joint Stock Company, 1824; and by the Provincial, the National, the Royal, and London and Dublin Joint Stock Banks; and branches of the Ulster Bank, the Union Bank of Ireland, the latter opened in 1865. There are, besides, five private banking-houses and 2 savings' banks. The affairs of the Bank of Ireland are managed by a governor, who must hold 4,000*l.* stock; a deputy governor, with 3,000*l.*; and 15 directors with 2,000*l.* each. It is the place of deposit for all government monies. The buildings, formerly the Irish parliament house, form a quadrangle, standing on an area of 1½ acre, presenting three fronts; that to the E. of the Corinthian order, and those to the S. and W. of the Ionic. There is a very ingenious system of steam machinery for printing the bank notes, so as to render frauds extremely difficult. A statue of George III. occupies the spot on which the throne stood in the former House of Lords, now the directors' board-room.

An exchange was erected in 1767, in the centre of the city, partly by a parliamentary grant, and partly by subscription. The merchants held their meetings in it until 1796, when the greater facilities afforded by the Commercial Buildings in College Green induced them to transfer their dealings thither; and the exchange has been since nearly useless. The building presents a fine specimen of Grecian architecture, and contains pedestrian statues of George III., Grattan, and Dr. Lucas.

The mercantile society of the Owzel Galley, for deciding disputes relative to shipping and mercantile dealings by arbitration, was formed in 1705, and took its name from that of the vessel on which the first decision was pronounced. A chamber of commerce was established in 1820.

The river and port were vested in the corporation in 1220, by a charter of Henry III. Admiralty jurisdiction between Arklow, S., and the Nanny Water, N., was granted by Elizabeth. In 1707, it was empowered to erect a ballast-office, the annual expenses of which were 4,400*l.* at an average of thirteen years, from 1753 to 1780. In 1783, the management of the office was committed to a new board, with control over the ballastage, tonnage, wherries, quayage, and pilotage of the port, including the harbours of Dunleary (now Kingstown) and Dalkey.

The commerce of the port of Dublin had increased so much towards the close of the last century, that the accommodation afforded in the river for shipping was found insufficient, and Parliament, consequently, granted 45,000*l.* for forming docks on both sides of it. The docks communicating with the Grand Canal, on the south side, were opened in 1796, and St. George's, the latest of the Custom House Docks, in 1821. These latter cover an area of 8 acres, have 16 feet depth of water, and 1,200 yards of quayage, and are capable of accommodating 40,000 tons of shipping. The docks on the south side afford commodious wharfage for merchantmen and colliers, exclusive of that supplied by the river-quays. The receipts of the Dublin Ballast Corporation for tonnage and quay-wall dues levied on vessels entering the port in 1863, was 35,871*l.*

The principal lighthouse of the port is at Poolbeg, on the extremity of the South Wall, and opposite to the great Northern Wall or breakwater, between which is the entrance crossing the bar to the harbour and quays; it is a bright light of 26 burners, 63 ft. in height. The other harbour lights are a floating light on the Kish Bank off Dalkey Island, the Bailey of Howth lighthouse, and a light on the extremity of the North Quay Wall. At the entrance to Kingstown Harbour there are lighthouses on each pier; that on the E. pier is a revolving light, every half minute, that can be seen 9 miles in clear weather. The mail packets to Holyhead start from Kingstown Harbour, which is 6½ miles from the city.

There were in 1863 registered at the port of Dublin 513 sailing vessels, with a tonnage of 38,167 tons, and 61 steamers, burden 11,986 tons. Most of those vessels were employed in the coasting or cross-channel trade, there having been but 6 or 8 in that of the West Indies, the same number in that of France and the Spanish peninsula, and 20 or 30 in the North American timber trade.

The brewing of porter is carried on extensively, and the number of barrels exported in 1861 was 170,384; 1862, 156,077; 1863, 174,941, nearly one-half was shipped by the eminent firm of Guinness.

The shipments of grain, &c., from Dublin, in 1863, were as follows:—

Wheat	31,729	quarters
Indian Corn	7,745	,,
Oats	50,525	sacks
Barley	3,931	,,
Flour	30,546	,,
Oatmeal	38,424	,,

The exports of provisions for the same period were:—Butter, 182,443 firkins; beef, 392 hogsheads, 1,901 tierces and casks; bacon, 6,672 bales, 501 boxes; hams, 980 hogsheads, 403 tierces and casks; pork, 4,503 barrels; lard, 6,231 barrels, 1,222 firkins and kegs; and of live stock, 162,742 head of cattle, 145,825 sheep, 1,124 calves, 90,904 pigs. Of wool, 16,204 bags were shipped.

The cross-channel trade is now carried on chiefly by steamers, which sail to Liverpool, Holyhead, and Bristol, London, Glasgow, Cork, and Belfast. Coals pay a duty of 4*d.* per ton, imposed to compensate the coal-meters, whose services have been rendered nearly unnecessary by the regulation allowing coal to be sold either by weight or measure. The amount of the customs' duties received at the port was 1,053,511*l.* in 1859; 1,004,276*l.* in 1861; 1,025,092*l.* in 1862; and 974,091*l.* in 1863.

The subjoined table shows the comparative amount of duties received at the port of Dublin in each of the years 1862 and 1863:—

Articles	1862	1863
	£	£
Tea	355,226	285,598
Muscovado Sugar .	62,777	52,579
Refined Sugar . .	38,225	32,564
Coffee . . .	5,306	4,642
Wine	67,725	71,463
Spirits . . .	47,125	49,860
Tobacco . . .	394,480	431,947
Timber . . .	5,369	4,961
Other Articles . .	48,859	40,477
Total . .	1,025,092	974,091

The fiscal business of the port is carried on at the custom-house on the N. side of the river, near its mouth; a very extensive and magnificent structure, capable of serving as a custom-house for the empire. The transfer of part of the business to London, in consequence of the union of the British and Irish boards of customs and excise, having rendered great part of the building useless, many of its apartments have been appropriated to the use of the stamp office, the vice-treasurer's record department, the board of public works, the poor law commissioners, &c. Adjoining the main building are a floating dock and extensive stores, which were materially injured by a fire in 1834, but have since been in a great measure restored. The business of the post-office is transacted in a large and stately building in Sackville Street. The exports of home produce from Dublin to foreign countries are altogether not very considerable. The declared real value of the total exports of such produce to foreign ports amounted to 48,270*l.* in 1859; to 22,192*l.* in 1860; to 28,138*l.* in 1861; to 48,777*l.* in 1862; and to 38,196*l.* in 1863.

Dublin is the seat of an archbishop's see, and of the second of the archiepiscopal provinces into which Ireland is now divided. The provincial jurisdiction is nearly coextensive with the two civil provinces of Leinster and Munster. The see, including the bishopric of Glandelough, which was incorporated with it in 1214, includes the counties of Dublin, and Wicklow, and Kildare. The landed property contains 30,040 acres, of which 23,926 are profitable. There are two cathedrals: Christ Church, built near the summit of the hill on which the city stands, is the more ancient and superior. The building is plain, with no exterior architectural embellishments; it contains several remarkable monuments; among which is that of Strongbow, earl of Pembroke. St. Patrick's Cathedral, in the valley, S. of Christ Church, also contains some remarkable monuments. The chapters and installations of the Knights of St. Patrick are held in it. The city contains 20 parishes or parts of parishes.

According to the Roman Catholic ecclesiastical arrangements, these 20 parishes are consolidated into 9 unions, each having a place of worship; besides which, there are sundry chapels attached to friaries or nunneries. There are nearly 100 places of worship. St. George's Church in the NE. part of the city is a splendid structure, in the Grecian style. It is the only place of worship, except the cathedrals, which has a peal of bells. The Roman Catholic church of the Conception, in Marlborough Street, considered the archbishop's cathedral, is of very large dimensions, and highly embellished internally, but not yet complete as to its exterior. The Roman Catholic chapel of St. Francis Xavier is also an elegant building of the Ionic order.

Dublin had, by the census of 1861, a pop. consisting of more than two-thirds of Roman Catholics. There were 23,807 males, and 25,444 females belonging to the established church; 89,337 males and 107,212 females who were Roman Catholics; 2,899 males and 1,976 females who were Presbyterians; 946 males and 951 females who were Methodists; and, finally, a few hundred persons entered as belonging to other sects. There were but few Jews, the total number, in 1861, being 154 males and 170 females.

Dublin was the seat of a university so early as 1320, but the institution gradually declined in consequence of the unsettled state of the country and the deficiency of funds. The existing university of Trinity College was founded in 1593, in the buildings of the dissolved monastery of Allhallows, applied to this purpose by the corporation, to which it had been granted at the dissolution of the monasteries. It consisted originally of a provost, 3 fellows, and 3 scholars; but at present it consists of a provost, 7 senior, an undefined number of junior fellows (at present 27), and 70 scholars. It has, also, 27 professors, with lecturers and assistants, all endowed. A school of engineering, founded in 1842, has 7 professors, and is said to furnish a very complete course of theoretical and practical instruction. The university is presided over by a chancellor and vice-chancellor, one of whom holds occasional visitations, and by a board, consisting of the provost and senior fellows, which sits weekly. The period of undergraduate instruction is four years; the number of students above 1,800. The course of studies for candidates for a fellowship is logic, mathematics, natural philosophy, ethics, history, Latin, Greek, and Hebrew. The examinations, which are public, are carried on in Latin. Exclusive of the fees of students, the university derives a large income, said to exceed 15,000*l.* a year, from lands; and it has, also, the patronage of 32 benefices. It enjoys the right of returning two members to the H. of C., who are elected by the fellows, scholars, and all those who at any time have been fellows or scholars, and have kept their names on the books. The buildings, which present an extended front to College Green, are large and elegant: the principal are a library, containing upwards of 120,000 volumes, and entitled to a copy of every work published in the empire; a chapel, an examination hall, a museum, a dining-hall, a theatre of anatomy, and a printing-office; it also maintains a small but well kept botanical garden in the SE. suburb. The College of Physicians is connected with the university; some of the courses of lectures are given in that institution, others in Sir Patrick Dun's Hospital. The College of Surgeons, St. Stephen's Green, was founded in 1784. The Incorporated Company of Apothecaries has established courses of lectures in pharmacy and other branches of medical science, at their hall in Henry Street. There are also several private medical and surgical schools, much frequented by students.

The chartered scientific and literary societies are —the Royal Dublin Society, for the promotion of the useful arts, having professorships in botany, chemistry, and experimental philosophy; drawing schools, a library, a museum, and a large botanic garden: the Royal Irish Academy, founded in 1786, for the encouragement of abstract science, polite literature, and antiquities, with a small but increasing library, containing a good collection of Irish MSS., and a museum: it has published nearly 20 vols. of Transactions. The Royal Hibernian Academy, founded in 1823, for the encouragement of the polite arts, meets in a building erected for its use, at an expense of 13,000*l.*, and presented to it by the late Francis Johnston, architect. An exhibition of the works

of native artists takes place annually. These institutions mostly receive grants of public money. The principal libraries, besides those already noticed, are Marsh's or St. Patrick's Library, near the cathedral of that name; and the Dublin Library, confined exclusively to subscribers. There are smaller collections of books, none of which are open to the public, at Sir Patrick Dun's Hospital, Steevens's Hospital, the Royal Hospital, Christ Church, and the Presbyterian meeting-house at Strand Street. The unchartered societies for science, literature, and the fine arts, supported wholly by voluntary contributions, are—the Royal Irish Institution for Painting; the Zoological Society, which has a handsome garden in the Phœnix Park; the Horticultural, which maintains an annual show of flowers and fruit; the Agricultural, with an annual show of cattle; the Historical, for historical and political discussion; the Civil Engineers' societies; the Natural History Society; and the Mechanics' Institute, formed in 1837.

The model schools of the board of National Education are held at their respective establishments. Schools, on the foundation of Erasmus Smith, are founded on the Coombe and in St. Mark's parish. Most of the parishes and congregations have free schools attached to them. The total number of schools maintained by grants of public money and voluntary contributions is about 200; the total number of pupils is about 15,000.

The principal charitable institutions which maintain as well as educate orphans and destitute children are—the Foundling Hospital, now very much circumscribed; King Charles's, or the Blue-Coat Hospital, a large and handsome range of buildings, maintains about 100 boys, the sons of reduced citizens. The Hibernian Society, in the Phœnix Park, was founded for soldiers' children; the Marine school, on the SE. quay for sailors' children; the Protestants' Orphan Society; and the Female Orphan House, N. Circular Road, for female orphans. The principal institutions for the relief of disease and accidents are—Steevens's Hospital, near Kilmainham; Sir Patrick Dun's; the Meath Hospital, which is also the county infirmary; the City Hospital; Jervis Street Infirmary; St Mark's and Ann's; the Westmoreland Lock and Netterville Hospitals; the Hospital for Incurables; two fever hospitals, one in Cork Street, the other on the N. Circular Road; and 10 lying-in hospitals, of which that in Rutland Square is the principal. Attached to this last-named is a fine suite of apartments and an enclosed garden or pleasure ground for public amusements, the profits of which contribute to the maintenance of the institution. There are 10 dispensaries, supported partly by parliamentary grants and partly by private contributions. The institutions for cases of mental derangement are the District Richmond Lunatic Asylum for the city and county, and for Louth, Meath, and Wicklow cos., supported by grand jury presentments; Swift's Hospital, supported chiefly by the founder's bequest; an asylum near Donnybrook; and 5 private institutions. Since the introduction of the compulsory provision for the support of the poor, Dublin has been divided into 2 Poor Law Unions, the N. and S., each of which has a separate workhouse, on a large scale, and board of guardians. The chief asylum for the aged and impotent is the House of Industry, established in 1773, and supported wholly by grants of public money. Its buildings, yards, and gardens extend over an area of 11 acres.

The minor asylums for age, debility, and want, are numerous. There are 2 for the blind, the Richmond, in Sackville Street, for males; the Molyneux, in Peter Street, for females; the inmates in each contribute to their maintenance by their labour. There are 2 houses of refuge for females of good character, and 10 for penitent prostitutes.

The places of public amusement are few, and not much encouraged. They comprise the Theatre Royal, the Queen's Theatre, the Rotunda Gardens, and the Portobello Gardens. Clubs for social and convivial purposes are numerous. The principal are the Dublin University, Leinster, Kildare Street, Sackville Street, United Service, Beefsteak, and the Friendly Brothers. The Royal St. George's and the Royal Irish Yacht clubs hold annual regattas at Kingstown.

The environs of the city in every direction are very beautiful; the view of the valley of the Liffey from the rising grounds on the S. boundary of the county commanding the highly cultivated lands inclining to the sea-side, well planted, and studded with numerous seats and villages, the bay with the hills of Killiney on the one side, and the city spread out on the other; the Hill of Howth, Lambay, and Ireland's Eye, in the back ground; and, in clear weather, the Mourne mountains in the remote distance, present a landscape of superior tranquil beauty. The external appearance of the city itself is equally striking. The main avenues to it, particularly on the E. side, are spacious, airy, and bordered with large dwelling-houses; the public buildings, both civil and ecclesiastical, numerous, as compared with the size of the city, mostly of elegant architecture, and placed in imposing points of view. But, as already stated, this description is by no means applicable to a large portion of the city. A line drawn N. and S. through Dublin Castle would divide it into 2 parts, extremely different in appearance. The E., in which are the residences of the more wealthy class, contains most of the public buildings, all the squares, and streets of fashionable resort, both for amusement and trade; the W., once the principal seat of the trade of the town, is now in a state of dilapidation and extreme destitution.

A love of convivial enjoyments pervades all ranks. The habits of the higher and middle classes are social to a degree often bordering on profusion. Letters of introduction from strangers are the never failing harbingers of rounds of dinner parties, evening entertainments, assemblies, balls, and suppers. The dinner hour varies from five to seven, and scarcely any business is transacted afterwards. Neither do the daily occupations commence at an early hour in the morning. The courts of justice seldom meet before eleven, and generally close before four. Dancing is a favourite amusement; cards are every year getting less fashionable. Jaunting-cars, both open and covered, carrying four persons, supply the place of the London cabriolets, and have wholly supplanted hackney-coaches. The appearance of the lower classes, however, exhibits, particularly in the W. division of the city, every indication of wretchedness. The habitations are mean and neglected, their clothes tattered, and they seem as if they maintained a constant struggle with poverty; but, despite all this, there is a lightheartedness about them that not only enables them to bear up under the pressure of want, but which, by rendering them comparatively insensible to its existence, paralyses their efforts to improve their condition, and makes them contented with the abject poverty in which they live. They are equally fond of amusement as their superiors;

equally ready to indulge in dance and song. Intoxication is less frequent than formerly, and the spirit of riot and turbulence, which not many years since was the all but invariable consequence of festive meetings, is rapidly subsiding—a change partly owing to a stricter and better system of police, and partly to the moral influence of an improved state of society. Several meetings are held annually in the neighbourhood, ostensibly for the transacting of business, but in reality almost solely for festive purposes. The most celebrated is Donnybrook fair, in August, which formerly continued for a fortnight, but is now restricted to a few days, and has, in fact, quite lost its old character. The fairs of Rathfarnham, Palmerston, and Finglas are of the same character, but in a minor degree.

The principal events in the history of Dublin are identified with that of the island in general, and are therefore to be found in the article IRELAND. But a few facts may be stated with respect to it. In 1169 it was taken by storm by the English, under Richard de Clare, better known by the name of Strongbow; and the Danes, who two years after laid siege to it with a numerous naval and land armament, were defeated with the loss of their leader, and forced to raise the siege. This was their last attempt to recover the dominions they once held in Ireland. In 1172, Henry II. landed, and held his court here in a temporary building erected outside the town, which was too small to afford suitable accommodations for the monarch and his retinue. In 1205, the castle was erected, and four years after the citizens were unexpectedly attacked while amusing themselves in Cullen's Wood, now a suburb, by a party of Irish from the Wicklow mountains, and forced to seek the protection of the fortifications, after the loss of many lives. In 1210, King John held his court in Dublin, and about the same time the first bridge was built across the Liffey. In 1316, Edward Bruce was repulsed in an attempt to take Dublin. It was twice visited by Richard II., who took his final departure from it in 1399, the year of his dethronement and death. In 1486, the citizens declared for Lambert Simnel, and crowned him in Christ Church. About the same time the mayor was compelled to walk barefooted through the city, as a penance for a violent outrage committed by the citizens in St. Patrick's church. In 1533, Lord Thomas Fitzgerald, having rebelled against Henry VIII., laid siege to the city, on which occasion his batteries were mounted at Preston's Inn, now almost in its centre; but the obstinate resistance of the citizens, who burnt great part of the SW. suburb to check his approach, compelled him to raise the siege. In 1583, a dispute between two of the Irish family of O'Conor was decided by wager of battle in the castle, before the lords justices and council. About the same time, the king's exchequer, which was kept between College Green and the castle, was plundered by a party of Irish from the mountains. During the civil wars of 1641, the battle of Rathmines, in which the Duke of Ormond was totally defeated by the garrison of Dublin, was fought in the neighbourhood. The Grand Canal was commenced in 1765. A penny post-office was opened in 1773. In 1778, the first regiment of Dublin volunteers, arrayed for the defence of the kingdom against the threatened invasion by the French, appeared under arms. The Royal Canal, to the N. of Dublin, was commenced in 1789. The first steam-engine was set up in 1791; next year the buildings of the House of Commons took fire, while the members were assembled, and were completely burnt down: the cause of the fire was never clearly ascertained. The insurrections of 1798 and 1803 form part of the general history of the island. A jubilee was celebrated in 1809, in commemoration of George III. having entered on the 50th year of his reign. In 1816, the first steam packet sailed from the harbour. In 1821, Dublin was visited by George IV., who landed on his birth-day at Howth. In 1834, the railway between Dublin and Kingstown was opened. In 1849, on the 6th of August, her Majesty Queen Victoria and Consort landed at Kingstown. A great international exhibition of works of art and industry took place in Dublin in the summer of 1865, and was visited by above a million of people.

DUBNO, a town of European Russia, govern. Volhynia, on the Irwa, 36 m. NE. Brody. Pop. 7,500 in 1858. The town belongs to the princes Lubomirski, and is ill built, with narrow, crooked, and unpaved streets.

DUDLEY, a town and parl. bor. of England, in a detached part or *enclave* of the co. of Worcester, surrounded on all sides by Staffordshire; 8½ m. W. by N. Birmingham, 119 m. NW. London by road, and 141 m. by Great Western and West Midland railway. Pop. of parl. bor. 44,975 in 1861. The town consists principally of a long street, with a church at each end; the houses are generally good, and the streets paved, macadamised, and lighted with gas. St. Thomas's church, rebuilt in 1819 at an expense of 23,000*l.*, is a fine Gothic structure, with a lofty conspicuous spire. There are altogether five churches, and twelve chapels for Catholics, Methodists, Baptists, Independents, Unitarians, and Quakers. It has a grammar-school, founded in the reign of Eliz., and endowed with land worth about 300*l.* a year. There is a charity school for clothing and educating 40 girls, and a charity for clothing 7 poor men, established in 1819. A school was also founded in 1732, for clothing and educating 50 boys, exclusive of about 200 not on the foundation. There is likewise a blue-coat school, where many boys are educated, and a school of industry. The Unitarians have a school for girls, and there are Sunday schools attached to the several places of worship. There are several book societies, and a well-supported subscription library.

Dudley is a principal seat of the iron trade; its vicinity furnishing inexhaustible supplies of coal and iron ore, while the canals with which it is connected afford the means of readily conveying its products to all the great markets of the empire. The inhabitants are principally engaged in nail-making, which is the staple trade of the town, mining, the smelting of iron ore, and the manufacture of flint glass. Exclusive of nails, a great variety of iron implements are made here. In 1862 above 6,000 hands were employed in the coal and metal works.

The workmen comprise engineers, able mechanics of almost every description, such as pattern makers, carpenters, first-rate masons, founders, men of great science for working the iron-stone, coal, and many others. Boys are employed in the pits and mines to attend to the fires, and various light work about the furnaces, to fill the boxes, barrows, &c. for the men. The price of coal in this district varies from 4*s.* to 8*s.* and 10*s.* a ton: the men engaged in most of the works are supplied with the coal at prime cost. The custom mostly is, to pay the men by the ton: some masters, however, pay them by the day. It takes a long time to make a man a collier. He is first apprenticed to a person, himself a collier, either his father or fellow workman. The labour is severe, and the workmen generally live upon good food,

Earl Dudley, the chief landowner, is the largest ironmaster in the kingdom.

A mayor and other officers are annually appointed by the lord of the manor, but the town is within the jurisdiction of the county magistrates, who hold petty sessions every Monday. A county court is established here. In the 23 Edward I. Dudley sent 2 members to the H. of C.; but the privilege was afterwards withdrawn, and the town remained unrepresented till the passing of the Reform Act, when the right to send 1 member to the H. of C. was conferred on it. Registered electors 1,127 in 1865, all 10*l.* householders. The returning officer is appointed by the sheriff of the county.

To a stranger, for the first time approaching the town at night, the appearance presented by the numerous fires rising from the furnaces, forges, and collieries, is particularly imposing, their lurid glare illuminating the country for a considerable distance round. There are, in many places, subterranean fires, which generally continue until the fuel which supplies them is nearly exhausted. This phenomenon has been observed, more or less, in the neighbourhood, for upwards of a century. At Russell Hall, a stratum of from 25 to 30 ft. of argillaceous substances, lying between the upper stratum of coal and the surface of the earth, has been transmuted into a species of stone by the heat arising from these subterranean fires.

In the Saxon times a strong castle was built here, which has since undergone many vicissitudes. In 1644, it withstood a siege; and the occurrence of a fire, in 1750, completed its destruction. Its ruins, which are very extensive, stand on an elevated situation, and command very fine and extensive views.

One of the most striking objects at Dudley consists of the remarkable development of the mountain limestone in the hills under and immediately adjoining the castle. The peculiar stratification incident to a force acting powerfully from beneath, which has elevated a portion of the previously deposited beds of limestone, leaving them to dip on both sides from a central ridge, is developed with great distinctness. The stratification of this locality is still farther exhibited by the very extensive excavations in the limestone itself: some of these are open, and consequently very readily inspected, but the more extensive consist of long, horizontal galleries, whose extent and brilliancy can only be observed with the aid of torches, but which well repay the labour required in gaining a view of their dark and secret recesses. These workings extend 1½ m. under the hill, and a canal, for the conveyance of the produce of the mine, extends the greater part of this distance. The organic remains of former races of animals are very numerous. Several species of *trilobites* (Dudley locust) and *crinoidea* are met with not unfrequently, and corals and madrepores are in great profusion. Perhaps it may be said, that few localities in the kingdom present so many curious and interesting subjects of observation to the geologist as this. Seldom have the operations of nature and of art united in bringing so much of the secret economy of the interior of the globe under the observation of the inhab. of its surface. Many noble seats, and spacious residences, lie within a circuit of a few miles of the town. At Ladywood, within the par.. and about 2 m. from the town, is a valuable spa, possessing similar qualities to the Cheltenham and Leamington waters, and equally efficacious for cutaneous diseases: here are also commodious hot and cold baths open to the public. There are also several chalybeate springs in the neighbourhood. The celebrated nonconformist divine, Richard Baxter, was for some time master of one of the schools in the par. Dudley conferred the title of earl upon Lord Ward in 1860.

DULCIGNO (Turk. *Olgun*), a maritime town of Turkey in Europe (the ancient *Olcinium*), prov. Albania, on the Adriatic; 19 m. SW. Scutari, and 40 m. SSE. Cattaro: lat. 41° 53′ 50″ N., long. 19° 11′ 49″ E. Pop. estimat. at 7,000. The town possesses a citadel and a harbour, has some little trade, and is the residence of a R. Cath. bishop. Its inhabitants are the only natives of Albania who have a taste for a sea-faring life, or rather, perhaps, for piratical excursions by sea. When Sir J. Hobhouse visited this town in 1809, they were accustomed to enter into the naval service of the Barbary powers, or to issue, 'as the Illyrians did of old, from the same port of Olcinium, to plunder the merchant ships of all nations.' (Journey through Albania, p. 163.)

DULWICH, a hamlet of England, co. Surrey, par. of Camberwell, hund. Brixton, 5 m. S. London by road, and 5¼ m. by the London, Chatham, and Dover railway. Pop. of ham. 1,723 in 1861. It is a quiet rural place, mostly consisting of groups of respectable mansions scattered round a large open area planted with avenues of trees. Here is the celebrated Dulwich College, established in 1619, by Edward Allen or Alleyne, a contemporary of Jonson and Shakspeare, and the most celebrated tragic actor of his day. He endowed it with the manor of Dulwich, and certain lands and tenements in the parishes of Dulwich, Lambeth, and St. Botolph, Bishopsgate; the ann. rev. being at the time 800*l.*, but at present it is very much larger. The college was originally built by the founder in the Elizabethan style, from a design of Inigo Jones; it has of late years been renovated and augmented, and forms three sides of a quadrangle, with offices, a picture-gallery, and a large garden. It was founded for a master, warden, 4 fellows, 6 poor brethren, 6 sisters, 12 scholars, 6 assistants, and 30 out-members. According to the statutes, the master and warden must each be of the blood and surname of Alleyne, or, in default of relatives, of the same surname: they must be 21 years of age, and unmarried. The 2 senior fellows are required to be of the degree of M.A., and unmarried; and the 2 junior fellows graduates in holy orders. The brethren and sisters must be 60 years old, and single, when admitted. On the death of the master, the warden succeeds, and a new warden is chosen by lot from amongst candidates qualified as above. The fellows are also chosen by lot, when vacancies occur. The poor brethren and sisters are chosen in the same mode, from the 30 out-members, who must be parishioners of St. Saviour's, Southwark, St. Botolph, Bishopsgate, or St. Giles's, Cripplegate (10 from each par.), and are lodged in almshouses appropriated to the purpose: the churchwardens of the above pars. are *ex officio* assistants in the government of the college. The Archbishop of Canterbury is visitor. A library was bequeathed to it by Edward Cartwright, a comic actor, who died about the end of the 17th century, which contained a large, curious, and unique collection of old plays, subsequently (and with very questionable propriety) assigned to Garrick in exchange for some modern works. A respectable collection of pictures was also left to the institution by the founder, and by Cartwright; and to this a most valuable and splendid addition was made in 1810 by a bequest of Sir Francis Bourgeois, R.A., who also left 2,000*l.* to build a gallery for their reception, and to defray the expense of their preservation, &c. This fine collection of the old masters is open (except on Fridays

and Sundays) to the public, admission tickets being obtainable by any respectable person, on application in London. It consists of about 800 pictures, mostly of the cabinet size, and was formed by M. Desenfans, an eminent collector, who bequeathed them, on his decease, to Sir Francis; and he, in turn, to the widow of his friend, for life, with reversion to the college: a mausoleum in the college chapel contains the remains of Sir Francis and Desenfans. Public service is regularly performed there, and it serves as a chapel of ease to the hamlet. There is a free school in Dulwich, founded in 1741, by James Alleyne, then master of the college, for 60 boys and 60 girls: the present revenue amounts to 200*l.* a year. There are many elegant villas in the vicinity; and in summer the villa is much resorted to by temporary visitors.

DUMBARTON, or DUNBARTON, a marit. co. of Scotland, consisting of two detached portions, of which the principal, or most westerly, lies between Loch Lomond on the NE., Loch Long on the W. and NW., the Clyde on the S., and the Milngavie burn on the E.: the other and much smaller portion lies on both sides the Forth and Clyde canal, from Cumbernauld to Kirkintilloch. Total area, 297 sq. m., or 189,844 acres, of which nearly 20,000 are water, being principally part of Loch Lomond. It consists mostly of lofty, rugged mountains incapable of cultivation; the arable lands being principally in the S. part of the co., between Loch Lomond and the Clyde, and along the Forth and Clyde canal. The low ground is very fertile, and is pretty well cultivated. Estates mostly large; but arable farms are rather small, and even stock farms are not so large as in most highland cos. Oats and potatoes principal crops, but very good wheat is also raised. Cattle in the upper parts chiefly of the Highland breed; but in the low grounds, where dairying is extensively carried on, Ayrshire cows are almost exclusively met with. Sheep partly black-faced, and partly Cheviots. There are mines of coal and iron, and freestone and limestone quarries. There are large cotton mills at Duntocher in this co.; and paper-making, &c. are carried on to a considerable extent; there are extensive print-fields on the Leven, the only river of any importance. The co. returns 1 mem. to the H. of C. Registered electors, 1,597 in 1865. The town of Dumbarton unites with Renfrew, Rutherglen, Kilmarnock, and Port Glasgow, in sending a mem. to the H. of C. Dumbarton is divided into 12 parishes; and had, in 1861, a pop. of 52,034, living in 5,893 houses. The old valued rent was 2,777*l.*; the new valuation for 1863–4 was 242,586*l.*

DUMBARTON, or DUNBARTON, a royal and parl. bor. and sea-port of Scotland, cap. of the above co., on the W. bank of the Leven, within 100 yards of its junction with the Clyde, 13 m. NW. Glasgow, on the railway from Glasgow to Helensburgh. Pop. 8,253 in 1861. The town consists of one well-built, crescent-shaped street, and of some smaller ones. The houses are crowded closely together, so that many of them are ill-aired. There is a suburb E. of the Leven, connected with the burgh by a bridge of five arches. Chief public building par. church, a modern structure, with a spire and clock. There are also two chapels, belonging respectively to the United Associate Synod and the Rom. Cath. At high water, the Leven is navigable for large vessels to the quay at Dumbarton; but not so at low tides. This is owing partly to a bar across the mouth of the river, and partly to sandbanks between the entrance and the quay. The burgh has long been celebrated for its excellent schools. Among the distinguished individuals to whom they have furnished instruction may be specified Sir John Smollet, of Bonhill, one of the commissioners for framing the articles of union between England and Scotland; his grandson, Smollet, the celebrated novelist; Dr. Colquhoun, author of a Treatise on the Police of London, and other works. Shipbuilding and rope-making are carried on to a considerable extent. Bleaching, the printing of cottons, and other branches of industry are carried on, along the line of the Leven from Loch Lomond, whence it flows, to the Clyde, a distance of 7 m. Dumbarton was made a royal burgh by Alex. II., in 1222; but on or near its site there had been a still more ancient town, called Alcluid, the cap. of the Strathclyde Britons. The most important object connected with the town is the castle, on a steep, isolated, basaltic rock, at the mouth of the river, once surrounded by water. It has two summits, the highest being 206 ft. above the sea, and is a conspicuous and interesting object from the Frith of Clyde and the opposite coast. The date of the erection of the castle is not known, but it has existed from a very remote period. It is intimately connected with the history of Scotland; and was successively in the possession of Edward I., Bruce, Queen Mary, Charles I., and Cromwell. It is one of the forts which it was stipulated in the treaty of Union should be kept in repair. The Dumbartonshire railway, from Baloch on the S. of Loch Lomond to Bowling on the Clyde, passes the town: it is intended to extend the line to Glasgow. Dumbarton unites with Port Glasgow, Renfrew, Rutherglen, and Kilmarnock, in sending a mem. to the H. of C.; and had 288 regist. voters in 1865.

DUMBLANE, or DUNBLANE, a market town and formerly a bishop's see, Scotland, co. Perth, on the Allan, a tributary of the Forth, 4 m. N. Stirling, and 22 m. SW. Perth on the railway from Perth to Stirling. Pop. 1,709 in 1861. Though once a city, having been the seat of a bishop, it is now only a small village, destitute of importance, and consisting of a single street, with a few lanes. But little business is carried on, except what results from a weekly market and four annual cattle fairs. A few strangers are attracted to it in summer, owing to an excellent mineral well in its vicinity. It is chiefly celebrated for the remains of its cathedral and other episcopal edifices. The former is pretty entire, but no portion of it is converted to use except the choir, which serves for the parish church. The dean's house is now used as the minister's manse or parsonage-house. Robert Leighton, afterwards archbishop of Glasgow, held the see of Dumblane from 1662 to 1670. This celebrated scholar bequeathed his library, consisting of 1,400 volumes, to the cathedral and diocese of Dumblane. It is still extant, and has received great accessions by subsequent bequests. It is open not only to the clergymen of the presbytery, but, on easy terms, to the public. The battle of Sheriffmuir, on the 13th of November, 1715, between the constitutional forces, under the Duke of Argyle, and those of the Pretender, under the Earl of Mar, was fought near this town. Though indecisive, the result of the conflict was eminently favourable to the revolutionary establishment.

DUMDUM, a military village and extensive cantonment in Hindostan, prov. Bengal, 6 m. ENE. Calcutta. It is the head-quarters of the Bengal artillery, and consists chiefly of several long low ranges of buildings of one story, ornamented with verandahs, the lodgings of the troops, and some small but convenient officers' quarters; the whole adjoining a large plain, used as a practice ground. A battalion of European artillery is

usually stationed here: it has a church and a free school.

DUMFRIES, a marit. co. in the S. of Scotland, having S. the Solway Frith, E. Cumberland, N. Roxburgh, Selkirk, Peebles, and Lanark, and W. Ayrshire and Kirkcudbright. Area, 1,129 sq. m., or 722,813 acres, of which only about 1-4th or 1-5th part is supposed to be arable. With the exception of Annandale and Nithsdale, that is of the low grounds traversed by the rivers Annan and Nith, the principal in the co., it is for the most part mountainous; the mountains, however, are not generally rugged or heathy, but are mostly of an easy ascent, and afford good sheep pasture. This, like most other Scotch cos., has been wonderfully improved in recent years, principally through the facilities afforded by steam navigation for the conveyance of fat sheep, cattle, and other farm produce to Liverpool, and the consequent extension of the turnip culture, the introduction of bone manure, and furrow draining. Roads, fences, and farm buildings have been astonishingly improved, and are now, speaking generally, as good as any in the kingdom. Cattle are mostly of the Galloway breed; and Cheviots have been, for some years past, a common breed of sheep among the hills, where at no remote period the principal flocks were black faced. But such has been the progress of improvement, that it is now found not only practicable but more profitable to introduce extensively half-bred sheep, or a cross between the Leicester ram and Cheviot ewe. This has, latterly, been the favourite stock, and its numbers are increasing rapidly. There are other crosses between the same rams and blackfaced ewes, a hardy breed, which thrive well on the coarser grasses, and are in great request in certain districts of England and Wales for their feeding qualities. The formation of the Caledonian railway has been of very great advantage to the store-masters of Annandale. English lime, formerly brought 25 m. and upwards by cart, is now conveyed by railway in trucks, and deposited at stations within trifling distances of the homesteads along the line; a saving and convenience the good effects of which are obvious in the increased use of the mineral, and the improved appearance of a great extent of hill pasture land. Hogs extensively raised (see next article). Property, mostly in very large estates; that of the Duke of Buccleugh, in this co., is one of the finest in Scotland. Farms in the lower districts vary from 100 to 500 acres; in the hill district they vary from 500 to 10,000 acres. There are valuable coal and lead mines in the par. of Sanquhar; and freestone is abundant, particularly in the vicinity of Dumfries. Manufactures unimportant. The co. is divided into forty-three parishes, and sends 1 mem. to the H. of C. Registered electors, 2,097 in 1865. The bors. of Dumfries, Annan, Sanquhar, and Lochmaben (which are the principal towns), unite with Kirkcudbright in sending a mem. to the H. of C. In 1861 Dumfriesshire had a pop. of 75,878, living in 13,192 houses. The old valued rent was 13,219*l.*; the new valuation, for 1864–5, was 375,144*l.*, exclusive of railways.

DUMFRIES, a sea-port and parl. bor. of Scotland, co. Dumfries, of which it is the cap., on the E. bank of the Nith, about 9 m. from its influx into the Solway Frith, 64 m. S. by W. Edinburgh, and 32 m. W. by N. Carlisle, on the Glasgow, Dumfries, and Carlisle railway. Pop. 14,023 in 1861. The town is well and handsomely, though irregularly, built; the High Street, which stretches nearly 1 m. in length, does not run in a straight line, and is greatly obstructed at one point by a steeple, or building, in which the town council holds its meetings, placed in its very centre. The other streets lie either at right angles to the High Street, or parallel to it. The houses are generally built of red freestone, which the neighbouring country produces in unlimited abundance; and such of the buildings as are of old date are generally whitewashed; while many in the modern part of the town are painted in imitation of Portland stone. Altogether, the town is clean, neat, and substantially built, with comparatively few marks of poverty or destitution; and is regarded as the provincial capital of the S. of Scotland. There has been no material increase in the streets or buildings of the town for years past, but there has been a considerable increase in the number of villas in the vicinity. The suburb of Maxwellton is connected with it by two bridges, one built in the 13th century, and consisting originally of thirteen arches, of which only seven are now visible; the other, a very elegant structure, erected in 1795. The public buildings are numerous. There are two parish churches; St. Michael's, rebuilt in 1745, and the New Church, erected in 1727. The former is chiefly remarkable for its extensive and crowded burial-ground, and the vast number and variety of its monuments. It has been estimated that, exclusive of ruinous and dilapidated monuments, the cost of erecting those in preservation could not have been less than 100,000*l.* In this cemetery was erected, by public subscription, in 1815, at an expense of 1,500*l.*, a mausoleum in memory of Burns, who spent the last years of his life in Dumfries, and whose remains are deposited in a vault below. An emblematic piece of marble sculpture, executed by Turnerelli, in the interior of the structure, represents the genius of Scotland finding the poet at the plough, and throwing her mantle over him. The house in which the poet lived and died, with some adjoining properties, was purchased on the 3rd July, 1850, for Lieut.-Colonel Burns, the second son of the bard. Near the churchyard gate are deposited the remains of Andrew Crosbie, esq., advocate, once the ornament of the Scotch bar, who exemplified in real life the character of Counsellor Pleydell, as portrayed by Sir Walter Scott. A third church was erected in 1840; and there are sundry dissenting chapels, some of them favourable specimens of architecture. The steeple in the High Street, already mentioned, is a handsome structure, the work of Inigo Jones. In Queensbury Square, off this street, is a handsome Doric column, erected in 1780, in honour of Charles, duke of Queensberry. The other public buildings are the trades' hall, court-house, county gaol containing a bridewell, infirmary, dispensary, academy, assembly-rooms, theatre, and lunatic asylum. The latter, called 'The Crichton Royal Institution,' was founded in 1838, by Mrs. Crichton. An additional building was erected in 1849, capable of accommodating 200 pauper patients. The total expense exceeds considerably 100,000*l.* The infirmary, which was opened in 1776, is the only institution of the kind in the S. of Scotland. There is a workhouse, founded and endowed by two brothers of the name of Muirhead, in 1753, which accommodates, at an average, thirty old and twenty young paupers, besides dispensing charity to about forty widows, who live out of the building. There are three parochial schools in the parish, and four endowed seminaries under the patronage of the town-council, united under the name of the Dumfries Academy.

The chief manufactures carried on are those of hats and hosiery. Formerly checked cottons were produced here; but this branch has disappeared, and the cotton weavers who remain are employed,

through the medium of agents, by Carlisle or Glasgow manufacturers. The trade of tanning has declined; but the quantity of leather prepared by pit and bark processes is still considerable, and is esteemed for its durable qualities. There are several breweries, and the largest basket-making establishment in Scotland. The manufacture of *clogs*, or strong shoes, with thick wooden soles, the use of which is almost entirely confined to the inhab. of the S. of Scotland, is with one or two slight exceptions peculiar to Dumfries; but it does not employ many hands, the use of the article being on the decline. Shoemaking is here a flourishing branch of industry.

Dumfries has long been celebrated for its weekly cattle-markets, and its four great annual fairs, for the sale of cattle and horses, which, with the markets, are held on the *Sands*, an open space between the town and the river. Most part of the cattle raised in the co. of Dumfries, and a considerable part of the peculiarly fine breed of cattle raised in Galloway (cos. Kirkcudbright and Wigtown), are disposed of in the Dumfries markets. At an average, 25,000 head of cattle are annually sent up from Dumfries and Galloway to England, principally to Norfolk, where they are fattened for the London markets. From 400 to 600 horses are annually sold at each of the two great horse-fairs. Dumfries is also the principal pork-market in Scotland. The pigs come principally from Galloway, but they are produced to a greater or less extent in all parts of the district. The principal foreign trade is with America and the Baltic for timber, of which the annual value imported varies from 8,000*l.* to 10,000*l.*; the remainder is coasting trade. The imports are coal, slate, iron, tallow, hemp, bones, timber, wine, and colonial produce; the exports, wool, freestone, hosiery, shoes, pork, fat cattle and sheep, grain, wood, nursery plants, and grass seeds. There belonged to the port on the 1st January, 1864, 52 sailing vessels under and 65 above 50 tons burden; there were no steamers. The customs' revenue amounted to 8,464*l.* in 1859; to 7,593*l.* in 1861; and to 6,451*l.* in 1863. Vessels of above 60 tons burden can approach the town, the river having been much deepened: there is also a quay about 700 yds. distant; one for vessels of greater burden about a mile and a half farther down; and a fourth near the mouth of the river for foreign vessels, and such as draw too much water to approach nearer to the town. Dumfries is governed by a provost, three bailies, and twenty-five councillors. Corporation revenue, 1,515*l.* in 1863–4. Annual value of real property, 33,043*l.* in 1863–4. Dumfries unites with Annan, Kirkcudbright, Sanquhar, and Lochmaben, in sending a mem. to the H. of C. Registered electors, 677 in 1865.

Dumfries is a place of great antiquity, though it was not made a royal bor. till the 12th century. In less than a century afterwards, Devorgilla, daughter of Alan, last lord of Galloway, and mother of John Baliol, erected a monastery here for Franciscan friars; and, for the sake of this religious house, she built the old bridge, the toll on which formed part of the endowment of the institution. It was here that John Comyn, the heir and representative of Lady Devorgilla, and one of the competitors for the throne, was assassinated, under circumstances of great provocation, in 1305, by his rival, the illustrious Robert Bruce. The castle belonging to the Comyns was situated on a spot in the immediate vicinity of the town, which still bears the name of Castledykes. A strong castle once stood on the site now occupied by the new church. Being in some respects a border town, Dumfries frequently fell into the hands of the English. It was for some time in the possession of Edward I. It was burnt by the English previously to 1440, and again in 1536. In 1570, the castle was taken and sacked, together with the town, by the Earl of Essex and Lord Scrope. Queen Mary and her privy council, in 1563, ratified, at Dumfries, a peace with England. James VI., in passing through the town, in 1617, on his return to England, presented the trades with a small silver gun, to be awarded, from time to time, to the best marksman; but this dangerous pastime has been discontinued. The inhab., in 1706, displayed their opposition to the union of the two kingdoms, by burning the articles and the names of the commissioners at the market-cross. They evinced great loyalty towards the reigning family in 1715, and so fortified their town, that a large body of insurgents, who had determined to attack it, found it expedient to change their resolution. But, in 1745, it suffered severely from the rebel army, which was stationed here a few days on its return from England.

DUNBAR, a royal and parl. bor. and sea-port of Scotland, co. Haddington, on a slight eminence on the German Ocean, 27 m. E. by N. Edinburgh, and 28 m. NW. Berwick, on the Edinburgh and Berwick railway. Pop. 3,796 in 1861. The borough consists of a long and well-built street running E. and W., with inferior streets, towards the sea, and one on the S. introducing the road from Edinburgh. Its public buildings are a new parish church of Gothic architecture, with a tower 107½ ft. high; Dunbar House, the ordinary residence of the family of Lauderdale; the town-hall; and burgh schools. It has a subscription and mechanics' library; an English and Latin school under one master; a mathematical school; and several private seminaries; a sailors' society for the benefit of superannuated seamen and their widows; three dissenting chapels, two belonging to the United Associate Synod, and one to the Wesleyan Methodists. Dunbar is governed by a provost and 12 councillors; corporation revenue 1,226*l.* in 1863–4. The harbour has 9 ft. water at neap, and 14 at spring tides, but owing to rugged rocks the entrance is dangerous. Coal is imported to the extent of about 20,000 tons a year; foreign grain to a considerable extent. Corn of various kinds, including beans and peas, exported to the amount of about 25,000 qrs. White fish of all kinds are caught off the coast. The cod is pickled, and sent to London; the haddocks are smoked, and sent chiefly to Edinburgh and Glasgow; the lobsters are preserved in pits, cut in the rock within sea-mark, and sent to London. The herring fishery is, also, considerably productive. Dunbar was created a royal bor. by David II., but existed as a burgh long before that date. It evidently grew up under the protection of the castle of Dunbar, a fortress which stood on a lofty rock within sea-mark; but the date of its building is unknown. The castle and lands of Dunbar were conferred, in 1072, by Malcolm Caenmore, on the Earl of Northumberland, whose descendants, created earls of Dunbar and March, retained possession of them till their forfeiture in 1434. This fortress rendered Dunbar the theatre of many warlike exploits. It was taken by Edward I. in 1296. Edward II took refuge in it after his defeat at Bannockburn. It was often besieged, and seems alternately to have belonged, for longer or shorter periods, to the English and Scotch. Four times it received within its walls Queen Mary. In 1567 parliament ordered it to be demolished, and scarcely a vestige of it now remains. The 6th earl of Dunbar, in 1218, founded in the neighbourhood a monastery of Red Friars, of which some traces yet remain; and the

7th earl founded a monastery of White Friars, but of it no vestige can now be seen. The title of earl of Dunbar was revived, in 1605, by James VI., in the person of George Home, of Manderston, lord high treasurer of Scotland, at whose death, as he left no heirs male, it became extinct. A splendid marble monument was erected to his memory in the old, and is now preserved in the new church of Dunbar. Dunbar unites with N. Berwick, Haddington, Lauder, and Jedburgh, in sending a mem. to the H. of C., and in 1865 had 148 registered voters.

DUNDALK, a sea-port town and parl. bor. of Ireland, co. Louth, prov. Leinster, 45 m. N. Dublin, at the extreme E. point of Dundalk Bay, near the mouth of Castletown river, on the railway from Dublin to Belfast. Pop. 10,782 in 1841, and 10,428 in 1861. The town consists of two main streets, each 1 m. in length, intersecting each other near the centre, with several transverse thoroughfares. They are paved, lighted, and kept in order by commissioners under the watching and lighting act. A bridge crosses the Castletown river on the N. There is an assembly-room, a literary society, and two news-rooms. A hunting club holds its meetings here, and races take place occasionally in the neighbourhood. Near the seaside is a large cavalry barrack. The parish church is a spacious building: there is also a large R. Cath. chapel, and meeting-houses for Presbyterians, Independents, and Methodists. It has an endowed classical school, to which the sons of freemen are admissible at a low quarterly fee, a school called the Dundalk Institution, under the Incorporated Society; one on the foundation of Erasmus Smith; and some others supported by the contributions of individuals: these educate in all about 600 pupils. It has also a co. infirmary, a mendicity association, a savings' bank, and several minor charitable institutions.

Though incorporated by charter of Richard II., the bor. is governed under a charter of Charles II. The ruling body consists of a bailiff, 16 burgesses, and an unlimited number of freemen chosen by the burgesses. Dundalk returned 2 mem. to the Irish H. of C., and now returns 1 to the imperial H. of C. The parl. bor. comprises 445 acres. Registered electors, 304 in 1862. The assizes and general sessions of the peace for the co. are held here twice a year, and petty sessions every Thursday. A guildhall contains apartments for municipal purposes, an assembly-room, and offices for several branches of public business. The co. court-house, an elegant modern structure, is built on the model of the temple of Theseus at Athens. There are several distilleries, tanneries, salthouses, a malthouse, and a foundry. The trade consists principally in the export of a large portion of the agricultural produce of Louth, Cavan, and Monaghan; comprising wheat and wheat-flour, oats and oatmeal, barley and malt, with cattle, sheep, and pigs. The introduction of steam navigation has occasioned a great increase in the export of eggs and poultry. The harbour, which is safe though shallow, has been much improved. A lighthouse has been erected on the bar at the mouth of the river. The anchorage ground has from 4 to 8 fathoms water. There belonged to the port, on the 1st of January, 1864, five sailing vessels under, and 23 over, 20 tons burthen; besides 4 steamers of a total burthen of 1,703 tons. The customs revenue amounted to 30,575*l.* in 1859; to 51,797*l.* in 1861; and to 39,313*l.* in 1863. Markets on Mondays; fairs on the Monday next but one before Ash-Wednesday, May 17, first Monday in July, last Monday in August, second Monday in October, and second Monday in November.

Dundalk was one of the fortresses erected by the English shortly after their settlement, for the defence of the northern pale; but its defences have since been suffered to fall into decay, and few remains of them are now in existence.

DUNDEE, a flourishing royal and parl. bor. and sea-port of Scotland, co. Forfar or Angus, on an acclivity on the N. bank of the Frith of Tay, on the railway from Perth to Arbroath; 37½ m. N. by E. Edinburgh, 57 m. SW. Aberdeen, and 9 m. W. of the lighthouses on Buttonness Point at the mouth of the Frith. Pop. 90,417 in 1861. The pop. has increased considerably since 1841, when it amounted to 62,794. The town stretches upwards of a mile along the Tay, and inland about half a mile up the acclivity which terminates in Dundee Law, an insulated conical hill, 525 ft. above the level of the river. In the centre of the town is a spacious parallelogram, 360 ft. long by 100 broad, called the High Street, and seven of the principal streets diverge from it, the Nethergate and Overgate to the W., the Murraygate and Seagate to the E., Castle Street and Crichton Street to the S., and Reform Street to the N. There is generally great irregularity in the streets, except in the modern portions of the town; and there are many narrow and mean lanes which contrast strikingly with the new streets. The suburbs along the Tay are marked by many elegant villas. Of public buildings the most imposing is St. Mary's Church with its tower 156 ft. high, a splendid edifice built in the 12th century. The only part of the original building, however, which remains is the tower, the other parts having been rebuilt in the last and present centuries. It is in the form of a cathedral, the tower at the west end, next to it the nave, then the transept, and at the east end the choir. After the Reformation it was divided, by partition walls, into different Presbyterian churches, of which at one time there were four. In 1841, three of these were burned down by an accidental fire. They have been rebuilt conformably to the original style of the structure, but now it has only three places of worship, the transept containing only one instead of two, into which it was previously divided. There being a large open space in front of the building, it has a fine appearance, and is well seen by strangers passing through the town on their way to or from Perth. There are two other churches belonging to the Establishment, and numerous chapels belonging to Dissenters, but none of them are remarkable for their architecture. The town house is a fine building, on the S. side of the High Street, erected about the year 1738. The custom house was erected in 1841 after a design by Mr. James Leslie, the engineer of the harbour, the cost having been defrayed by government. A splendid arch, in commemoration of her majesty's landing at the harbour in 1844, was constructed at a cost of about 3,000*l.* The public school, better known by the name of 'The Public Seminaries,' is a handsome building in the Grecian style. The exchange buildings contain a splendid reading-room and other conveniences for the mercantile and professional classes. The 'Watt Institution,' so called in honour of the illustrious James Watt, is a neat building, containing a lecture-hall, library, &c., for the use of the working classes, for whose benefit it was erected by public subscription.

The chief of the *public works* connected with the town is the harbour. Previously to 1815 it was of very limited extent, and quite unsuited to the trade of the place. In that year an act of parliament was obtained for enlarging it, and placing it under the management of commissioners elected by the various incorporated public

bodies of the town and county. The first plan of enlargement contained only one wet dock, but now there are three, measuring together about 26 acres, and capable of accommodating vessels of the largest size. Besides the wet or floating docks, there is a large graving dock capable of containing three vessels at a time, and a graving slip on Morton's plan, on which sailing-vessels or steam-vessels of almost any size can be hauled up for repair. The harbour cost nearly 1,000,000*l.* sterling. The cost has been defrayed from the dues collected on goods and vessels entering and departing, except about 200,000*l.* of borrowed money. Dundee has ample railway accommodation. W. there is the 'Dundee and Perth,' E. the 'Dundee and Arbroath,' N. the 'Dundee and Newtyle,' S. the 'Edinburgh and Dundee.' There are two gas companies in the town. Until the year 1845 Dundee was ill-supplied with water; but a joint-stock company was established at that time, and they brought a plentiful supply from Monikie parish, distant between 8 and 9 m. A large reservoir is formed there to collect the rain-water of the district, and a covered conduit conducts the water to the town. There is a smaller reservoir within a mile of the town on high ground, from which, by means of pipes, there is a constant pressure of water, so that it rises to the attics of the highest houses, and is very convenient for extinguishing fires, there being fire-cocks in all the streets, and leather hoses or flexible pipes to lead the water to the house in which the fire breaks out. The whole cost of the water-works has been about 130,000*l.*

The staple trade of Dundee is the manufacture of linen, chiefly of the coarser descriptions, such as are used for the clothing of the lower orders, both at home and abroad. Large quantities of sacking, bagging, and sail-canvas are also manufactured both for the home and foreign markets; and some of the manufacturers have of late turned their attention to finer fabrics, such as drills, striped and checked linen, and fine shirting. The linen trade of Dundee is the most extensive in the U. Kingdom. Besides what is manufactured in the town, the greater part of what is made in Forfar, Kirriemuir, and the other inland villages of Forfarshire, is sent here to be dressed, packed, and sent off; so that the quantity exported from Dundee exceeds considerably that from any other port in the kingdom. The declared value of the exports of home produce from the port of Dundee amounted to 137,473*l.* in 1859; to 72,424*l.* in 1860; to 97,081*l.* in 1861; to 65,549*l.* in 1862; and to 95,981*l.* in 1863. The raw materials for the linen manufacture of Dundee are received chiefly from Russia and Prussia. The gross amount of customs duties received was 66,257*l.* in 1859; 59,747*l.* in 1860; 58,808*l.* in 1861; 60,420*l.* in 1862; and 65,049*l.* in 1863.

The linen trade seems to have been introduced into Dundee early last century; but for a lengthened time it was quite inconsiderable. In 1745 only 74 tons of flax were imported. From that period to 1791 the progress of the manufacture was more rapid; in the latter year, 2,444 tons flax, and 299 tons hemp being imported, and about 8,000,000 yards of linen, sail-cloth, &c., exported. Previously to this period all the yarn used in the manufacture was spun upon the common hand-wheel, partly in the town and partly in the adjacent country. But the spinning of yarn by machinery began soon after to be introduced, and the increased facility of production consequent to the erection of flax spinning mills has been such, that the cost of the yarn, including of course the raw material, is now less than the mere expense of spinning amounted to forty years ago. The result has been the total cessation of hand-spinning in all parts of Scotland, and a wonderful increase of the quantity of yarn produced, and of the manufacture. In 1862, from 20,000 to 24,000 persons were engaged in the manufacture. The weaving of the linen, which was formerly done on hand-looms, is in course of being superseded by machines, or 'power-looms.' There are many calendering and packing establishments, all of them of considerable extent. At these works the linens are passed through machines named 'calenders,' for the purpose of making them smooth and close in the texture. They are then cut down into short pieces, folded into such shapes as are suitable for the markets to which they are to be sent, and packed into bales by means of hydraulic presses, which squeeze them into very small bulk, in order that they may require less room in the vessels in which they are shipped to foreign countries.

More than half the linens sent from Dundee are exported to foreign countries, the remainder being sent to London, Glasgow, Manchester, and other large towns for home consumption. The linens which are exported to foreign countries are for the most part sent to Liverpool, London, and Glasgow, to be shipped there, it being found more advantageous to send them abroad as parts of general cargoes of goods, than to send whole cargoes of them direct from Dundee. Some of the manufacturers are the exporters of their own linens; others sell to exporting merchants in Dundee, who employ their capital in that branch of trade. The linens are in general sent on consignment to agents in foreign countries for sale, and are sold by them to retailers on credit of six to twelve months. The foreign countries to which Dundee linens are exported are the United States, Canada, Mexico, the West India Islands, Brazil, Peru, Chili; and some are also sent to Spain, Portugal, and the countries on the Mediterranean. A large amount of capital is required to carry on the linen trade of Dundee, as the raw material is mostly paid for in ready money, and the manufactured article is sold on long credit. For that portion of the latter which is sent abroad it is in general about two years from the time when the manufacture of it is commenced till the time when returns are received. It may, therefore, be estimated that nearly 3,000,000*l.* sterling are constantly employed in the Dundee trade, and in that of the small towns of which it is the sea-port. The gross annual value of real property, including railways, assessed to income tax, amounted to 214,905*l.* in 1857, and to 281,853*l.* in 1862.

The other important branches of trade carried on in Dundee, besides the retail trade common to all large towns, are the shipping trade, ship building, and machine making. The number of ships or vessels belonging to the port on the 1st of Jan., 1864, was as follows:—6 sailing vessels under 50 tons, of a total burden of 195 tons; and 199 vessels above 50, and of a total burden of 42,678 tons. There were, besides, 2 small steamers, of a total burden of 69 tons, and 15 larger steamers, of 4,631 tons burden. Many of these vessels are employed in foreign trade not connected with Dundee; a considerable number is required for the importation of flax from the Baltic, some are engaged in whale fishing, and the rest in the coal and coasting trades. There are seven ship-building yards in Dundee, and there are commonly 10 or 12 vessels on the stocks.

Dundee is well supplied with schools for the children of the middle and lower classes, and a plain education can be got on very moderate terms. At the public seminaries, which are under the management of directors appointed by the town

council and those who contribute to the cost of the building, classical education, to a certain extent, as well as the elementary branches, can be obtained at a very moderate cost. There are teachers of Latin, Greek, French, German, Mathematics, and Natural Philosophy. The number of pupils of all ages and ranks at the public seminaries is generally between 600 and 700.

The principal charitable institutions are the infirmary or hospital, the industrial school, and the orphan house. The infirmary has accommodation for about 150 patients, and is supported entirely by donations and yearly contributions from benevolent individuals. The industrial, or ragged, school is for poor boys and girls who are deserted or not cared for by their parents, and is also supported by voluntary contributions. The number of children in it averages about 120. The orphan house is likewise maintained by contributions and bequests.

The municipal government of the town is vested in a provost, 4 bailies, a dean of guild, treasurer, and 21 councillors. The revenue of the corporation, which is derived from rent of property, and petty customs on provisions, amounted to 3,512*l.* in the financial year 1863–4. Previously to the passing of the Reform Act in 1832, Dundee was joined with Forfar, Perth, Cupar, and St. Andrew's in returning a member to the H. of C. But the act referred to conferred that privilege on Dundee singly. The parl. const. was 2,895 in 1865.

The origin of Dundee is involved in obscurity. In the early centuries of the Christian era it had probably been a village inhabited by a few fishermen, who gained a livelihood by supplying the neighbouring country with fish. In the eleventh century King Malcolm erected a residence here, and lived in it occasionally with Margaret his queen, a daughter of one of the Saxon kings of England. The next remarkable occurrence concerning Dundee was the building of a church in honour of the Virgin Mary, of which the old steeple or tower is now the only remaining original part, by David, earl of Huntingdon. Sir William Wallace was educated at the grammar school of the town, and was often in its neighbourhood with his gallant companions during the struggles which they made for the independence of Scotland. After he was overpowered by the forces of Edward I., Dundee suffered much for its adherence to the cause of Scottish independence. In the civil wars, during the reign of the Stuarts, it was also frequently the object of contention between the two parties; and ultimately it was almost totally destroyed by the army of General Monk, in 1651. After 1745 it gradually recovered, and towards the end of last century it had attained to a considerable degree of prosperity. It was formerly a walled town, but of its walls and gates no traces remain, except the 'Cowgate Port.' Dundee was made a royal burgh in 1210, when it received a charter from William the Lion. The charter was renewed at different times by the sovereigns of Scotland, and the existing charter was given by Charles I. in 1641.

DUNFERMLINE, a royal and parl. bor. and eminent manufacturing town of Scotland, co. Fife, 3 m. N. Frith of Forth, 16 m. NW. Edinburgh, and 6 m. NW. North Queensferry, on the railway from Stirling to Dundee. Pop. 13,506 in 1861. The town is about 300 ft. above the level of the sea, and occupies an agreeable but rather inconvenient situation, being placed on the face of an extensive eminence, difficult of ascent from the S. The town stretches fully a mile in length from E. to W., and its average breadth is about ¾ m. The main street, which is handsome and substantially built, is pretty regular. Almost all the other streets are more or less irregular; and while some are handsome, not a few are of an opposite description. A large suburb having risen up on the W., and being separated from the town by a deep ravine, formed by the Tower-Burn, a bridge was thrown over the rivulet in 1770; and the ravine having been so far filled up, buildings have been erected on both sides. The only remarkable public building is the parish or Abbey church, being part of a monastery founded here by Malcolm III., surnamed Caenmore, and which served as the parish church till 1821, when a new church was erected to the E. of the old building, and in immediate connection with it. When digging in what was called the Psalter churchyard (on which spot the choir formerly stood), for a proper site for the new edifice, the tomb of the most illustrious of the Scotch sovereigns, ROBERT BRUCE, was discovered in 1818. His skeleton, which was pretty entire, and 6 ft. in length, was disinterred, and a cast of his skull taken. It was re-interred amidst much state, by the barons of exchequer, the bones being placed in a new coffin, filled up with bituminous matter, calculated to preserve them. The spot is below the pulpit of the new church. This building, which is of Gothic architecture, harmonises well with the old structure, of which it is a continuation; and is surmounted by a high square tower, round the sides of which, in open hewn work, are the words 'King Robert the Bruce,' in capital letters 4 ft. in height. The Abbey church of Dunfermline is altogether one of the most imposing and magnificent structures of the kind in Scotland. It has 2,051 seats; but is only available, from the obstruction of pillars and otherwise, for about 1,400 hearers. There are numerous other churches in the town and parish, some recently built, and neat in their construction. The largest church of the United Presbyterian Synod is a huge barn-looking building, which raises 'its enormous rectilinear ridge' over all the other buildings in the town. In front of it was placed, in 1849, a statue of Ralph Erskine. The other public buildings are the town-house, county-court buildings, grammar and commercial schools, gaol, poor's-house, and fever hospital. The town-house consists of three stories, and is surmounted by a steeple 100 ft. in height. The 3rd story was formerly used as the town gaol, but being extremely ill-suited for that purpose, a new gaol, erected on the town green, was opened in 1844. The county court buildings were originally named the guildhall, afterwards the Spire Inn, on account of the lofty spire (132 ft.) that distinguishes the edifice.

The means of instruction are ample: there is a grammar-school, established prior to the Reformation, of which Robert Henryson, an ingenious poet of the times of James II. or III., is believed to have been master; a commercial school under the patronage of the guildry; the M'Lean and various other schools. There is a mechanics' institute, and a scientific association for popular lectures on science and literature: the fees of admission to these lectures being low, they have been well attended. There are several subscription libraries and a local museum.

In addition to the Abbey church, which is collegiate, there are several churches of the establishment; besides Free churches; United Presbyterian churches, Episcopalian, Baptist, and Independent chapels. The Secession from the established church in 1732 originated here. Of the Messrs. Erskine, regarded as the fathers of the Secession, one, Mr. Ralph Erskine, was minister of the Abbey church of Dunfermline. The Relief church, also,

originated here in 1752, by the deposition of Mr. Thomas Gillespie of Carnock, in honour of whom an elegant church was erected in 1849. More than three-fourths the inhab. of the par. are Presbyterian dissenters.

Dunfermline is distinguished by its proficiency in the manufacture of fine table linen and coloured table-covers. The business is of considerable antiquity, having been introduced towards the beginning of the 18th century; but the original fabrics were of a coarse description, namely, ticks and checks. Damask and diaper looms were introduced early in the last century, by an ingenious mechanic of the town, of the name of Blake; but for a lengthened period the trade increased very slowly. In 1778 a new epoch commenced in the manufacture, by the introduction of the fly-shuttle; and many improvements have since been effected in the construction and working of the loom, and in other particulars. Among the most important of these was the Jacquard loom, introduced in 1825, and now universally employed.

Previously to the end of last century, all the yarn was spun by the hand-wheel; but at that time machinery was introduced, and has now entirely superseded the former clumsy and expensive system. The manufacturers are supplied with the finer sorts of yarn chiefly from Yorkshire and Ireland, and the other sorts from the neighbourhood, Dundee, and elsewhere. They do not spin exclusively for the local market, but prepare such articles as linen thread, shoe thread, and twist, for the general market.

This branch of manufacture has found its way to a small extent to other parts of Fife, and to the north of Ireland.

Among other manufactories Dunfermline has breweries, candle-works, rope-works, tan-works, iron foundries, and flour-mills.

Dunfermline unites with Stirling, Culross, Inverkeithing, and Queensferry, in returning a mem. to the H. of C. Parl. constit., 502 in 1865. Annual value of real property assessed to income-tax, 25,148*l.* in 1857, and 26,945*l.* in1862. The borough is governed by a provost, 2 bailies, and 22 councillors. There are several endowments in the bor. for the support of decayed widows and other poor persons.

The town is connected by railways with Edinburgh, Dundee, Perth, Alloa, and all the principal towns of Scotland. There are three harbours in the parish, each about 3 m. from the town, viz. Charleston, Brucehaven, and Limekilns. The last does not admit vessels of more than 200 tons burden. Charleston admits vessels of 400 tons. Its basin is capacious, and perfectly sheltered from every wind.

The parish of Dunfermline abounds in coal, lime, and ironstone. The coal has been wrought for upwards of 500 years. The quantity worked is nearly 150,000 tons a year. Brucehaven and Charleston, two of the three harbours referred to, were originally constructed by Lord Elgin, whose collieries and limeworks are on a very extensive scale.

Dunfermline can boast of great antiquity. A tower or fort, built here by Malcolm Caenmore in the 11th century, gave origin to the burgh. The same king also founded a spacious Benedictine monastery, which ultimately became one of the most wealthy and important institutions of the kind in Scotland; and ordained that its precincts should form the burying-place of the Scottish kings. His own remains and those of his consort, Queen Margaret, were interred there, as also those of eight others of the royal line, including Robert Bruce. Dunfermline continued to be a favourite royal residence as long as the Scottish dynasty existed. Charles I. was born here; as also his sister Elizabeth, afterwards queen of Bohemia; and Charles II. paid a visit to this ancient seat of royalty in 1650. The Scottish parliament was often held in it. The date of the erection of the palace is unknown; but it is believed to have been much extended and adorned by James IV. and James V. There now remains only the S. wall, and a vaulted apartment, which was the king's cellar, having the kitchen above. Of the tower, erected by King Malcolm, only a mouldering fragment is seen. Of the monastery, which was once of great extent, nothing remains entire except the S. and W. walls of the fratery, or refectory, in the latter of which is a fine Gothic window; and the nave of the old abbey church, which, as above stated, forms the vestibule to the new church. But ancient as the place is, it was not made a royal burgh till 1588.

DUNGANNON, an inland town and parl. bor. of Ireland, co. Tyrone, prov. Ulster, 12 m. N by W. Armagh, and 7 m. W. Lough Neagh, on the railway from Dundalk to Londonderry. Pop. 3,801 in 1841, and 3,984 in 1861. The town consists of a square, with several good streets branching from it along the sides of a hill. The par. church is a large ancient building, and it has also a Rom. Cath. chapel, and meeting-houses for Presbyterians, Seceders, and Methodists; a classical school, founded in the reign of Charles I., well endowed, and capable of accommodating 100 resident pupils; a dispensary, and a mendicity institution. The corporation, which consisted of a portreeve, burgesses, and commons, is now extinct. The town returned 2 mems. to the Irish H. of C. till the Union, since which it has returned 1 mem. to the imperial H. of C. Previously to the Reform Act the franchise was vested in the portreeve and burgesses. The ancient liberties of the bor. comprised 836 acres, but the parl. bor. has been restricted to 230 acres. Registered electors, 221 in 1865. A manor-court, with jurisdiction to the amount of 20*l.*, is held every three weeks; as also general sessions twice in the year, and petty sessions every fortnight. The court-house, with a bridewell attached, is a handsome modern building: a party of the constabulary is stationed here. The linen manufacture, though much fallen off, is still carried on pretty extensively, and there are several bleach-greens in the neighbourhood; earthenware and pottery are also manufactured, and there are iron-works, a brewery, and a large distillery. Markets on Tuesdays and Thursdays, in a spacious and convenient market-house: fairs on the first Thursday of every month. It is the seat of a ppor law union. Dungannon is famous in Irish history from its being the place where the delegates of the Ulster volunteers met in 1782; and whence they issued their resolutions declaratory of the independence of Ireland.

DUNGARVAN, a marit. town and parl. bor. of Ireland, co. Waterford, prov. Munster, principally on a peninsula in the estuary of the river Conigar, 25 m. W. by S. Waterford. Pop. 8,625 in 1841, and 5,886 in 1861. As vessels of above 150 tons cannot come up to the town, it is not a place of much trade, though some corn and other produce is shipped for England. Recently it has been much improved, principally through the exertions of the Duke of Devonshire, who has built, at his own expense, a handsome bridge, connecting the main body of the town with the suburb of Abbeyside, on the opposite bank of the river. It has a neat appearance, and is a good deal resorted to for sea-bathing; but is not rich in proportion to its population. The public buildings are the par.

church, a new Rom. Cath. chapel, with three others belonging to convents, a school-house for 300 pupils, a court-house and bridewell, a barrack, and a fever hospital and dispensary. It returned 2 mems. to the Irish H. of C. till the Union, since which it has returned 1 mem. to the imperial H. of C. Previously to the Reform Act, the franchise was vested in the occupiers of 5*l.* houses in the town, and the resident 40*s.* freeholders of the manor. But the extent of the existing parl. boundary, as fixed by the Boundary Act, is only 392 stat. acres. Reg. electors, 205 in 1865. A manor court is held every three weeks; also general sessions in Jan., April, and Oct., and petty sessions on Thursdays. Markets on Wednesdays and Saturdays; fairs, Feb. 7, June 22, Aug. 27, and Nov. 8. The deep sea fishery was formerly carried on here pretty extensively, but has latterly much declined.

DUNKELD, a bor. of barony and market town of Scotland, co. Perth, on the N. bank of the Tay, 15 m. N. by W. Perth, and 49 m. N. by W. Edinburgh, on the railway from Perth to Inverness. Pop. 1,096 in 1841, and 929 in 1861. Little Dunkeld is a suburb, though in a different parish, being divided from the bor. by the Tay, which is here crossed by an elegant bridge of seven arches, built in 1809. Except a handsome new street leading from the bridge into the town, the houses are generally old and of mean appearance. But the situation of Dunkeld and the surrounding scenery are most beautiful, and have long been objects of admiration to every stranger. The town is situated in the centre of a valley surrounded by mountains of considerable elevation, presenting a great variety of picturesque forms, and covered to their summits with trees of every species. It is, besides, regarded as the great pass to the Highlands on the E.: the bulk of its inhab. are of Highland origin, and speak the Gaelic language. The banks of the mountain stream Braan, which joins the Tay nearly opposite to Dunkeld, present some of the most striking scenery connected with the place. Dunkeld House, the residence of the ducal family of Atholl, is on the verge of the town, and the style, extent, and natural and artificial beauties of the pleasure grounds are not equalled by any in Scotland. The most imposing object in Dunkeld is its cathedral, situated on the banks of the Tay; an edifice partly Saxon and Gothic, and the remains of which, owing to the care of the family of Atholl, are both extensive and in good preservation. The choir of the building is used as the parish church. Different portions of the cathedral were erected at different times, but the oldest portion, the choir, was built in 1350. Gavin Douglas, who translated Virgil's 'Æneid,' and Henry Guthrie, author of 'Memoirs of Scottish Affairs from 1637 to the Death of Charles I.,' were both bishops of this see. The Culdees had a monastery here so early as 729. When Iona, the original and chief seat of that order, was ravaged by the Danes in the 9th century, the primacy resided for some time in Dunkeld, but was afterwards transferred to St. Andrews. 'But the rank of the abbots of Dunkeld,' says Pinkerton, 'one of whom was the father of a royal race in Scotland, and another, Ethelred, the son of Malcolm III., sufficiently marks the estimation in which that dignity was long held.' (Early Hist. of Scotland, ii. 271, 272.) The monastery, however, was changed by David I. into a cathedral in 1127, at or about which period the system of the Culdees was superseded throughout Scotland by that of the Roman Catholics.

DUNKIRK (Fr. *Dunquerke*, the Church of the Dunes, or Sand Banks), a sea-port town of France, and the most northerly in that kingdom, dép. du Nord, cap. arrond., on the Straits of Dover, 40 m. NW. Lille, and 47 m. E. Dover, on a branch of the railway from Paris to Calais. Pop. 32,215 in 1861. The town is well built, and has broad and well-paved streets. The Champ-de-Mars and the Place Jean Bart are large and fine squares: the latter, which is planted with trees, has a bust of the brave sailor whose name it bears, and who was a native of Dunkirk. The greatest drawback upon the town is its want of good water, it being indebted for this necessary wholly to the rain-water collected in cisterns. Its defences consist of a rampart and ditch, a citadel, and Fort Louis, about 3-4ths of a mile distant: the fortifications were formerly more formidable, but having been demolished, according to the stipulations in the treaty of Utrecht, they have not been completely re-established. Principal public buildings are the church of St. Eloi, with its fine portico, the naval storehouses, barracks, town-hall, and college. The *Tour des Pilotes* serves for a landmark, and was one of the positions whence Cassini, and more recently Biot and Arago, conducted their observations relating to the map of France, and the measurement of the earth: it has a very fine chime of bells. Dunkirk has also a communal college, a public library containing 18,000 vols., a school of hydrography, a theatre, and concert-hall.

The harbour of Dunkirk, though in a great degree artificial, is large and commodious; but a sand bank, which dries at low water, being interposed between the town and the roadstead, it is rather difficult of access, and is apt to fill up; but these inconveniences have been to a considerable extent obviated by works constructed in 1826. Dunkirk has both an inner and an outer roadstead, defended from the violence of the sea by sand-banks parallel to the shore, and having deep water and good holding ground. Being connected, by means of numerous canals, as well as a line of railway, with a very fertile district, Dunkirk is a considerable emporium. The inhabitants have always been distinguished for enterprise. During the late and former wars between England and France, great numbers of privateers were fitted out here. At present several vessels belonging to the port are engaged in the herring-fishery, and in the cod-fishery on the Dogger Bank, and the banks of Newfoundland. Dunkirk was made a free port in 1826, since which its commerce has materially increased, particularly its trade in French wines destined for the supply of Belgium, of which it is a depôt. It has extensive soap-works, with starch-works, rope-works, tanneries, and iron-foundries. It has also considerable Geneva distilleries, breweries, and sugar-refineries. It has a general and a foundling hospital, a military and civil prison; and is the seat of a subprefect and of tribunals of primary jurisdiction and commerce. There is regular communication by steamers between the port and London. Dunkirk is said to have been founded by Baldwin, count of Flanders, in 960; in 1388 it was burnt by the English; and in the 16th and 17th centuries alternately belonged to them and to the Spaniards and French. Charles II. sold it to Louis XIV. for 200,000*l.*, who, aware of its importance, had it strongly fortified at a vast expense. But, as already stated, Louis was compelled, by the treaty of Utrecht, to consent to the demolition of its fortifications, and even to the shutting up of its port. It was unsuccessfully besieged by the Duke of York in 1793.

DUNLOP, a par. of Scotland, celebrated for its manufacture of cheese, partly in the co. of Ayr, and partly in that of Renfrew, 8 m. N. Kilmarnock. The village of Dunlop in the par., had 330

inhab. in 1861. Dunlop cheese has for nearly a century and a half held a high character. Previously to this date, or between 1688 and 1700, cheese here, as well as throughout Scotland, was made of skimmed milk, as is still the case in various districts. A female of the name of Barbara Gilmour, who had fled to Ireland during the persecuting times of Charles II., returned at the Revolution, and, having married a farmer, was the first to introduce the practice of using the unskimmed milk in the making of cheese. This practice, which succeeded admirably, was for a time confined to the par., but it gradually extended to almost every part of the W. and S. of Scotland, all the cheese made in these districts with unskimmed milk being called *Dunlop*. The fact, however, is, that cheese made in the par. of Dunlop is not superior but inferior to that made in other districts. Besides the cheese produced in the par., a great proportion of what is manufactured in other parts of Ayrshire passes through it on its way to the consumer. Being a convenient *entrepôt* between the producing country to the S. and W., and Glasgow, Paisley, &c., a considerable number of persons resident in Dunlop follow the business of cheese dealers, purchasing it from the farmers, and supplying the victuallers in the manufacturing towns and districts.

DUNMANWAY, an inl. town of Ireland, co. Cork, prov. Munster, near the junction of three streams, which form the Bandon, 28 m. W. by S. Cork, on the railway from Cork to Skibbereen. Pop. 2,738 in 1831, and 2,068 in 1861. The town has a par. church, a Rom. Cath. chapel, a market-house, and a bridewell. The linen trade, after being for some years rather flourishing, has declined; but tanning and brewing, and the corn trade, are largely carried on. A manor court is held every third Saturday, and petty sessions on alternate Mondays.

DUNSE, a bor. of barony and market town of Scotland, co. Berwick, in a plain at the S. foot of Dunse Law, an eminence 630 ft. above the level of the sea, 13 m. W. Berwick-upon-Tweed, and 36 m. SE. Edinburgh, on a branch of the Edinburgh and Berwick railway. Pop. 2,556 in 1861. Dunse is neat and regularly built, but devoid of public buildings, except the town-hall and Dunse Castle, in its vicinity, the residence of the feudal superior of the bor., of Gothic architecture, the greater part modern, but added to an ancient tower said to have been built by Randolph earl of Murray, in the time of Robert Bruce. The par. church is a plain building; as are the three dissenting chapels belonging to the Associate Synod and the Relief. The means of education are ample; a par. school, an eminent unendowed academy, six other unendowed schools, besides private seminaries for females, and several Sabbath schools. A subscription library was commenced so far back as 1768. There are two circulating libraries, and a reading-room. The assessment for the poor of the bor. and par. is 710*l*. There are two friendly societies, a savings' bank, and two branch banks. There is a weekly market, three fairs for black cattle and horses annually, and a quarterly fair for sheep.

Dunse was erected into a burgh of barony by James IV. in 1489; it was then situated on the NW. side of Dunse Law; but having been afterwards burnt by the English, it was rebuilt in 1588, and its present site adopted, in order that it might be more immediately under the protection of Dunse Castle. After Berwick-upon-Tweed was ceded to the English (1482), and ceased to be the co. town, Dunse enjoyed that distinction in common with Lauder. It was afterwards (1600) transferred by act of parliament to Greenlaw; but Dunse was not altogether deprived of the privilege till 1696. It is, however, by far the largest and most important town in the co., and more country business is done in it than in both the towns referred to. In 1639, when Charles I. lay on the S. side of the Tweed with the intention of reducing the Scotch Presbyterians to submission, General Leslie took up his station on Dunse Law, with a body of 20,000 Covenanters, to defend the country from invasion. After the two armies had continued in this position for three weeks, a treaty of peace was concluded, and both were dissolved. Dunse has given birth to many distinguished men, among whom may be specified, John Duns Scotus, the Subtle Doctor, descended of the ancient family (not long extinct) of Duns of Duns, or of that ilk; Boston, author of the Fourfold State and other works; and Dr. M'Crie, the historian of Knox.

DUNSTABLE, a town and par. of England, co. Bedford, hund. Manshead; 32 m. NW. London by road, and 36¾ by Great Northern railway. Pop. 4,470 in 1861. The town, situated on the S. acclivity of the Chiltern Hills, near the source of the Lea, has four streets, and is pretty well built. A celebrated priory was founded here by Henry I., in 1131, of which the par. church contains the nave. The Baptists and Methodists have also places of worship. Here is a charity school, founded in 1727, for 40 boys and 15 girls; with 12 almshouses for poor widows, and 6 do. for decayed maiden ladies. Dunstable is the principal seat of the British straw plait manufacture, which employs many females in the town and vicinity. Ladies' straw hats were, and still are, not unfrequently called Dunstables.

DUNWICH, a sea-port bor. and par. of England, co. Suffolk, hund. Blything, on the E. coast of the co.; 90 m. NE. London, and 26 m. NE. Ipswich. Pop. 232 in 1831, and 227 in 1861. Though now a poor fishing station, this was once an important sea-port, having an extensive trade, a large population, 2 abbeys, and several churches. It has been reduced to its present state of insignificance by repeated inroads of the sea; and would probably have been totally abandoned, but for its having had the privilege of returning two mem. to the H. of C. The encroachment of the sea began previously to the Conquest. In the reign of Edward III., an inundation swallowed up more than 460 substantial houses. The last great encroachment was in 1740; but the sea has continued progressively to encroach on the land; and at present there remains only the ruins of one of its many churches. It was disfranchised by the Reform Act; and no longer attracts any attention, except from those who visit the coast to study the great natural revolutions of which it has been the theatre. (Campbell's Survey, i. 277; Lyell's Geology, i. 403, 3d ed.)

DURANGO, a town of Mexico, cap. of the state of the same name, in the Sierra Madre, 6,848 ft. above the level of the sea; 450 m. NW. Mexico, and 150 m. NW. by W. Zacatecas; lat. 24° 25′ N., long. 108° 15′ W. Pop. estimat. at 20,000. The town is regularly built, and contains a cathedral and other churches, several convents, a mint, and a theatre. It is the seat of a bishopric. Its inhabs. are industrious: they manufacture many wooden articles, woollen goods and leather, and have a considerable trade in cattle. Iron mines are worked in the vicinity.

DURAZZO (an. *Epidamnus* and *Dyrrachium*), a sea-port town of Turkey in Europe, Albania, on the E. shore of the Adriatic, and on the S. side of a projecting tongue of land, 7 m. S. Cape Pali;

lat. 41° 17′ 32″ N., long. 19° 26′ 44″ E. Estim. pop. 6,000. This town, which has greatly declined from its ancient importance, is surrounded by walls, and is indifferently fortified. It has some trade in the export of corn. The bay, on the N. side of which it stands, is 5 m. broad from N. to S., with from 7 to 3 fathoms water, the best anchorage being about 1½ m. S. by E. from the town.

According to Plautus, the inhab. of Dyrrachium were immersed in every sort of debauchery and vice; wherefore, says he,—

'—— huic urbi nomen Epidamno inditum est,
Quia nemo ferme huc sine damno divortitur!'
Menæchmi, Act ii. Sc. 1.

According to the statements of a modern traveller, M. Poucqueville, the descendants of these contemporaries of Plautus, if they be less luxurious, exhibit few other symptoms of improvement. He calls their town '*une anarchie, un repaire de pirates, un séjour d'assassins, et le receptacle impur des scélérats qui peuvent s'échapper des côtes de l'Italie!*' (Voyage dans la Grèce, i. 326.)

Dyrrachium was founded by a colony from Corcyra, anno 625 B. C. After it fell into the hands of the Romans, it became a place of great importance, from its being the port which vessels from Brundusium, bound for the opposite coast, endeavoured to make, and from its being the usual place of departure for ships crossing the Adriatic with despatches or passengers from Greece or Italy. It became the seat of some important strategical operations during the struggle between Cæsar and Pompey, which terminated advantageously for the latter. (Cæsar, de Bello Civili, iii. § 41). It was made a Roman colony by Augustus; and, after various vicissitudes, was subjected to the Turks, under whose destructive sway it still continues, by Bajazet II.

DURHAM, a marit. co. in the N. of England, having E. the German Ocean, N. Northumberland, W. Cumberland and Westmoreland, and S. Yorkshire. Area, 973 sq. m., or 622,476 acres, of which about 200,000 are waste above ground, but rich in mines below. In its W. parts it is occupied by offsets from the Pennine range of mountains, and by black heathy moors. Soil in parts good; but generally it rests on a sub-soil of stiff clay, and is cold and infertile. It is a curious fact, however, that the W. parts of the co., though naturally the least productive, are the best cultivated. Principal crops, wheat, oats, barley, beans, and pease. A mixture of rye and wheat, provincially called *maslin*, is also rather extensively cultivated. Turnips are generally introduced, particularly in the W. districts. Lime, of which there is an abundant supply, is principally used as manure, the quantity applied being from 70 to 80 bushels an acre. Drainage is much neglected in the E. parts of the co., which, in consequence, are in a comparatively backward state. The Teeswater breed of short-horned cattle, so called from the river Tees, which bounds the co. on the S., is admitted to be one of the very best, both for feeding and milking, and is now very widely diffused. Sheep mostly Cheviots; stock estimated at between 200,000 and 250,000 head. A great deal of property belongs to the church, and there are besides some large estates; but property is, notwithstanding, a good deal subdivided. Farms of all sizes, but the greater number rather small; and the condition of the occupiers of the small farms is said to be very unfavourable. Durham has some of the most extensive and valuable coal-fields in the kingdom; and also valuable lead and iron mines. Vast quantities of grind-stones are produced from the quarries at Gateshead Fell. Manufactures various, but not very extensive or important. Principal rivers, Tees, Wear, and Derwent. Durham has 4 wards and 75 parishes, and returns 10 mem. to the H. of C., viz. 4 for the co., 2 each for the city of Durham and Sunderland, and 1 each for Gateshead and S. Shields. Registered electors for the co., 12,717, namely 5,722 for the Northern and 6,995 for the Southern division. Pop. 508,666 in 1861, inhabiting 84,807 houses. Gross annual value of real property assessed to income tax—Northern division 619,268*l.* in 1857, and 945,750*l.* in 1862; Southern division 882,730*l.* in 1857, and 1,189,496*l.* in 1862. Principal towns, Durham city, Sunderland, Gateshead, S. Shields, and Darlington.

DURHAM (originally *Dunholme*, from *dun*, a hill, and *holme*, a river), an ancient and celebrated city of England, cap. co. same name, and nearly in its centre, on a bend of the river Wear, 230 m. N. by W. London, and 65 NNW. York, on the York and Newcastle railway. Pop. of city 14,088 in 1861, and of distr. 70,274. The chief objects of interest in the city are the cathedral and castle: their appearance from the surrounding country is striking, being situated on a rocky peninsula, elevated about 80 ft. above the Wear, by which it is nearly encircled. The first of these structures, begun in the reign of William Rufus, but much enlarged and improved in subsequent ages, is a large and majestic pile of Norman architecture: it is 461 ft. in length, by about 200 in extreme breadth, from the N. to the S. transept; it has a central tower, 214 ft. in height; and at the W. end are two low towers, once topped with spires. The inside has much of the clumsy though venerable magnificence of the early Norman style. The pillars are vast cylinders, 23 ft. in circumference, and variously adorned. In the Galilee, or lady's chapel, at the W. end of the cathedral, is the tomb of the venerable Bede, his remains having been transferred thither from Jarrow in 1370; and in the Nine Altars, at the E. end of the cathedral, is the shrine of St. Cuthbert, the patron saint of the sacred edifice. Dr. Johnson says of this noble structure, that 'it strikes with a kind of gigantic dignity, and aspires to no other praise than that of rocky solidity and indeterminate duration.'

The bishop of Durham was, till deprived of it by the act 6 and 7 William IV. cap. 19, *custos rotulorum* and chief civil governor of the co., which has distinct courts and law officers; he presided at the assizes, and all writs were returnable to him, and not to the king. The practice in the palatinate courts is now, however, assimilated in a great measure to that of the superior courts at Westminster; and as actions may be commenced in them for any sum, however large, the change has been productive of great public benefit.

Cromwell founded a university in Durham in 1657, assigning to it the houses and part of the lands belonging to the dean and chapter. This institution, which, had it survived, must have been of great service to the N. counties, fell to pieces on the Restoration, when the church recovered her old possessions. No new attempt, or at least no successful one, was made to establish another university at Durham till 1831. In that year, however, a university, endowed by the dean and chapter, the bishop, and other wealthy individuals, was founded, to afford instruction, and grant degrees in the different faculties. It was incorporated by royal charter in 1837, and consists of a warden, professors, tutors, &c.; but, however creditable to the liberality of the founders, it is far from adequately meeting the existing wants of society, its

grand object being to furnish instruction for candidates for holy orders in connection with the church of England. There are 25 fellowships and 20 scholarships attached to the university. It has two colleges—University and Bishop Hatfield's Hall.

The castle, founded by William the Conqueror, and intended partly to bridle that part of his own dominions, and partly as a defence against the irruptions of the Scotch, stands a little to the N. of the cathedral, and on the same elevated peninsula. It was long used as the bishop's palace, and has some magnificent apartments. It is now (with the exception of a suite of rooms reserved for the accommodation of the bishop, on his visits to the city) appropriated to the purposes of the university, being occupied by students. Adjoining the castle, on an artificial mound of considerable elevation, is the ancient tower, or keep, which had fallen into decay, but has recently been restored, and presents a most imposing appearance. On the palace green is the exchequer, a large square building, in which the bishop's courts of exchequer and chancery were held, and near it is a magnificent library, erected by Bishop Cosins; and a little further distant is the office for the registry of wills. The cloisters adjacent to the cathedral are 147 ft. square, and very neat. The chapter-house, a plain building, opens into them.

The shelving sides of the peninsula, from the cathedral, castle, and other buildings, down to the river, are laid out in hanging gardens, intersected with walks, and planted with trees, that have a most imposing effect.

Besides the cathedral, there are here six parish churches. Those of St. Nicholas and St. Oswald, the latter remarkable for its vaulted roof of wood, are of considerable antiquity. The Primitive and Wesleyan Methodists, Rom. Catholics, Independents, and Quakers have also places of worship.

The grammar school connected with the cathedral has four exhibitions, of 25*l.* each, for the sons of clergymen at the school, and of 50*l.* each at either university: in addition to this, it has five scholarships, of 10*l.* each, at Peterhouse, Cambridge. There is a blue-coat school, an infant school, and an endowed charity school, which together furnish gratuitous instruction to about 1,000 children. It has an infirmary, founded in 1791, dependent on voluntary contributions, a lying-in hospital, and several almshouses. There are here also a public reading-room, a library, and assembly rooms, and two weekly newspapers. Races take place annually in May.

The city is divided into several distinct portions: that which contains the cathedral and castle has some excellent and finely situated houses, principally occupied by the dignitaries of the church. What is called the old town adjoins the castle on the N.: in it are the market-place, the theatre, and principal shops, but it has a great many inferior houses. In the market-place is a fountain for the supply of the city with water, conveyed thither from springs about 1½ m. distant, consisting of an octagon building, surmounted by a statue of Neptune. The township of Elvet lies on the E. side of the cathedral peninsula, being separated from it by the Wear. It is comparatively well built. In this quarter of the town is the magnificent new co. gaol and co. court house, erected in 1809, at an expense of nearly 140,000*l.* On the W. side of the Wear and of the cathedral are the townships of Crossgate and Framwellgate; they are occupied by a very inferior class of houses, and have the appearance of great poverty. The communication between the different parts of the town is kept up by two old and one comparatively modern bridge. The latter, called 'Prebend's Bridge, was erected by, and is maintained at the expense of the dean and chapter. It is placed in a very romantic situation, and connects the public walks called 'the Banks,' already alluded to. The city is well paved and lighted.

Durham, for a lengthened period, made little or no progress. It used to be one of the dullest and most stagnant of cathedral cities. But from the flow thitherward of the tide of pop., through the opening of the collieries, previously mentioned, and the construction of several railways in the district, connecting it with Shields, Sunderland, Hartlepool, and Stockton, none of which are more than 20 m. distant, a powerful impetus has lately been given to its trade. This is visible in the crowded state of the weekly markets, the improvement of the shops, and other signs of the increasing importance and trade of the town. An extensive carpet manufactory and a worsted spinning mill are situated on the banks of the Wear.

The Great N. of England railway connects the city directly with Newcastle-on-Tyne, 14 m. distant; and the Newcastle and Carlisle railway opens an easy communication with the W. coast. The neighbourhood of Durham abounds with situations well adapted for the establishment of various manufactures, having numerous rivulets and inexhaustible stores of stone, lime, coal, and iron. The want of means of outlet have hitherto rendered these resources unavailable; but as the railways now constructed supply facilities of transit, this part of the kingdom may, in the course of a few years, be expected to afford an excellent field for the advantageous employment of capital and industry.

Durham has sent two members to the H. of C. since 1675. Previously to the Reform Act, the right of voting was in the freemen who had acquired their freedom by patrimony or servitude within the city of Durham, the bor. of Framwellgate, 'or the streets and suburbs adjoining thereto.' Hence the limits of the parl. bor. were not definitely fixed, but varied with the varying size of the suburbs: a definite limit was, however, given to it by the Boundary Act. Registered electors, 1,161 in 1865, including 500 freemen. Gross annual value of real property assessed to income tax, 58,977*l.* in 1857, and 85,975*l.* in 1862. Under the Municipal Reform Act, the city is divided into three wards, and is governed by a mayor, 6 aldermen, and 18 councillors.

DURLACH, a town of the grand duchy of Baden, circ. Central Rhine, 2 m. ESE. Carlsruhe, with which it communicates by a road lined throughout with poplars. Pop. 5,617 in 1861. Before Carlsruhe was built this town was the residence of the margraves of Baden-Durlach, an old castle belonging to whom, now in ruins, stands upon a contiguous height; and has attached to it a fine garden, in which several Roman antiquities have been discovered. A palace of a later date has been in part converted into a cavalry barrack. The inhabitants manufacture porcelain, tobacco, and sealing-wax; and have some trade in corn, wine, fruit, and other agricultural produce.

DUSSELDORF, a town of Prussia, prov. Rhine, cap. reg. and circ. same name, at the confluence of the Dussel with the Rhine, on the main line of railway from Cologne to Berlin. Pop. 41,292 in 1861, exclusive of a garrison of 3,376. Dusseldorf has quadrupled its pop. in the course of the present century, at the commencement of which, as the name implies, it was but a village. It is a well-built, handsome, thriving town. It stands so close upon the Rhine, that vessels sail up to its quays, and there take on board the merchandise of

which the town is the depôt. Near the river the streets are narrow, and full of symptoms of industry; but beyond these the town consists of handsome white stone houses, disposed in rows as streets, or as open squares and places with trees in the centre, all which are remarkably clean and quiet. The castle and other fortifications were destroyed by the French in 1794. The town is the seat of the provincial states or parl. of the Rhine prov.; has a court of appeal for the regency, a gymnasium or college, an academy of sciences, an observatory, a fine public library, a theatre, and some remains of the noble collection of paintings transferred to Munich. Recently the *school* of painting at Dusseldorf, under Schadow, has attained to very considerable celebrity. There are considerable manufactures at Dusseldorf; but it derives its principal importance from its position on the Rhine, nearly opposite to where it is joined by the canal leading to Venlo on the Maese, and from its being the *entrepôt* and principal port of the contiguous flourishing manufacturing district, of which Elberfeldt is the capital. Cottons, cloths, &c. are imported from the latter; hardware, iron, and steel, from Solingen and Remscheid; and linen from Ratingen. Large quantities of coal, brought from the mines on the Roer, are shipped here for the Netherlands; and there is also an extensive trade in corn, oil, and wine.

DWARACA, or JUGGUTH, a marit. town of Hindostan, prov. Gujerat, the most W. point of which it occupies, dom. of the Guicowar, on a sandy shore 95 m. NW. Joonaghur; lat. 22° 15′ N., long. 60° 7′ E. It is the most sacred place in this part of India, and is annually frequented by about 15,000 pilgrims from all parts of that extensive country. Its principal pagoda is a magnificent carved stone building of high antiquity, dedicated to Runchon, an incarnation of Krishna, with an entrance towards the sea by a very long and noble flight of stone steps, succeeded by a massive gate, where the whole front breaks upon the view with a striking effect; its great pyramid is 140 ft. high, and much ornamented. There are numerous subordinate temples, having flags with representations of the sun and moon. In front of the large temple is the sacred place of ablution, formed by a creek of the sea, which is lined for some distance by small temples with stone steps down to the margin of the water, on which prayers are made, and idols, rings, and amulets sold by the Brahmins: the town itself is small, but surrounded with walls and towers washed by the tide. The devotees here are usually stamped by means of a hot iron, with the insignia of the god, and this rite is often practised upon young infants. The chalk with which the Brahmins mark their foreheads comes from Dwaraca, whence it is carried by merchants all over India. The revenue of the temples, derived from pilgrims, is estimated at about one lac of rupees, and was formerly swelled by the plunder of many piratical vessels, fitted out in the name of the idol. Dwaraca submitted to the British forces in 1816; but in the following year was transferred to the Guicowar, to whom its sanctity rendered it a highly acceptable acquisition.

DWINA, the name of two Russian rivers, one of which falls into the White Sea by several mouths, 35 m. below Archangel, and the other into the Gulf of Riga in the Baltic, 9 m. below Riga. The first, or *Northern Dwina*, is a large and important river. It is formed by the junction of the Soukhona, which rises in the farthest W. part of the government of Vologda, with the Joug rising in the central S. part of the same government. From the point of confluence, near Ouste-oug-Veliki, the united river flows in a deep and broad stream, NW. to its embouchure below Archangel, a distance of about 350 m. Its principal affluent is the Vitchegda, flowing W. from the confines of Perm. The extent of natural navigation for boats and barges on this river and its affluents is very great, extending W. to the city of Vologda, S. to Nikolesk, and E. to the frontier of Perm. At Vologda an artificial navigation begins, which, by means of the Lubinski canal and the lake Bielo, connects the Soukhona with the Neva; while, on the E., the Severnoi canal connects the Vitchegda with the Kama, one of the principal affluents of the Wolga. Hence, goods imported at Archangel may be sent by water to either Petersburg or Astrakhan, and conversely. The ebb and flow of the sea is perceivable in the Dwina many m. above Archangel. Opposite to the latter it is above 4 m. in width; it is also very deep, though, owing to the sand-banks at its mouth, it does not admit vessels drawing more than from 12 to 14 ft. water. It is frozen over for about half the year. (See ARCHANGEL.)

The second, or *Southern Dwina* or *Duna*, though of inferior dimensions to the preceding, is also a large and important river. It rises in the Valdai hills, not far from the source of the Wolga; and following a SW. course to Vitebsk, it thence pursues a WNW. course to its embouchure below Riga. It is navigable from near its source, or for about 625 m. Near Dunaburg, however, it is a good deal interrupted by cataracts, and in other places it is encumbered with shoals, so that it can only be navigated with safety after the breaking up of the ice in the spring, and after the setting in of the autumnal rains. It has few affluents of any considerable magnitude. At Riga it is about 2,400 ft. broad. Its mouth is encumbered with banks, which render it inaccessible for vessels drawing more than from 12 to 15ft. water. It begins to freeze over about the end of Nov., and the breaking up of the ice, or *débacle*, usually takes place in the beginning of April, when there are inundations that frequently occasion great injury to Riga and the adjacent country.

This river has always been the principal channel by which the masts and other timber exported from Riga were conveyed to it. But owing to the gradual exhaustion of the forests, it is necessary to go much farther S. than formerly, to the provs. of Tchernigoff and Kieff, the timber from which is conveyed by water, against the stream, up a part of the Dniepr, and then carried across the country separating that river from the Dwina, to be embarked on the latter. This, however, is a very expensive and tedious process, requiring about two years for its completion; and hence the mast trade, that formally centered wholly at Riga, is now beginning to be transferred, in part, at least, to Kherson, to which place the trees are, at the proper season, easily and rapidly floated down the Dniepr. (Hagemeister on the Black Sea, p. 122, English trans.)

DYSART, a royal bor. and sea-port of Scotland, co. Fife, on the N. coast of the Frith of Forth, 11½ m. N. by E. Edinburgh, and 1 m. E. Kirkaldy, on the Edinburgh-Perth railway. Pop. 7,057 in 1841, and 8,066 in 1861. Dysart consists chiefly of three narrow streets, with a square in the centre. The central or High Street is full of antique substantial buildings, the fronts of which are generally decorated with inscriptions and dates, and, in one part, with piazzas, the latter being the places in which, in former times, merchants exposed their goods to sale; but the greater part have been built up. In the middle of the town stands the town-house, erected in 1617, but re-

built, after having been accidentally burnt by Cromwell's soldiers. Under its roofs are, the council-chamber, the prison, the public weigh-house, the guard-room, the black hole. Dysart House, the residence of the Earl of Rosslyn, stands on the W. of the town, being separated from it only by a wall. The par. church is a plain building; also the two dissenting chapels, which belong respectively to the Relief and Associate Synod. Dysart is a collegiate charge, or has the services of two parochial clergymen.

There are 14 schools in the par., all unendowed except three. There are four subscription libraries in the par., two reading rooms, several friendly societies, and a savings' bank.

Before the union between England and Scotland, Dysart was a place of such commercial eminence as to have been called 'Little Holland.' But its importance in this respect is now greatly reduced. Nail-making flourished in the bor. and neighbourhood, particularly at Gallaton, for a hundred years previously to the end of last century. But that trade has now entirely disappeared. It was in reference to Gallaton that Adam Smith remarked, in his 'Wealth of Nations,' published in 1776, 'There is at this day a village in Scotland where it is not uncommon, I am told, for a workman to carry nails, instead of money, to the baker's shop or the ale-house.' The manufacture of linen cloth, once extensively carried on here, has also disappeared. Salt was made here from sea-water at so early a period as 1450; and the trade continued to flourish till 1823, when the duty being repealed, it was relinquished. The principal trade at present is the manufacture of checks and ticks, a branch of the Dundee staple trade. This business was introduced into Dysart between 1710 and 1720. The number of looms employed in the manufacture of this fabric is not less than 2,088; and the value of the cloth annually produced is estimated at about 150,000*l*. The number of looms employed by the manufacturers out of the par. is above 1,000.

Dysart coal was among the first wrought in Scotland, operations having been begun upwards of 350 years ago. Upwards of 100,000 tons are dug yearly. Sandstone, limestone, and ironstone, also abound, and are in considerable demand, particularly the two latter. The harbour is one of the safest on the Frith of Forth, except with easterly winds. It has a wet dock. There are only, however, a few brigs and sloops belonging to the port, and no foreign vessel appproaches it, except occasionally from Holland or the Baltic, laden with flax, or when coals are wanted. The bor. is governed by a provost and 9 councillors; corpor. revenue, 1,193*l*. in 1863-4. Annual value of real property, 13,113*l*. in 1863-4. Dysart unites with Kirkaldy, Burntisland, and Kinghorn in returning 1 member to the H. of C., and in 1865 had 187 registered voters.

Dysart is a place of great antiquity. It is mentioned in history so early as 874, when the Danes invaded Fife. But it was not made a royal burgh till the time of James V. The town was taken by Cromwell. There is a place at the harbour called the Fort, said to have been fortified by the Protector, but no remains of any work on it can now be seen. To the W. of the burgh is the castle of Ravenscraig, standing on a steep crag fronting the sea, but now a ruin. It has been the property of the Sinclairs, now earls of Rosslyn, for 500 years. On the S. or lower part of the town, there are the remains of a chapel, said to have deen dedicated to St. Dennis. The ruins of the old church of Dysart are nearly at the same spot. One of the windows bears the date of 1570.

E

EAGLESHAM, a market-town and burgh of barony, Scotland, co. Renfrew, on a tributary of the White Cart, 9 m. S. Glasgow. Pop. 1,769 in 1861. The town, which is modern, though on the site of an ancient village, consists of two rows of well-built houses, all of freestone, with a space between varying from 100 to 250 yards, laid out in fine green fields interspersed with trees, with a beautiful streamlet running down the middle. Length of the town nearly 3 furlongs. The cotton manufacture was introduced here about the year 1825. Besides cotton-spinning, there are about 400 persons in the town engaged in weaving. The noble family of Eglinton are the feudal superiors of the place, and appoint the baron bailie.

EARLSTON (formerly *Ercildoun*), a village in the par. of the same name, Scotland, co. Berwick, 30½ m. SE. Edinburgh, and situated in the middle of a pastoral district, within ¼ m. of the Leader, a tributary of the Tweed. Pop. 980 in 1861. The village is straggling and irregularly built; but is well known in manufactures, 'Earlston ginghams' being familiar to most persons in the S. of Scotland. 'Thomas the Rhymer,' whose proper name was Thomas Learmont, who flourished in the 13th century, and is famous both as a poet and an alleged prophet, belonged to this place. An account of this celebtated person is given in Sir W. Scott's edition of 'Sir Tristram,' a poem ascribed to the Rhymer. The walls of the castle, called 'Rhymer's Tower,' in which he lived, are still standing within ¼ m. of Earlston.

EBORA, or EVORA, a city of Portugal, cap. prov. Alentejo, 85 m. E. Lisbon, 42 m. SW. Elvas, on the railway from Lisbon to Badajoz and Madrid. Pop. 17,121 in 1858. The city is built on an eminence, in the centre of a fertile plain, and is venerable from the appearance of its ancient towers, as well as striking from its elevation. It is surrounded by ramparts, and has two forts in ruins. Streets narrow, crooked, and filthy; but it has some good houses. It is the see of an archbishop, and has a magnificent Gothic cathedral, with an altar in the Italian style, decorated with various marbles. Exclusive of the cathedral, there are four churches, several convents and hospitals, a house of charity, and fine barracks. There is a good collection of books in the bishop's library, and the museum is one of the finest in Portugal. It was formerly the seat of a university, suppressed on the expulsion of the Jesuits.

The city was for a lengthened period the headquarters of the famous Roman general Quintus Sertorius, by whom it was fortified, and adorned with several fine public buildings. An ancient temple, supposed to have been dedicated to Diana, though much dilapidated, has still to boast of some noble columns, evidently raised during the best period of Roman architecture, but this fine ruin has been greatly neglected. There is also a

magnificent aqueduct, said to have been built by Sertorius, in fine preservation, and still applied to its original purpose. The city has manufactures of hardware, tanneries, and a fair for cattle on St. John's day, which is much frequented. Julius Cæsar made it a municipal town, and gave it the name of *Liberalitas Juliæ*. The Moors took it in 715. It has been the residence of many of the Portuguese sovereigns.

EBRO (an. *Iberus*), one of the principal rivers of Spain, through the NE. part of which it flows, uniformly almost in a SE. direction, being the only great Peninsular river that has its embouchure in the Mediterranean. It rises at Fontibre, prov. Santander, on the S. declivity of the Sierra Sejos, about lat. 43° N., and long. 4° W., near the sources of the Pisuerga, an affluent of the Douro. It afterwards separates the provs. Santander, Biscay, and Navarre from Old Castile, intersects Aragon in its centre, and disembogues near the S. extremity of Catalonia, about lat. 40° 40′ N., and long. 0° 55′ E. Its entire length is estimated at somewhat above 400 m.: its principal tributaries are, the Nela, Aragon, Gallego, and Segre, with the Cinca on the N., and the Oca, Tiron, Nagerillo, Xilon, Guadaloupe, &c., on the S. side. Reynosa, Miranda, Logrono, Tudela, Saragossa, Mequinenza, and Tortosa, are the chief cities and towns upon its banks. It runs mostly through a succession of narrow valleys till it reaches Mequinenza; after which it enters Catalonia, and flows through a more level country. At Amposta, 13 m. W. from its mouth, it is about 300 yards wide. It immediately afterwards forms a kind of delta; a navigable canal having been cut from the port of Alfaquez, or San Carlos, at its S. mouth, to Amposta. The Ebro is navigable for boats as high as Tudela, but its current is very rapid, and its bed in many parts encumbered with rocks and shoals. To avoid these obstacles, and the numerous windings of the river, the Aragon canal has been cut along its right bank from near Tudela to Sastago. An ancient Moorish canal, now dry, formerly connected the town of Alcanez, on the Guadaloupe, with the Ebro. The principal commercial utility of the Ebro is the transport of grain from Saragossa to Tortosa, together with the floating down of timber from the Pyrenees. This river, before the second Punic war, formed the boundary of the Roman and Carthaginian territories, and, in the time of Charlemagne, between the Moorish and Christian dominions.

ECBATANA. See HAMADAN.

ECIJA (an. *Astigi*), a city of Spain, prov. Seville, finely situated on the banks of the Xenil, which is here crossed by a fine ancient bridge, 47 m. ENE. Seville, 31 m. SW. Cordova, on the railway from Seville to Cordova. Pop. 28,759 in 1857. The city is surrounded by walls, and has narrow crooked streets. Its churches, of which there are six, are built of brick, fitted up in the old taste, and crowded with pillars, loaded with proportionate ornaments, and covered with gold. The most notable is the church of *Nostra Senora del Rosario*, in the convent of the Dominicans. Exclusive of churches there are twenty convents, four hospitals, a foundling hospital, and a public granary. The Plaza Mayor, a fine spacious square, has a double row of balconies the whole way round. Along the river's side is a handsome *alameda*, or public promenade, planted with elms and other ornamental trees, provided with seats, and decorated with statues. It has manufactures of coarse cloth, serges, camlets, friezes, and linens; and the vicinity produces wheat, wine, and oil. Ecija is a very ancient city, having been called by the Romans *Astigi* and *Augusta Froma*. (Plin. Hist. Nat., iii. s. 1.) It was for a lengthened period a border town between the Moors and Christians, and is famed in many a romance; but it is no longer of any importance as a fortress, and its walls are covered with brambles.

ECKMUHL, an inconsiderable village of Bavaria, circ. Regen, on the great Laber, 13 m. S. by E. Ratisbon. Pop. 110 in 1861. Here, on the 22nd April, 1809, the great French army, under Napoleon, gained a decisive victory over the Austrians, under the Archduke Charles. Marshal Davoust having particularly distinguished himself on this occasion, was raised by Napoleon to the dignity of Prince of Eckmuhl. The battle of the 22nd was preceded by partial actions on the 19th, 20th, and 21st, all of which terminated favourably for the French.

ECLOO, a town of Belgium, prov. E. Flanders, cap. arrond., on the road between Ghent and Bruges, 15 m. E. the former city. Pop. 8,790 in 1856. It is generally well built, and has several squares and well paved streets. It has 2 churches, a town-hall, an ancient convent, 8 schools, and a prison. Its manufactures are chiefly of coatings and other woollen stuffs, cottons, starch, soap, and chocolate; it has also breweries, distilleries, salt refineries, and various mills. Its trade, which is very active, especially at its weekly markets, which are the largest in the prov., is mostly in corn, linens, timber, and cattle.

EDDYSTONE LIGHTHOUSE. This, which is one of the most remarkable structures of its kind, is built on one of the points of a reef or ridge of rocks, from 600 to 700 ft. in length, in the English Channel, about 9 m. S. by W. from the Ramhead, and 14 m. from Plymouth; lat. 50° 10′ 56″ N., long. 4° 15′ 3″ W. The Eddystone rocks are covered at high water; and being much exposed to heavy swells from the Bay of Biscay and the Atlantic, the waves frequently break over them with tremendous fury. In consequence of the many fatal accidents occasioned by ships running against these rocks, a lighthouse was erected on one of them in 1696: after standing many storms, it was overthrown in the dreadful tempest of the 27th Nov., 1703. A second lighthouse, erected in 1708, was burnt down in 1755. The present edifice, built by the celebrated engineer Smeaton, and finished in 1759, is universally admired for its solidity and the skill displayed in its construction, and bids fair to last for ages. The total height of the lighthouse is 100 ft.; the lantern being elevated 72 ft. above the sea at high water. The light is fixed, and is of the first magnitude. This lighthouse has served as a model for that on the Bell Rock, and others of the same kind.

EDEN, a river in the NW. of England, which has its sources on the borders of Westmoreland and Yorkshire, near Pendragon Castle, close to the sources of the Swale, in one of the highest parts of the Pennine or central range of mountains. It pursues a NW. course through the valley between the Pennine and Cumbrian mountains past Carlisle, 7 m. below which it falls into the Solway Frith. It is navigable to Carlisle; but the navigation being tedious and difficult, a canal has been cut from Carlisle to Bowness, lower down the Frith, a distance of 11¼ m., which admits vessels of from 60 to 80 tons burden.

EDER, a town of Hindostan, prov. Gujerat, cap. of a principality of the same name; 17 m. N. by W. Ahmednuggur, and 117 m. SW. Odeypoor; lat. 23° 53′ N., long. 72° 3′ E. Estimated pop. 12,000. It is but a poor town, though built within

the walls of a magnificent fortress constructed by the Mohammedan kings of Gujerat.

EDFOU (the Ἀπόλλωνος πόλις of Strabo, and *Apollonopolis Magna* of the Romans), a town, or more correctly a large assemblage, of mud huts, congregated around and amidst the superb ruins of an ancient temple on the W. bank of the Nile, in Upper Egypt, about 2 m. from the river, and 52 m. S. by E. Thebes. Lat. 24° 58′ 43″ N., long. 32° 54′ E. Pop. from 1,500 to 2,000, consisting principally of Ababdie Arabs, with a few Coptic families, who manufacture blue cotton, cloth and pottery, and boast of inheriting from their ancestors the art of making earthen vessels; and it must be admitted that their kilns and the forms of their vases exactly resemble those of ancient Egyyt, as represented on the monuments. Dr. Richardson says that the inhab. are 'civil and dirty,' and the place would be unworthy notice were it not for its antiquities; but two noble temples, placed opposite to each other, though half buried in the sand, and an ancient quay, still remain to evince the former grandeur of *Apollonopolis Magna*. The great temple, on a small eminence, commands a view of all the surrounding country, and is therefore called, in Arabic, *Qala*, or 'the citadel.' Its *propylon*, or entrance, consists of a doorway, 17 ft. 4 in. wide, between two vast truncated rectangular pyramids or moles. The base of each of these pyramids is 104 ft. by 37 ft.; their height is 114 ft.; and the horizontal section of each at the top 84 ft. by 20. The door is surmounted by the often repeated sculpture of the globe with the serpent and wings, and three rows of immense figures are sculptured on the sides of the pyramids. These gigantic structures are not solid, but have chambers, to which and to the top access is provided by means of staircases. Within the doorway is an open rectangular court, now filled with huts and rubbish, 161 ft. by 140 ft., enclosed by high walls, which also confine the temple itself, and are 414½ ft. on each of the longer sides, and 154½ ft. on the shorter. Notwithstanding these vast dimensions, the walls are elaborately covered with hieroglyphics. On each side of the longer walls in the court there is a row of pillars, so disposed that a space intervenes between them and the walls, which being roofed form two covered ways, leading from the *propylon* to the portico or *pronaos* of the temple. The columns, of which there are 32, present a most magnificent perspective. There is a gradual ascent in the court to the portico, the outside of which is adorned with six columns, having various capitals; and within are several apartments and corridors, supported by columns, and ornamented with sculptures. The *sekos*, or sanctuary, is an oblong apartment, about 33 ft. by 17 ft. The terraced roofs of the temple, from the *pronaos* to the extremity, are covered with mud huts, and the sanctuary and adjoining chambers are now either used as repositories for grain or other products, or are half filled with sand, and with filth and rubbish, shot down by the Arabs through the apertures that formerly lighted the chambers. (Egyptian Antiquities, 'Library of Entertaining Knowledge;' Modern Traveller, vi. 176, &c.)

The plan and arrangement of this temple is simple and symmetrical. Its largest columns are 6 ft. 4 in. in diameter, 21 ft. in circ., and 42 ditto in height; the capitals are 37 ft. in circ. The *palmiform* capital, peculiar to Egyptian architecture, is here seen to great advantage. It represents the trunk of a palm, of which the spreading foliage forms a graceful frieze. Art has here copied Nature with great fidelity; it has preserved the same number of leaves, the exact form of the fruit, and the scales of the trunk, and the capitals gradually augment in size till they balance the leaves. The 32 capitals of the peristyle, and the 6 of the pronaos, exhibit in alternate columns the dactyliform and lotiform figure, which last is as faithfully borrowed from Nature as the palmiform. This is the account given by Jomard in the 'Description of Edfou' (p. 20), and copied by Ritter, who praises the simplicity and pure antique style of the temple But a French authority, M. Champollion, is of a wholly different opinion:—'Ce monument,' says he, 'imposant par sa masse, porte cependant l'empreinte de la décadence de l'art égyptien sous les Ptolémées, au règne desquelles il appartient tout entier. Ce n'est plus la simplicité antique; on y remarque une recherche et une profusion d'ornements bien maladroites, et qui marquent la transition entre la noble gravité des monuments pharaoniques et le papillotage fatigant, et de si mauvais goût, du Temple d'Esneh, construit au temps des empereurs.' (Lettres, p. 191.) This, however, is probably too unfavourable an opinion.

Notwithstanding its truly colossal character this temple is not, as was long supposed, of the Pharaonic æra, but is comparatively modern, being, as now stated, the work of the Ptolemies. This is proved by the date of its decorations, the most ancient of which, according to Champollion, belong to the age of Ptolemy Philopater. It would appear from the same authority, that the meaning of the sculptures, and the object of the temple, had been completely misunderstood by Mr. Hamilton, M. Jomard, &c., who supposed that it was sacred to Osiris, the beneficent deity. M. Champollion affirms that this magnificent edifice was consecrated to a triad consisting of—1st, the god Harhat, the personification of heavenly science and light; 2dly, the goddess Hathor, the Egyptian Venus; and 3rdly, their son Harsont-Tho, the Eros of the Greeks and Romans. (Lettres d'Égypte, p. 192.)

The other and much smaller temple at Edfou is peripteral, and was supposed to be devoted to the worship of the malignant deity, Typhon, whose image was believed to be represented above the capitals of the columns, and elsewhere on the walls. But Champollion has shown that this temple is really one of those *mamisi* that were always erected near the grand temples devoted to the worship of a triad, and that it represents the birth-place of the third person of the triad, or of Harsont-Tho, son of Harhat and Hathor. The *bas-reliefs* on this temple are of the age of Ptolemy Euergetes II. and Soter II. (Lettres, 193.)

Between Edfou and El Cab, one of those transverse valleys which frequently divide the mountain ranges of the E. desert, opens to the E., and is called the valley of Edfou. It extends from the Nile to the Red Sea, near Berenice; and upon it have been traced the tracks of a great commercial road, over which the traffic of the ancient sea-port of Berenice, and the produce of the celebrated emerald mountains were conveyed. It was also, formerly, a much frequented caravan route.

EDINBURGH, or MID-LOTHIAN. See LOTHIAN.

EDINBURGH, a celebrated city, the metropolis of Scotland, co. Mid-Lothian, 2 m. S. from the Frith of Forth, built principally on three parallel ridges, running E. and W., and separated by deep depressions; 357 m. NNW. London by road, and 399 m. by Great Northern railway. The central ridge of the ground on which the city stands, is terminated on the W. by a rock, nearly 400 ft. above the level of the sea, surmounted by the castle, and on the E. by the palace of Holyrood,

108 ft. above the same level. The circumference of the city, exclusive of Leith, its sea-port, lying between it and the Forth, is rather less than 6 m. When comprised within its ancient limits, the pop. of Edinburgh was extremely dense. It is said by Maitland (Hist. of Edin., p. 7), referring to the year 1600, to have been 'so full of inhabitants that probably there is no town elsewhere of its dimensions so populous.' At the Union, in 1707, the pop. was estimated at 35,000; in 1755, before the New Town was commenced, and when the southern districts did not exceed a fifth part of their present extent, the pop. was estimated at 50,000; in 1775, soon after the commencement of the New Town, the pop. was 60,000; in 1791, about 71,000; but these enumerations exclude Leith, the pop. of which in 1756 (ibid. p. 500) was 7,280. The pop. of Edinburgh, city and suburbs, exclusive of Leith, according to the censuses since 1801, has been as follows: viz. 1801, 66,544; 1811, 81,784; 1821, 112,235; 1831, 136,301, and 1841, 138,182. By the census of 1861, Edinburgh had 168,121 inhabitants living in 9,760 houses. In Edinburgh a house often accommodates several families, each story (provincially *flat*) constituting, in such cases, a separate dwelling, to which access is obtained by means of a common stair. Nay, a story is sometimes subdivided into two or more separate residences, each being accessible by its own door opening to the same common stair. In the Old Town common stairs are all but universal. They are general also in the southern districts; but more rare in the New Town, separate or 'self contained houses,' as they are termed, generally prevailing in this fashionable and wealthy quarter of the city. The loftiest houses are in Mound Place, in the Old Town; they extend to 11 stories, including the attics; and as each story is generally divided into two lodgings, each house is supposed to contain, at an average, about 20 families, or 100 individuals. With the exception of the older buildings, which range from five to six stories in different districts, the usual height is three stories, exclusive of the attics and the basement floor, which latter is generally half sunk under the level of the street. This is the case, with very unimportant exceptions, throughout the New Town. The word *land* is used in Edinburgh to signify a house or tenement from top to bottom, whether it be occupied by one family or several. Previously to the houses being numbered, they were distinguished by such names as Todrig's *land*, Moodie's *land*, Gavenlock's *land*, &c. Similar remarks apply to Leith.

The situation of this city is eminently romantic. It stands, as previously stated, on three separate ridges, of which that in the middle, having the castle at its W. extremity, is at once the most striking and the best defined. The castle is peculiarly picturesque. The rock on which it is built is on three sides, N., W., and S., high, steep, and in parts almost perpendicular. On its E. side the ground declines in a sloping ridge to Holyrood Palace; and on it,

'Piled deep and massy, close and high,'

stands the greater part of the Old Town. The neighbourhood is also marked by lofty hills, except towards the N., where the ground gently declines to the Frith of Forth. The Calton Hill, 347 ft. above the sea, on the E. side of the city, now surrounded with fine terraces of houses, affords the remarkable spectacle of a verdant hill, except where covered with monuments, within the precincts of a large town. Arthur's Seat (822 ft. above the level of the sea) and Salisbury Crags (547 ft.), the latter divided from the former by a deep and gloomy ravine, lie on the SE. of the city. Each of these hills rises abruptly from its base, and commands varied and very extensive views. Blackford Hill, the Braid Hills, the Pentland Hills, and Corstorphine Hill, rise at different distances on the S. and W. These eminences form a magnificent amphitheatre, within which, on elevated but lower ground, the Scottish capital is situated.

The ridge on which the Old Town is built was not inaptly compared by Arnot to a turtle, of which, says he, 'the castle is the head, the High Street the ridge of the back, the *wynds* or *closes* the shelving sides, and the palace of Holyrood-house the tail.' (Hist. of Edin., 4th ed. p. 179.) It is separated from the New Town on the N. by a deep valley, which for centuries formed a lake, called (as it is still) the North Loch; but having been drained in 1763, it is now laid out in gardens, and is traversed by the Edinburgh and Glasgow railway. On the S. the Old Town is divided from the southern districts by a similar valley, the site of the Cowgate, now a narrow and mean, though once a fashionable street. From the High Street, on the summit of the ridge, descend, on both sides, in regular rows, numerous narrow lanes, which are mostly steep and difficult of passage, being rarely more than 6 ft. in width, and in general very dirty. Those of the greatest width, or which admit of a cart or carriage, are termed *wynds*, as Blackfriars' Wynd, St. Mary's Wynd, &c., while those which admit foot passengers only are called *closes*. A few have no thoroughfare, being in the form of *culs de sac*.

The High Street, which (including the Castle Hill, Lawn Market, and Canongate) stretches in nearly a straight line from the castle to the palace, a distance, as already stated, of more than 1 m., is a magnificent street; the houses, which vary from five to six or seven stories in height, have been mostly rebuilt; but a few, especially on the Castle Hill, are of great antiquity. One of these lofty buildings fell in 1861 from sheer age. This street, with its shelving lanes and appendages, constitutes the whole of what is properly the 'old town.' It is connected with the southern districts by the Cowgate, and by two bridges which stretch over the valley in which that street is built, viz. the South Bridge, opened in 1788, and George the Fourth's Bridge, opened in 1836. On the other hand, the Old and New Towns are connected by the North Bridge, which spans the North Loch, and forms a continuation of the line of the South Bridge, and by the 'Earthen Mound.' The North Bridge, which consists of three central arches, with several smaller ones at each extremity, was opened in 1768; while the Mound, which was begun in 1784 from the accumulation of the rubbish from the excavations of the New Town, was formed into a thoroughfare about the beginning of the present century, but it has since received great additions. It is supposed to contain 500,500 cubic yards, or about 1,500,000 cartloads of earth. W. of the Cowgate lies the Grass Market, a wide, open street, used as a market-place for the sale of horses, sheep, and corn.

The New Town, which, as well as the more modern parts of the southern districts, is built of light coloured freestone, procured in abundance in the immediate vicinity of the city, stands on an eminence, which slopes to the water of Leith, the small river at the mouth of which Leith is built. The leading streets run in straight lines from E. to W., and are crossed at the distance of about every 250 yards, by streets running in an opposite direction; so that great regularity, elegance, and beauty characterise this quarter of the city. George's Street, which stretches along the top of

the ridge, is terminated on the E. by St. Andrew's Square, and on the W. by Charlotte Square. Great King Street, which lies considerably down the declivity, and nearer the Water of Leith, has, in like manner, the Royal Circus on the W., and Drummond Place on the E. There are, also, James's Square (the oldest in the New Town), and Rutland Square. Another portion, built between 1822 and 1825, has Moray Place in the centre, and Randolph Crescent on the W. This is the most elegant and fashionable part of the city. The *feus*, or building leases, in this quarter fetch from 20*s*. to 40*s*. annually per foot of frontage. The New Town is terminated by the steep banks of the Water of Leith, and is connected with the grounds N. of that stream by the Dean Bridge, an elegant structure, consisting of 4 arches, each 96 ft. span, the height of the road-way above the bed of the river being 106 ft. One of the most celebrated streets in the New Town is Princes Street, forming a species of terrace, and facing the Old Town, of which it commands a fine view, which, especially by moonlight, is probably unequalled. Waterloo Bridge connects this street with the Calton Hill, being thrown over a deep ravine occupied with ancient but shabby buildings, called the Low Calton. The line of road, to which this bridge leads along the E. side of the Calton Hill, forms a grand approach to the city in this direction. The Queen Street Gardens, a piece of ground which extends from E. to W., about ¾ of a mile, by about 200 yards in width, may be regarded as bisecting the New Town. Elegant streets have, at different periods, been built W. of Princes Street and Charlotte Square, of which the most important are Atholl and Coates's Crescents.

The situation of the southern districts is considerably more elevated than that of the New Town; but the buildings are of an inferior order, nor has much regularity been observed in the laying out of the streets. The houses are high, mostly four stories, and common stairs prevail, with partial exceptions, particularly in George's Square: this, which is the handsomest place in this quarter of the town, was built in the last century, and is of large dimensions. It has on the W. the public walk leading to the Meadows; and on the S. it is separated from them by Buccleuch Place. The principal line of buildings is Nicolson Street, which stretches from the South Bridge, already mentioned, to the country on the S., and now forms the main approach to the city in this direction. The former approaches on this side were parallel to Nicolson Street, being an old street, called the Pleasance, on the E., and the Causeway Side on the W. While the Meadows bound the southern districts on the W., a valley or ravine, fronting Salisbury Crags, forms their termination on the E. Not a few of the public buildings, including the university, are in this district.

The original *royalty*, or '*borough roods*,' embraced only the Old Town, excluding even the Canongate, which intervenes between it and the Palace. But the 'extended royalty,' as it is called, obtained from Parliament in 1767, while it excludes the Canongate, embraces the whole of the New Town, with the exception of a few streets which have stretched beyond its limits. The suburbs of Edinburgh may be briefly enumerated: the Canongate, including the Calton, a contiguous hamlet at the base of the hill of that name, the superiority of which is vested in the city of Edinburgh. The town council of the city has a veto on the election of two resident bailies for the Canongate: that body, besides, appoints one of its own members as baron-bailie. Wester and Easter Portsburgh, the former lying W. of the Grass Market, and the latter, now called the Potter Row, SE. These two places, which are of considerable antiquity, and which took their names from *ports* or gateways in the Old Town Wall, are also subject to the city of Edinburgh, being governed in a way similar to the Canongate. Leith was formerly in the same predicament; but it has of late years been rendered entirely free and independent. Broughton, a burgh of regality under the same jurisdiction, and lying on the site of the streets in the New Town, which now bears its name, has been nearly obliterated, and will soon entirely disappear. Its separate jurisdiction was destroyed when the act for extending the royalty was obtained.

Edinburgh was first walled in 1450. But the wall was confined to the town as it then existed; that is, it did not embrace the Canongate, nor did it extend so far S. as the site now occupied by the Cowgate. But after the battle of Flodden, in 1513, a new wall was built, comprising not merely the Cowgate, but the acclivity S. of that street, and running parallel to it throughout its whole length. Some remains of this wall, which enclosed the ground now occupied by the workhouse, the university, infirmary, Old High School, &c., are yet standing. A number of *ports*, or gates, gave access to the city in different directions, the last of which was removed in 1785. The Netherbow port, between the High Street and the Canongate, removed in 1764, was ornamented with a spire.

Public Buildings.—Of these the castle deserves the first notice. The date of its foundation is unknown. It was originally called *Castrum Puellarum*, because the daughters of the Pictish kings were educated and kept in it till their marriage—a necessary precaution in these barbarous times. Queen Margaret, widow of Malcolm Caenmore, died in this fortress in 1093. James VI. of Scotland, and afterwards I. of England, was born here in 1556. The fortress, which corresponds with none of the rules of art, being built according to the irregular form of the precipice on which it stands, is anything but impregnable. It has been successively taken and retaken by contending parties, and was often in the hands of the English. It is, in short, of little or no strength, and is interesting only from its romantic situation on the top of a rugged basaltic rock, perpendicular on all sides except on that next the Old Town, the splendid view which it commands, and the many historical associations connected with it. It was occasionally used as a royal residence. In an apartment called the crown room were deposited the Scottish regalia at the Union in 1707: these relics, which consisted of the crown, sceptre, sword of state, and the lord treasurer's rod of office, were long supposed to have been removed or lost, but they were discovered, in 1818, in a large oaken chest in the crown room, by royal commissioners appointed to conduct the search. They are now open to the gratuitous inspection of the public. Queen Margaret's chapel, in the Norman style of the 11th century, was restored in 1859.

The Palace of Holyrood, which stands at the E. extremity of the city, next claims attention. It is a fine castellated edifice, of a quadrangular form, with an open area in the centre, 94 ft. square. The most ancient parts of the present palace were built by James V. in 1528. It was partially burnt by the English during the minority of Queen Mary, and again by the soldiers of Oliver Cromwell; but after the Restoration it was repaired and altered by Charles II., and underwent again considerable repairs in 1850. The mean and unsightly buildings by which it is hemmed in on the S. and on the side next the city, should be removed. The Pretender took up his residence here in 1745.

George IV., on his visit to Scotland in 1822, though he resided at Dalkeith Palace, held levees and drawing-rooms in this ancient abode of his ancestors. Meetings of privy council were also held here. The Count d'Artois, afterwards Charles X. of France, and other royal and noble French refugees, obtained a refuge here in 1793; and in 1831 the same apartments served a second time as an asylum for nearly the same individuals. It has a peculiar interest, from the circumstance of the apartments occupied by Queen Mary having been carefully preserved in the state in which she left them. Her bed is an object of interest to strangers; and many relics of her Majesty's needlework exist in the rooms The spot where Darnley and his accomplices murdered her favourite, David Rizzio, and other interesting localities, are carefully marked. The closet in which Mary was at supper, with the Countess of Argyle, Rizzio, and others, when this tragical scene was acted, is only 12 ft. square. In what is called the picture gallery, a hall 150 ft. in length, and 27½ in breadth, are hung the portraits (most of them fanciful) of 111 Scottish monarchs, painted towards the end of the 17th century by De Witt, an artist of the Flemish school, by order of James II. of England, when Duke of York. In this hall the election of the sixteen Scottish representative peers took place.

In immediate connection with the palace on the N., are the ruins of the Abbey of Holyrood, founded by David I. in 1128. The king conferred a large endowment and other privileges on the monks (of the order of St. Augustine) whom he established here; among these, the privilege of erecting a burgh between the abbey and the town of Edinburgh. Hence the origin of the Canongate, the superiority of which at the Reformation passed from the hands of the monks to the Earl of Roxburgh, from whom it was purchased in 1636 by the city of Edinburgh, which still retains it. At the Reformation, the buildings connected with this abbey suffered much; and it is now in a state of ruin, the roof having fallen in so long ago as 1773. The area of the royal chapel, which formed the nave of the Abbey church, has long been used as a burial-place by several of the Scotch nobility. In the SE. corner of the chapel is the royal vault, in which are deposited the remains of several of the Scotch sovereigns, and branches of their families. The precincts of the Abbey of Holyrood, including Arthur's Seat and Salisbury Crags, constitute a sanctuary for insolvent debtors.

The buildings of the Royal Institution, an edifice in a pure classical style, situated at the N. termination of the Earthen Mound, and fronting Princes Street, have a range of Doric pillars on each side, and another range surmounted with a pediment in front. The Royal Society of Edinburgh, the Royal Society of Arts, and the Board of Trustees, which last was instituted in 1727, for encouragement of trade and manufactures in Scotland, have also apartments under the roof of this institution. The Board of Trustees, besides the primary object for which it was founded, pays 500*l.* a year to the Royal Academy for the encouragement of the fine arts. The Royal Scottish Academy of Painting, Sculpture, and Architecture has hitherto had annual exhibitions in the Royal Institution. On the Mound, a ridge 800 ft. long, stands the National Gallery, a modern building, in the Grecian style. The Assembly, or Victoria Hall, is a handsome Gothic building, 141 ft. long, with a spire 242 ft. high: it was built in 1842, and is used for the meetings of the General Assembly.

The Calton Hill is the site of several interesting monuments: that of Nelson, though by no means on the edge of a precipice, and consists of a lofty circular hollow tower, having a stair inside, and battlements at the top. Here, also, is the National Monument, in commemoration of the naval and military glories of the late French war. The foundation stone of the latter was laid in 1822, when George IV. was in Scotland. It is meant to be a *facsimile* of the Parthenon in the acropolis of Athens, except that it is of sandstone, whereas its great prototype is of marble. On the same hill are monuments to Dugald Stewart, the celebrated metaphysician, and Professor Playfair; the former singularly chaste and beautiful, being a reproduction, with some variations, of the choragic monument of Lysicrates at Athens. On the S. of the hill, on a detached eminence overlooking the Canongate, is a monument to Robert Burns, belonging to the Corinthian order. The Calton Hill is also the site of the Observatory and of the High School. On the SW. corner of the hill, along the right of the road leading from Princes Street to the country on the E., stand bridewell and the gaol, two heavy and plain but well arranged buildings.

There are various other monuments in different parts of the town: that to the late Lord Melville, in St. Andrew's Square, consists of a column, surmounted by a statue, total height 153 ft., after the model of Trajan's pillar at Rome; but the shaft, instead of being ornamented with sculpture, as is the case with its archetype, is fluted. Bronze statues of George IV. and William Pitt, by Chantrey, are placed on granite pedestals in George Street, at the crossings, respectively, of Hanover Street and Frederick Street; and a bronze statue of the late Earl of Hopetoun, by the same artist, is placed within a vacant space, opposite to the office of the Royal Bank, in St. Andrew's Square. Another bronze statue, by Campbell, of the late Duke of York, has been erected on the Castle Hill, between the High Street and the castle. A statue of the Duke of Wellington, erected in 1852, stands near the register house. The monument to Sir Walter Scott, on the vacant ground south of Princes Street, at the foot of St. David's Street, though not, perhaps, in the best situation that might have been selected, is one of the most striking and magnificent of this class of buildings. It is open Gothic, 200 ft. in height, and, including the statue, cost 15,650*l.* An equestrian statue of the Duke of Wellington is placed in front of the register office. The monument of David Hume, the historian, within the old Calton Hill burying-ground, is a conspicuous and interesting object.

The Register Office, a building erected to preserve the public records of Scotland, was constructed after a plan designed by Mr. Rob. Adam, and though begun in 1774 was not completed till 1822. It is situated at the E. end of Princes Street, and fronts the North Bridge. The building, which is of two stories, exclusive of the basement floor, consists of a square of 200 ft., with a quadrangular court in the centre, covered by a dome of 50 ft. diameter. It has great architectural beauty. Its front is ornamented with Corinthian pilasters, supporting a pediment, within which are the royal arms of Great Britain, with a fine entablature of the same order. It is disposed in nearly 100 small arched apartments entering from long corridors on both stories; and, though heated by flues, is, from the total absence of timber, proof against fire.

Churches and Chapels.—Edinburgh originally consisted of one parish, and John Knox was, for a time, the only minister of the city, that is, of the ancient royalty, independent of the suburbs. The

or the High Church. In 1625, the royalty was divided into four pars.; in 1641, into 6; in 1841, into 9; and subsequently into fifteen parishes. This is exclusive of the Canongate, whose church is collegiate, of the par. of St. Cuthbert, of South Leith, and three others.

The most important ecclesiastical edifice is St. Giles, so called after the tutelary saint of Edinburgh. It stands in the High Street, and forms the N. side of the Parliament Square. It is an ancient Gothic building, the date of its erection being unknown; and is built in the form of a cross. Its length is 206 ft., its greatest breadth 129. It is adorned with a lofty square tower, the top of which is encircled with open figured stonework, whilst from each corner of the tower springs an arch, which, meeting together in the centre, form a magnificent imperial crown. A pointed spire, elevated 161 ft. from the ground, terminates this stately tower. Shortly after the Reformation, St. Giles was divided into separate places of worship. In 1822–23 it was thoroughly repaired, with the exception of the tower, renovated, and greatly improved in appearance by an entire casing of new freestone walls, its ancient character being at the same time carefully preserved. It now contains only three churches. The High Church, or Easter St. Giles, has an ornamented seat for the sovereign, with a canopy supported by four handsome columns. It has, also, the official seats of the magistrates of the city, and of the judges of the court of session.

The next church, in respect of antiquity, was Trinity College church, founded in 1462, by Mary of Gueldres, widow of James II. The building, which was Gothic, and in the cathedral form, appears never to have consisted of more than the choir or E. part, and the transept or cross, the W. part having been begun but not finished. But this interesting relic of a bygone age has been removed to make room for the terminus of the North British railway.

The Tron church, which stands at the point of intersection of the South Bridge and High Street, is of Gothic architecture, blended with Roman ornaments and details. The present spire of this church, 160 ft. in height, replaces a former spire of wood, burnt down in 1824. Among the other and more modern churches are St. Andrew's, erected in the extended royalty, in 1781, with a spire 168 ft. high; St. George's, opened in 1814; St. Mary's, in 1821; St. Stephen's, in 1828: Greyfriars, built 1612, and rebuilt 1846; and Greenside, in 1839. St. George's, on the W. side of Charlotte Square, is a large, heavy, tasteless square fabric. From the centre rises a tower surmounted with a dome 150 ft. in height, in imitation of St. Paul's: the building cost 33,000*l.* The church for the Tolbooth parish is situated on the castle hill, has commodious apartments, inc. Victoria hall, already mentioned, for the use of the General Assembly, and is the most conspicuous object in the city. The town council of Edinburgh are the patrons of the fifteen city pars.

The churches and chapels, nine in number, belonging to the Scotch episcopal church, are generally handsome structures. Of these, the principal are, St. John's, the seat of the dean, at the W. end of Princes Street, in the florid Gothic style, with a square tower, 120 ft. high; St. Paul's, the seat of the bishop of Edinburgh, in York Place, of Gothic architecture; and Trinity chapel, at the N. extremity of Dean Bridge, also in the Gothic style.

The Rom. Cath. have three places of worship, besides a convent of nuns, called St. Margaret's, at the head of Bruntsfield Links, attached to which is an establishment at Milton House, in the Canongate.

The chapels of the various dissenting denominations (including the Free Kirk) are all respectable, and many of them spacious, elegant, and costly. The following is the number of places of worship in the city and suburbs (exclusive of Leith), with the denominations to which they severally belong:—

Established Church	27
United Presbyterian Church	19
Associate Synod of Original Seceders	2
Free Church	31
Independents	3
Episcopalians	9
Roman Catholics	3
Baptists	7
Methodists	4
Glassites, Quakers, Unitarians, Jews, New Jerusalemites, Bereans, 1 each	6
Total number of Churches and Chapels	111

The city parochial clergy are supported chiefly by an assessment (called annuity tax) of 6 per cent. levied on all houses and shops within the ancient and extended royalty, with the exception of the dwelling houses of the members of the College of Justice, that is, of the legal practitioners before the court of session. The annuity being a very unpopular impost, its payment is often evaded, even at the risk of imprisonment or distraining of goods, so that great defalcations are experienced in its collection. The clergy drew, till 1838, certain shore dues at Leith, and other trifling imposts; but, by an act of parliament passed in that year (Edinburgh and Leith Agreement Bill, cap. 55), the sum of 2,000*l.* was secured to them, in lieu of all such claims. Their average income of late years has exceeded 500*l.*

Education.—University.—Edinburgh is not more celebrated for anything than for her literary and educational institutions: of these, the university deserves the first notice. The building of this seminary, the only foundation of the kind established in Scotland since the Reformation, began in 1580, after many unsuccessful efforts had been made by the citizens of Edinburgh to obtain for their city the advantages of such an institution. It received a charter from James VI. in 1582; and in 1583 the college was opened for the reception of students, the number of whom was forty-eight. (Crawfurd's History of the University of Edinburgh, p. 31.) On the first institution of the college there was but one professor or *regent*; a second was soon afterwards added, then a third, and so on, till there were six; a principal, who was also professor of divinity; four regents of philosophy; and a regent of humanity. Each of the regents of philosophy conducted his class for four successive years, including, in his course of study, almost every department of science and literature—the classics, logic, metaphysics, ethics, mathematics, and physics. A division of labour in teaching was gradually introduced, as new professorships were founded; but it was not till 1708 that the old system was entirely superseded. In the year just mentioned, the number of professors, including the principal (from whose duties the office of regent of theology had been withdrawn in 1620), was fifteen; but such has since been the increase, that, in the year 1864, there were thirty-four.

The medical school of Edinburgh, of late years so famous, had its origin so recently as the end of the 17th century, there being no professor of medicine previously to the year 1685. The magistrates, whose predecessors may be regarded as the founders of the university, and who have been at

all times its munificent guardians, are its general patrons, and have power to institute new professorships, and to alter or modify the academical discipline. Out of the 32 appointments, they possess the exclusive right of presentation to the offices of principal and of 14 professors; they unite with other parties in the right of election to 7 other chairs; the crown enjoys the patronage of 8; while the principal and professors are invested with the patronage of 1, viz. music, instituted in 1839. The chair of clinical medicine is taught in rotation by certain of the medical professors, according to an arrangement among themselves. The crown is the patron of those chairs only instituted by itself. No party except the crown (and even that was at one time disputed) has a right to found a professorship without the sanction of the magistrates. The incomes of the professors depend chiefly (some of them entirely) on the fees paid by the students. The crown endowed most of the chairs which it has founded; while such of the others as have salaries attached derive them either from the patrons of the university, their respective founders, or the bequests of private individuals. The chair of music, founded and endowed by General Reid, has attached to it the comparatively large salary of 300*l.*

The above sums include, in the case of the older chairs, allowances for house rent, as the professors and also the students originally lived within the walls of the college; but such is no longer the case. Both parties now live wherever they choose; and no discipline is exercised over a student, except when within the walls of the college. The professorships are divided into the four faculties of philosophy, law, medicine, and divinity. The students wear no particular academical dress. There is no such officer as a chancellor or rector except that the functions of the latter are said to be officially vested in the lord provost of Edinburgh. A standing body, called the college committee, appointed by the town council out of their own number, has charge of the seminary. There is but one session annually, from the first of November till the end of April.

The exhibitions, or *bursaries*, attached to the university are 34, their benefits being extended to 80 students; their aggregate amount is 1,172*l.* a year. Three are of the annual value of 100*l.*, six of 30*l.*, ten of 20*l.*, four between 20*l.* and 15*l.*, one of 15*l.*, five between 15*l.* and 10*l.*, forty-two between 10*l.* and 5*l.*, and three under 5*l.* The fees paid by the students are—for each class in the faculty of divinity, 2*l.* 2*s.*; in that of arts, 3*l.* 3*s.*; in those of law and medicine, 4*l.* 4*s.* There is, also, 1*l.* paid annually on matriculation.

The number of students increased pretty regularly from the institution of the university till 1823, when it was at its maximum. There were in that year 2,344 students on the books. In 1830, the number had declined to 2,023; and in 1850 to 1,564. The average number of students in recent years has been 1,000.

The great diminution of students is generally allowed to be owing, not to any inefficiency that attaches to the university of Edinburgh, but to a combination of circumstances, particularly to the institution of the Free Church College, and of several colleges in England, to an increased emigration to the British colonies, and to the country having become more commercial, and supplying more advantageous channels of employment than those afforded by the learned professions.

The university library consists of about 100,000 vols. It is open on payment of the matriculation fee, referred to above, to all students, who may borrow from it and carry to their lodgings as many books as they please, on depositing a sum equal to their value, which is returned to them when the books are replaced. The library is supported by the matriculation fee, by 5*l.* paid by each professor on his election, and by a portion of the fees of graduates both in medicine and in arts. It was formerly one of the institutions that were entitled to a copy of every book entered in Stationers' Hall; a right commuted for a certain fixed sum paid by government. The library hall is 198 ft. in length by 50 in width, and is certainly one of the largest and finest halls in the kingdom. There are various other subsidiary apartments. The theological faculty has a library, consisting of about 6,000 vols. appropriated to the use of its own students. The college museum, which occupies two large and elegant rooms, besides minor apartments, is particularly rich in objects of natural history.

The present university buildings, which are on a very magnificent scale, were begun in 1789, the expense being defrayed partly by public subscriptions, but chiefly by repeated grants from government. The structure is quadrangular, 358 ft. by 255, enclosing a court. A handsome portico, supported by massive Doric columns, forms the chief entrance. This is to be surmounted by a dome, the only thing that is now wanted to complete the building.

Free Church College.—In addition to the old, Edinburgh has now a new college in connection with the Free Church. The latter, situated at the S. end of the Mound, is a handsome and commodious building. Though complete in itself, the present structure forms only one of three quadrangles, embraced in the original plan. The N. front has a church at the E. end, and in the centre two large towers rise on each side of the portico or entrance. The buildings around the area of the quadrangle consist of the hall of the senatus academicus, the library, museum, divinity hall, and several class rooms. The S. part of the ground, which is unoccupied, extends to the High Street. It was founded in 1843, and though principally intended for the education of students belonging to the Free Church, it is not confined to any denomination; and the classes of moral philosophy, logic, and natural science, as well as those of theology, are open to all who choose to avail themselves of them. Besides the principal and two professors of theology, there are professors of divinity and ecclesiastical history, Hebrew, exegetical theology, moral philosophy, logic, natural science, and a classical tutor. The number of pupils at the college amounts to nearly 500 on the average. The professors have 400*l.* a year of salary, and there are several scholarships. The necessary funds for the maintenance of the college are derived from contributions and collections throughout the church and the fees of students. The library exceeds 10,000 vols., and the museum possesses several valuable specimens in the department of natural history.

The celebrity of Edinburgh as a medical school has depended materially (but formerly more than during the last fifty years) on the schools of a number of private lecturers of eminence in their separate departments, particularly in medicine. They are generally members of the Royal College of Surgeons, and attendance on their courses of lectures is allowed by that body to qualify for examination. This college grants diplomas in surgery, but not in medicine; so that a person may obtain the rank of surgeon in Edinburgh without attending a single class in the university. The lectures delivered under the auspices of the Royal College of Surgeons are recognised by the Uni-

versity of London, and qualify for examination before that body. The Royal College of Surgeons, incorporated by charter in 1778 has recently built a hall in Nicolson Street, which ranks amongst the handsomest buildings in the city.

The Royal College of Physicians was established so early as 1681 by a charter from Charles II. The number of its fellows, resident and non-resident, is 186.

The *High School* is at once the oldest and most celebrated of all the Edinburgh schools; and is surpassed by few classical seminaries in the empire. It was instituted in 1519, but having fallen into decay, was re-erected in 1577. It consists of a rector, and four other Greek and Latin masters, each of whom begins an elementary class yearly, and at the end of four years hands it over to the rector, under whom, generally during two additional years, the *curriculum* of study is completed. The present building, one of the ornaments of the city, is situated on the S. slope of the Calton Hill: it was opened in 1829, is composed of a central body and two wings, and cost 34,000*l*. The number of scholars has been (1820) as high as 968; but, for some years past, the number has been between 400 and 500. This decline is not, however, ascribable to any falling off in the reputation of the school, but to the institution, in 1824, of a more aristocratical establishment of the same kind, called the Edinburgh Academy, conducted by a committee of subscribers. A Naval and Military Academy, instituted in 1825, embraces all the classes necessary for the two professions from which its title is derived, as well as all the branches implied in a liberal education. The other more eminent schools are the Normal Schools in connection with the Church of Scotland and the Free Church, the latter being held in the house that once belonged to the Regent Murray; the Southern Academy, situated in George Square, embracing not merely classical literature, but all the branches requisite in a commercial or general education; the Hill Street Institution in the New Town, of which a similar character may be given; the Circus Place School, a seminary for English literature; the Ladies' Institution for the Southern Districts; the Scottish Institution for the education of young ladies; Dr. Bell's Schools; Lancastrian School; the Sessional School, supported by the Kirk Sessions of Edinburgh; and School of Arts, or Mechanics' Institute. There are, also, ragged and industrial schools. Literary and scientific associations are common in Edinburgh, such as the Royal Society, the Astronomical Institution, the observatory attached to which on the Calton Hill is in the purest classical taste, the Society of Antiquaries, Wernerian Society, Royal Physical, Royal Medical, Cuvierian, Plinian, Speculative, &c. There are also various subscription libraries, some of them of great extent and value.

Charitable institutions are very numerous in Edinburgh. The most important is George Heriot's Hospital, from the name of its founder the goldsmith and jeweller of James VI. This noble structure, which is of a quadrangular form, with a court in the centre, and of Gothic architecture, from a plan of the celebrated Inigo Jones, is devoted to 'the maintenance and education of poor fatherless boys, freemen's sons of the town of Edinburgh.' It was opened for the reception of boys in 1659, when thirty were admitted. It now contains 180; but, by a recent act of parliament, the governors of the hospital are empowered to erect schools from the surpluses of income, throughout the town, for the gratuitous education primarily of freemen's sons; but if circumstances admit, to be open to the children of poor parents generally. There are ten such schools, including three infant schools; aggregate attendance about 3,500. The management of the charity is vested in the eighteen city clergymen, and in the members of the town council. The revenue of the hospital is upwards of 17,000*l*. a year. The other charitable institutions are George Watson's Hospital, founded in 1741, containing eighty boys; John Watson's Hospital, founded in 1825, and containing 120 children, male and female; the Merchant Maiden and the Trades' Maiden Hospitals; the Orphan Hospital; Gillespie's Hospital, for the reception of old decayed men and women, having attached to it a free school, attended by about 160 poor children; Trinity Hospital, founded by the widow of James II. in 1461, for the benefit of 'burgesses, their wives, or children not married, nor under the age of fifty years;' Cauvin's Hospital, for the maintenance and education of the sons of poor teachers, and of poor but honest farmers; the Institution for the Deaf and Dumb; Asylum for the Blind; Magdalene Asylum; Lunatic Asylum; House of Refuge; Royal Infirmary, founded in 1736; Society for the Relief of the Destitute Sick; Lying-in Hospitals; Dispensaries. In addition to these, and other less important charities, some large bequests have recently been made for benevolent purposes. James Donaldson, printer, Edinburgh, who died in 1830, bequeathed 210,000*l*. for the endowment and erection of a hospital for the maintenance of poor boys and girls, of whom a certain number are to be deaf and dumb. The building for this hospital, opened in 1850, is quadrangular, in the Elizabethan style, and is one of the finest of all the structures belonging to Edinburgh. Sir William Fettes, who died in 1836, left the greater part of his large fortune to form an endowment for the maintenance, education, and outfit of young people whose parents have fallen into adverse circumstances. George Chalmers, plumber, who died in 1836, bequeathed 30,000*l*. for the erection and support of a hospital 'for the sick and hurt.' There is, finally, a hospital for the maintenance and education of poor boys, from a fund which amounts to 90,000*l*., bequeathed by Mr. Daniel Stewart.

Courts of Law.—Edinburgh is the seat of the supreme courts of Scotland, or College of Justice, founded by James V. in 1532. Of these, the principal is the Court of Session, or supreme civil court, which possesses in itself all those peculiar powers exercised in England by the Courts of Chancery, Queen's Bench, Common Pleas, Admiralty, and others, being a court both of law and equity. The constitution of the court has undergone various modifications in its different departments during the last 300 years. At present it consists of thirteen judges, called lords, and separated into the first and second divisions: in the former there are six lords, in the latter seven. The two divisions form distinct courts, but they may, and on important questions do, sit in judgment together. From the first division are detached two judges, called Lords Ordinary, and from the second there are taken three. Before one or other of these ordinaries, all cases must be brought in the first instance; but an appeal lies from their judgment to that division before whose ordinary the case was primarily tried. Cases may be appealed from the Court of Session to the House of Lords, the decision of the latter being final. The court has a winter term of four months, and a summer term of two months. Trial by jury in civil cases was introduced into Scotland, under a separate court, in 1816; but in 1830 this tribunal merged in the court of session. In the same

supreme court has been vested the jurisdiction of the Teind or Tithe Court (the peculiar duty of which was to regulate the stipends of the clergy of the established church of Scotland), of the Commissary or Consistorial Court, and the Court of Exchequer. The High Court of Justiciary, or supreme criminal court, was instituted in 1672. It is composed of a president called the Lord Justice Clerk, and of other five judges, who must, at the same time, be lords of session, but the crown may appoint any of the other lords to act should such a step be thought expedient. (See SCOTLAND.)

The edifice which, since the Union, has been the place of meeting of the College of Justice, was the parliament house of Scotland, from 1640, the date of its erection, down to 1707, when the Union extinguished the separate legislature of Scotland. The building is situated in the centre of the Old Town, being separated from the High Street by the cathedral of St. Giles. A small space called the Parliament Square intervenes between it and that church. Nearly half the buildings which formed this square were burnt down in 1824; but both St. Giles and the Parliament House escaped. A new front, though but little in harmony with the surrounding buildings, has been given to the latter, and great changes have been effected in its interior in the course of the present century. There is in the court occupied by the second division an admirable statue by Roubilliac, of Duncan Forbes, of Culloden, president of the court of session; and in the court occupied by the first division is a statue of President Blair; and in the hall, where the lords ordinary sit, is a statue of Henry Dundas, Lord Melville; the last two are by Chantrey, but they are poor and spiritless, compared with the masterly production of Roubilliac.

The faculty of advocates is an association of barristers (but not incorporated), entitled to plead before the supreme or any other courts of record. The society of writers to the signet is an incorporated body, qualified to conduct cases, as agents, before the same courts, and enjoying the exclusive right of preparing such papers or warrants as are to receive the royal seal or signet, whence their designation. The solicitors before the supreme courts form a body of attorneys incorporated in 1797, but of inferior grade and dignity to the writers to the signet. Advocates' first clerks may practise before the supreme courts on undergoing the usual examination, and paying certain fees.

The legal practitioners, all ranks included, may be regarded as the most important class in Edinburgh. Public opinion is, to a considerable extent, affected by their influence: they form a very numerous body; but while they have greatly increased in numbers during the last 40 years, the business of the court of session, before which almost all of them exclusively practise, has undergone a remarkable diminution. It appears from official returns, that while the number of cases annually enrolled in the court of session is at present only about 2-3rds of what it was in 1798, the number of advocates has almost doubled, and that of agents of all kinds has nearly trebled. As, however, the capital and pop. of the country have more than doubled within the time specified, it is probable that conveyancing and such departments of business have greatly increased, though not nearly, to the same extent as the number of lawyers.

In immediate connection with the parliament house are numerous apartments, some of them spacious and highly ornamented, fitted up for the libraries belonging to the faculty of advocates, and the writers to the signet. The library of the former body was established in 1682. This collection, which exceeds 150,000 volumes, is by far the most extensive and valuable in Scotland, and is, in fact, a very noble national library. It receives a copy gratis of all works entered in Stationers' Hall. The library of the writers to the signet is also large and very valuable.

Places of Amusement.—Among these may be specified the theatre, which is tolerably well attended, and the assembly rooms. The former, situated at the N. end of North Bridge Street, is a plain building externally, but is handsomely and conveniently fitted up. The assembly rooms in George Street are large and elegant. Golf is a favourite game; and curling and skating are very favourite amusements in winter, when the *lochs* of Duddingstone and Lochend happen to be frozen over. Cricket is now also beginning to be practised, and various cricket clubs have recently been formed.

Manufactures.—Edinburgh can scarcely be regarded as a manufacturing town. The brewing of ale has for upwards of two centuries been established in Edinburgh, and there are many coach-making establishments. Figured shawls, in imitation of those of Cashmere, were first successfully made in Edinburgh. This took place about 1805, and the honour of it belongs to a Miss Bowie, who, with her father, had been for a number of years engaged in the gold lace manufacture. The invention of the Jacquard loom gave for a time the superiority in shawl-making to our French neighbours. But a knowledge of the invention having reached this country, produced a reaction in favour of the Scotch manufacture; and while this business was being cultivated with greater or less success in France, it established itself in Norwich, and in Paisley and Glasgow. Edinburgh, from the commencement of this manufacture, has taken the lead in most of the improvements connected with it, always producing the best goods of the kind; but from the circumstance of labour of various kinds being lower in Paisley and Glasgow, the manufacture has mostly been transferred to these places.

Literature has long been not only the principal glory of Edinburgh, but has also afforded a principal source of employment to the population. The publication of the Edinburgh Review, which commenced in 1802, made the celebrity of Edinburgh as a literary mart, which was not long after still farther extended by the appearance of the earlier productions of Sir Walter Scott. Since then a vast number of works of the highest eminence, in almost every department of literature, philosophy, and science, have appeared in Edinburgh. There are in Edinburgh about 60 printing offices, employing from 1,000 to 1,200 workmen, exclusive of masters. The business of bookbinding gives employment to about 500 persons, exclusive of masters.

The linen manufacture, both as respects the coarser and finer fabrics, long flourished in Edinburgh. 'The number of looms,' says Arnot, 'employed in Edinburgh in the linen trade is extremely fluctuating'; the largest number that has been known is about 1,500; at present (1779) it is supposed there are upwards of 800. This city has long been famous for making the finest damask table linen, and linen in the Dutch manner, equal to any that comes from Holland.' (Hist., p. 461.) But so thoroughly has the linen trade disappeared, that there are not at this moment 50 looms employed in the city. Dunfermline and Dundee have become the chief seats of the manufacture, the former devoting itself chiefly to damask and

diaper, the latter to Osnaburghs and the coarser fabrics.

Canals and Railways.—The Union Canal, which commences at Port Hopetown, on the W. of Edinburgh, and joins the Forth and Clyde Canal, near Falkirk, forms a continuous line of water communication between the Scottish capital and Glasgow and the W. of Scotland. The course of the Union Canal is 31½ m., its depth 5 ft., its width at the surface 40 ft., and at the bottom 20 ft.

Edinburgh is, also, extremely well supplied with railway accommodation, and it has in this respect the peculiar advantage that, with one exception, the railways have their termini in the very centre of the city, in the hollow contiguous to N. Bridge. They consist of the railway to Glasgow; the N. British railway to Berwick, with a branch to Hawick; the railway to Perth and Dundee: the latter is carried under the New Town by a tunnel, whence it extends to Granton, and begins again at Burntisland on the N. side of the Frith of Forth. The Caledonian railway, which has its terminus at the Lothian Road, in the W. of the city, extends to Carlisle. The express trains from Edinburgh reach London in 11 hours.

For a lengthened period, Edinburgh was very indifferently supplied with water. There are no springs of any importance within the city, the water required for its consumption being conveyed in pipes from a considerable distance. The first of these pipes was laid in 1681; and additions were made to it in 1722, 1787, and 1790. Still, however, the supply, owing to the increase of population, was very defective, and it became necessary to take more efficient measures for increasing its quantity. With this view a joint-stock company was established by act of parliament in 1819, which conveyed into the town the water of the Crawley and Glencorse springs, about 7 m. SW. from the city, and afterwards, in 1849, the Bavelaw and Harlaw springs, 7 m. directly W. of the city. The works constructed to effect this object are on a scale of great magnificence, and the cost amounted to upwards of 300,000*l*. Edinburgh is well lighted with gas; and the pavement of the streets and lanes has long been celebrated for its excellence. The best material for paving is found in the neighbourhood.

The Scotch metropolis had long the unenviable reputation of being one of the dirtiest towns in Europe; and though vast improvements have been effected in this respect, the reproach is not yet completely obviated. The dirtiness of the Old Town seems to have been mainly attributable to the crowded state and height of the buildings, and to the want of water. These circumstances hindered the formation of water-closets, and of common sewers; and down to the commencement of the American war, there was probably not a dozen of the former, and certainly not one of the latter, in the city. Both are now universal in the New Town, but they are still wanting in very many parts of the Old Town; and notwithstanding the regulations laid down and enforced as to the casting of filth on the streets, they can never, under the circumstances, be perfectly clean. In very many, too, of the stories (*flats*) or houses, especially those in the narrow closes or wynds on each side the High Street, there is no supply of water, save what is obtained from the public pumps in the vicinity; and this circumstance, combined with the want of ventilation, and with the poverty and usually crowded state of the inmates, render them the abode of misery and disease, to an extent that would not easily be believed.

None but burgesses were till lately entitled to carry on any trade or manufacture within the royalty. But there does not now exist any such prohibition or exclusion. None, however, but burgesses or their children have a claim on the charity of the Trinity Hospital, and none but the sons of burgesses are entitled to admission to Heriot's Hospital.

Representation.—Before the passing of the Reform Bill, in 1832, the town council of Edinburgh, which consisted of thirty-three members, may be said to have been self-elected. With the exception of six, who were returned by certain incorporated trades, the council for the time being had the exclusive right of nominating their successors, the public having no voice or right to interfere in the matter. The town council thus elected possessed the exclusive right of choosing a representative in parliament for the city. Owing to the unpopularity that necessarily attached to this self-elected and irresponsible body, the passing of the Reform Bill was nowhere more strenuously insisted upon, or received, when framed into a law, with more sincere rejoicing, than in Edinburgh. By this law two representatives were given to the city. In 1864 the registered voters were 9,752. Under the Municipal Reform Act, Edinburgh is divided into five wards, and is governed by a lord provost, four bailies or aldermen, and forty-one councillors. The corporation revenue amounted in 1863–4 to 43,942*l*., exclusive of police revenue. The annual value of real property was 971,889*l*. in the financial year 1864–5.

History.—The origin of Edinburgh is involved in obscurity. So early as the beginning of the seventh century it had obtained the name of Edwinesburgh, derived, it is supposed, from Edwin, a prince of Northumberland, who overran a great part of the S. of Scotland. In the year 1128, it is called by David I. *his burgh of Edinburgh*; whence we infer that it was then a royal burgh. It was not a walled town, as previously stated, till the middle of the fifteenth century. James IV. encouraged the erection of its first printing press, in the beginning of the sixteenth century; but it was not till the succeeding reign that it was recognised as the undoubted capital of Scotland. From this time its history merges in that of the kingdom. It was converted to the Protestant faith at an early period of the Reformation; and the great bulk of its inhabitants, in successive ages, and under various forms of persecution, adopted the Calvinistic creed, and adhered rigidly to the Presbyterian form of worship. John Knox was, for some time, minister of Edinburgh; and the house which he inhabited (at the Netherbow, near the E. extremity of the High Street) is still standing, and is regarded with no ordinary degree of reverence. The union of the kingdoms excited great tumults in Edinburgh with the view of intimidating those members of the Scotch parliament who were favourable to the obnoxious measure. The act, however, was eventually passed (1st May, 1707) without bloodshed. In the rebellion of 1715, an unsuccessful attempt was made by the Jacobites to surprise the castle. In the subsequent rising of 1745, the rebels got possession of the city, a party of the Highlanders having secured the Netherbow Port; and they remained masters of the town from the 15th Sept. to the 31st Oct. But finding it impossible to reduce the castle, they abandoned the city, and proceeded on their march to England.

In 1736, a remarkable occurrence took place in Edinburgh, known by the name of the Porteous mob. On the 14th of April, at the execution of a smuggler of the name of Wilson, a disturbance arose, and the executioner and city guard were assailed by the populace. Porteous, the captain of the guard, having ordered his men to fire on

the crowd, six people were killed and eleven wounded. Having been tried for the offence before the high court of justiciary, Porteous was condemned to death, but was reprieved by the crown. Resolved, however, that he should not thus escape the fate which they thought he merited, the mob, on the evening of the day previously to that on which he was to have been executed, broke into the gaol in which he was confined, and having dragged him out, led him to the usual place of execution, and there hanged him by torch-light on a dyer's pole. It being supposed that the municipal authorities had neglected their duty on this occasion, the city was ordered to pay a fine of 2,000*l.* sterling to the widow of Porteous; and, what is remarkable, though a reward was offered for the discovery of the perpetrators, they never were discovered, and their names continue to be unknown.

Few events worth notice have since occurred in the annals of Edinburgh. On the 2nd of Feb. 1779, during the parliamentary discussions on the subject of the Catholic claims, an infuriated mob burnt one Catholic chapel, plundered another, and threatened to demolish the house of Principal Robertson. Soon after the breaking out of the French Revolution, a number of the inhabitants of Edinburgh, sympathising with the principles which then prevailed in France, formed themselves into societies for obtaining parliamentary reform, and similar political objects. The proceedings of these associations, the members of which styled themselves 'the friends of the people,' were, on the whole, neither wise nor constitutional. After doing much mischief, they at length attracted the notice of government; and the servility of the judges, and the wretched state of jury trial in Scotland at the time, afforded a ready means of inflicting on them the utmost penalty of the law. One of the prosecuted men, named Watt, was beheaded for sedition; and Muir, Skirving, and others were transported. Among the other events connected with Edinburgh which may, perhaps, be worth notice, may be specified the visits of George IV., in 1822, being the first sovereign who had entered the city since the year 1650, and of Queen Victoria and her consort, in 1842.

EGER (Boh. *Cheb*), a town of Bohemia, ranking third in that kingdom, near its W. frontier, circ. Elbogen, on a rock on the Eger, 94 m. W. Prague, on the railway from Pilsen to Hof. Pop. 11,172 in 1857. The place was formerly an important fortress; but its walls are now almost destroyed, and its ditches gradually filling up. It contains some handsome buildings, inclusive of a fine par. church and town-hall. In the centre of the town is a large market-place, at the E. end of which is the *Burgomaster's house*; in a bed-room of which, Wallenstein was assassinated in 1634. In an angle of the fortifications overhanging the river, stand the ruins of the imperial castle, containing an ancient square tower, built of black lava, supposed by some to have been constructed in the time of the Romans, a singular double chapel, and the hall in which the principal friends of Wallenstein were treacherously put to death at the same time with their master. Eger has a gymnasium, 2 convents, a high school, a school for the children of soldiers, 2 hospitals, an orphan asylum, 3 workhouses, a foundation for 12 old men, and manufactures of chintz and cotton fabrics, wool, hats, and soap.

EGHAM, a par. and village of England, in the N. part of the co. of Surrey, hund. Godley, 18 m. W. London by road, and 21 m. by South Western railway. Pop. of par. 4,864 in 1861. The village, situated near the Thames, is connected with Staines on the other side of the river by an iron bridge, erected in 1807. The church, though of mean appearance, is ancient, and contains some curious monuments. There are two almshouses, one for 5 poor women, and one for 6 poor men and as many women. N. from Egham, between the village and the Thames, is Runnymede, famous in English history from its being the scene of the conferences between King John and the Barons, that led to the signing of *Magna Charta* by the king, in 1215. In this parish is Cooper's Hill, which commands a fine prospect, and is the subject of the well-known descriptive poem of the same name, by Sir John Denham.

EGINA, or ENGIA (an. *Ægina*), an island of Greece, in the centre of the gulf to which it gives name (*Saronicus Sinus*), 16 m. S. by W. Athens, 34 m. E. by S. Corinth, and 6 m. from the nearest point of the promontory of Methana. It is about 8 m. from E. to W. and 8 from N. to S.: surface diversified with hills and valleys; in the N. part of the island there are rocks of lava. Soil rocky and of a light colour. The low and cultivated grounds are however fertile, and produce good crops of corn, with wine, cotton, olives, figs, almonds, and other fruits. The hilly and uncultivated portions are deficient in water, and are covered with pines, small cypresses, and junipers. The red-legged partridge is very abundant. The pop. was estimated to amount to about 6,000 in 1861; during the revolution it was much greater, Egina having been then resorted to by crowds of emigrants from the adjoining continent and islands, but since the peace these have mostly returned home. The inhab., who are industrious, carry on a considerable trade. The port, and principal town, called Egina, or Engia, is on the W. side of the island, near the extensive ruins of the ancient city of the same name. There are from 15 to 18 fathoms water in the roadstead, on a tough clay-ground. There is another and smaller town in the N. part of the island.

Though unimportant in modern times, in antiquity Egina was early celebrated for its wealth and population. Its position is very favourable for commercial pursuits; and it was indebted for its greatness to the zeal and success with which it carried them on. At one period its naval power was superior even to that of Athens; and it sent 30 ships to the battle of Salamis, to whom the prize of valour was accorded by the suffrages of the Greeks. But the proximity of Egina to the Piræus awakened the jealousy, and provoked the vindictive hostility of the Athenians, who, having defeated the Eginetans and taken their city, treated them with the utmost severity—'*Duris etiam Athenienses, qui sciverunt ut Æginetis, qui classe valebant, pollices præciderentur: hoc visum est utile; nimio enim imminebat, propter propinquitatem, Egina Piræus.*' (Cic. de Offic., lib. iii. § 11.) After various vicissitudes, Egina was restored to a nominal independence by Augustus; since which period it has usually followed the fortunes of the adjacent country of Greece.

The temple of Jupiter Panhellenius in the NE. part of the island, is among the most interesting of the Grecian ruins. The hill on which it stands, though of no great height, commands the greater part of the island, the whole coast of Attica, with the city of Athens, part of Peloponnesus, and several of the islands in the gulf. It is built on a platform, supported on all sides by terrace walls. The temple, said to have been erected by Æacus, grandson of Jupiter, is certainly one of the most ancient in Greece. It is of the Doric order, being 90 ft. in length, measured at the base of the

columns, by 45 in breadth. Originally it had 36 columns, exclusive of those in the *cella*, of which 25 were standing when it was examined by Mr. Dodwell. The greater number of the statues that occupied the tympanum of the pediment, were dug up in 1811; and having been carried off, were purchased by king Ludwig I. of Bavaria for 10,000 sequins, and are now in the Museum at Munich. They are in the peculiar style of sculpture called Eginetan, and are amongst the most interesting relics that have ever been conveyed from Greece. (Chandler's Greece, caps. 3 and 4; Dodwell's Greece, i. 558–574.)

EGYPT (the Mizraim of the Hebrews, and Αἴγυπτος of the Greeks), a country on both banks of the Nile, occupying the NE. angle of the African continent; one of the earliest seats of art, science, and literature, and famous alike for the historical events of which it has been the theatre, its magnificent monuments, and physical character.

Boundaries and Extent.—There have been very discordant statements as to the boundaries of this famous country. There cannot of course be any doubt as to its N. limit, which is formed by the Mediterranean; and it seems to have been generally agreed from a very remote period, that its S. limit should be fixed at Syene, or rather at Philæ, in lat. 24° 3′ 45″ N. But the difficult point is to determine its breadth. From Philæ to near Cairo, the Nile in most parts flows through a narrow valley, bounded on either side by a ridge of hills, or inferior mountains; at Cairo these ridges diverge, that on the E. to Suez, and that on the W. in a NW. direction to the Mediterranean. Some authors identify Egypt with the tract lying between the mountain chains now referred to; while others, regarding the Nile as the source of life and vegetation in Egypt, restrict its territory within the limits covered by the inundation of the river. (Strabo, lib. xvii. p. 544.) But from the age of the Ptolemies down to the present day, the desert country lying between the valley of the Nile and the Red Sea has been uniformly included in Egypt. On the W. side the mountain ridge already noticed seems to be its only natural boundary. Still, however, it has been usual to reckon the oases that lie within 100, or even 200 m. of this limit, as belonging to Egypt.

From Cape Bourlos, on the coast, lat. 31° 36′ N., to Philæ, the distance N. and S. is 7° 32′ 15″, about 452 geographical, or 520 English m. But the distance by water and the extent of the alluvial territory are considerably greater than would appear from this, because of the many and considerable bends of the river. The breadth of the Egyptian coast is 160 m.; but in ascending to Cairo (104 m. from Cape Bourlos), the cultivated tract tapers off to a point, and the rest of the country is chiefly comprised in the narrow valley of the Nile; which, however, at Beni-souf, 83 (by water) m. higher, spreads to the W. to form the vale of Faïoum, a circular valley of great fertility and beauty, measuring about 40 m. from E. to W. and 30 m. from N. to S. Thence to Syene, the valley of the Nile is mostly confined within very narrow limits. The whole cultivable territory of Egypt, including its lateral valleys, has been estimated at about 16,000 sq. m., or about half the area of Ireland. (Malte-Brun, iv. 21, 23; Modern Trav., art. 'Egypt,' l. 6; Heeren's Researches, ii. 210, Engl. trans.)

The Nile, so important among the great rivers of the world, is also the most striking object in the *general aspect* of a country which not only is wholly comprised within the sphere of its influence, but is entirely indebted to it for existence. As already stated, the Nile enters Egypt at the island of Philæ; and from it to Assouan (*Syene*), a distance of about 6 m., it has cut a passage for itself, through a ridge of granite rocks with which its stream is much encumbered. At Assouan is the last of the cataracts of the Nile, so celebrated by ancient authors. (Senec. Nat. Quest., lib. iv. § 2; Plin. Hist. Nat., lib. v. § 9; Lucan, lib. x. line 320, &c.) Their statements with respect to it seem to be not a little exaggerated, though there can be no doubt that the cataract must have been much more magnificent 2,000 years ago than at present, as the attrition of the water for so long a period could not fail materially to deepen and smooth its bed: at all events, however, it is now rather a rapid than a cataract. According to Sir F. Henniker, it is not really more formidable than the fall in the Thames at low water at Old London Bridge, previously to its demolition. (p. 147.) But it is clear that its height and rapidity must depend materially on the state of the river. When the inundation is at its height the fall is hardly perceptible, but at low water it varies from 8 to 10 ft. After leaving Assouan, the river runs on in a placid quiet stream, till, a little below Cairo, at Batn-el-Bakara, it divides into two great arms, the most E. of which falls into the sea at Damietta, and the most W. at Rosetta; but it has other, though very subordinate, outlets. For the immense distance of 1,200 m.,—that is, from lat. 17° 45′, and about 34° 5′ of E. long., where it is joined by the Atbara, or Tacazze,—the Nile rolls on to its mouths in the Mediterranean in solitary grandeur, without receiving a single affluent: an unexampled instance in the hydrographic history of the globe. The periodical inundations, which water the country and cover it with mud, have given occasion, in all ages, for much discussion, and modern discovery has confirmed the conjectures of the ancients (Herodotus, Euterpe, §§ 20–28; Strabo, xvii. 543), that these overflowings result from rains falling near the mountains amongst which the Nile has its source, or early course. Bruce has explained this phenomenon as follows: —'The air is so much rarified by the sun during the time he remains almost stationary over the tropic of Capricorn, that the winds, loaded with vapours, rush in upon the land (to restore the equilibrium) from the Atlantic Ocean on the W., the Indian Ocean on the E., and the cold S. Ocean beyond the Cape. Thus a great quantity of vapour is gathered, as it were, into a focus; and as the same causes continue to operate during the progress of the sun N., a vast train of clouds proceed from S. to N. In April all the rivers in the S. of Abyssinia begin to swell; in the beginning of June they are all full, and continue so while the sun remains stationary in the tropic of Cancer.' When the sun approaches the tropic of Cancer, the Etesian winds along the coast of Egypt begin to blow from the N., and convey vast quantities of aqueous vapours to the mountains, which are there precipitated in torrents along with the vapours derived from the oceans already specified. The Etesian winds also contribute to increase the inundation, by determining the waters of the Mediterranean to the coast of Egypt, and obstructing the exit of those of the river. On the sun again turning to the S. the rains begin to abate, and on his passing the equator they cease in the N. and commence in the S. hemisphere. The torrents, detaching in their rapid course the soil from the upper country, bring down supplies of alluvium, so that the valley of the Nile is constantly gaining in elevation. Nor is the delta of Egypt exempted from this peculiarity; though, from there being a wider space for the deposits to spread over, the in-

crease of soil is not nearly so great; indeed, the accumulation decreases, even in Upper Egypt, in proportion as the river approaches the sea. 'According to an approximate calculation,' says Wilkinson (Journal Geog. Soc., ix. 432), 'the land about Elephantiné, or the first cataract, in lat. 24° 5′, has been raised 9 ft. in 1,700 years; at Thebes, in lat. 25° 43′, about 7 ft.; and at Heliopolis and Cairo, in lat. 30°, about 5 ft. 10 in. At Rosetta and the mouths of the Nile, in lat. 31° 30′, the diminution in the perpendicular thickness of the deposit has lessened in a much greater decreasing ratio than in the straightened valley of Central and Upper Egypt, owing to the great extent E. and W. over which the inundation spreads.'

Were it not that the bed of the river rises in the same proportion as its banks, the country would cease to be inundated,—an apprehension which till lately was strongly entertained. It is impossible to find anywhere among terrestrial objects a more striking instance of the stability of the laws of Nature than the periodical rise and fall of this mighty river. We know by the testimony of antiquity that the inundations of the Nile have been the same, with respect to their season and duration, for 3,000 years. They are so regular that the value and annual certainty of this gift regulates the public revenue; for when, by means of Nilometers, it is ascertained that the waters promise an unusually prosperous season, the taxes are proportionally increased. (Russell's Egypt, p. 46.) Sometimes, however, when the river exceeds its ordinary height, it becomes a calamity; occasioning the loss of life and property. In September, 1818, Belzoni witnessed a scene of this sort; the river having risen 3½ ft. above the highest mark left by the former inundations, it ascended with uncommon rapidity, and carried off several villages, and some hundreds of inhabitants. The swellings of the Nile in Upper Egypt are from 30 to 35 ft.; at Cairo, 23 ft.; in the N. part of the Delta, owing to the breadth of the inundation and artificial channels, only 4 ft. Pliny says of the inundation:—'*Justum incrementum est cubitorum* 16. *Minores aquæ non omnia rigant; ampliores detinent tardius recedendo. Hæ serendi tempora absumunt solo madente; illæ non dant sitiente. Utrumque reputat provincia. In duodecim cubitis famem sentiant, in tredecim etiamnum esurit: quatuordecim cubita hilaritatem afferant, quindecim securitatem, sexdecim delicias.*' (Hist. Nat., lib. v. § 9.) The depth and rapidity of the river vary at different times in different places. It is seldom that any vessel exceeding 60 tons burden can ascend as high as the Cataracts. The mouth of Damietta is between 7 and 8 ft. deep when the waters are low, that of Rosetta does not exceed 4 or 5 ft.; but when the waters are high, caravels of 24 guns may sail up to Cairo. (Mod. Trav., i. 52.) As a beverage the water of the Nile is considered delicious: Maillet declares that it is among waters what champaign is among wines. The mud of the river gives on analysis one-half of argillaceous earth, one-fourth carbonate of lime, the remainder being water, oxide of iron, and carbonate of magnesia. (See NILE.)

The *Mountain system* of Egypt is very peculiar. Two ranges, already noticed, pressing closely on each bank of the river, extend from Syene to Cairo, and form the valley of the Nile, protecting it from the ravages of the deserts on either side. That to the E. gives out an arm at Kenneh (lat. 26° 12′), and bisects the desert to the Red Sea at Cosseir in nearly the same latitude; while the Libyan or W. range branches off from Assouan to the Great Oasis. (Ritter, ii. 397.) Near Cairo the mountains diverge on both sides; one ridge running in a NW. direction to the Mediterranean, the other due E. to Suez. (Malte-Brun, iv. 22.) The geological components of the hills, from Philæ through the cataract region to Syene, are chiefly granite, and a peculiar highly crystallised red formation called syenite marble. This primitive rock is remarkable for durability and the fine polish it is capable of receiving. From quarries of this stone the Pharaohs, Ptolemies, and Antonines drew materials not only for the stupendous monuments which still make Egypt a land of wonders, but also for many of the public buildings of Italy, the remains of which attest the genius of the Roman artists. Some days' journey S. of Thebes extends the limestone region, dug out into innumerable catacombs, their entrances artfully contrived to conceal the abode of the ancient dead, a precaution suggested by a prominent superstition of the Egyptians. Between this district and the most S. one, the mountains are composed of sandstone, evidently a recent deposit; for it is so very soft that the buildings constructed of it would not have long resisted the weather, had they not been covered with a coloured varnish. Towards the valley of Suez the mountains contain limestone. On the W. side of the Delta not the least remarkable object presented by this wonderful country is the Scete, or valley of Natron *Lakes*, bounded on one side by a lofty ridge of secondary rocks, which, perhaps, proves the means of concentrating the saline deposit which gives its name to the place. The banks and waters of these lakes, six in number, are covered with crystallisations, consisting of sea-salt and natron, or carbonate of soda, sometimes united; at others, found separately in different parts of the same lake. (Russell's Egypt, p. 48.)

The most considerable of the Egyptian lakes are those of Menzaleh, Bourlos, Etko, and Marcottis, lying along the shore of the Delta. But though called lakes, they are more properly lagoons, and bear a striking resemblance to the *haffs* that skirt the shores of Prussia. Some of the lagoons, especially that of Menzaleh, E. of Damietta, are of large dimensions. They are all shallow; are separated from the sea, with which they communicate, by a narrow bank or ridge of sand; and are in the course of being gradually, though slowly, filled up. In antiquity, the Nile is said to have disembogued itself by seven channels—*Septem-gemini ostia Nili*; but of these some were certainly artificial; and then, as now, there were two principal mouths—the Pelusiac, or Eastern, and the Canopic, or Western. The Sybennitic mouth, in the centre of the Delta, was also of considerable importance. But considering the nature of the soil, and the efforts that have been made from the remotest times to divert a portion of the river by canals and otherwise into new courses, we need not be surprised that very great changes should have taken place in the channels by which it pours its waters into the Mediterranean.

Exclusive of the lagoons in the Delta, there is a considerable lake occupying the NW. parts of the valley of Faïoum. The principal *canal* of Egypt, the Bahr Jousef, communicates with this lake. It branches out from the Nile at Deirout-el-Sherif, S. of Minzeh, traversing the valley of the Nile at the foot of the Libyan chain, till it reaches the waters of Faïoum at Habun, and thence continues still parallel to the Nile, the Rosetta branch of which it finally joins at Alkam. Under the name of Souhadj the same canal is continued to Farhout in Upper Egypt. The whole of the Delta is intersected with canals in every direction, in which the overflowings of the Nile are preserved after the inundations, to afford communication

between the various towns, and to keep a constant supply for the irrigation of the cultivated lands. (Browne's Travels, pp. 177–187, &c.)

Egypt is naturally divided into—1. The Delta, or Lower Egpyt. 2. The Valley of the Nile, comprising Central and Upper Egypt. 3. The E. Desert. 4. The W. Desert and Oases.

1. *The Egyptian Delta*, which derived its name from the similarity of its figure to the Greek Δ, is a triangular tract, formed by the bifurcation of the Nile. The soil consists of the mud of the river, resting upon desert sand. Near the banks of the two branches this alluvium has collected to a thickness in some places of more than 30 ft., while at the extremity of the inundation it does not exceed 6 in. This constant accumulation and spreading of the deposit E. and W., has gradually extended the limits of the Delta further into the adjoining deserts than they reached in antiquity (Wilkinson on the Levels of Egypt, in 'Geographical Journal,' ix. 437), so that the arable land of the country is constantly increasing; and though the sand in its turn frequently encroaches in various places, yet the injury it inflicts is only partial and temporary, while the alluvial deposit goes on steadily increasing in extent. The greatest length of the Delta is at present about 85 m. from E. to W., and from the fork of the Nile to the sea about 90 m. intervene; but the inundations extend very considerably beyond these limits. The Delta is covered with meadows, plantations, and orchards, and presents a more fertile aspect than any other part of the country; but various causes have combined to prevent the spread of husbandry and cultivation, proportionally to the increase of territory rescued from the deserts by the annual overflows. (Ibid. p. 437.) This district, from its comparatively low situation, and from the absence of those mountains which enclose the Valley of the Nile and confine its waters, aptly designated by Browne 'the walls of Egypt,' is more influenced by the inundations than the upper lands; and when the river is at its greatest height, it presents the aspect of an extensive marsh. The river begins to swell in June, and continues to increase till Sept.; at which period the fields of the Delta are completely submerged, its villages, towns (which are built on natural or artificial mounds), and trees, only appearing above the water. After remaining stationary for a few days, the waters begin to subside, and by the end of Nov. leave the land altogether, having deposited a rich alluvium. An Egyptian spring, corresponding to our winter, gives to the Delta its most smiling and verdant appearance. The rice fields, having been sown before the water has entirely receded, are covered with a vivid green, trees put forth their blossoms, and the whole country bears at this season the aspect of a fruitful garden.

The question as to the origin of the Egyptian Delta, has engaged the attention of the ablest inquirers from the remotest period. The most probable as well as most ancient theory is, that which represents it as wholly formed of the deposits brought down by the Nile, and as constantly, though slowly, gaining on the sea. (Herodotus, ii. § 5.) Originally the sea is said to have flowed as far S. as the Pyramids; but in the course of ages, through the gradual accumulation of the mud of the river, assisted in some degree by the construction of canals and dykes, the land rose above the level of the sea, and ceased to be submerged, except during the period of the inundation. (Savary's Letters on Egypt, Letter I.) This opinion has, however, been stoutly denied; and though it be admitted on all hands that the land of Egypt and the bed of the river are both slowly rising, it is contended that the limits of the Delta to the N. are the same now as in the remotest antiquity. This opinion is supported by the high authority of Sir J. G. Wilkinson; and it is also supported by the learned author of the very able and elaborate article on Egypt, in the new edition of the 'Encyclopedia Britannica.' But though it were admitted that the limits of the Delta on the N. had continued nearly stationary from the age of Herodotus, that would not invalidate his statement that the cultivated portion of Egypt is the *gift of the river*. The chain of sand-banks skirting the Delta on the N. probably existed long before the Delta attained its present form; and the lakes, or lagoons, already noticed, lying to the S. of this chain, are apparently the last remains of the sea by which it was anciently covered. That the Delta should owe its existence to the Nile, is perfectly agreeable to what is observed in all similar situations; and no positive evidence has been brought forward to controvert, or even materially weaken, the strong and all but conclusive presumptions in its favour. (Shaw's Travels, 385, &c. 4to. ed.; Rennel's Geog. of Herodotus.) But few traces are now to be found of the many famous cities with which this part of Egypt was formerly studded; and that, except Alexandria, the only places of consequence in the Delta, at the present day, are Rosetta and Damietta, situated at the two mouths of the Nile. At the former the river is 1,800 ft. wide, but at Damietta only 800. The villages are numerous, and generally large; but the houses seldom exceed from 10 to 12 ft. square. They are built of sun-dried bricks, and are covered with flat roofs of straw and Nile mud. (Dr. Richardson's Travels, i. 40; Clarke's Travels, iii. 13; Modern Traveller, i. 180–232, &c.)

2. *The Valley of the Nile of Central and Upper Egypt.*—Ascending the river from its fork, the cultivable land at the apex of the Delta and for some distance is found to decrease; for here the banks are much more elevated, and are seldom quite covered with water, even during the highest inundations. (Geog. Journal, ix. 434.) Hence the alluviums do not reach the interior at this point. The E. or Arabian mountain chain terminates abruptly at Mount Mokattem, near Cairo, and diverges towards Suez; while the opposite or Libyan range ends at Faïoum, having turned off to the W. to enclose that valley. Throughout the entire district the E. chain has generally more transverse breaks and ravines, is more lofty and rugged, and comes closer to the river, than the hills on the opposite side. Between Faïoum and the Nile the Libyan ridge has nearly a level summit, overlooking the country below; and this table-land was chosen for the site of the Pyramids. The space left between both ridges seldom exceeds 10 m. in Central Egypt, while in the upper country they press even more closely upon the sides of the river; thus that part of the Valley of the Nile which belongs to Egypt has but a contracted breadth, and even that is not all available for the labours of the husbandman, a great portion of it being, from the height of the banks, out of the reach of the overflowings and their beneficent deposits; hence a strip of desert mostly runs along at the foot of the hills. Where, however, the land is laid under water at high Nile, communication is kept up between one village and another by means of elevated roads or dykes, which commence on a level with the banks of the river; and, as they extend to the interior, rise to so great a height above the fields as to leave room for the construction of arches for the passage of the water. As the river

enters the Egyptian territory from Nubia, the granitic hills bear the appearance of having been rent by the stream. Hence, between the Isle of Philæ and Assouan the current is interrupted by innumerable islands. Others, of a less rocky character—some of them extensive, considering the breadth of the Nile—spring up out of its bed at various intervals during its progress to the Mediterranean. The Isle of Elephantiné, opposite to Assouan, wears so beautiful an aspect that it is called by the natives the 'Isle of Flowers' (*Djeyiret-el-Šahir*); and most European travellers describe it as a sort of terrestrial paradise. The Egyptian valley is strewed with those stupendous monuments of human labour, those beautiful remains of ancient art, which have excited the wonder and admiration of ages; and which seem the more marvellous, the more closely they are examined.

3. *The desert E. of the Nile* is broken by rugged mountains, and intersected by numerous wadys or ravines, sometimes thickly, but more frequently scantily, clothed with verdure. It has, however, the advantage of numerous springs; beside which are traced ancient caravan tracks, that are still traversed in exactly the same manner as when the 'company of merchants' found Joseph in the pit. The leading characteristic of this desert, particularly in the N. part, is its gradual ascent from the Nile to a certain distance E., where commences a plain nearly level, and of some extent, from which all the valleys or torrents running in a W. direction empty themselves into the Nile, and those to the E. into the Red Sea. Of such a character are the Ataka hills, mentioned before as branching E. from the Mokattem mountains, near Cairo. These are joined at a right angle by a series of eminences which skirt the shores of the Red Sea into the Nubian country, under the names of the Zarafana, Dolfa, and Jaffatine ranges; and form the E. edges of the plateaux raised by the transverse hills, a chain of which appears again in lat. 29° between Benisouef and that part of the Suez gulf called Birket Farân. These are entirely of limestone, and present a gradual ascent from the Nile to a distance E. of 30 m.: the high plain which succeeds is about 16 m. broad, and the descent down to the Red Sea occupies a space of about 50 m. At the S. declension of the N. Kelâlla mountains is a copper-mine, which appears from the ruined huts, furnaces, scoriæ, &c., found by Wilkinson to have been extensively worked. (Geog. Journ., ii. 32.) The Wady Arabah intervenes its desert of sand to the S. Kelâlla or Kolzim mountains, at the foot of which are situated the two celebrated convents of St. Anthony (17 m. from the sea) and St. Paul, placed about 14 m. apart. Between these convents and the gulf at Wady Girfi are the remains of houses and catacombs, which appear to belong to the Greek period. In lat. 28° 26', the limestone formation, which continues with little interruption throughout the N. hills of this desert, is joined by primitive rocks, which present more irregular surfaces, but rise from the banks of the Nile with a gentler declivity than the series already described, and abut with proportionate abruptness upon the shores of the Red Sea. Mount Grârib (28° 15'), one of these rugged eminences, is the highest of the hills in this desert, being 6,000 ft. above the sea. Four hours S. of Grârib are two copper mines, with the same appearances of having been worked as those before mentioned. In lat. 28° the character of the levels again changes, being higher and more uniform from the Nile to where they make a descent to the sea, which is gradual till they reach Mount Azzeit, which gives them an abrupt termination. Near Mount Dokhan (lat. 27° 25') are the ruins of a town, and vast quarries of red porphyry, strewed with the materials of a small temple, which seems to have never been completed. At Cosseir, whose bay indents the Red Sea, at about lat. 26° 6', end the primitive hills that intersect the desert in a direction parallel to the Nile and the Red Sea, and join a transverse range, upon which extends the caravan route from Kenneh on the Nile to Cosseir, where pilgrims embark to pay their devotions at the shrine of Mecca. (See Cosseir.) The valley of Cosseir extends down to about 25°, where another transverse range occurs, which contains, near the sea, some lead mines. Mount Zabarah, celebrated by ancient writers for its emeralds, rises a little further inland. Attempts have been made to re-open the sources of wealth which these mines are said to have afforded, but without success. (Calliaud's Travels, fol. Paris, 1822, p. 60.) Nearly on a line with Assouan (lat. 23° 56') are the ruins of Berenice. The whole of the desert of Egypt is the resort of distinct tribes of Arabs, who confine themselves to particular localities; they consist of the Maazy, occupying the country to the E. of Benisouef, Atouni, and Benihasel, S. of the Maazy and the Ababdie Arabs, who are scattered over the N. part of the desert, and breed camels for the market of Esneh.

4. *The desert W. of Egypt* presents a scene so formidable to travellers, that few have visited the *oases* by which it is here and there interspersed. The most N. of these is Sivah, or Ammon; SE. from which, and nearer to the Nile, is the Little Oasis, or Wah-el-Bahryeh; the chief village of which lies in lat. 28° 16' N., and long. 28° 55' E. S. and W. are the small oases of El Hayz, Farafreh, and Zerzoora; and still further S. is the Dakhleh oasis, whose first European visitant was Sir A. Edmonstone, in 1819. Its chief village stands in about lat. 25° 35' N., and long. 28° 55' E. Three days' journey to the E. brings the traveller to the Great Oasis, or Wah-el-Khargeh, extending in length from 24° 30' to near 26° N. lat. Instead of islands of the blest (Μακάρων νῆσοι) springing up amidst the surrounding and desolate ocean of sand, as the ancients describe them, the oases are valleys or *depressions* of the lofty plain which forms the extensive table-land of E. Africa. On descending to them, they are found to bear, in many respects, a similarity to a portion of the Valley of Egypt, being surrounded by steep cliffs of limestone, at some distance from the cultivated land, which vary in height in the different oases, those rising from the S. oases being the highest. Neither do they present a continuation of cultivable soil, all of them being intersected by patches of desert. They, no doubt, owe their origin to the springs with which they abound, the decay of the vegetation thence arising having produced the soil by which they are now covered. Their fertility has been deservedly celebrated; but the glowing eulogiums of travellers on their surpassing beauty are probably, in a great measure, to be ascribed to the striking contrast they present to the surrounding deserts of arid, burning sand. It may appear contradictory, considering the high opinion the ancients entertained of the fertility and beauty of the oases, that they should have selected them for places of banishment; but that such was the case, at least under the Romans, is certain. A law of the Digest (lib. 48, tit. 22) refers to this practice; and it has been supposed that the poet Juvenal was one of those who suffered a temporary banishment (*relegatio*) to the oases, though the evidence of this is by no means clear. (Biographie Univer-

selle, art. 'Juvenal.') But the fact of their being selected as places of banishment is not in anywise inconsistent with the received opinions as to their salubrity and fertility. They were selected, not because of their being naturally noxious or disagreeable, but because of their being, as it were, out of the world, and from the extreme difficulty of escaping from them. The larger oases have some fine remnants of antiquity, the most celebrated of which is the temple of Jupiter Ammon, at Siwah. (Edmonstone's Visit to the Oases, *passim*; Geog. Journal, ix. 440, 441, &c.)

The climate of Egypt is extremely hot: this is a consequence, no doubt, of the lowness of its elevation, of its being surrounded on all sides except the N. by vast tracts of burning sand, and of the scantiness of the rain. According to Volney, two seasons only are distinguishable, spring and summer; or, rather, the cool and the hot season. The latter continues from February or March to October; and during the greater part of this period the air is inflamed, the sky sparkling, and the heat oppressive to those unaccustomed to it: during this season the average height of the thermometer is about 90° Fahr. But the heat of the atmosphere is so much tempered by the inundations of the Nile, by the vapours brought by the Etesian winds from the N., and by the dews in the nights, that the natives and even Europeans occasionally complain of cold. During the remainder of the year, the average height of the thermometer is about 60° Fahr. It is necessary at all times to avoid exposure to the night air.

It might be imagined that Egypt, being for about three months of the year either wholly or partially inundated, and being subjected, at the same time, to the action of a powerful sun, producing an excessive evaporation, would be extremely unhealthy. But such is by no means the case. The exhalations from stagnant waters, so fatal in Cyprus and at Iskenderoon, and most other parts of the Levant, are here comparatively innoxious. They are not, however, entirely divested of their bad qualities. On the retiring of the waters, in November, which is the Egyptian seed-time, W. winds and fogs are prevalent, which produce ophthalmia, fever, diarrhœa, and catarrh. From December to March the winds blow mostly from the E.; the nights are cold, but the temperature during the day is that of June in France: the various productions of the earth are then vigorously on the increase; its surface is covered with the finest verdure; and all nature, reanimated by the fertilising influence of the river, and the moderate temperature, seems to grow young again. In Upper Egypt, the exhalations being comparatively few, the climate is proportionally healthy.

This general salubrity of the climate, notwithstanding the powerful deleterious influences to which it is exposed, is ascribable to the natural dryness of the air; the proximity of the African and Arabian deserts, which incessantly absorb the humidity; and the currents of wind that sweep over the country without meeting with any interruption. The aridity is such that butcher's meat exposed, even in summer, to the N. wind does not putrefy, but dries up, and becomes hard as wood. In the desert dead carcases are found dried in this manner, so light that a man may easily lift the entire body of a camel. But near the sea the air is much less dry than farther up the country, and that at Alexandria and Rosetta iron exposed to the air speedily rusts.

It has been mentioned already, that on the approach of the sun to the tropic of Cancer the winds invariably blow from the N. or NW.; but as the sun recedes to the tropic of Capricorn the winds become variable, blowing from the E. and W., passing to the S. about the vernal equinox, and blowing from this quarter till about the end of May or the beginning of June. During this season Egypt is at intervals visited by the pestilential hot winds of the desert, here called *khamsin*, but identical with the *simoom* of the Arabs, and the *samiel* of the Turks. They have the same effects as in Arabia and other contiguous countries. (See ARABIA.) Their heat is sometimes excessive; the soil is parched, and broken by chasms; the trees are stripped of their foliage, and the fields of their verdure. The fine impalpable sand with which they are loaded obscures the sun, and gives to everything a dusty appearance. During the simoom the streets are deserted, and are as silent during day as during night. The rising of the Nile terminates those accesses of heat and drought, and again diffuses life and gladness over the land. The beneficent river

> 'From his broad bosom life and verdure flings,
> And broods o'er Egypt with his wat'ry wings.'

The saline properties of the earth, or, as Volney supposes, of the air, in conjunction with the heat of the climate, give to vegetation an activity in Egypt unknown in cold climates. Wherever plants have water the rapidity of their growth is prodigious. But it is a curious fact, that the soil is exceedingly unfavourable to exotics, and that the seeds of those raised in the country require to be annually renewed. (Volney, Voyage en Syrie et en Egypte, i. 61–66, ed. 1787.)

In consequence of the extreme dryness of the air, comparatively little rain falls in Egypt; and some seasons have passed away without the occurrence of a single shower. But this is not usually the case, and occasionally the rains are pretty heavy. In this respect there is a great variety in the seasons; and, according to Marshal Marmont, falls of rain would appear latterly to have become comparatively frequent. He says that in Lower Egypt they have now pretty generally from thirty to forty rainy days in the year; and that the pacha has constructed immense warehouses for the securing of products in harvest, which were formerly exposed without inconvenience to the open air. (Voyage, &c. iii. 177.) No doubt, however, the rains have been quite as frequent and heavy in Egypt in past times, as at present. In proof of this we may mention, that the learned and accurate Mr. Greaves, who visited Egypt in 1638 and 1639, states that the rains were heavier at Alexandria in December and January, than he had known in London; and that there were also, at the same time, very heavy falls in Cairo. (Pyramidographia, 'Works,' i. 103.) Hail showers occasionally occur in winter at Alexandria, and sometimes, though rarely, in Cairo. Snow is totally, and thunder and lightning nearly, unknown in Egypt. Earthquakes occur but seldom, but they are not unknown.

Diseases.—The inhab. of Egypt are subject to a variety of diseases, some of which seem to be, at least in their extent, to a considerable degree peculiar. Of these ophthalmia is one of the most prevalent; nothing appears more extraordinary to a stranger in Cairo, than the number of persons whose sight is either lost or impaired. It is more common in Lower than in Upper Egypt. 'It generally arises from checked perspiration, but is aggravated by the dust and many other causes. Where remedies are promptly employed, this disease is seldom alarming in its progress; but vast numbers of the natives of Egypt, not knowing how to treat it, or obstinately resigning themselves to fate, lose one or both their eyes.' (Lane, i. 4.) Small-pox and leprosy are also very fre-

quent. Elephantiasis is met with among labourers in the rice fields; and, in the marshy districts of the interior, the legs often swell to an enormous size. Syphilis is exceedingly prevalent; and maliguant fevers prevail in April and May. The plague occasionally breaks out with great violence in Egypt; and in 1825 it destroyed 80,000 persons in Cairo only, and in 1835 its effects were still more fatal. Scarcely any year passes without this formidable disease making its appearance. It generally, though not always, breaks out during the prevalence of the Khamsin, or hot wind from the desert. But notwithstanding this formidable list of diseases, it is still true, as already stated, that no part of Egypt can be justly characterised as insalubrious. The diseases to which the people are subject are mostly to be ascribed to their depressed circumstances—their filth, miserable accommodations, and the bad quality and deficiency of their food. Much also is owing to their apathy, their belief in the doctrine of predestination, and, consequently, in the inutility of remedies and precautions, and the inefficieney of the police.

Plants and Animals.—The *vegetable productions* of Egypt are of a nature peculiarly fitted to its exigencies. The absence of rain forbids the existence of forests; and there being no high mountains, alpine productions are no where found. The native plants of Egypt are of a loose, plethoric texture; so that their proper aliment is prepared in continually distended veins, whose widely-opened mouths receive and retain the copious dews, and cause the leaves to perform the functions of so many roots. Hence, great transpiration is excited, and the continually moist roots enable the plants to pass from the extreme drought of summer to the humidity of a three months' flood. These characteristics will be found in the celebrated papyrus, the lotus, and its three varieties, Egyptian arum and safflower. Bulbs find a congenial soil in Egypt, and the gourd and cucumber tribe are everywhere planted. The acacia of the Nile, and date palm, and sycamore, are scattered rather than grouped over the country. The constant use to which the soil is put in rearing valuable plants prevents the accumulation of such as are noxious and weeds; so that the country is remarkably free from them. The number of fruit trees in Egypt by no means answers to the culture and fertility of the soil.

The peculiar hydrography and vegetation of Egypt exercise a great influence over its *zoology*. The larger species of wild animals find no forests in which to prowl—no recesses for their dens; and except those monsters of the Nile—hippopotami and crocodiles—are banished from the land. Birds also, that inhabit mountains and groves, avoid the exposed deserts and scorching fields around the Nile. The country is also unfriendly to some insects; their eggs and chrysalides being either washed away by the overflowings of the river, or smothered in the stagnant pools formed by its overflow.

The only primeval animals now left in Egypt are the hippopotamus and crocodile. The former, so poetically yet accurately described in the book of Job (xi. 15–24), has been known to measure 16 ft. long, 15 ft. in circumference, and to stand 7 ft. high. The skin is sufficiently thick and tough to withstand the effect of a musket-ball. Though amphibious, the animal is not nearly so powerful on land as in the water. Its appetite is enormous. The Nile crocodile is a lizard of enormous size, covered with a complete armour of ball-proof scales; its feet are provided with strong sharp claws; an immense mouth, opening as far as the ears, exhibits two rows of teeth like saws, fitting into each other when closed. This is also an amphibious animal; but more than one-fourth part of its existence is passed in water, and, like the hippopotamus, it is a most voracious eater. The ichneumon is a persevering destroyer of the eggs of crocodiles and serpents. The jerboa, or jumping mouse, Nilotic fox, Egyptian and Alexandrian rat and arvicola, complete the list of wild animals. The domestic and tame animals are chiefly oxen and buffaloes, which are employed in agriculture; the Egyptian goat; dogs, of which there is a peculiar breed at Alexandria; and the true cat, a native, it is supposed, of Egypt. Horses are much esteemed, and the Egyptian grooms are reckoned among the best in the world. Asses are in requisition all over the country. Lastly, the camel and dromedary yield their important services to the inhabitants of this desert-bounded land. (See ARABIA.)

Of the feathered tribe peculiar to Egypt, the first to claim attention is the ibis, so often mentioned by ancient writers, and identified by Bruce with the *abonhannès*,—a species of curlew, placed by Cuvier amongst the *grallæ*, or wading birds. Its size is equal to that of a hen, with white plumage, except the tips of the quill feathers, which are black, the largest of them having violet reflections. Part of the head and neck are naked; black in the adult, but clothed with short black feathers in the young. (Cuvier's Animal Kingdom, by Blyth and others, 243.)

The Egyptian vulture and stork perform the office of scavengers in towns, by feeding upon the animal substances that would be otherwise left to corrupt the air. Pelicans are numerous along the banks of the Nile, and have a beautiful plumage. Pigeons are kept by almost every farmer in the country for the sake of their dung, and are provided with curious conical huts. Poultry abounds in Egypt; and the artificial mode of hatching eggs forms an important branch of Egyptian industry. Plovers, bustards, and partridges are often met with; quails visit the land in immense flocks, from the interior of Africa; and sea swallows abound along the base of the Delta, and on the shores of the Red Sea. History, sacred and profane, attests the predilection of the Egyptians for *fish* as an article of food; and the Nile abounds with it. Nile salmon is highly esteemed. The fishermen of the coast form an important and turbulent community. Besides the crocodile, the reptiles of Egypt are numerous. Serpent-charming is a regular profession; and some of the Arabs really perform extraordinary feats with the most venomous snakes. The horned and hooded viper (*Coluber cerastes* and *C. Haje*) are the most dangerous. Insects abound in Egypt during a great part of the year, particularly flies and musquitoes. (Lane, i. 3.) Locusts also occasionally scourge the land, visiting it in such immense flights as to obscure the sun's rays, and destroying when they alight every vestige of herbage. The breeding and keeping of bees forms an extensive branch in the rural economy of the country. The beetle peculiar to Egypt (*Scarabæus sacer*), so often represented on the sacred monuments, is rather larger than the common beetle, and is entirely black. The Egyptian bat is also much larger than that of other countries. Zoophytes abound in the Red Sea, and it is the red coral which supplies its name. Sponges, various corallines, polypes, and madrepores, are also found on its shores. (Hasselquist's Appendix to Voyages and Travels in the Levant, &c.; Richardson's Travels, *passim*; Russell's Egypt, 464, &c.; Conder's Egypt, *passim*.)

Population, Manners, and Customs.—The political revolutions to which Egypt has been sub-

ject from the earliest historical era have—as the Persians, Greeks, Romans, Arabs, Turks, and other nations, gained in their turn the ascendency—introduced into the country people of all those races. These, added to the Copts, descendants from the ancient Egyptians, slaves from the Upper Nile countries, a small number of Jews, and a few Europeans, make up the motley congregation at present assembled in the land of the Pharaohs. But of all its conquerors, Mohammed has left the most permanent traces in Egypt. The descendants of the Saracens who fought under his banner form by far the greatest portion of the present population. In the absence of more precise data, the total number of inhabitants may be estimated at about 5,000,000; of whom Arab-Egyptians 3,000,000; Copts or Christian Egyptians, 500,000; Turks, 300,000; Greeks and Armenians, 200,000; and the rest belonging to various tribes scattered over the country.

The Arab-Egyptians are divided, by Volney, into *three* classes. The first are the fellahs or husbandmen, the posterity, he says, of the Arabs, who emigrated from the peninsula after the conquest of Egypt by Amrou in 640. They still retain the features of their ancestors, but are taller and stronger. In general they reach 5 ft. 4 in., and many 5 ft. 6 or 7 in. Their skin, tinged by the sun, is almost black. They have oval heads, prominent foreheads, large but not aquiline noses, and well-shaped mouths. They constitute the bulk of the Egyptian peasantry. The second class of Arabs are Moghreibbins, or settlers from Mauritania. They are very numerous in the Said, where they live in villages by themselves; they likewise are fellahs. The third class are Bedouins of the desert, or wandering tribes.

The Arabs, particularly the Bedouins, wherever they are found, have a remarkable identity of appearance and character. (See ARABIA.) But the fellahs or husbandmen of Egypt, having been subjected for centuries to a despotical government, and deprived of that wild freedom that is now, as of old, enjoyed by their brethern of the desert, have lost several of the distinguishing traits of the Arab character. They are rigid Mussulmen, and strictly observant of the religious rites and ceremonies laid down by their sheiks, or priests. Mr. Lane says:—'Very few large or handsome houses are to be seen in Egypt, excepting in the metropolis and some other towns. The dwellings of the lower orders, particularly those of the peasants, are of a very mean description: they are mostly built of unbaked bricks, cemented together with mud. Some of them are mere hovels. The greater number, however, comprise two or more apartments; though very few are two stories high. In one of these apartments, in the houses of the peasants in Lower Egypt, there is generally an oven (*foorn*), at the end farthest from the entrance, and occupying the whole width of the chamber. It resembles a wide bench or seat, and is about breast high: it is constructed of brick and mud; the roof arched within, and flat on the top. The inhabitants of the house, who seldom have any night-covering during the winter, sleep upon the top of the oven, having previously lighted a fire within it; or the husband and wife only enjoy this luxury, and the children sleep upon the floor. The chambers have small apertures high up in the walls, for the admission of light and air—sometimes furnished with a grating of wood. The roofs are formed of palm branches and palm leaves, or of millet stalks, &c., laid upon rafters of the trunk of the palm, and covered with a plaster of mud and chopped straw. The furniture consists of a mat or two to sleep upon, a few earthen vessels, and a hand-mill to grind the corn. In many villages large pigeon-houses, of a square form, but with the walls slightly inclining inwards (like many of the ancient Egyptian buildings), or of the form of a sugar loaf, are constructed upon the roofs of the huts, with crude brick, pottery, and mud. Most of the villages of Egypt are situated upon eminences of rubbish, which rise a few feet above the reach of the inundation, and are surrounded by palm trees, or have a few of these trees in their vicinity. The rubbish which they occupy chiefly consists of the materials of former huts, and seems to increase in about the same degree as the level of the alluvial plains and the bed of the river.' (Lane, Modern Egyptians, 30, 31.) The dress of the peasantry consists of coarse woollen cloths; and, like all Orientals, they are fond of attending coffee-houses, and listening to the tales of pretended magicians, or the rude music of strolling musicians. They submit, without murmuring, to every species of ill-treatment; principally, it seems, from a deep-rooted conviction of its inutility, which has degenerated into an apathy that now forms the main feature of their character. They are—in spite of diet both poor in quality and scanty in quantity—robust, healthy, and capable of undergoing great severity of labour and fatigue, being muscular without fleshiness or corpulency. Like Bedouins, they have a habit of half-shutting their eyes, from constant exposure to the sun. The women are in a most degraded condition, and perform all the laborious and menial offices. The Bedouins, or wandering Arabs, have a great contempt for the established peasantry of Egypt, and apply to them the name of fellahs, as one of contempt, signifying boors; distinguishing themselves as true Arabs (*bedawees*). The latter, whenever they please, take the daughters of the former in marriage, but will not give their own daughters in return. Should a Bedouin be slain by a fellah, blood revenge is often perpetrated upon the offending tribe three or four fold.

The Egyptian Christians, or Copts, are usually regarded as the descendants of the ancient Egyptians; and it is believed that their written language is identical with that spoken by their ancestors. Some learned men have supposed, from certain resemblances between the Hebrew and Coptic, that the latter was a dialect of the former, or that it belonged to the Semitic languages. But this opinion is now all but abandoned. Michaelis says, that 'every person competent to form an opinion knows that the Coptic and the Hebrew *have not the slightest original affinity*; and that although some words occur in the former that resemble Semitic vocables, they are to be attributed to the influence which the proximity and intercourse of Semitic nations have exercised over the idiom of the native Egyptians.' (Quoted by Prichard, ii. 211.) The characteristics of the Coptic language are shortness of the words, and the simplicity of its grammatical construction; its genders and cases are expressed by prefixes and infixes, and not, as is usual with Asiatic and European languages, by terminations. (See Quatremère, Recherches sur la Littérature Egyptienne.) The modern Copts, however, speak Arabic, their original tongue being understood but by few persons; and though their liturgy be written in Coptic, it is expounded in Arabic. (Lane, ii. 312; Quarterly Review, lix. 170.) They are sober and steady; are much employed as secretaries in public offices; and are the best accountants in the country, few respectable traders being without a 'Coptic clerk.' They are held in great esteem by the government, and possess certain immunities, being unmolested in their religion, and exempted

from military conscription; for which privilege, however, they compound by payment of a tribute. Their patriarch, though called the patriarch of Alexandria, resides in Fostadt, or Old Cairo. Many conflicting opinions have been entertained as to the physical characteristics of the ancient Egyptians. Their early and high civilisation, and their great works, show conclusively that they were of a very different race from most other African nations. Cuvier, who states that he had examined the heads of more than fifty mummies, declares that not one of them had any of the distinguishing characters of the Negro or Hottentot races; and he concludes that they belonged to the same race of men as the Europeans. Even at this day the appearance of the Copts contrasts most advantageously with that of the Arabs. M. Pugnet, an intelligent and discriminating physician, observes, '*A l'extérieur chétif et misérable des Arabes*, les Coptes opposent un air de majesté et de puissance; à la rudesse de leurs traits une affabilité soutenue; à leur abord inquiet et soucieux une figure très-épanouie.'

The Turks settled in Egypt, though comparatively few in number, occupy important social positions, being masters of the country. They fill all the high offices of state, which are, however, often enough made the objects of bargain and sale, and administered with little impartiality. The Grecks and Armenians are chiefly devoted to mercantile business, and many of them persons of great influence; but the Jews, about 5,000 in number, are a despised, and therefore a distinctive class in Egypt, and have a particular quarter of every large town set apart for their residences—generally the most confined and dirty portion of the place. They are usually bankers, money changers, gold and silver-smiths, &c., and enjoy a fair share of religious toleration. Slaves, chiefly from Nubia, Abyssinia, and Darfur, are introduced in large numbers, and are sold in public markets belonging to every moderately sized town. (Lane, ii. 311–353; Burckhardt's Arabic Proverbs, *passim*; Niebuhr's Travels.)

The following statements, as to the condition of the labouring classes in Egypt, apply principally to the fellahs; they were supplied by an English gentleman long resident in the country:—

'With the labouring classes of Egypt *bread* is the great article of food, and may be said to be there more properly the staff of life than in any other country. Beans and lentils are next in importance. With bread, as a sort of seasoning, they use the yam, radish, cucumber, date, onion, and at certain seasons the melon, of which there is great abundance, and occasionally also cheese, and a sort of butter or ghee, in common use for cooking. Fish, too, and particularly the dried fish of Lake Menzaleh, is a favourite article of food. Rice is less used here than in most eastern countries, being dearer than bread; but still their favourite dish of pillau, or rice and butter mixed, with the addition of a fowl or meat, if the party happen to be of the better sort, is sometimes to be seen. Butcher's meat is beyond the reach of the labouring classes; and unless at their great festival of the Bairam, when the duties are taken off, they rarely taste it. But though thus living in a great measure on vegetable food, they are a robust and healthy people, capable of undergoing great fatigue; and in despite of the general unprepossessing appearance of both sexes, there are often to be seen specimens of the human form of matchless symmetry and beauty, particularly among the boatmen on the Nile. Their only luxuries are coffee and tobacco; the latter a coarse description produced in the country, yet still such a solace to the poor man, that while he has it he seldom complains, though all else were wanting. The dress of both sexes consists of a coarse blue cotton shirt manufactured in the country, without anything else, except the red, and often less showy cap, which covers the head, the shawl and broad cloth so ambitiously worn by the upper classes being far beyond the reach of the humble labourer. The richer classes of natives, including those in offices of trust under the government (which is the major part), or engaged as retailers or handicraftmen in such pursuits as yield a decent livelihood, live as well and as fully, and are as well clothed, as the same classes in any other country.

'In Egypt, where there is no personal liberty—where the government claims and enforces its right to the *labour* of every man, willing or not willing, on its own terms,—where among the native traders there is no property, or if it exist is not seen,—where no enterprise can be undertaken but with consent of the government, or at the risk of clashing with some of its private interests, there can be no proper rate of wages as applicable to any particular trade, nor any chance of the remuneration for labour being bottomed otherwise than upon favour or caprice. The native artisans, as cutlers, silk weavers, shoe-makers, saddlers, coppersmiths, &c., confine their operations to their own little booths and shops, and usually find in themselves and their families sufficient hands for all their work; and the same applies to all retailers of silk and cotton goods, coffee, tobacco, sugar, and every other article of consumption. Were a capitalist, supposing him possessed of the authority of the government, to embark in any enterprise, he would be almost sure to come in competition with the pacha, and to be driven out of the field, commanding, as the latter does, all the labour of the country at his own price, besides having monopolies of nearly every thing consumed in the country. Hence it will be seen that it is upon the pacha the whole labouring classes must mainly depend for support; and it has been generally stated, that whatever be the nature of the work, the average rate of wages paid by him does not exceed a piastre per day for a full grown man; one half usually in bread, upon which he has his profit, for he is a large baker also, and the other half in money. To women and children he pays from 10 to 20 paras per day. A Frank cannot command the labour of the same people for less than double the money. In the manufactories men who have made themselves remarkable for their skill are occasionally to be found drawing from 3 to 6 piastres per day, but these are rare exceptions. The common rate of one piastre per day may be said just to preserve the parties in existence, and that is all.'

Government and Laws.—Egypt, whose history commences with the history of civilised man and organised government, which gave laws to the old world and art to the Greeks, after being, for many centuries, subjected to foreign masters, became, at length, a prov. of the Ottoman empire. Under the Turkish sway it was long her fate to suffer that worst kind of despotism resulting from the delegation of arbitrary power by a careless tyrannical master to a scarcely responsible servant. The bold, innovating spirit of the first independent ruler of Egypt, the celebrated Mehemet Ali, has, however, introduced several reforms into the administrative constitution of the government, which have been upon the whole beneficial. The government of Egypt, under the successors of Mehemet Ali, and as at present organised, consists of, 1st, the viceroy, or pacha, whose power is unlimited and despotic. 2d, His deputy, called *Ki-*

khy'a. 3d, Seven councils of state, who have each a distinct department of the government to preside over. 4th, Governors (*Nazir*) appointed to each prov. By the imperial *Hatti-Scheriff*—lit. 'the illustrious writing'—of Jan. 12, 1841, and a firman of the sultan of June 1, of the same year, the government of Egypt was made hereditary in the family of Mehemet Ali, subject to an annual tribute of 80,000 purses, or 400,000*l*., to the Turkish government. Under the new form of government, the country is divided into three great provinces, viz. *Saïd*, or Upper Egypt; *Vostani*, or Middle Egypt; and *Bahari*, or Lower Egypt. These provinces again are divided into 7 intendencies, and subdivided, after the French system, into departments and arrondissements. In other respects, the successors of Mehemet Ali have tried to imitate the forms of government of Imperial France. The civil and criminal laws are administered by a *cadi*, or chief judge, and his deputy, or *naib*. But most of these offices being filled by Turks, who speak their own language, an official interpreter is necessary. The court of the cadi has also its *bash roosol* (chief sergeant of arrests, which are executed by his inferior officers); its *bash kâtib*, or chief secretary; and *shâhids*, or recorders, who prepare the business of the court, and relieve it of such details as would unnecessarily take up the time of the cadi. Petty cases are at once decided by a *zabit* or magistrate. The police is numerous and effective, and consists of the military and the magistrates, or zabit police. Though still very defective, the administration of justice in Egypt has been vastly improved under the government of the successors of Mehemet Ali. Except in rare cases convicts are usually punished by being compelled to labour at the public works.

The pacha is, with some few exceptions, proprietor of all the land of Egypt; and he is, in fact, the only considerable agriculturist, manufacturer, and trader in the country. The pacha is the sole manufacturer, printer, and bleacher of cotton goods; the sole maker of sail-cloth and Fez caps; the sole glass-blower, paper-manufacturer, iron-founder, gun-maker, gunpowder manufacturer, &c.; he has the monopoly of opium, indigo, saltpetre, and linseed oils; he is the only tanner in his dominions; he is the owner of all the mills and manufactories, and of more than half the camels, horses, buffaloes, and cattle in the country; and of half its boats. He specifies the employments in which the bulk of the pop. shall engage; the crops or produce they are to raise or furnish, and the prices at which, when produced, they are to deliver them to his agents. This system of administrative interference, described in detail by Marshal Marmont, is carried out in the following manner. The head cultivator (*chef de culture*), in conjunction with the head civil authority (*cheyk-el-beled*) of each village, makes every year a division of the lands to be cultivated by the inhabitants: this division having been made, the kind of culture to which each portion is to be applied is determined,—so much being devoted to dhourrah; so much to wheat, barley, pulse, and trefoil; so much to sugar, rice, cotton, and indigo. The quantity of dhourrah to be cultivated is regulated according to the quantity presumed to be necessary for the support of the cultivator's family; and the produce is given up wholly to him for their support. The other products are divided into *two* classes. The different kinds of wheat, barley, pulse, and trefoil belong to the cultivator, after the quantity of each demanded by the pacha has been deducted: this quantity varies every year, but is most commonly one-half of the produce. The remainder, including rice, cotton, sugar, indigo, opium, and woad, are reserved exclusively for the pacha. The cultivator is prohibited, under the heaviest penalties, from retaining the smallest portion of any one of these articles: they are deposited in the public magazines established throughout the country, and placed to the account of the fellahs at a price fixed by the pacha, which never exceeds two-thirds of the market price.

The fellah has to pay to the pacha the *miry*, which may be regarded either as a land-tax, or the rent of the land. This impost is regulated according to the quality of the land; the maximum is 28 pataks (15*s*.), the minimum 17 pataks (8*s*. 1*d*.) the feddan. The average may be about 9*s*. or 10*s*. an acre. The fellah pays, moreover, a personal tax, which varies, according to the presumed circumstances of the individual, from 15 piastres to 5 cents. His cattle is also taxed; oxen and cows at 30 piastres, and at 70 piastres when they are sold to the butcher; on the animal being killed, the skin belongs to government. An account is opened by the village tax-gatherers with each inhabitant: the fellah is credited with the value of the produce which he has deposited; and debited with the *miry*, and the other imposts, as well as the prices of the articles with which he has been furnished, which always exceed their value. The accounts are balanced every four years.

A cultivator, included in that portion of a district on which the corn required by the pacha is ordered to be grown, if he wish to commute for the delivery of that article by a money payment, is charged at the rate of thirty-six piastres the ardep, and he will generally rather pay this sum than double the sum at his credit with government; such credit being of no service to him, since it is never paid; while, by selling his corn, even with the duties and the thirty-six piastres which he pays, he receives at least, in money, a fourth or fifth part of its value.

It must be admitted, notwithstanding the grinding oppressiveness of this system, that it has materially improved the agriculture of the country; and that some new and important branches of culture have been introduced, as that of cotton, now a staple product. Marshal Marmont states, and the fact can scarcely be doubted, that these improvements never could, under any system, have been effected by the fellahs, who are ignorant, attached to old habits, and easily satisfied. But the vice of the present system is, that the fellahs reap no advantage whatever from this increased production. On the contrary, it has stripped them of not a few of their limited enjoyments, and rendered them more impoverished and depressed than they ever were at any former period of their history; their increased labour, instead of bringing with it an increase of comfort, brings only an increase of privations. Hence, were anything to occur that should overthrow the government of the successors of Mehemet Ali, the whole fabric would fall to pieces. It is forced, factitious, and unnatural; and is certainly not based on or associated with the interests or affections of the people.

The gross yearly revenue of Egypt and its dependencies is unknown, and various estimates have been framed of its amount. It probably amounts to 790,000 purses, or about 3,950,000*l*. The expenditure, for a number of years, has been larger than the revenue. The deficit has created a floating debt which, in the beginning of 1860, amounted to 5,000,000*l*. In August of this year the government contracted a loan of 28 millions of francs, or 1,220,000*l*., in Paris; and a second loan of 40 millions of francs, or 1,600,000*l*., was contracted in March, 1862. The necessities of the

Egyptian government still increasing, a third loan of 5,000,000*l.* sterling was effected in Paris and London in October, 1864.

Army and Navy.—The regeneration of the army was one of Mehemet Ali's first projects on attaining to the pachalic of Egypt. To accomplish this, to consolidate his government, and to pave the way for his other reforms, the reconstruction, or, if that was impossible, the destruction of the Mameluke force that had so long ruled in Egypt, was indispensable; and this Mehemet accomplished, partly by force and partly by treachery. This superb cavalry being destroyed, with the exception of a small party who enrolled themselves under the banners of the pacha, the latter commenced his work of military reform with equal vigour and success. He had long been sensible of the vast superiority of European tactics and discipline over the brave but tumultuary onsets of Asiatic troops, and he was determined at all hazards to introduce the European system into his dominions. With this view he had his troops drilled and disciplined in the European fashion, chiefly through the instrumentality of some Italian officers. But the natives were naturally disinclined to the change; and the injudicious severity with which it was attempted to be introduced and carried into effect, gave rise to a dangerous mutiny, that threatened to put an end to the projects and power of the pacha. Mehemet having succeeded in suppressing this formidable insurrection, saw his error, and resolved to proceed with greater caution. With this view he formed a depôt of fellahs in Upper Egypt, and had them trained in the European manner by a French officer, Colonel Selves, who changed his name and title into Solyman Pacha. This officer, who had served with distinction under Napoleon, undertook the arduous task of new-modelling the army of the pacha, and of organising and disciplining it according to the most approved models; and by a rare combination of firmness, bravery, and good sense, he succeeded in gaining the confidence both of the pacha and the troops. The army organised in this manner is raised by conscription, which, in consequence of the limited pop. of the country, is very severe. The number of troops, in 1838, including veterans and invalids, amounted to 127,286, besides from 10,000 to 12,000 irregular Turkish troops, and the Bedouin Arabs, who can furnish 30,000 men. But the successors of Mehemet Ali, especially his grandson, Ismail Pasha, who succeeded to the government in 1863, greatly reduced this large army. From a semi-official statement of Sept. 1864, it appears that at that time the regular army numbered but 14,000 men, namely, 8,000 infantry, 3,000 cavalry, artillery, and engineers, and 3,000 black troops.

The Egyptian navy, also a creation of the founder of the present dynasty, comprised, in 1863, seven ships of the line, six frigates, nine corvettes, seven brigs, and eighteen gunboats and smaller vessels, besides twenty-seven transports. Many of these ships, constructed by native builders, are beautifully modelled; and though the crews have not attained to the proficiency of English or American sailors, they have, regard being had to the circumstances under which they have been placed, made the most extraordinary advances.

Literature and Education.—The literature of the Arabs is very comprehensive. The works on religion and jurisprudence comprehend about one-fourth of the entire number of Arabic books. Others on grammar, rhetoric, philology, history, and geography, are also numerous; as are, also their poetical compositions. There are many large libraries in Cairo, most of which are attached to the mosques. A system of public instruction has been organised by the late Mehemet Ali, which deserves high praise. The pupils are first sent to the 'primary' schools, of which there are fifty throughout the country. The youth having acquired the rudiments of education at these, they are advanced to the 'preparatory' schools. The next step is to the 'special' schools, which are ten in number, each devoted to particular studies; namely, medicine, midwifery, veterinary surgery, languages, music, and agriculture, the other three being military schools, to fit the scholars for the cavalry, artillery, or infantry service. At Aboosabel in Cairo, the pacha established a military hospital and a medical college. The success that attended this establishment has been quite extraordinary; and notwithstanding their old prejudices, many of the Arab pupils have become expert anatomists and clever surgeons.

It is impossible to appreciate too highly the beneficial influence of these establishments; they have already effected, and will, no doubt, continue to effect, a very great revolution in the public mind in the East; and will pave the way for reforms and changes of which, at present, no one can form any distinct idea. Almost every mosque or public fountain has a school attached to it, mostly endowed by benevolent persons. At these schools, getting the Koran by heart forms the chief employment; but reading and writing are also taught: those who aspire to the higher branches of learning become students of the University of El-Aghas at Cairo, the principal seat of learning in the East. In this building are certain *riwaks*, or colleges, set apart for the natives of particular provinces. The regular subjects of study are grammar, rhetoric, Mohammedan theology, and the traditions of the Prophet; law, religious, civil, and criminal: algebra, and arithmetic. The sciences are but imperfectly understood in Egypt, though great improvements have been made in medical science, in consequence of the introduction of European practitioners, and natives being sent to Europe to study. Egyptian geography describes the earth as a flat surface; and astronomy, beyond merely computing the calendar, is studied for the purposes of astrology. Music affords a favourite study for pastime, but the theoretical system is complicated, as each tone has three intervals or gradations of sound instead of two. Their melodies are mostly of a plaintive kind; but a kind of recitative, in which they chant their romances, has some bold measures. (Lane, i. 285, *et seq.*; Waghorn's Egypt in 1838, Appendix; Egypt, a Popular Description, 182–190.)

Productive Industry.—No soil can be better adapted for *agriculture* than that brought down by the Nile, and deposited on its banks. The earliest authentic records of the human race represent Egypt as the granary of the old world, to which less fortunate nations resorted in times of scarcity; while she received from them, in exchange for the necessaries of life, all those luxuries and riches which enabled her people to make such early progress in the arts, and to leave behind them monuments surpassing even the remains of the classic world in costliness, extent, and grandeur. The supplies of slime annually brought down by the river considerably abridge the labours of the husbandman, and have enabled the country, with but little of his assistance, to bear for the last 3,000 years three, and sometimes four annual crops, without the least impoverishment. The husbandry of Egypt is divided into two great classes:—the upper, or *sharakee* lands, where the banks are too high for the country

beyond them to benefit by the inundation; and the *rei*, or low lands, which are watered by the natural overflowings of the river.

About four millions of *feddáns* are now under cultivation in Egypt, of which from 200,000 to 300,000 are occupied with cotton; 1,000,000 with flax, indigo, sugar, dates, hemp, &c.; and the other 2,800,000 or 2,700,000 feddáns with grain, principally millet (*dhourra*), maize, wheat, and rice. In Lower Egppt sowing commences immediately after the waters subside; the seed only requiring to be strewed over the land, and it either sinks into the soft earth by its own weight, or is trodden down by cattle driven over it. This is generally done in November; in February the fields are verdant, and in May the harvest takes place. In July rice and maize are again planted, and yield a second harvest in September. In Upper Egypt the constant artificial supply of irrigation required by the land gives to the farmer unceasing employment. Deprived of rain, and exposed almost always to a burning sun, the land would be arid and barren if not constantly refreshed with moisture. After the water has been preserved in canals and wells, it is raised by Persian water-wheels, worked by oxen, or by means of a hand-machine of a more simple construction. Sowing begins here about November, as in Lower Egypt; and the corn begins to spring up before the end of the month, and by December gives to the country the appearance of a verdant spring. In January lupines, dolichoes, and cumins are sown: and towards the end of the month the first barley harvest commences. In February sugar-canes are cut for the press. By April flax has ripened, and the plants are pulled up; tobacco leaves are gathered, and the wheat harvest is got in. In July there is a third crop of trefoil, and a second of rice. October is the month for all sorts of leguminous seeds to be sown. (Malte-Brun, iv. 43–45; Burckhardt's Arabic Proverbs, 134; Wilkinson's Topography of Thebes.)

The efforts of the present government have been principally directed to the culture of cotton, so that the crops of wheat have greatly fallen off, and Alexandria has ceased to be a port for the shipment of this species of grain. The cotton of Egypt is long-stapled, of good quality, and the soil is well suited to its growth. By far the largest amount of this produce is exported to the United Kingdom. These exports more than doubled in quantity and more than quintupled in value in the five years 1859 to 1863. The exports of raw cotton to the United Kingdom, which were 336,313 cwts., valued 1,241,577*l.* in 1859, had risen to 835,289 cwts., of the value of 8,841,557*l.* in 1863. The shipments, however, decreased in 1864, and still more in 1865, owing to the restoration of peace in the cotton growing districts of the great American republic.

As the productiveness of Egypt depends wholly on the extent of the inundation and the command of water, it would be of vast importance to the country if means could be found of regulating the inundation, and preserving the waste of water, which is here the one thing needful. These important considerations, which engrossed a large share of the care and attention of the ancient rulers of Egypt, who excavated the lake Mœris with this view, have not been overlooked by the present rulers, who have projected and, to some extent, carried out great works for the regulation of the inundation. It is believed that it is by no means impracticable so to regulate the flow of the river that it might always be equably diffused over a much larger extent of country than at present, and that an inexhaustible supply might be secured for irrigation in the dry season. Fully realised, such works could not fail to double or treble the productive capacities of the country; and with them and private enterprise and industry, the wealth and population of Egypt in modern times might be as great as under the Pharaohs.

Commerce.—No country can be better situated for commerce than Egypt. She forms the link that connects the Eastern and Western worlds; and it is to her admirable situation in this respect, and to the commerce of which she in consequence early became the centre, that her ancient wealth and civilisation are mainly to be ascribed. It has been customary to trace the ruin of commerce in Egypt, in modern times, to the discovery of the route to India by the Cape of Good Hope; but more stress has been laid on this event than it really seems to deserve. No doubt it most probably would, under any circumstances, have diverted a portion of the trade with the extreme western states of Europe, and in the bulkier articles, into a new channel; but had the same facilities for conducting the commerce with the East existed in Egypt in the 15th and 16th centuries that existed in antiquity, the trade between India and the countries on the Mediterranean, and in the lighter and more valuable products, would, there is every reason to think, have continued to a great extent in the old channel. The truth seems to be, that the extinction of the trade through Egypt, at the epoch referred to, was mainly owing to its having become subjected to the lawless and arbitrary dominion of the Mamelukes, who loaded all articles passing through the country with oppressive exactions, and treated all foreigners, especially Christians, with insolence and contempt. But a new æra has begun; and the intercourse with the East has already in part reverted to its old channels. The establishment of a steam communication between Europe and India by way of Alexandria and Suez, with a railway through Egypt, is one of the most striking and important events in recent times. It has shortened the journey to India, from six months to a month, and has thus immensely contributed to strengthen the hold of Great Britain over her vast possessions in the East. At the beginning of 1865, Egypt had no less than 360 miles of railway, the most important of the lines being that of the 'Overland Route' from Alexandria to Suez, 223 m. in length. This line, constructed chiefly by English engineers and with English capital, has proved of the greatest benefit to the commerce and trade of Egypt.

It was one of the grand projects of the late Mehemet Ali to reconstruct the famous canal that formerly connected the Red Sea and the Nile. According to Herodotus, this canal was commenced by Necho, king of Egypt, and finished by Darius. (Lib. ii. § 158, iv. 39.) Under the Ptolemies, by whom, according to some authorities it was completed, this canal became an important channel of communication. It joined the E. or Pelusiac branch of the Nile at Bubastis, the ruins of which still remain; it thence proceeded E. to the bitter or natron lakes of Temrah and Cheik-Aneded, whence it followed a nearly S. direction to its junction with the Red Sea at Arsinoe, either at or near where Suez now stands. It is said by Strabo (lib. xvii. p. 805), to have been 1,000 stadia (122 m.) in length; but if we measure it on the best modern maps it could hardly have exceeded from 85 to 95 m. Herodotus says that it was wide enough to admit two triremes sailing abreast. This great work having fallen into decay after the downfall of the Ptolemaic dynasty,

was renovated either by Trajan or Adrian; and it was finally renewed by Amrou, the general of the caliph Omar, the conqueror of Egypt, anno 639. (Hérodote, par Larcher, iii. 450.) The French engineers traced the remains of this great work for a considerable distance; and during Mehemet Ali's lifetime great efforts were made to form a new 'Isthmus of Suez Canal.' In the end, an enterprising engineer, M. F. de Lesseps, succeeded in forming a company to carry out this object, and in the spring of 1865 the works were so far advanced that a party of delegates, representing the chief states of Europe and America, actually passed from the Mediterranean to the Red Sea by the new canal. The delegates performed the journey from the Nile to Ismaila by the freshwater canal, and from Ismaila to Port Said by the maritime (saltwater) canal. The boats were towed by camels and horses, and for a distance also on the maritime canal by steamers. After inspecting the works in progress at Port Said the delegates returned again south, sailing back to Ismaila with a fresh northerly wind. The maritime canal, in the spring of 1865, was not navigable for boats beyond Ismaila; the remainder of the journey therefore to the Red Sea had to be performed by the freshwater canal. This latter canal takes its source at the Nile, close to the town of Zagazig, and runs nearly due east through the once fertile land of Goshen until it reaches Ismaila; at about 2 m. from the latter town it branches off to the southward, leaving Lake Timsah and the Bitter Lakes on the east, and joins the Red Sea at Suez.

Ismaila is a flourishing and picturesque little town of 3,000 inhabitants, situated in the centre of the isthmus, 75 kilometres from Port Said, midway between the two seas at the north end of Lake Timsah, and owes its existence to the works of the canal. The width of the maritime canal varies at present, according to localities, from about 16 to 58 metres, except in the immediate vicinity of Port Said, where it attains 84 metres. Its average depth at present is not more than from 2 to 3 ft. The depth of the freshwater canal is much the same at present as that of the maritime canal, but, of course, it is deeper during high Nile; its width varies from about 16 to about 25 metres. The company of M. F. de Lesseps, it is stated, have contracted with various French firms for the completion of the whole of the works from the Mediterranean to the Red Sea by the 1st of July, 1868, at which date the company expect that the canal will be opened to navigation, at a cost to the shareholders not exceeding the subscribed capital of 8,000,000*l.* sterling. (Malta Times, May 4, 1865.)

The whole foreign trade of Egypt centres in Alexandria; and we beg to refer the reader to the article on that city for an account of the imports and exports of the country, and of the mode in which the trade is at present carried on.

Money.—Accounts are kept in Egypt in current piastres, each equal to something under 3*d.*, there being 100 of them to the pound sterling. There are, besides, coins to represent the ½ piastre (*noos ckīrsh*) and 1-40th *fuddáh* or *paráh*) and 5 and 10 fuddáh pieces. The *saadeeyeh* is a small gold coin, of the value of four piastres; and the *kheyreeyeh* is equal to nine piastres, or 21*d.* and 3-5ths. These are the only Egyptian coins. There is, however, the nominal *kees* or purse, which stands for 500 piastres, and the *kazneh*, or treasury of 1,000 purses, or 5,000*l.* sterling. The coins of Constantinople are current in Egypt, but scarce. European and American dollars are pretty generally exchanged for 20 piastres. The English sovereign is called *gin yeh*, for guinea, and is freely taken.

Antiquities of Egypt.—A contemplation of the remains of antiquity scattered throughout Egypt, carries us back to a period of which history furnishes no other records than those derived from the monuments themselves. The temples, the palaces, and pyramids of the country, mark the spot where idolatry began—where civilisation commenced its career; while the annals of other nations prove that this land of gigantic fabrics had attained to a high degree of civil and social order and architectural proficiency, when the rest of the world was involved in barbarism. The range of objects presented to the archæologist may be classified thus:—1. Pyramids; 2. Temples; 3. Colossi and Sphinxes; 4. Sculptures and hieroglyphics; 5. Tombs and paintings.

1. The *Pyramids*, which, for vastness and duration, stand at the head, not only of all the monuments of Egypt, but of the ancient world, are placed at irregular intervals along the E. foot of the Libyan hills, at some distance from the W. bank of the Nile. They commence at Ghizeh, nearly opposite to Cairo, in about 30° lat., and extend S. to about 29°. The pyramids of Ghizeh, three in number, are the best known, the largest, and most celebrated. They stand on a plateau of rock, elevated about 150 ft. above the desert, about 7 m. W. by S. from Cairo. The pyramidal form seems to have been adopted in order to ensure stability. Their plan is that of a perfect square, and their sides contract by regular gradations till they terminate in a point, but so that the width of the base always exceeds the perpendicular height. They are not solid; at least chambers and galleries have been explored in some of the principal pyramids. The greatest of the pyramids of Ghizeh, and indeed of Egypt—that of Cheops, the building of which is described by Herodotus, is a gigantic structure. The sides of its base, which are in the line of the four cardinal points, measure, at the foundation, 763·4 ft., so that it occupies a space of more than 13 acres. Its perpendicular height is about 460 ft., being about 100 ft. higher than the summit of St. Paul's. This huge fabric consists of successive tiers of vast blocks of calcareous stone, rising above each other in the form of steps. The thickness of the stones, which is identical with the height of the steps, decreases as the altitude of the pyramid increases, the greatest height being 4·628 ft. and the least 1·686 ft. The mean breadth of the steps is about 1 ft. 9 in. The best authorities agree in estimating the number of steps or tiers of stone at 203. According to the information communicated to Herodotus by the priests, 100,000 men were employed for twenty years in the construction of this prodigious edifice; and ten years were employed in constructing a causeway by which to convey the stones to the place, and in their conveyance. (Lib. ii. § 124.)

The other pyramids are of inferior dimensions; but they are mostly all, notwithstanding, of vast magnitude—*instar montium eductæ*; they are not all of stone, some of them being of brick.

Many learned dissertations have been written, and many fanciful and a few ingenious conjectures have been framed to account for the original use and object of these imperishable structures. But the difficulty of the subject is such, that hitherto no satisfactory conclusion has been arrived at. Even in the remotest antiquity their origin was matter of doubt, and nothing certain was known with respect to them or their founders. (Plin. Hist. Nat., lib. 36, § 12.) On the whole, however, it would seem to be most probable that they were

intimately connected with the religion of the ancient Egyptians; and that they were at once a species of tombs and temples, but participating more of the latter than of the former character. (For some remarks on this part of the subject, see Shaw's Travels, p. 170, &c. 4to edit.; and Greaves's Pyramidographia, in his works, vol. i.)

It has long been customary to regard the pyramids as monuments merely of the power and folly of the monarchs by whom they were raised, and of the bondage of their subjects. This, however, seems to be a very superficial prejudiced view of the matter. The varying magnitude of the pyramids, the fact of their being scattered over a space extending lengthwise about 70 m., and their extraordinary number, appear to show pretty conclusively that they must have been constructed from a sense of utility or duty; and not out of caprice, or from a vain desire to perpetuate the names or the celebrity of the founders. If we had a sufficient knowledge of antiquity, it would probably be found that the motives which led to the construction of the pyramids were, at bottom, nearly identical with those which led to the construction of St. Peter's and St. Paul's; and that they are monuments of the religion and piety, as well as of the power, of the Pharaohs.

It is impossible for any one to look at these stupendous piles without a deep sense of their sublimity. Their prodigious magnitude, the impenetrable mystery that hangs over their origin, and the purposes to which they were applied, and the conviction that they will endure long after the proudest existing monuments of human greatness have been levelled with the dust, awaken feelings that cannot be excited by any other display of the power and industry of man. The pyramids, too, are associated with some of the most interesting events in the history of the human race. They were probably gazed upon by Moses, and certainly were regarded with wonder and admiration by Homer and Herodotus, Pythagoras and Plato: Alexander the Great and Napoleon marshalled their hosts under their shadow; and they are no doubt destined to receive the homage of poets, historians, and philosophers, and to witness the exploits of warriors, through the all but endless series of future ages. (For further details as to the Pyramids, besides the authorities already referred to, see the Description de l'Egypte, tom. ix.; Modern Traveller, 'Egypt,' vol. i.; Clarke's Travels, vol. v. 8vo ed.; Greaves's Works, i. 1–164, ed. 1737; Ancient Universal History, i. 425–445; Hérodote, par Larcher, lib. ii., with the notes; and a host of other works.)

2. *Temples.*—The remains of buildings devoted to religious worship form, next to the pyramids, the most considerable reliques of antiquity in Egypt. Reared after one uniform design, gigantic in size, massive in detail, and calculated to strike awe to the heart of the worshipper, they show how large a share religion occupied in the policy of the rulers, and in the social condition of the people. Egyptian architecture has—unlike that of Greece—found few imitators; for the vastness and solidity it demands, the enormous proportions it exhibits, require an amount of labour and material only to have been furnished in the land of the pyramids. Hence the unvarying uniformity which all the specimens of it present, unmixed as they are with the additions of modern taste, untouched by the hand of improvement, renders the architecture of Egypt, above that of all other nations, the most characteristic and unique. The plan and appurtenances of an Egyptian temple consist, first, of the approach to it, or *dromos*; a sacred avenue, lined on each side with sphinxes, and in some instances a mile long. This conducts to the entrance, or *propylon*, a principal feature in the building, consisting of pyramidal moles, with a rectangular base and sides, inclining less to one another than in the perfect pyramid, upon which the most elaborate sculptures were cut. Between them is the door; but before the door sometimes two obelisks rise beside two colossi, as in the temple of Luxor (*Thebes*). The number of these propyla and dromi is indefinite; occasionally three must be passed before arriving at the pronaos, or portico of the temple itself, which has a massive façade, supported by pillars. A doorway leads to the sekos, or cell, which is always divided into several apartments. A second door generally leads to an hypostolite hall, having a flat roof, supported by huge pillars. (Denderah.) Some of these halls are of immense size. Other chambers succeed, until the holy recess presents itself; an oblong room, with an altar and several idols sculptured in stone. To almost every apartment there are staircases leading to the terraced roofs, many of which are of such dimensions that at present Arab villages are built upon them. Although many of the temples are more than a mile in length, their interiors are uniformly covered in every part with the most elaborate sculptures. The structures will be found more minutely described under Denderah, Edfou, and Thebes. (Strabo, Edt. de Casaubon, 805; Egyptian Antiquities, i. 69–77.)

3. *Colossi, Sphinxes, &c.*—Although these have been invariably found as appendages to the temples, yet the important place they occupy in the antiquities of Egypt demands a separate notice. Immensity of size, so main an element in producing grandeur of effect, was the chief end of the Egyptian artist; and that this might take a stronger hold upon the imagination of the spectator, the largest colossi have mostly placed near them a small figure for contrast and measure of magnitude. Those representing men are always the figures of some deity, and were placed in pairs opposite the propylæa. They are naked, except a head-dress and cloth bound round the waist. Some are sculptured of one entire stone (hence called monolithes), and were cut out of the quarries and transported to the temples at an enormous expense of time and labour. On the plain of Thebes, about half way between the W. desert and the Nile, are two colossal figures, about 50 ft. in height, seated each on a pedestal 18 ft. long, 14 ft. broad, and 6 ft. high. One of these, supposed to be the 'Memnon,' the most celebrated by far of the Egyptian statues, is said to have emitted sounds at sunrise or soon after, and when the sun's rays fell on its lips. Strabo saw the statue, and heard the mysterious sound; and Tacitus tells us that Germanicus visited the '*Memnonis Saxea effigies, ubi radiis solis icta est, vocalem sonum reddens.*' (Annal., lib. ii. § 61.) A portion of a similar statue, but of smaller dimensions, may be seen in the British Museum (No. 4, Egyptian Saloon), which was brought by Belzoni from the Memnonium. Besides these gigantic representations of deified human beings, those of other gods are met with throughout the country. The strangest are those ideal figures called sphinxes, some having a man's head, and lion's limbs and body (*andro-sphinxes*); others, the most numerous, with a female head; others again displaying a ram's head.

Sphinxes were usually placed in those double rows which formed the avenues, or dromi, of the temples, and vary very much in size. The largest is that placed E. of the second pyramid of Ghizeh. It is an andro-sphinx, much of it buried in sand, but the head and a portion of the body

are visible; the first measuring, from the chin to the top of the forehead, 28 ft., the body being above 100 ft. long; the face has been much mutilated. The excavations of M. Caviglia disclosed some curious appendages to this gigantic monster. On a stone platform, between the fore-paws, is a block of granite 14 ft. by 7 ft., and 2 ft. thick, highly embellished with sculptures in bas-relief; and on the second digit of the southern paw, a Greek inscription is deeply cut (given with others in the Quarterly Review, xix. 411, with a translation by Dr. Young). Between the legs of the sphinx, and on the ground in front of it, is a small temple, a plan of which may be seen in the Quarterly Review. (xix. 416.) Appearances around the sphinx indicate that it was originally enclosed within a wall. Besides the human colossi and sphinxes, other figures belonging to the Egyptian mythology are of frequent occurrence. All the colossi, of whatever denomination, were, it is supposed, coloured over in every part, many of them still exhibiting traces of paint. (Heeren's Researches, ii. 214, Engl. trans.; Quarterly Review.)

4. *Sculptures and Hieroglyphics.*—The preceding chapters only give an account of those specimens of Egyptian architecture and sculpture whose immensity, and, when compared with the classic elegance of Grecian models, whose uncouth forms might be deemed the first rude, though gigantic efforts of the Egyptian artists; but a close examination of the ornaments with which the ancient buildings are profusely enriched, shows the great proficiency to which they had attained in the more refined branches of art. The obelisks, the walls, and all the apartments of the edifices described above, are covered in almost every part with sculptures executed with the most minute finish and exquisite skill. The ruined temples and obelisks of Egypt are, in fact, so many historical records. The wars and triumphs of the Egyptian sovereigns were, for the most part, the theme of the sculptor. The immense propylæa and walls of Luxor and Karnac, for example, give a vivid picture of the forms of pursuit, the attitudes of the victors, the wounded, and the dying,—the sea fights, the religious sacrifices and processions.

The *hieroglyphics* or figures, symbolical devices, and characters with which the Egyptian obelisks and other monuments are covered, are highly interesting, from the insight which they afford into the steps by which men were led to the use of a written language. The most obvious expedient for communicating substantive ideas would be by drawing figures of the objects: thus, a battle might be represented by the figures of armed men contending with each other. But this is a very clumsy and inconvenient mode of conveying information, and cannot be applied to represent mental feelings or abstract ideas. Hence pictorial are very soon superseded by or mixed up with symbolical or allegorical representations, which depict facts, qualities, or circumstances, by conventional or arbitrary marks; and these sorts of characters being, in the course of time, still further simplified, lose a great portion of their original pictorial character, and degenerate into what may be called a common, *demotic*, or *enchorial* writing. The Chinese is the most perfect example of this sort of conventional writing; and Duhalde has given an interesting account of the steps by which it was derived from pictorial writing. (Duhalde, Description Géographique, &c.; ii. 272, ed. 1736.) The present Chinese characters are, in truth, nothing but a refined and improved species of hieroglyphics, each character presenting to the eye a distinct object or quality. At this point the Chinese have stopped; and it seems never to have occurred to them to attempt to mark the different sounds of the voice by characters or letters, and by combining these to form a written language. Now, it was long supposed that, like the Chinese, the characters on the Egyptian monuments were wholly hieroglyphical, and much learning and ingenuity have been expended in efforts to decipher them. It was latterly, however, conjectured by Zoega (De Origine et Usu Obeliscorum, p. 454), that some of the characters on the monuments might be neither pictorial nor symbolical, but *phonetic* (from φωνὴ, *vox*); that is, that they might represent sounds, and not things, and be either alphabetic or syllabic, or both. Warburton had already shown how the refined symbolic writing might pass into the phonetic, but he erroneously concluded that the monuments afforded no specimens of the latter. (Divine Leg., iii. 161.) The surmise, for it was little better, of Zoega has since, however, been established by Dr. Young, Champollion, and others. But in doing this they had facilities unknown to Warburton, Zoega, and previous inquirers. The French, when in Egypt, discovered at Rosetta a stone, now in the British Museum, on which three inscriptions are sculptured; and it appears from the last and most perfect of these, which is in Greek, that the inscriptions are either entirely or substantially identical with each other, being the same royal decree which, it says, was ordered to be cut in sacred characters or hieroglyphics, in *enchorial* characters (that is, in modified or conventional hieroglyphics), and in Greek. The inscriptions are a good deal mutilated, particularly the hieroglyphical; but they are still sufficiently distinct to allow the hieroglyphical and enchorial to be compared with each other and with the Greek. The study of this trilingual stone enabled Dr. Young to determine, or rather perhaps conjecture with considerable probability, which of the enchorial and hieroglyphical signs were phonetic, and to fix their value. M. Champollion and others have since zealously followed up the path thus opened, but with no great or marked success. If, indeed, the Egyptian writing were either wholly figurative or wholly phonetic, a key to its mysteries might be discovered, and its long hidden treasures be again brought to light. But the most probable conclusion seems to be, that it is partly the one and partly the other; or that the characters are in a state of transition from the former to the latter. This, also, is the matured opinion of Champollion, who lays it down distinctly, in the second edition of his Précis du Système Hieroglyphique, that 'the hieroglyphic mode of writing is a complex system—a system *figurative*, *symbolical*, and *phonetic*, in the same text, in the same phrase, I would almost say in the same word.' An examination of the hieroglyphic writings must go far to satisfy every one that this is a tolerably correct statement. Many of the characters are purely pictorial; while others are mere arbitrary symbols, and may be, and most probably in some instances are, phonetic; or, which is the same thing, alphabetic or syllabic. In fact, no certain conclusions can be, or, at all events, have been drawn with respect to it. No doubt it was sufficiently intelligible to those who were instructed in its mysteries, but to those destitute of such instruction its interpretation must be a work of all but insuperable difficulty; so that there seems but little probability that the veil which covered Isis in antiquity should ever be wholly removed. (Besides the authorities already referred to, the reader may consult the art. 'Hieroglyphics' in the Encyc. Britannica, one of the most able and elaborate treatises on the subject that has ever appeared.

5. *Tombs and Paintings.*—Every relic of the ancient Egyptians appears to have been originally

designed for an almost perpetual endurance. Their architecture,—the forms of which are mostly pyramidal, with bases that have withstood the most studious and continued destruction; their colossal sculptures,—many of them monolithes cut out of the solid rock; and even the bodies of their dead,—all seem to have been intended for eternity. Thousands of years have passed since many of the mummies recently unrolled were embalmed, yet every feature, every fibre, still remains. Even the colours of the paintings with which their sepulchres were adorned are still as vivid as if they had been laid on yesterday. So deep were their religious sentiments concerning dissolution, that they bestowed more labour and ornament upon the dwellings of the dead than upon the habitations of the living. 'They call,' says Diodorus Siculus, 'the houses of the living inns, because for a short space we inhabit them; but the sepulchres of the dead they call *eternal mansions*, because they continue with the gods for an infinite space. Wherefore, in the structure of their houses, they are little solicitous; but in exquisitely adorning their sepulchres, they think no cost sufficient.' (Diod. Sic., lib. i.) It was not enough that the bodies of individuals should be preserved by the laborious and expensive process of embalming, but their actions and employments during life were elaborately recorded, and, as it were, perpetuated, by the hand of the painter on the walls of the tombs in which they were laid. In every instance the entrances of the tombs were artfully concealed, presenting an exact resemblance to the rest of the rock in which they were cut; for all the tombs of Egypt are excavations, those of the people being dug in the side of the mountains, and those of the kings within the enclosures of the temples, the most remarkable of which is *Biban-el-Moluk* at Thebes. The expedients employed to secure the dead from desecration are elaborate in the extreme: not only were their entrances a secret, but descent to the chambers where the bodies were laid is only to be made by deep shafts and endless winding recesses. The mummy was enclosed in a sarcophagus profusely ornamented, and standing in the midst of a chamber. Besides human bodies, those of animals held to be sacred were also often embalmed. (Belzoni's Operations and Discoveries; Wilkinson's Topography of Thebes.)

As the monuments unravel, in some degree, the mystery of Egypt's ancient history, so an examination of the paintings that cover the tombs gives us some insight into the domestic condition and usages of its people. Every employment and amusement is vividly pourtrayed around these sepulchral walls, each according to the station of life of the person to which it refers. The forms of every article of furniture, of ships, of carriages, of every thing, in short, pertaining to civilised life, are there accurately figured. As pictures, however, these efforts of the primeval artists are far from pleasing. The colours, though still bright and vivid, are all positive, seldom being blended or softened; and perspective, or any approach to it, is no where to be detected. But the details of private life that they present are wonderfully minute and copious: and by a long and careful study of these, assisted in parts by an active imagination, and by a large infusion of what Dugald Stewart has called conjectural history, Sir J. G. Wilkinson has produced a singularly interesting and instructive work. In fact, if we might trust to his ingenious suggestions and deductions, we should have a clearer insight into the habits, manners, and every-day life of the ancient Egyptians, than we have into those of most European nations. (Manners and Customs of the Ancient Egyptians, 3 vols. Lond. 1837. See also Rosellini, Monumenti dell' Egitto, Pisa, 1834.)

History.—The origin of the Egyptian nation, and the history of their native princes, are involved in the greatest obscurity and uncertainty. This much, however, is established beyond the possibility of doubt, that the Egyptians had attained to great wealth and civilisation, and had established a regular, well-organised, and (if we may estimate it by its results) wisely-contrived system of government, while the greater number of the surrounding nations were involved in the grossest barbarism. At length, however, Cambyses, emperor of Persia, added Egypt to his other provinces. It continued attached to Persia for 193 years, though often in open rebellion against its conquerors. Alexander the Great had little difficulty in effecting its conquest; and it has been inferred from his foundation of Alexandria, which soon became the centre of an extensive commerce, that he intended to establish in it the seat of the government of his vast empire. On the death of Alexander, Ptolemy, the son of Lagus, became master of the country. Under this able prince and his immediate successors, Egypt recovered the greater portion of its ancient prosperity, and was for three centuries the favoured seat of commerce, art, and science. The feebleness and indolence of the last sovereigns of the Macedonian dynasty facilitated the conquest of Egypt by the Romans: Augustus possessed himself of it after a struggle of some duration, and for the next 666 years it belonged to the Roman and Greek empires, constituted their most valuable prov., and was for a lengthened period the granary, as it were, of Rome. In 640 Egypt submitted to the victorious Amrou, general of the caliph Omar; under whose successors it continued till about 1171, when the Turkmans expelled the caliphs: these again were in their turn expelled, in 1250, by the Mamelukes. The latter raised to the throne one of their own chiefs with the title of sultan; and this new dynasty reigned over Egypt till 1517, when the Mamelukes were totally defeated, and the last of their sultans put to death by the Turkish sultan Selim. The conqueror did not, however, entirely suppress the Mameluke government, but merely reconstructed it on a new basis, placing at its head a pacha appointed by himself, who presided over a council of twenty-four Mameluke beys or chiefs. So long as the Ottoman sultans preserved their original power and authority, this form of government, though about the worst that could have been devised had the interests of the country been ever so little attended to, answered their purpose of preserving Egypt in dependence, and of drawing from it supplies of men and money: but the power of the pachas declined with that of their masters; and latterly the whole executive authority centered in the beys, who, except upon rare occasions, paid little more than a nominal deference to the orders of the sultan.

This state of things continued till 1798, when a French army, commanded by Napoleon, landed in Egypt. The Mameluke force having been annihilated or dispersed in a series of engagements with the French, the latter succeeded in subjugating the country. Napoleon having returned to France, the French in Egypt were attacked in 1801 by a British army, by which they were defeated, and obliged to enter into a convention for the evacuation of the country. The British having not long after also evacuated Egypt, it relapsed into its former state of anarchy and barbarism, from which it was at last rescued by the good fortune and ability of Mehemet Ali. This extraordinary man,

a native of an obscure village of Albania, having entered the military service, attained, partly by his bravery, and partly by his talent for intrigue, to the dignity of pacha in 1804. His subsequent history is well known. The massacre of the Mamelukes, in 1811, raised him to almost absolute power; and his victorious arms subsequently wrested Syria from the Grand Seignior. But he was compelled, in 1840, by the interference of the European powers, to relinquish all his Asiatic possessions. The treaty of London, in 1841, ratified by the imperial edict of June 1, made the government of Egypt hereditary in the family of Mehemet Ali. The fifth viceroy—more truly king—of the new dynasty, Ismail Pasha, who assumed the government in January, 1863, was the eldest surviving son of Ibrahim Pasha, eldest son of Mehemet Ali.

EHRENBREITSTEIN, a town and strong fortress of Rhenish Prussia, on a steep and picturesque rock, 773 ft. in height, on the E. bank of the Rhine, opposite to Coblentz, with which it is connected by a bridge of boats. Pop. 3,337 in 1861, excl. of garrison of 1,236. A tower or fortress is said to have been constructed on the summit of this rock by the Romans; and in modern times it was regularly fortified, a well was cut in the rock to the depth of 584 ft., and it was justly regarded as one of the principal bulwarks of Germany. It was unsuccessfully besieged by the French in 1795, 1796, and 1797; but it fell into their hands on the 27th of January, 1799, the garrison having been previously reduced to a state of famine. The French blew up the fortifications subsequently to the treaty of Luneville. They have, however, been reconstructed by the Prussian government since 1815, and rendered more extensive and formidable than ever. Ehrenbreitstein, with the new fortresses on the hill of the Chartreuse and the Petersberg, forms a portion of the grand military position of which Coblentz (which see) is the centre. The town of Ehrenbreitstein is situated at the foot of the castle rock.

EICHSTADT, a town of Bavaria, circ. Regensburg (Ratisbon), on the Altmühl, 41 m. WSW. Ratisbon. Pop. 7,335 in 1861. The town is well built, and contains the summer residence of the ducal family of Leuchtenberg, with a Brazilian cabinet, and other collections of art and science; a cathedral, in the Gothic style, commenced in 1259; with several other churches, a Capuchin convent, bishop's palace, Latin school, ecclesiastical seminary, public library, and museums of painting, antiquities, and natural history. It has four suburbs. About 1 m. distant is the Willibaldsburg, a castle on a height, believed to have replaced a Roman fortress. It has a well of great depth, and its trenches have been cut in the solid rock; but it is now in a state of decay. Eichstadt has manufactures of hardware, earthenware, and woollens; besides breweries and stone quarries. The town originally belonged to the prince-bishops, successors of St. Willibald, and was given by Napoleon I. to Prince Eugene Beauharnois, to whose memory the citizens have erected a handsome monument in the vicinity.

EIMBECK, or EINBECK, a town of Hanover, cap. principality Grubenhagen, distr. Hildesheim, on the Ilme, by which it is surrounded, 37 m. S. by E. Hanover, on the railway from Hanover to Hildesheim. Pop. 5,660 in 1861. The town is enclosed by walls and broad ditches, and is ill built and dirty. It has two hospitals, and a superior school. Eimbeck was formerly celebrated for its beer, which, like London porter, was sent all over the empire. At present, Eimbeck is less celebrated for its beer; but it has some breweries, with fabrics of woollen and linen cloth, linen yarn, stockings, shoes, leather, and chemical products, and a brisk trade in flax and other agricultural produce. In 1836 it suffered severely from a fire.

EISENACH, a market-town of Central Germany, duchy of Saxe-Weimar-Eisenach, cap. of the principality and prov. of same name, on a gentle declivity at the confluence of the Nessa and Hörsel, encircled by wooded hills; 44 m. W. by S. Weimar, and 91 m. NE. Frankfort-on-the-Mayne, on the railway from Frankfort to Leipzig. Pop. 11,517 in 1861. It is the principal town in the Thuringian Forest, and is well built, and laid out, paved and well lighted. It has five suburbs, with four churches, a handsome market-place, in which is the ducal residence, and the new citizens' academy, estab. 1825; a mint, four hospitals, a workhouse, house of correction, town-hall, gymnasium, teachers' seminary, school for foresters, schools for the indigent, and various other public and benevolent institutions. Formerly, this was the most flourishing of all the manufacturing towns between Leipzig and Frankfort. It was formerly noted for its manufactures of serge, plush, and other woollen stuffs; but during the period of the 'Continental System,' the capitalists of Eisenach forsook the manufacture of wool for that of cotton, which, on the re-opening of the continental ports to British goods, was all but annihilated. About 1½ m. S. of the town, is the celebrated castle of Wartburg, on a hill, 1,243 ft. above the level of the sea, in which Luther passed his 10 months' durance, under the friendly arrest of the Elector of Saxony. Travellers are still shown the room he occupied, though the castle is, in great part, in a state of decay.

EISLEBEN, a town of the Prussian states, prov. Saxony, distr. Merseberg; 19 m. W. by N. Halle, and 35 m. SW. by S. Magdeburg, on the railway from Halle to Nordhausen. Pop. 11,120 in 1861. The town is situated on elevated ground, near the Böse, and is divided into an old and a new town, the former of which is encircled with walls and ditches. It has several suburbs; an ancient castle, formerly the residence of the counts Mansfeld; four churches; a Protestant gymnasium, and two hospitals; and is the seat of a council for the circle, a judicial tribunal for the circle and town, and a board of mines. Eisleben is celebrated as the native place of the great reformer, Martin Luther, born here on the 10th of Nov., 1483; and who also died here on the 13th of Feb., 1546. The house in which he was born, and where he breathed his last, was almost wholly destroyed by fire in 1689. Being afterwards rebuilt, it was converted into a gratuitous school for poor children, and a teacher's seminary; the cap, cloak, and other relics of Luther, are preserved in it, and shown to visitors; and his bust is placed over the door. In one of the churches of the town is a pulpit, from which he occasionally preached; and here, also, are busts of himself and Melancthon. Luther was the son of a miner at Eisleben, and the greater part of its inhab. continue to work in the copper and silver mines in its vicinity; but it has also some potash and saltpetre factories, and one of tobacco, besides several breweries.

EKATERINEBURG, a town of the Russian empire, gov. of Perm, near the bottom of the E. declivity of the Oural chain, on the Iset, and in the line of the great road leading from Perm to Tobolsk. Pop. 12,380 in 1858. The town was founded by Peter the Great in 1723, and is regularly built and fortified. Besides being the key of Siberia, it is the cap. of the richest mining district of the empire; has a board for the general direction of the mines, a mint for the coinage of

copper, and extensive iron and copper foundries in its immediate vicinity. Its inhab., who consist mostly of emancipated serfs, formerly belonging to the crown, are almost wholly employed in the mines and working metals.

EKATERINOSLAF, a gov. of European Russia, having the sea of Azoff, and the gov. of Taurida on its S. frontier. Area, 25,630 sq. m. Pop. 870,100 in 1846, and 1,842,681 in 1858. Nearly two-thirds of the surface consist of a vast steppe or plain, without trees, and with a thin arid soil. The portions on this side the Dniepr, by which it is traversed, are the most fertile. Grazing is the principal occupation of the inhab., who possess immense numbers of horses, cattle, sheep, hogs, and goats. The breed of sheep has been materially improved. Bees are abundant; and the silk-worm is raised in the vicinity of Mariopoul. The pop. consists principally of Russians and Cossacks; but there are several other races, among whom 10,000 German colonists. Principal towns, Ekaterinoslaf, Bakhmont, and Mariopoul.

EKATERINOSLAF, the cap. of the above gov., on the Dniepr, immediately below the cataracts; lat. 48° 27′ 20″ N., long. 34° 55′ E. Pop. 11,620 in 1858. Catherine II. laid the first stone of this town, in presence of the emperor Joseph II., in 1787. It is designed on a large scale, and its broad rectangular streets are still very far from being completely filled up. Exclusive of the gov. offices, it has a gymnasium, and some other literary as well as charitable institutions.

ELBA (the *Œthalia* of the Greeks, and the *Ilva* or *Ilva* of the Etruscans and Romans), an island of the Mediterranean, or rather of the Tyrrhene sea, belonging to Italy, from which it is separated by the strait of Piombino, 7 or 8 m. across, between lat. 42° 43′ and 42° 53′ N., and long. 10° 5′ and 14° 25′ E. Shape irregular, but not very unlike that of the letter T, having the upper end towards the E. Length, E. to W., 16 m.; breadth, varying from 2 to 12 m.; circumference, about 68 m.; area, 150 sq. m. Pop. 18,450 in 1861. The island is covered with mountains; a central chain runs through its whole extent, the principal summit of which, towards its W. extremity, is 2,624 ft. in height. Granite abounds, especially in the E. part of the island, and it in a great measure constitutes the numerous rocky shelves with which the coasts are bristled. Geologically the island affords no traces of the action of fire. Secondary and tertiary formations, calcareous, aluminous, or magnesian, are plentiful in the W.; on the E. shore the surface is covered with a reddish vegetable earth, many feet in thickness, and furrowed with ferruginous veins. Iron is everywhere abundant:

'Insula inexhaustis Chalybum generosa metallis.'
Æneid, x. 174.

besides which, copper, calamine, antimony, alum, asbestos, opal, tourmaline, and various kinds of marble are found. There is no navigable river, but there are many small rivulets used to turn mills; the largest are on the N. side of the island, where there are also some salt marshes. Climate excellent, the heats being neither excessive, nor of long duration; nor the cold severe. Except in a few particular localities, Elba is decidedly healthy. The appearance of the island is far from prepossessing; and the cultivable land is but of very limited extent. 'Ruins scattered over the face of the country, wretched hamlets, two mean villages and one fortress—these, generally speaking, are all that meet the sight on the side of the island which extends along the channel of Piombino. The traveller, however, finds the scene changed on visiting Monte-Grosso (in the NE.), covered with myrtles, rosemary, the mastick tree, laurel-thyme, &c.; and Monte-Giove, where the green holm oak, cork tree, laurel, yew, and a small number of wild olives, afford an agreeable repose to the eye. The branches of the hills, which stretch towards Lungone (SE.) present only naked rocks, almost destitute of verdure. In the centre of the island the hillocks are overspread with olives, mulberries, and vines. On the W., the summits and declivities of the mountains consist of granitic rocks. Industry and toil render fertile the small quantity of earth which is collected at their base.' (Berneaud's Voyage to Elba, pp. 94, 95.)

Though the soil is throughout hilly, and the vegetable earth generally shallow, little labour suffices to render it productive. Agriculture, however, is nearly confined to the lowest hill ranges, and the sheltered valleys between them. The corn crop is trifling: at the beginning of the present century De Bernaud says it would have hardly supplied the wants of the inhab. during ¼ part of the year. Maize and pulse are grown. The produce of flax is very small, and hemp is not cultivated: the thread that is used is manufactured from the leaves of the numerous aloes with which the fields of Lungone are covered. All kinds of fruit trees common to Europe grow, excepting the apple; but they are generally ill cultivated, and their fruit inferior. The vintage takes place in September. Both white and red wines are produced; the former are chiefly for home consumption: the latter in small quantity, and good; constitute a chief article of export. The most esteemed is the *Aleatico*, obtained from a superior red Muscadine grape. The oak, beech, chestnut, poplar, alder, and buckthorn, are amongst the forest trees; but timber fit for carpenter's work is rare, the island affording little more than mere underwood. Pasturage is scarce, and cattle few: they consist of asses, some mules, and a few stunted horses, oxen, and cows. The number of pigs, sheep, and goats is more considerable; but the breeds are very inferior. The sea around Elba swarms with fish, including tunnies, anchovies, soles, the *donzellina* (*Labrus julis*, Linn.) and mullet (*Mullus barbatus*). Of these the tunny and mullet are taken in large quantities, and from 5,000 to 6,000 tons of the former are annually exported, besides a considerable supply of the latter.

The chief wealth of Elba is in its mines of iron and salt, which have been wrought from a very remote epoch. The principal mine near the little town of Rio, on the E. side of the island, consists of an entire mountain about 530 ft. in height, which, to use the words of Pliny, is *totus ex eâ materiâ*. It supplies iron ores in every known variety; some yielding from 0·75 to 0·85 of excellent iron, from which a very good steel is obtained. The ancients made many deep excavations and winding galleries in this mine; and pickaxes, nails, lamps, and various other antique articles have been from time to time discovered in it. The average produce of iron ore from Elba has of late years been nearly 18,000 tons a year, worth about 21s. a ton; the whole of which is taken to the opposite coast of Italy to be smelted. The miners work eight or nine hours a day, and are paid 40 lire (about 25s.) a month, 5 per cent. of which is deposited for a pension from the government, for themselves or their widows. Marine salt is manufactured by evaporation in four basins, near Porto Ferrajo. About 4,000,000 lbs. are produced annually, and nearly 100 persons employed in the manufacture. The other branches of industry are principally domestic.

Commerce is chiefly limited to the importation from Leghorn and Marseilles of grain, cheese, cattle, and other articles of prime necessity; and

the exportation of tunny, salt, iron ore, Vermont and Aleatico wines, vinegar, and granite. There are two towns—Porto Ferrajo on the N., and Porto Lungone on the E. coast. The former, which is the cap., is built on a peninsula, between which and the main land is a spacious and good harbour. Pop. about 3,000. It is fortified; its streets, which are wide, clean, and well paved, are mostly terraces cut out in the rock; houses small, badly divided, built of brick, and generally two stories high. It is the residence of the governor of the island and of a military commandant, the seat of a civil and criminal court, and contains two churches, with a prison, lazaretto, hospital, and some subterranean corn magazines. Porto Lungone, with 1,500 inhab., has a tolerable harbour, and is well fortified and difficult of access. The ordinary food of the pop. consists of dried pulse, cheese, bacop, smoked provisions, coarse bread, fresh fish, and a few vegetables; fresh meat and white wine are used only on holydays. Their houses and furniture are equally simple and solid. Bowls, nine-pins, quoits, tennis, and firing at a mark, are the chief sports of the men; there is not much gaiety exhibited in the amusements of the island generally. Robbery is rare, murder still more so; the number of paupers inconsiderable.

The Etruscans, Phocians, Carthaginians, and Romans successively possessed Elba; in the middle ages it was subject to the Saracens, Pisans, Genoese, Lucchese, the counts of Piombino and Orsini. In the 16th century it was ravaged by Barbarossa, and soon afterwards fell to the crown of Naples. Under the French empire it formed part of the kingdom of Etruria. Its chief historical interest is derived from its having been the residence and empire of Napoleon from the 3d of May, 1814, to the 26th of Feb. 1815. During this short period a road was opened between the two principal towns, trade revived, and a new æra seemed to have opened for Elba.

ELBE (an. *Albis, flumen inclytum et notum olim*, Tacit. Germ., § 41.), a large and important river of Europe, through the central part of which it flows, generally in a NW. direction from Bohemia to the German Ocean. Its total length is about 720 m., during which course it passes through Austria, Saxony, Prussia, Anhalt-Dessau, Hanover, Mecklenburg, Denmark, and Hamburg. Its principal affluents are—on the left, the Moldau, Eger, Mulda, Saale, Ohre, Ietze, Pimenau, and Oste; and on the right, the Iser, Schwarz Elster, and Havel, with the Spree. Dresden, Meissen, Torgau, Magdeburg, Leutzen, Lauenburg, Harburg, and Hamburg, are situated upon its banks. It originates in several streams on the S. side of the Schneekoppe (*Snow-cap*), one of the Riesengebirge chain in the circ. of Bidschow in Bohemia, about 4,400 ft. above the level of the sea. At first its direction is E., next S.: at Pardubitz it turns W., and at Kolin NW., from which direction it does not afterward greatly vary. After leaving Torgau it runs for the most part through a flat country. Near Königgratz, about 40 m. from its source, its elevation above the sea is only 658 ft., at Melnik 454 ft., at Schandau 341 ft., at Dresden 279 ft., at Magdeburg 236 ft., and at Arneburg (Brandenburg) 176 ft. only. Above Melnik it is navigable for only small craft, but vessels of 1,500 centners burden may come up to that town. Its volume receives a considerable augmentation by the union of the Moldau; and when it enters Saxony the Elbe is upwards of 350 ft. in width. Between Hamburg and Harburg it is divided into several arms, enclosing some large islands; but these soon afterwards reunite, and the river proceeds in an undivided stream to its mouth. Its estuary, opposite Cuxhaven, 12 m. wide, is encumbered with sand banks, which render its navigation difficult; but ships drawing 14 ft. water come up to Hamburg at all times, and those drawing 18 ft. come up safely at spring tides.

The bridges across the Elbe are numerous above Hamburg; but below that town communication between the opposite banks takes place by means of ferries only. It is connected by the Finow and Frederick William canals, within the Prussian dom., with the Oder and the Vistula, and by that of Steknitz with the Trave near Lubeck; while the short railway from Budweis to Linz connects its affluent, the Moldau, with the Danube.

In a commercial point of view, the Elbe is a river of much importance, being the channel by which the countries of NW. and Central Germany, from Hamburg to the E. parts of Bohemia, export some of their heavy products. By the treaty of 1815 it was provided that its navigation should be free throughout its whole course. But the governments through whose dominions the river flows have contrived to evade this provision, and a series of vexatious tolls and heavy duties are imposed on foreign merchandise. Prussia obliges the transfer at Magdeburg of many goods passing downward to her own vessels, and the government of Mecklenburg-Schwerin levies heavy taxes at Boitzenburg. Above Hamburg, the river has lost much of its former importance by the establishment of railways.

ELBERFELD, a town of Rhenish Prussia, circ. Elberfeld, distr. Düsseldorf; 15 m. E. by N. Düsseldorf, and 23 m. NNE. Cologne, on the railway from Berlin to Düsseldorf. Pop. 56,307 in 1861. The town stands on both sides of the river Wüpper, and is irregularly built, but contains some good houses, most of which have gardens attached to them. It is the seat of the council for the circle, of the judicial and police courts, a commercial tribunal, and a board of taxation, and has two Protestant churches, a R. Cath. church, gymnasium, citizens' and commercial schools, a school of industry, numerous elementary schools, a town-hall, exchange, theatre, general hospital, two orphan asylums, two workhouses, and a savings' bank. There are several *casinos*, or club-houses, and a promenade. In the winter there are frequent balls and concerts. Its principal manufactures are silk, which employ about 6,000 looms; with cotton and linen fabrics, linen and cotton thread, velvet, lace, ribands, with establishments for calico printing. In the cotton factories many steam engines are employed, and there are numerous water-mills and establishments for the bleaching of linen. But the most celebrated of the Elberfeld factories are those appropriated to the dyeing of Turkey red. In this art, whether it be owing to the air or the water, or to some peculiar process or mystery, the dyers of Elberfeld have attained to unrivalled excellence. Considerable quantities of yarn were formerly exported from Glasgow and other places in the United Kingdom to be dyed at Elberfeld, and again imported to be wrought up. Elberfeld is the seat of the Rhenish Foreign Trade Company, the German-American Mining Union, the Rhenish Prison-Society, a Bible and a scientific society, and many benevolent institutions.

Adjoining Elberfeld, and forming, in fact, a kind of suburb of it, is Barmen, a long straggling place, made up by the union of several villages. It has four churches, one of which, erected in 1830 for the use of the R. Cath. pop., was liberally contributed to by the Protestants; a high school, a deaf and dumb asylum, exchange, two discount banks, a police court, and a commercial tribunal. Its manufactures are the same as those

of Elberfeld, with the addition of steel and plated articles, hardware, chemical products, and earthenware. Along the banks of the river are some extensive meadow grounds, used for bleaching linen, which branch of industry contributed greatly to the rise of both towns. Numerous kitchen gardens surround Barmen, the cultivation of which occupies many individuals. The road through the valley of the Wüpper, for a distance of perhaps 6 m. adjacent to Elberfeld, is lined on either side with mills, factories, and habitations; this being the most populous as well as the most industrious district of the Prussian monarchy. It is estimated that altogether nearly 16,000 hands are employed in manufactures in and near Elberfeld and Barmen, and that the value of the manufactured goods annually amounts to 12,000,000 or 14,000,000 thalers, or from 1,800,000*l.* to 2,100,000*l.* Wages, owing to the increasing demand for labour, are high at Elberfeld, and the working classes are comparatively well off.

ELBEUF, a town of France, dép. Seine Inférieure, cap. cant., on the Seine, a tributary of which intersects it, 11 m. S. by W. Rouen, on the railway from Rouen to Paris. Pop. 20,692 in 1861. The town is generally ill built, but possesses a tolerably good square, and some handsome buildings. It has no public edifices worthy of notice except two churches, one of which has some stained glass, presented by the cloth manufacturers of the town in 1466, exhibiting a curious emblematical device indicative of their profession. Elbeuf has been long celebrated for its woollen manufactures, and is at the present moment the principal seat of that branch of industry in France. In 1787, Elbeuf produced about 18,000 pieces of cloth yearly: in 1814, the quantity had increased to from 20,000 to 25,000 pieces: and at present the produce is estimated at about 100,000 pieces, valued at 75,000,000 francs, or 3,000,000*l.* It is stated that about 20,000 men, women, and children are employed in the different departments of the business; but of these many belong to the surrounding districts, and return from town at night to their lodgings in the country. 'The working classes of Elbeuf,' says an official report, by the maire of the town, 'enjoy, in general, easy circumstances; they have always lived happily, for two very powerful reasons: the first, because the manufacturers are constantly in their workshops, work themselves with their workmen, know their wants, and identify themselves with all that happens to them for good or evil; the second, because the price of weaving varies little, the proportion between times of prosperity and times of distress being 20 per cent. at most on the amount of wages, and that only in certain departments. The work-people are divided into three classes; the adults, the day labourers, and the weavers.' There are in Elbeuf a gratuitous school of mutual instruction for boys, a gratuitous institution for girls, an infant school, and a gratuitous Sunday school for the adult workmen; and, independently of these public institutions, there are a number of private schools. M. Villermé (Etat Physique et Moral des Ouvriers) states that, compared with the work-people of Rouen, those of Elbeuf are much the more correct in their morals and habits. They are, he says, for the most part industrious and economical; and many of them are supposed to have saved a certain portion of their earnings, especially those who live out of town.

Elbeuf is said to have existed in the 9th century, but its origin is uncertain. During the administration of Colbert, its manufactures were in a comparatively flourishing state; but they suffered severely by the revocation of the edict of Nantes. At the beginning of the 18th century, its manufacturers had begun to establish commercial relations with Spain and Italy; and it now has a direct trade not only with those countries, but with America, Germany, and the Levant.

ELBING, a town of Prussia, prov. Prussia, cap. circ. on the Elbing, about 5 m. from where it flows into the SW. angle of the Frische Haff, 31 m. SE. by E. Dantzig, and 58 m. SW. Königsberg, on the railway from Dantzig to Königsberg. Pop. 25,540 in 1861. The town is divided into the old town, new town, and suburbs, part of which are enclosed, together with the old and new town, within a line of fortifications. The ramparts and walls are lofty, flanked with towers, and surrounded with ditches, but they have not been in a state of efficient defence since 1772. The town is entered by 7 gates. The new town is well built, but it is quite otherwise with the old town. Elbing is well lighted; it has a Catholic and 9 Protestant churches, a synagogue, a gymnasium with a library, 6 hospitals, an orphan and other asylums, a convent for old women, a house of industry, established by an Englishman named Cowle, in which 400 children are educated, and numerous schools for both sexes and all classes, education among the poor having made great progress in this town. It is also the seat of a council, a judicial court for the circle, and a municipal tribunal. It has a garrison, a bank, exchange, fire assurance office, numerous warehouses, principally in one of its suburbs, and many sugar refineries, with pearl-ash, vitriol, tobacco, linen, sail-cloth, oil, starch, soap, chicory, and other factories, in some of which large steam engines are employed. The trade of Elbing is extensive: its exports consist chiefly of corn, timber and staves, hemp and flax, the produce of its own manufactures, feathers, horse-hair, wool, fruit, butter, and packthread. The Krafuhl canal connects Elbing with the Nogat. The Frische Haff is too shallow to be navigated by vessels of any considerable burden, so that the trade of the town by sea has to be carried on, by means of small vessels or lighters, through Pillau at the mouth of the Frische Haff. About 25 ships, besides river craft, belong to merchants of the town. Elbing was founded about 1237, and became afterwards one of the Hanse Towns. It was united to the Prussian dom. in 1772.

ELCHE (an. *Ilici*), a town of Spain, prov. Valencia, near the left bank of the Elda, in a plain almost entirely covered with palm trees, 15 m. WSW. Alicante, and 8 m. W. from the Mediterranean. Pop. 10,353 in 1857. The town is surrounded by walls, has some good streets and squares, and 6 public fountains, but of these one only has potable water; 3 par. churches, the principal of which is a fine building, with a majestic dome; 3 convents; a magnificent old castle, belonging to the Duke of Arcos, on whose estate the town is built; a barrack for cavalry; 3 primary schools, and a grammar-school. It has manufactures of coarse linens and cottons; 10 flour-mills; with distilleries and tanneries.

Elche might, with propriety, be called the 'city of dates,' being everywhere surrounded by plantations of palms. Besides its large produce of dates, the country round abounds in barilla, that exported from Alicante being chiefly raised in the vicinity of Elche. A great proportion of the dates imported into England as the produce of Barbary, are from this city. The wages of field labour here are 3 or 4 reals, and every thing is proportionably cheap. Elche is the native country of Don George Juan, a distinguished mathematician and natural philosopher, the companion

of Ulloa, in the commission sent to Peru, towards the middle of last century, by the French and Spanish governments, for the measurement of a degree of the earth's surface. Elche was recovered from the Moors in 1363.

ELCHINGEN, a small village of Bavaria, on the N. bank of the Danube, about 7 m. NW. Ulm. Pop. 570 in 1861. This village was the scene of an obstinate engagement between the French, under Marshal Ney, and the Austrians, on the 14th Oct., 1805: the former at length succeeded in carrying the bridge and position of Elchingen, and by this success contributed materially to the capture of Ulm, which, three days after, surrendered to Napoleon. Ney was rewarded for his gallantry on this occasion with the title of Duke of Elchingen.

ELEPHANTA, a small island on the W. coast of Hindostan, presid. Bombay, prov. Aurungabad, on the E. side of the harbour of Bombay. It is about 6 m. in circumference, and consists of two long hills and a narrow valley between them. It is named *Gorapori* by the Hindoos: the Portuguese gave it the name of Elephanta, from a colossal elephant, about three times the natural size, hewn out of the solid rock, and standing about ¼ m. from the landing-place, but which has now almost entirely fallen to decay. A gentleman who visited the island in 1836 reports, that only three legs and a part of the fourth were then remaining. This island is celebrated for some remarkable cave-temples, so many of which exist on the W. side of India. In the face of a hill, about ½ m. from the landing-place, is the first cave; little of which, however, appears to have been completed. About ¾ m. farther is the great cave, an excavation 130½ ft. from N. to S., by 133 ft. from E. to W.; its ceiling flat, varying from 15 to 17½ ft. in height, and supported by 26 pillars and 16 pilasters. It has three entrances—on the N., E., and W.; the front of each consisting of 2 pillars and 2 pilasters; but the N. front is the principal, and directly faces the remarkable triad or three-headed figure—the principal object within the temple. This is a gigantic bust, 15 ft. high, composed of three colossal heads; the front face having a placid and agreeable physiognomy; that on the left being to all appearance a female, and also mild looking; but that on the right, according to most travellers, having a repulsive aspect. The latter, as well as the front face, has the third eye in the forehead, so characteristic of Siva. Indeed, in the opinion of the best authorities (see Erskine, in Trans. of the Bombay Lit. Soc., i.; Sykes, in Journ. of the Asiat. Soc., v. 81–90, &c), the whole three-headed figure relates to Siva only, and not to a trinity of Brahma, Vishnu, and Siva, as has sometimes been imagined. Similar busts abound in the Brahminical caves at Ellora (which see) appropriated to the worship of Siva. This figure has originally had 6 arms, each of the hands of which held some object; but all are now greatly mutilated. The niches on either side the triad are of considerable size, and crowded with figures, among which, as well as in the other compartments around the temple, Brahma, Vishnu, Paravati, Kartik, Ganesa, and other Hindoo divinities, may be recognised, but always in a condition inferior to Siva. On either side of the principal figure is a small dark chamber, probably anciently devoted to the use of the Brahmins; and there are three separate sanctuaries within the temple, each containing a figure of the *lingam*. The columns and other portions of this cave are ornamented in a most elaborate manner, and, altogether, the temple within presents an imposing appearance. From some cause, however, it is not much frequented by pilgrims: several of its pillars have been thrown down; it is in part mouldering away with damp, and becoming choked with earth; and, unless some effectual means be speedily taken for its preservation, it will in a few years be in a state of irreparable decay. (Erskine, in Bombay Trans.; Sykes, Asiat. Res.; Grindlay's Views.)

ELEPHANTINE', the last of the larger islands, at the extremity of the cataracts of the Nile, immediately opposite to Assouan, near the S. boundary of Egypt; lat. 20° 5′ 2″ N., long. 32° 54′ 49″ E. Placed at the threshold of the kingdom, Elephantiné has been justly called the key of Egypt, and claims some importance as a military post. Under Psammetichus it contained an Egyptian garrison, to protect the country from the inroads of the Ethiopians. Herodotus (Euterpe, § 30) found it occupied with Persian troops; and, in Strabo's time, the Romans had three cohorts there, to guard, what Tacitus has expressively called the *Claustra Romani imperii*. (Strabo, lib. 17; Tacit. Annal., lib. 2, § 61.)

The base or kernel of the island is a granite rock, covered with the rich alluvial soil brought down by the river; and to prevent this from being again washed away, it has been protected by quays, which have been repaired from time to time, so that it is impossible to fix the epoch of their first construction. The richness of its soil admits of the island being cultivated in every part; and though it be less than 1 m. in length, and not ¼ m. broad, it presents a verdure and fertility equal to the finest spots of Egypt, and forms a refreshing contrast to the sterility to which, for many miles round, beyond the banks of the Nile, the country is doomed. Hence, the Arab name for Elephantiné is *Djeziret el-Chaf*, 'the islet of flowers.' The S. extremity of the island only is rocky and elevated, and the bare rock comes down to the edge of the river; but the rest of it is covered with shrubs, groups of palms, mulberry gardens, acacias, dates, and sycamores interspersed amongst human habitations, mills, canals, and the ruins of temples. (Ritter's Africa, 3rd division, § 26; Richardson's Travels.)

The wreck of the ancient town forms a sort of plateau, and gives to the island its greatest elevation. Here, till recently, were the remains of two temples, one dedicated to Cnouphis by the Pharaoh, Amenophis III.; and one dedicated to a triad consisting of Cnouphis, Sate, and Anouke, the latter being of the age of Alexander, son of Alexander the Great. But we regret to say that these interesting ruins no longer exist, having been barbarously demolished in order to employ the stones in building barracks and warehouses at Assouan. In the quay Champollion found fragments of edifices that had been constructed by the Pharaohs Mœris, Mandouei, and Rhamses the Great, or Sesostris. (Lettres de l'Egypte, p. 172.)

The most interesting part of Elephantiné is its quarries. These furnished, in the reign of Amasis, one of the greatest marvels Herodotus (Euterpe, § 175) saw at Sais—a single block of granite, out of which was cut an entire temple. No fewer than 2,000 men are said to have been occupied during three years in transporting this huge monolithic edifice down the Nile to its destination. The quarry affords ample proofs of the mechanical skill and patient labour of the ancients. Immense columns have been evidently cut out of the solid rock in one mass. The marks of the workman's chisel and wedge are as fresh as if they had been imprinted yesterday, and the tracks of carriage wheels are equally distinct. Some sculptures are

merely blocked out, while others appear in a more advanced stage, and a large sarcophagus is two-thirds cut out of the rock.

Besides the remains of Egyptian architecture, others have been found which would appear to belong to the Romans, particularly a large wall to the S. Another, from 40 to 45 ft. high, and 609 ft. long, of a convex construction, had a Nilometer fixed in it, which, there can be little doubt, was the one mentioned by Strabo (lib. xvii.). Champollion, however, says nothing of the Nilometer; and it may, perhaps, have been destroyed as well as the remains of the temples. Over the ruins of the ancient town are strewed many fragments of pottery, among which other memorials of the Romans have been found, consisting of tokens or coins of red earthenware, having the name *Antonius* inscribed on them in a Greek running hand. (Ritter; Jowett's Christian Researches, p. 40; Conder's Egypt, ii. 191–193.)

Elephantiné is inhabited by Nubians, who are said to be kind and hospitable to strangers. The women are described by Dr. Richardson as possessing much personal beauty, somewhat too freely displayed. (Light's Travels, pp. 51–53; Richardson's Travels.)

ELGIN, a royal bor. and market town of Scotland, co. Elgin or Moray, on the Lossie, 5 m. from its influx into the sea at Lossiemouth, 120 m. N. Edinburgh, and 59 NW. Aberdeen, on the railway from Aberdeen to Inverness. Pop. 7,543 in 1861. The situation of the town is very agreeable, having the Lady Hill, a beautiful verdant mount on the W., and the Quarrywood Hill on the E., clothed with wood to the summit. The town consists of one street, about a mile in length, with a few small streets intersecting it at various distances. The principal street is handsome, well paved, and so wide that a new church stands in the middle of it, on the site of an old church, called St. Giles. This new church, which has a richly ornamented cupola 112 feet high, and a spacious Doric portico, is one of the best of the numerous public buildings which Elgin contains. Grey's hospital (founded in 1819 for the reception of the sick poor of the town and county of Elgin), a building of two stories, of Grecian architecture, with a projecting portico of four Doric columns, and the centre crowned with a dome, stands on a rising ground at the W. end of the town, and forms a beautiful termination of the High Street. At the opposite end of the town stands the Elgin Institution, a quadrangular building of Grecian architecture, founded by the late General Anderson, for the education of youth, and the support of old age. This institution, which cost 12,000*l.* (its founder having bequeathed 70,000*l.* altogether for the charity), is calculated to contain 10 aged and indigent persons, and 60 children, and to afford gratuitous education for about 230 children belonging to the town and parish. The other public buildings are the academy, assembly rooms, Trinity Lodge rooms, jail and court-house, and chapels belonging respectively to the Episcopalians, the United Associate Synod (two), the Independents, and the Roman Catholics. But Elgin, which was the seat of the bishops of Moray, is principally celebrated for the ruins of its cathedral, one of the most magnificent in the kingdom. It was built in 1224, the cathedral establishment having been transplanted at that time from Spynie to Elgin. The original structure (with other sacred buildings, and no small portion of the town) was burned in 1390 by the Earl of Buchan, youngest son of Robert II., known by the name of the 'Wolf of Badenoch.' It was rebuilt by the bishops of Moray, in the form of a Passion or Jerusalem cross, having 5 towers, one at each end, and one in the centre. The length of the building was 264 feet; the breadth of the traverse 114; while the height of the centre tower was 198. The cathedral was unroofed in 1568, by order of the Regent Morton, for the sake of its lead; and this venerable specimen of architecture and sculpture has since been allowed to fall into decay. The great centre tower fell in 1711. But the chapter-house, the turrets and walls of the east choir, and the towers on the west, are still remaining. Of the walls of the nave and traverse only a few fragments remain. Steps have been taken by the barons of exchequer in Scotland to prevent any further dilapidation. A college was attached to the cathedral, and contained not only the church and grave-yard, but also the bishop's house and those of 22 canons. The eastern gateway and part of the wall are still standing. The ruins of a convent of Greyfriars, settled here by Alexander II. in 1234, are still to be traced S. of the town. Of the convent of the Observatines, established here in 1479, no remains can now be seen. A Maison Dieu, or religious hospital, once stood on the site now occupied by the Elgin Institution. (Keith's Scot. Bishops, by Russell, Edin. 1824, pp. 138, 141, 142, 444, 453.)

In addition to the two charitable institutions already mentioned (Grey's and Anderson's), there are eight other charitable endowments of a subordinate order, most of them old. One of them is Grey's charity (the founder of the hospital), for the support of reputed old maids of the town of Elgin, with funds amounting to 3,000*l.* The seven incorporated trades, and the guildry, are each, in one respect, of the nature of provident institutions. The academy, which is partly endowed, and partly supported from the town's funds, contains three separate schools, and has long been a distinguished seminary. There are no fewer than ten schools in the town. There is a subscription and other libraries, as also a reading-room, with numerous benevolent and religious societies. There are no manufactures, except a tannery and a brewery. The town has ten fairs yearly for live stock, and a weekly market for grain and other agricultural produce.

Elgin can boast of great antiquity. In the 12th century it was a considerable town with a royal castle situated on the Lady Hill. The earliest charter of guildry was granted in 1234. It unites with Cullen, Banff, Peterhead, Kintore, and Inverary, in sending a member to the H. of C., and, in 1864, had 314 registered voters.

EL JEM. See TYSDRUS.

ELORA, or ELLORA (*Elura*), a village of Hindostan, dom. of the Nizam, prov. Aurungabad, in about lat. 19° 58′ N., and long. 75° 23′ E.; celebrated for some remarkable cave temples, excavated in the solid rock, about 1 m. to the E., which in magnitude and perfection of execution, surpass all other structures of the kind in India. The site of these curious monuments of art is a crescent-shaped hill, of moderate elevation, the concavity of which faces W. or NW. Its constituent rocks are chiefly basalt, a hard vesicular rock, and a rock of a loose, gritty, absorbent, and crumbling nature, interspersed with veins of quartz, silicious stone, and blood-stone. The caves are cut in the W. slope or concavity of the hill above mentioned, extending, with intervals of various length between them, for about 1 m. from one extremity to the other. They may be divided into three groups: the N., which appear to have belonged to the Jain sect, since the purely Buddhic sculptures and emblems in them are intermixed with many Brahminical ones; the central, which are by far the most nu-

merous, and are solely Brahminical; and the S., which are as decidedly Buddhic. Beginning at the N. extremity, a few hundred yards up the hill, cut in a mural rock of black basalt, is what is called the *Parisnauth*, a colossal figure of Buddh, 10 ft. high, apparently in a triumphal car, and seated on the folds of a large snake, whose seven heads form his canopy. Six attendant figures surround this statue, over which a handsome stone porch was erected about a century since. This idol is still held in much reverence by the Jains, many of whom make an annual pilgrimage thither. About 200 yards below this idol is what is called the *Indra Subbah*, or 'Court of Indra,' a temple consisting of three caves, opening one into another, and situated behind an area cut out of the rock, in which stand an elaborately sculptured pagoda, a handsome obelisk, and the figure of an elephant. The front of this temple is in many parts covered with sculptures in relief; and at the extremities of the verandah before it are two figures, a male and a female, the former seated on a couchant elephant, and the latter on a lion. These figures have been generally called Indra and Inderanee; but Col. Sykes contends that they represent the prince and his consort who founded this temple. (Journ. of the Asiat. Soc. of Bengal, vi. (1837), 1038.) The caves consist of two stories each; but the lower stories are greatly injured by damp, and partially choked up with earth. The three chambers on the story above vary from about 60 to 70 ft. in length, by nearly as much in breadth, and from 13 to 15 ft. in height, and their ceilings are supported by numerous pillars and pilasters. Each contains a colossal figure of Buddh, similar to that already described; and in the first and second chambers there are figures of other personages. The compartments round the walls of each of these rooms contain figures of Buddh, in various attitudes, 'some standing and some sitting: the attendants are riding on elephants, tigers, and bulls.' (Sykes.) None of these caves have any cells opening from it, which appendages are almost universally found in temples strictly Buddhic. About 40 or 50 paces farther to the E. there is a fourth cave, and still farther on, another; but both are much choked up with earth.

The first of the series of Brahminical temples, proceeding from the W., is about 200 yards distant from the latter, and entitled *Doomar Leyna*, 'the Nuptial Palace.' This is the most extensive chamber of all: under one roof it is 185 ft. in length, by 150 ft. broad; its ceiling averages 19 ft. in height, and is supported by 28 pillars and 20 pilasters. The entrance to this excavation is through a passage cut in the solid rock, 100 ft. long by 8 ft. broad. On the left-hand side of the W. entrance is an eight-armed figure of a revengeful character, representing Siva in one of his forms; on the right are Siva and Parvati together in a heaven, which Rawun (the Hindoo *Briareus*), a figure with numerous heads and arms, is endeavouring to shake. At the end of the central colonnade is a square sanctuary, entered by four doors, each guarded by two gigantic figures, 14 ft. 8 in. in height, and containing the *lingam*, which emblem is found in nearly all the second group of caves at Ellora. There are numerous small caves, all of which are considered to have been devoted to the worship of Siva: in the front of each there is a bust of the celebrated triad, a mutilated specimen of which exists at Elephanta. (See ELEPHANTA.) Over the door of one cave is the image of Luximee, attended by elephants; and another, a noble hall, 90 ft. long, 26½ ft. wide, 15 ft. in height, and adorned by highly-finished pillars, has numerous compartments full of figures, amongst which is a group supposed to represent the marriage of Siva and Parvati.

But the most splendid temple at Ellora is that called *Kylas*, or 'Paradise,' a pagoda of a sugar-loaf form, 100 ft. in height, surrounded by five chapels, nearly similar in form; the whole, together with the area in which they are situated, being excavated in the solid rock, and covered with sculptures from top to bottom, both within and without. The extreme depth of the excavation is 401 ft.; the area itself is 323 ft. in depth, by 185 ft. in its greatest breadth (on the E. side). On the N., S., and E. it is surrounded by colonnades, varying in length from 185 to 115 ft., and having from 15 to 18 square pillars each: the walls which these colonnades surround are covered with sculptures, and in the front of the wall by which the area is enclosed on the W. side are niches filled by gigantic figures. *Kylas* contains the representations of nearly all the Hindoo Pantheon; but, as Col. Sykes observes, notices of its figures alone would fill a volume, and the temple must be seen to be duly appreciated. (Those who wish for farther information may resort to Captain Seely's work, and to the accounts of the Ellora Caves, by Col. Sykes, in the Trans. of the Lit. Soc. of Bombay, iii. 281, &c.; Sir C. Malet, in the Asiatic Researches, vi. 382–424.)

The southern group of caves is very interesting. There are four principal ones: the first has three stories; the second, 2; the third, 80 ft. long by 42½ broad, and 35½ in height, is in beauty inferior to none, and has an arched roof, supported by ribs of wood similar to that of Carlee, or the great cave at Kennery; the fourth is accompanied by several smaller ones, and all are very highly finished. Each temple of this group contains a large figure of Buddh, and other characteristics of Buddhic temples. (For some speculations as to the era of these caves, see Journ. of the Asiat. Soc. of Bengal, vi. (1837), 1038–41.)

ELSINEUR, or ELSINORE (Dan. *Helsingor*), a marit. town of Denmark, on the E. shore of the isl. of Zealand, at the narrowest part of the Sound, or principal channel leading from the N. Sea to the Baltic, 7 m. W. Helsingborg in Sweden, and 23½ m. N. by E. Copenhagen; lat. 56° 2′ 17″ N., long. 12° 36′ 49″ E. Pop. 8,442 in 1861. The town stretches irregularly over sloping ground towards the shore. It is well built, and has some good edifices. There are two churches, one of which, though externally very plain, contains many interesting objects of antiquity, and a lofty altar gorgeously ornamented. The public cemetery of Elsineur is a large and handsome enclosure. Immediately adjacent to the town, on the NE., is the castle of Cronborg. This edifice, built by Frederick II. in the boldest style of Gothic architecture, is said to be one of the finest structures of its kind in Europe. 'Though of great extent, yet so elegant are its proportions, that it seems as light and graceful as a building raised more for ornament than for use. So far, however, from being a mere thing of show, it is a strong and substantial fortress, strengthened by all the advantages that military science can give to a position which, though very low, is still extremely important, from its sweeping the Sound most completely, both up and down. The approach, therefore, is garnished with lunes and demi-lunes, scarps, ditches, stockades—in short, all the imposing externals of a fortress kept in the highest order.' (Bremner, i. 253.) From the summit of the lighthouse of this fortress the scene is one of surpassing beauty. Cronborg is now chiefly used as a prison; it was the place of confinement for some years of the unfortunate Queen Matilda, sister of George III. of

England. Before the abolition of the Sound dues —bought off, in 1856, by the payment of 3,324,632*l.*, one-third of which was contributed by Great Britain—all merchant ships passing to and from the Baltic were obliged, under certain reservations depending on the weather, to salute Cronborg Castle by lowering their topsails when abreast of the same; and no ship, unless belonging to Sweden, was allowed to pass the Sound without clearing out at Elsineur and paying toll. The Sound duties had their origin in an agreement between the King of Denmark on the one part, and the Hanse Towns on the other, by which the former undertook to construct light-houses, land-marks, &c. along the Cattegat, and the latter to pay duty for the same. The duties varied at different periods; and the greater part of the inhab. of Elsineur were, in some way or other, connected with their management or collection. Now that the Sound dues are abolished, the place is very quiet, though not in a state of decay. The principal communication between Denmark and Sweden takes place here, and regular boats sail three times a day to and from Helsinborg.

Elsineur is well known from its being the scene of Shakspeare's noble tragedy of 'Hamlet.' 'The principal incidents of the play are founded on fact, but so deeply buried in remote antiquity, as to make it difficult to discriminate truth from fable. Saxo-Grammaticus, who flourished in the 12th century, is the earliest historian of Denmark who relates the adventures of Hamlet. His account is extracted, and much altered, by Belleforest, a French author; an English translation of whose romance was published under the title of 'The Historye of Hamlet;' and from this translation Shakspeare formed the groundwork of his play, though with many alterations and additions.' (Coxe's Travels in the N. of Europe, v. 90.)

ELVAS, a fortified city of Portugal, on the frontiers of Spain, prov. Alemtejo, 120 m. E. Lisbon, 12 m. W. Badajoz, on the railway from Lisbon to Badajoz and Madrid. Pop. 18,510 in 1858. The town is picturesquely situated, on a hill covered with olive trees and orchards, between two other hills which command it, and on which are the fortresses of Santa Lucia and La Lippe. These and the other defences of the town, reckoned the *chef-a'œuvre* of the Count de La Lippe Schomberg, and a model of their kind, render it so strong, that no impression could be made upon it, except by a large army and a regular siege. The principal street, Rua de Cadea, has an antique, venerable appearance, from the remains of Moorish houses and towers. The cadea, or prison, stands at one end, and opposite to it is the hospital for the townspeople, which is well conducted, and divided into wards, as in England, with separate apartments for infectious diseases. On the whole, however, the town is ill built, and the streets mostly narrow and dirty. The principal edifices are—the cathedral, arsenal, bomb-proof barracks for 6,000 or 7,000 men, and theatre. It has several churches and convents, with a college and a seminary. There are manufactures of arms and jewellery; but the principal dependence of the inhabitants is on the contraband trade carried on across the Spanish frontier. The Plaça, or great square, is remarkable for a singularly formed tower in front of the cathedral, and the houses exhibit specimens of domestic architecture from the days of Moorish splendour and elegance down to modern times. Several of the grotesque carvings are executed with great richness and delicacy. The rooms in the modern houses are large, lofty, and paved with bricks arranged in various figures, the windows not being glazed, but merely closed with latticed blinds. The decorations of some of the chapels in the cathedral are extremely elegant, the walls and ceilings being covered with a profusion of gilded carving, but the pictures are execrable. The grand altar is supported by Corinthian pillars of grey marble, surmounted by a canopy of crimson and gold silk, beneath which is a large picture of the birth of Christ: the altar itself is covered with crimson and gold silk, and is crowded with silver candlesticks. There is no room in the town for public gardens, but the covered way from the Porta d'Esquina to the Olivença gate is planted with trees, and each *place d'armes* has a fountain, and is tastefully laid out. The walk round the ramparts is extremely fine, commanding a view of the country for many miles in all directions. The town is furnished with water, brought from an eminence about 3 m. W. from it by an aqueduct constructed by the Moors, which supplies numerous fountains, one of which is of very large dimensions. In crossing the valley 1½ m. in width, this aqueduct has four tiers of arches, each above the other, making together 250 ft. in height. It is supported by strong buttresses; and, to add to its strength, it is built in a zig-zag direction. The environs are fertile in grain, wine, oil, and fruit. Manufactures, arms and hardware.

Elvas was a post of great importance during the Peninsular war. Marshal Junot took possession of it in March, 1808, and held it till it was given up, under the convention of Cintra, in August following. It has bomb-proof barracks for 6,000 or 8,000 men, and furnished the artillery and stores for the siege of Badajoz. The Duke of Wellington had a powerful telescope placed in the tower of La Lippe during the operations, by which the interior of the castle of Badajoz could be plainly looked into, and all the operations discovered. (Napier's Peninsular War, i. 144, 160, 202; ii. 126; iii. 510; iv. 185, 401.)

ELY, a city of England, co. Cambridge, in the district called the Isle of Ely, on an eminence near the Ouse, 16 m. NNE. Cambridge and 72¼ N. London by Great Eastern railway. Pop. 7,428 in 1861. The city includes the parishes of Ely, Trinity, and St. Mary's; the extra-parochial district of Ely college, and the chapelry of Chetisham, comprising, in all, an area of 17,480 acres, of which about 5,000 may belong to the city properly, so called. The latter consists principally of one long street, with a market-place in the centre; several of the houses are built of stone, and have an antique venerable appearance; and the place seems to have been but little affected by those changes that have so materially modified the appearance of most other towns. It owes its entire distinction to its being a seat of a bishopric, established here in 1107. Its cathedral is one of the most celebrated in England. Being partly of the reigns of William Rufus and Henry I., and partly of subsequent periods, it displays a singular admixture of the Saxon, Norman, and English styles of architecture; but notwithstanding the dissimilarity of its parts, it must, when considered as a whole, be regarded as a truly magnificent edifice. Its extreme length from E. to W. is 535 ft.; the length of the transept is 190 ft.; the height of the lantern on the summit of the dome over the celebrated octagon tower, is 170 ft.; the extreme height of the W. tower, one of the finest in the kingdom, is 270 ft.; the height of the E. front to the top of the cross is 112 ft. It has many interesting monuments. St. Mary's chapel, contiguous to the cathedral, now

Trinity church, was commenced in the reign of Edward II., and is one of the most perfect structures of the age: it is 200 ft. in length inside, by 46 ft. in breadth; the height of the vaulted roof being 60 ft.: it has neither pillars nor side aisles, but is supported by strong buttresses. The cloisters and other buildings, which belonged to a monastery founded here at a very early date, have been long since demolished, with the exception of the refectory, that has been converted into a deanery. The episcopal palace, near the W. end of the cathedral, retains few traces of its ancient architecture. The bishops of Ely formerly possessed powers within the isle similar to those enjoyed by the bishop of Durham, appointing their own chief justice and magistrates; but these were taken away by the act 6 and 7 William IV. cap. 87. The assizes are held here in the new shire hall, erected in 1821. Ely has a grammar-school, founded by Henry VIII.; a free school endowed by a lady of the name of Needham; and a national school supported by voluntary contributions. A considerable landed property left for the benefit of the city poor is vested in a body of incorporated trustees. There is an earthenware and tobacco-pipe manufactory within the city; but the inhabitants are principally employed in gardening, which is extensively carried on in the vicinity. Ely sent two members to the H. of C. in the 23rd of Edward I., but has not subsequently been represented. The Isle of Ely is included within the great level of the Fens, and is extremely fertile.

EMDEN, or EMBDEN, a sea-port town of Hanover, being the second in that kingdom in respect of size and importance; prov. Aurich, cap. cant., on the N. bank of the æstuary of the Ems, or rather of the bay called the Dollart, 15 m. SW. Aurich, and 46 m. WNW. Oldenburg, on the terminus of the railway from Hanover to the bay of Dollart. Pop. 13,170 in 1861. The town is surrounded by walls and wet ditches, and divided into the old town and the Faldern; the latter being the best built. Emden has 6 churches one of which is a fine edifice, a council-house, judicial tribunal, custom-house, exchange, commercial weighing-house, naval assurance office, school of navigation, house of correction, orphan asylum, lying-in-charity, gymnasium, and society of natural history. A navigable canal connects it with Aurich, and various others intersect the adjacent country and the town, communicating with the port. The latter, which consists of two inner harbours opening into an outer harbour, is large, but shallow; so that vessels drawing more than 11 ft. can enter it only at high water, unless lightened of a portion of their cargo. But the roadstead, which is well protected, has water sufficient to float vessels of any size, and the holding ground is good. Emden has manufactures of linen and linen yarn, stockings, tobacco, brandy, leather, hats, soap, and starch; its herring fishery was formerly of considerable importance, and employed 1,300 hands, who took about 13,000 tons of fish annually; but this branch of industry has greatly declined, and from 60 ships formerly engaged in it, the number is now reduced to 15. The general trade of the town has also declined. In the 16th century it had 600 sea-going vessels; and, in 1784, 273 of the aggregate burden of 19,289 lasts. In 1863, the shipping had declined to 105 sea and river vessels, chiefly coasters, of a total burthen of 4,790 lasts. By far the greater number of the vessels that now frequent the port, are inland craft, but there are also regular steamers to Hamburg, Hull, and London.

Though Emden is a free port, the advantage it thence derives is very insignificant. It has little communication with the interior of Germany, except with E. Friesland and the co. of Munster, of which it continues to be the emporium. The import trade it formerly carried on in colonial produce has been almost entirely transferred to Amsterdam, Hamburg, and Bremen, whence it is supplied at second hand. Its chief imports are hemp, potash, and timber, from the Baltic and Norway. The imports of timber are very considerable, the vicinity of Emden being singularly deficient in wood. It also imports considerable quantities of French wine. Its chief exports are oats, wheat, beans, rapeseed, rye, barley, herrings, butter, cheese, gin, tallow, honey, wax, wool, and hides.

Emden belonged, in the Middle Ages, to the counts of East Friesland. It subsequently became a Hanse town; but fell, in 1806, to Holland; in 1809, to France; and in 1814, to Prussia. The latter power ceded it, in 1815, to Hanover.

ENGLAND AND WALES. This populous, wealthy, and important portion of the U. Kingdom of Great Britain and Ireland, comprises the most southerly, largest, and most fertile part of the island of Great Britain. It lies W. from and opposite to France, Belgium, Holland, and the S. parts of Denmark, between 49° 57′ 30″, and 55° 47′ N. lat., and 1° 46′ E. and 5° 41′ W. long.; being bounded by the German Ocean on the NE. and E.; by the British Channel on the S.; by St. George's Channel and the Irish Sea on the W.; and on the NW. and N. by Scotland, from which it is separated by a waving line extending in a NE. direction from the mouth of the Sark, in the NE. corner of the Solway Frith, by Peel and Carter Fells, and the Cheviots, to Carham, and thence along the Tweed to Berwick. Its SE. extremity, at Dover, approaches to within 21 m. of the opposite coast of France. (See BRITISH EMPIRE.) Its shape approaches nearest to that of a triangle, of which Berwick may be considered the apex, and a line from the Land's End to the N. Foreland (342 m.) the base; a line from the former along the W. side (426 m.), and from the latter along the E. side (334 m.) complete the figure. The sea-coast, if measured from one headland to another, is about 1,200 m. in extent; but if its principal indentations are followed, it will be found to be fully 2,000 m. The bays and harbours on the S. and W. shores are numerous, and some of them rank among the finest in the world; but on the E. side there are few that can be called safe, or easily accessible; the ports of London and Harwich being the only really good ones between the S. Foreland and the Tweed. The area amounts to 58,320 sq. m., or to 37,324,883 statute acres. The area of England alone is 32,590,397, and that of Wales 4,734,486 statute acres. (Census of England and Wales, 1861, vol iii., General Report, 1863.)

Aspect of the Country.—England combines within itself all that is most desirable in scenery with all that is most necessary for the subsistence and comfort of man. 'Although its features are moulded on a comparatively minute scale, they are marked with all the agreeable interchange which constitutes picturesque beauty. In some parts plains clothed in the richest verdure, watered by copious streams, and pasturing innumerable cattle, extend as far as the eye can reach; in others, gently rising hills and bending vales, fertile in corn, waving with woods, and interspersed with flowery meadows, offer the most delightful landscapes of rural opulence and beauty. Some tracts furnish prospects of the more romantic and impressive kind; lofty mountains, craggy rocks,

deep dells, narrow ravines, and rumbling torrents; nor is there wanting, as a contrast to these, scenes in which every variety of nature is a different charm, the vicissitude of black barren moors and wide uninhabited heaths.' (Aikin's England Described, p. 2.)

The distinguishing peculiarity in the aspect of England is, however, the exuberance of its vegetation, and the rich luxuriant appearance of its lower and far most extensive portion. It owes this distinction partly to nature and partly to art. The humidity and mildness of the climate maintain the fields in a constant state of verdure: in winter they are seldom covered with snow, or blighted by long-continued frosts, and in summer they are rarely withered and parched by droughts. In this respect England is as superior to the finest countries of continental Europe—to Italy and Sicily, for example—as she is superior to them and to every other country in the amount of labour that has been expended in beautifying, improving, and fertilising her surface. It is no exaggeration to affirm, that thousands upon thousands of millions have been laid out in making England what she now is. In no other nation has the combination of beauty with utility been so much regarded. Though without any extensive forests, England is extremely well wooded. The country is portioned out into innumerable fields; and these being all, or nearly all, surrounded with hedges and rows of trees, it has, even in the best cultivated districts, a woody appearance, and sometimes almost resembles a vast forest. Since the middle of last century, a great deal has been effected in this way. Most of the extensive, bare, and nearly worthless commons, that were then everywhere met with, have been in the interval subdivided, enclosed, and brought under tillage; making a vast addition to the productive capacities of the kingdom, and materially improving its appearance.

Another peculiar feature in the physiognomy of England is the number and magnificence of the seats of the nobility and gentry. These superb mansions, many of which are venerable from their antiquity, and all of which are surrounded with fine woods and grounds, give to the country an appearance of age, security, and wealth, that we should in vain look for any where else. The farm-houses and cottages have mostly also a substantial, comfortable look; and evince that taste for rural beauty, neatness, and cleanliness, that eminently distinguish their occupiers.

The number, and the prodigious size and splendour of many of the cities and towns of England, justly excite the admiration and astonishment of foreigners, and even of natives. They are the chosen seats of opulence, art, science, and civilisation. All the gratifications that wealth can command, or the caprices of taste or fashion require, may there be had in the utmost profusion; at the same time that art and industry are carried in them to the highest perfection to which they have attained, and are aided by every invention and discovery, how remote the country or distant the æra of their origin.

Description of the Country.—Though the mountains of England no where attain an alpine elevation, they form one of its most interesting, as well as most prominent features. The principal chains, which are found in its N. and W. portions, have received the names of the Pennine, Cumbrian, Cambrian, and Devonian ranges. The first of these ranges extends from the Scottish border, where it is connected with the Cheviots, S., to near Derby: it occupies the W. portion of the cos. of Northumberland, Durham, and York, and the E. portion of Cumberland, Westmorland, Lancaster, Chester, and the middle part of Derbyshire. Its highest summits are Cross Fell, in Cumberland (2,901 ft.); Shunnor Fell, on the confines of Yorkshire (2,329 ft.); Great Whernside (2,385 ft.); Ingleborough (2,361 ft.); and Pen-y-Gant (2,270 ft.), in Yorkshire: at either end, however, the range declines considerably, so that at the part traversed by the old Roman wall, and the modern railway between Newcastle and Carlisle, its height does not exceed 445 ft.; and on the S. side, where the Liverpool and Leeds Canal is conducted across it, the elevation is not more than 500 ft.; still further S., the Derbyshire portion of the chain again becomes more elevated, attaining at Castleton and Great Axehill, 1,751 ft.; and at the Weaver Hill, near Ashbourne (the S. extreme), 1,154 ft. The breadth of the range between Sheffield and Macclesfield is about 22 m., and it comprises, in this portion, some very picturesque scenery; but such is very far from being the character of the N. portion of this mountain system, which may be generally described as with rounded summits, of gradual ascent from either side, having a scanty peat soil, covered mostly with ling, and undulating in dreary succession; the patches of green sward being few and far between, and the aspect of the whole cheerless and monotonous. With the exception of the Thames and Severn, most of the great rivers of England have their sources in this chain: being much nearer the W. than the E. side of the island, the rivers that rise in its E. acclivities have generally the longest course, and are the largest and most important. Of the latter, the Tyne, Tees, the affluents of the Ouse, the Aire, Don, and Trent are the principal; the Eden, Ribble, and Mersey are the principal rivers flowing W. from the Pennine chain. The beautiful vale of the Eden, which separates the Pennine from the Cumbrian range, gradually expands into the Cumbrian plain, which extends N. to the Solway Frith, and occupies the whole tract from Brampton, Croglin, and Renwick, at the base of the Pennine chain W. to the sea, comprising an area of about 300,000 acres. On the E. side of the Pennine chain, from its N. extreme to the Coquet, the district, though hilly, has tolerably good pasture, and comprises a few breadths of well-cultivated land; S. of that stream, a large moorland tract extends through Northumberland, the middle of Durham and Yorkshire, to the Holm Moss in Cheshire, varying in breadth from 10 to 30 m., and in elevation from 500 to 1,000 ft.: its N. is its most sterile portion; but the whole tract consists of a series of monotonous wastes, furrowed, in the two N. cos., by a few narrow glens only: towards the S., these widen and become more frequent, but without much affecting the general aspect, which is preserved, for the most part, through the whole extent of the district. Betwixt it and the sea are the vales of the Tyne and Tees, and the great Yorkshire plain; the latter extending N. and S. between 60 and 70 m., with an average breadth of between 14 and 20 m.: it widens towards the S., and everywhere presents a gently undulating surface of fertile and well-cultivated land. The E. moorlands and wolds, bounding the York plain on that side, have, at their N. limit, the fertile vale of Pickering, extending about 35 m. E. and W., and 10 m. in the opposite direction. It presents the appearance of a drained lake, enclosed between the Hambleton hills and the Yorkshire wolds. The last-named tract, together with the Lincoln wolds, S. of the Humber, occupy about half the space between the German Ocean on the E. and the rivers Derwent and Trent on the W.: generally speaking, they form good pasture lands,

interspersed in parts by a few sterile moors, and, in others, by moderate breadths of good arable land. The plain of Holderness, N. of the Humber, and extending from the base of the wolds to the sea, has a strong clayey soil, producing heavy crops of wheat and beans, as well as luxuriant pasture, and ranks amongst the most productive districts in the kingdom. An alluvial tract, of somewhat similar character, also extends along the base of the Lincoln wolds between the Humber and Wash. The low line of coast, forming the E. limits of these tracts, has a submarine forest stretching along it, which is traceable for 1 or 2 m. in breadth between the high and low water-marks.

The Cumbrian group of mountains occupies the central and S. portions of Cumberland, the W. and largest portion of Westmorland, and the N. and insulated portion of Lancashire. It extends N. and S. about 37 m., and E. and W. about as much. It contains the most elevated summits in the kingdom, and is intersected by deep narrow glens, some of which are occupied by lakes, that radiate in all directions from the central portion of the mass, so as to form several distinct ranges: the whole system declines more rapidly on the N. than the S. side. The highest and most remarkable summits are, Helvellyn (3,055 ft.), Scafell (3,166 ft.), Bowfell (2,911 ft.), Coniston Fell (2,577 ft.), High Pike (2,101 ft.), in the central part of the group; at the N. extreme are Skiddaw and Saddleback (3,022 ft. and 2,787 ft. respectively); and at the SW. end, Blackcombe rises 1,919 ft. above the sea. The Cumbrian mountains are mostly bold, steep, and rugged; their slopes are in general covered with a fine green sward, affording good pasture for sheep, and have little of the tame, monotonous character that belongs to the Pennine range. Except in some of the glens, opening on the N. and W. sides, the cultivable land among these mountains is not very considerable. The lakes embosomed in these mountains rather resemble the reaches of a large river than the expanded figure usually considered as belonging to a lake. Winander Mere, the most extensive of these sheets of water, is between 10 and 11 m. long, and from 1 to 1½ m. broad, with a depth, in some parts, of 35 fathoms. It has 13 or 14 small islets or holms, the largest of which contains about 30 acres; its area, including these, is about 2,574 acres. Ulswater, the next in size, is about 8½ m. in length, by 1 m. at the broadest part, and zigzags in a NE. direction from Paterdale. Derwentwater, Bassenthwaite, Buttermere, Waswater, Ennerdale, and Coniston Mere are the names of the more considerable amongst the remainder: all of them abound in fish, chiefly trout, perch, pike, and eel; Ulswater and one or two of the smaller tarns have char; and Bassenthwaite salmon, which find their way thither by the Derwent. The scenery of the district occupied by the Cumbrian mountains is perhaps the most interesting and romantic of any in England: and in many parts, as at the head of Ulswater and the Kirkstone Pass, between that lake and Winander Mere, it assumes features of great power and magnificence. The line of road between Ambleside and Keswick, through the vale of St. John, is also interesting for its picturesque and beautiful scenery, well-known through the poems and delineations of Southey and Wordsworth.

The Cambrian mountains extend on the W. side of the kingdom, from the Irish Sea to the Bristol Channel, occupying nearly the whole of Wales. Of these, the Snowdonian range is the chief: its principal chain stretches NE. and SW., the whole length of Caernarvonshire, from Penmanmawr on the N. to the point of the peninsula of Lleyn on the S. Several of its summits exceed 3,000 ft. in height: that of Wyddva (the highest pinnacle of the huge mountain mass bearing the general name of Snowdon) has an elevation of 3,571 ft.; and commands a view of surpassing grandeur, which is only limited by the horizon. Two or three other chains branch from this main one, in a S. direction, many of whose summits reach 2,400 ft., and one (the Arennig Mawr) 2,809 ft. The country included between these ranges has a few picturesque and well-sheltered vales, such as those of Festiniog and Dolgelley; but its general character is that of a partially unreclaimed pasture tract, comprising most magnificent mountain scenery. Anglesea, on its W. side, has several small ridges and detached hills and peaks, but it cannot be called mountainous. On its E. side the beautiful vale of Clwyd extends between the Hierathog hills and another parallel range stretching between it and the estuary of the Dee; the vales of Mold and Llangollen, also celebrated for their beauty and fertility, extend on the same side, towards the great Cheshire plain.

The Berwyn mountains stretch across the whole principality, S. of the Snowdon ranges, from Llangollen to the middle of Cardigan Bay: the highest summit, Cader-Idris (2,914 ft.), gives its name to the portion of the chain between it and the sea, which narrows to a mere ridge, in parts, not more than 4 or 5 m. across. The general character of the country comprised within the Berwyn range is of the same kind as the former, though with less elevated and abrupt outlines: towards the vale of the upper Severn, and between it and the Plynlimmon chain, a few strips of cultivated land occur. The famous mountain, whence this chain takes its name, is 2,463 ft. in height, and gives birth to the two great rivers, the Severn and Wye, flowing S. to the Bristol Channel, and to the Rheidiol, which has its embouchure at Aberystwith, on Cardigan Bay. From Plynlimmon the chain extends in a curve to the Bredden hills, W. of the Shropshire plain, whose highest summit reaches 1,330 ft. The whole of the Plynlimmon range is characterised by smooth gradual slopes, and a succession of regularly rounded summits, clothed with a fine green sward, that supports numerous flocks of a small fine-woolled breed of sheep. The hilly tract extending through the S. of Shropshire to Wenlock Edge, may be considered as a continuation of this range, and is characterised by the same general features: its highest summit (Clee Hill) attains 1,805 ft. The mountain region extending S. of the Plynlimmon chain to the Towy, and stretching E. and W. between the Wye and Dyfi, forms the largest waste in the kingdom, and consists of a succession of rounded, barren hills, enclosing vast morasses, amongst which a few spots covered with coarse herbage are sparingly scattered, and afford summer pasturage to a small hardy breed of sheep: Dwggan Hill, near the centre of this cheerless region, is the highest summit, and attains 2,071 ft. The Epyut hills, on its S. border, enclose many strips of good arable land, and are themselves clothed with fine pasture; but the country on the W. side of this great waste, on to Cardigan Bay, is mostly of a rugged, desolate aspect, and comprises a series of table-lands, with broken surfaces and scanty vegetation. On the N. side the Ystwith, however, and along the courses of that stream and the Rheidiol, especially near Hafod, the scenery is picturesque, and includes many fine cataracts; and along the coast are several large pasture tracts of various degrees of fertility. S. of this, on to St. David's Head

and the Bristol Channel, the country consists mostly of unreclaimed table lands of unequal surface, with occasional ridges and detached hills, all of a rugged sterile aspect, with the exception of the district round Milford Haven and the Peninsula of Gower, between the bays of Swansea and Caermarthen in the Bristol Channel, which are fertile and well cultivated.

The Radnor and Black Forest ranges, that stretch S. from the centre of the Plynlimmon chain, on either side the Wye, are mostly covered with verdure, and form good sheep-walks: their offsets stretch into Herefordshire and terminate in that fertile and undulating plain. The districts on either side the range, especially the vales of the Wye and Usk, include much cultivated land. Two other main ranges complete the Cambrian mountain system,—those of the Forest Fawr and Glamorgan: the former stretches through Caermarthenshire and Brecknockshire to Abergavenny, on the Usk: the highest summits are the beacons named from those counties, which are respectively 2,596 ft., and 2,862 ft. high. It comprises excellent and extensive sheep-walks. The Glamorgan range extends S. of the last, in an E. and W. direction, from Pontypool on the Usk to Swansea, about 36 m., and in the widest part (from Merthyr-Tydvil to Llantrissent) about 15 m. The summits are mostly table-lands, with steep declivities on either side, intersected by deep narrow ravines, the whole having a rugged, cheerless aspect, but enclosing the most extensive coal and iron deposits in the kingdom. The tract between the two last-named ranges is also of the same sterile character, and wholly unreclaimed; but the plain stretching from the S. declivity of the Glamorgan chain to the Bristol Channel has a rich productive soil, and may, independently of its vast mineral treasures, be considered as the best and most fertile district of the principality. An alluvial tract, 3 or 4 m. in width, extends from the Taff to the Monmouth plain, and is of a similar character. The Welsh lakes are numerous, but for the most part small and uninteresting, rather absorbed by the majestic scenery round them than forming one of its essential features, as is the case with the Cumbrian lakes. The Bala Pool, or Llyn Tegid, is the largest of the Welsh sheets of water, and extends 4 m. from SW. to NE., with an average breadth of 1 m. and depth of 40 ft.: its waters cover an uneven rocky bed, and are remarkable for their purity and clearness. In common with most of the others, it abounds in red trout, pike, and eel; but the *gwyniad*, or silver skate, is peculiar to it. The Dee issues from its NE. end, flowing by the vale of Llangollen and the Cheshire plain to the Irish Sea; the Clwyd and the Conwy, discharging on the same side; the Seiout, Maw, and Teify, in the St. George's, and the Towy, Wye, and Severn, in the Bristol Channel, are the other chief rivers that originate in this the wildest and most mountainous portion of the kingdom.

The Devonian chain, stretching through the SW. peninsula of England, between the Bristol and the British Channels, is the last that requires any especial notice in this sketch. Dartmoor Forest, forming its wildest and most elevated portion, is an unreclaimed and extensive waste, affording summer pasturage for the store cattle of the lower and more fertile tracts surrounding it: the whole may be considered as a table-land (the average height of which is above 1,600 ft.), with an unequal surface, rising in large rounded swells, with corresponding concavities, and strewed with large boulders and fragments of granite, which also rises through the soil in irregular masses, or *tors*. Exmoor, at the NE. extreme of the range, and considerable tracts intermediate between the two, are also unreclaimed, and for the most part of a sterile character. The same description also applies to the central and northern parts of Cornwall, onward to the Land's End; but the less elevated districts on either side the range contain many extensive breadths of fertile land, more especially on the S. One of these, extending from Dartmoor to the sea, between the Dart and Yealm, and known as the South Hams, ranks among the most fertile corn districts in the kingdom. The chain gradually declines from Dartmoor to the Land's End, and also becomes more contracted in that direction. The chief summits are—Dunkerry Beacon, on Exmoor (1,668 ft.), Cawsand Hill (1,782 ft.), Rippon Tor (1,549 ft.), Butterton (1,203 ft.), all on Dartmoor; and in Cornwall, Brown Willy (1,368 ft.), Carnmarth (849 ft.), Carn Brea (697 ft.); and, lastly, the cape itself (about 70 ft.). The Taw and the Torridge, which discharge in the Bristol Channel, and the Fal, Fowey, Tamar, Plym, Dart, Teign, and Exe, descending to the British Channel, are the chief rivers of the district. On the N. coast sand accumulates rapidly in many of the creeks and inlets, forming in some places extensive dunes, beneath which the remains of ancient churches and villages have been discovered. On the beaches of Bude Bay, and a few others, this sand is chiefly composed of comminuted shells, and forms the chief manure of those localities.

The surface features of the central region of England, whence her wealth and importance are mainly derived, though extremely diversified, are almost wholly devoid of the magnificence and romantic beauty of those previously described. The great plain of Cheshire and Shropshire, on its W. side, extends about 50 m. in a N. and S. direction, and from 25 to 30 m. in the opposite: a few heathy moorlands occur within its limits, but by far the greater portion is very fertile; the soil is either rich sand, of a reddish colour, or strong loam. This plain is remarkable for its verdure, and is one of the principal grazing districts, being largely appropriated to the dairy husbandry. Of a similar character are the vales of Severn, Evesham, and Gloucester. The first of these extends about 70 m. on either side the Severn, with a breadth varying from 5 to 12 m., and is alike fertile and beautiful. The district S. of these last has probably the most broken and irregular surface of any part of the kingdom; it is, however, for the most part fertile and well cultivated. Beyond it are the Mendip, Quantock, and Black Down hills, and the fertile and beautiful vales of Taunton and Exe.

The basins of the Trent and Thames occupy the remainder of the central region: the former, in a general point of view, may be considered as forming an extensive plain, with gradual swells and broad intermediate vales, but with very few remarkable elevations. The vale of Belvoir is one of its most fertile portions. In the district forming the basin of the Thames, and drained by that great river and its various tributaries, the surface is, for the most part, gently undulating, forming wide vales, often extending into plains: the principal elevations are near the valley of the Thames, but none of their summits reach the height of 1,000 ft. The geological character of the tract is greatly diversified, which causes a corresponding variety in the soils. These however, on the whole, are of a light chalky nature, and moderately fertile, with but few absolute wastes of any extent; the higher constitute the least fertile portions, most of which are obviously indebted to skilful cultivation and the

humidity of the climate for a great proportion of their productiveness. The most fertile tract is the vale of Aylesbury, which has a fine loamy soil, not surpassed in fertility by any in the kingdom. The chalk hills, which (with some interruptions) range from the S. side of the Wash to the Thames, between Goring and Henley, to which part the name of the Chiltern Hills applies, form the SE. limits of the basin, sloping gradually in this direction to the Thames, but with many abrupt escarpments on the other; whence extensive views are commanded of the country between the basins of the Trent and Thames, through which the Ouse, Nen, and Welland flow NE. to the Fens, draining Bedfordshire, Hants, Northampton, and Rutland, in their course through a district possessing very few striking inequalities of surface.

The courses of these rivers to their outfalls in the inlet of the German Ocean, called the Wash, are by channels and embankments, artificially formed, through the whole of the extensive flat and marshy district known as the Fens. (See BEDFORD LEVEL.) Deposits of mud and sand are constantly and rapidly accumulating on this portion of the E. coast, so that it is not without considerable difficulty that the outfalls of the rivers are kept open, and the harbours accessible. Additions are always being made to the surface of the district, by encroachments on the sea. Within the 25 years from 1840 to 1865, no less than 170,000 acres of fertile land, extending seaward between the ports of Boston, Wisbeach, and Lynn Regis, were reclaimed in this manner.

The great plain SE. of the Fens, comprising Norfolk, Suffolk, and Essex, has an undulating surface throughout; but the inequalities are greater towards the N. extreme, where, in some places, an elevation of 200 ft. above the sea is attained. In this quarter it is not very fertile, but it has been wonderfully improved; and many parts of Norfolk and Suffolk that half a century ago were mere sandy wastes, have, by dint of marling and the introduction of the turnip culture, become among the best and most productive barley lands in the kingdom. The soil of Essex is mostly a strong clayey loam, ranking in the first class of wheat and bean lands. That portion of England extending from Bagshot Heath to Salisbury Plain, and comprising both, may be considered as a sort of elevated table-land, no part of which, probably, is less than 300 ft. above the sea: Thorney Hill is 610 ft., and Westbury Down 775 ft. Both these eminences are on Salisbury Plain, the highest portion of the tract. This celebrated plain extends about 22 m. from E. to W., and 15 m. in the opposite direction; it is traversed by many considerable depressions, and has a light scanty soil, ill-adapted to cultivation, but affording good sheep-walks. The part of the country of this tract between Chichester and Southampton Water has a fair proportion of tolerably fertile and well-cultivated land; but further W., the Hants and Dorset downs occupy the surface nearly to Dorchester, and form a continuous heathy, dreary, and sterile tract, with but a scanty proportion even of sheep pasture.

To the E. of the Anton river are the chalk ranges of the N. and S. Downs, which extend round the weald district of Sussex, Kent, and Surrey; Beachy Head forming the E. extreme of S. Downs, and the bold chalk cliffs of the Dover Straits that of the N. Downs. The Alton Hills extend between and connect the two. The first are clothed with fine pasture, and form excellent sheep-walks: at their base extends the fertile plain of Chichester. The tract of which the N. Downs forms the W. portion is, for the most part, well cultivated, and here and there attains considerable fertility, though, generally speaking, the soil is meagre and arid. The weald district, enclosed by the last ranges, has in some parts an undulating unequal surface; and there are a few detached hills that attain considerable elevation: taken as a whole, however, it may be considered as forming an extensive plain of about 1,000 sq. m. in extent, the more level portions of which are from 100 to 200 ft. above the sea. The soil is principally clay; in parts very stiff and adhesive, in others mixed with sand in various proportions. The whole is under cultivation, and includes many breadths of luxuriant pasture. At the E. extreme is Romney Marsh, an alluvial tract of about 50,000 acres, which has been reclaimed from the sea, and is defended from its encroachments by embankments. This marsh is, for the most part, remarkably fertile.

Geology.—A brief sketch of the geological structure of England will be best accomplished by commencing with the mountain ranges on its W. side, and thence following the general direction of the successive rock strata: of these, the primary and transition, or (as they are now more correctly designated) Plutonic and metamorphic formations, constitute the mass in the Cumbrian and Cambrian groups, and that of the SW. peninsula, all of which have a general resemblance in their mineral composition, though presenting some points of local and minor difference: thus, granite, which is only traced to a very limited extent in one or two parts of the Cumbrian system, and scarcely at all in Wales, is extensively developed in the SW. peninsula, where it occupies a considerable part of the most elevated portion of the range, in large interrupted masses, from Dartmoor to the Land's End; beyond which the Longship Rocks and the Scilly Islands continue the formation in the same general direction, and are supposed (with much probability) to have once formed continuous portions of the range. The veins of tin ore also appear to be limited to this last district. Neither gneiss nor mica slate (so abundant in the Grampians) occur, to any extent, in either of the ranges under consideration; clay and graywacke schists, of very various composition and texture, forming the prevailing rocks in all of them. The whole of these strata are traversed by beds and veins of porphyry, hornblende, and trap, and are for the most part considerably inclined and contorted, everywhere presenting indications of powerful disturbing causes, and of having been upheaved, but there are no traces of volcanic action. In the Carnarvonshire ranges elevated beaches occur at the height of 1,000 ft. and upwards above the sea-level, which are formed of gravel and fragments of recent shells, precisely similar to the present marine beaches. Similar beaches also occur on the N. coast of Cornwall and S. coast of Devon, from 20 to 30 ft. above the present reach of the tides.

The veins of tin and copper which intersect the strata in Devon and Cornwall make the SW. peninsula one of the most important mining districts in the kingdom. These veins, or lodes, have all a general E. and W. direction, and are intersected by others in an opposite (hence called cross-courses), which, by heaving or disturbing the regular course of the lodes, are often the cause of great perplexity and expense in mining operations. A large dyke of this kind traverses Cornwall, from one coast to the other, through its chief mining district, intersecting and disturbing the course of every one of its lodes. Besides these lodes of tin and copper, which furnish the chief

mineral riches of this range, lead ore occurs in some of the cross-courses, and has been extensively worked at Beer Alston on the Tamar, and one or two other localities: iron is also found in similar dikes near Lostwithiel in Cornwall, and at the Berryhead on the coast of Devon; from each of which places many thousand tons are annually shipped for the supply of the Welsh furnaces.

Plumbago and manganese occur on the E. side of Dartmoor, both which are worked to some extent, and shipped at Exeter for the manufacturing districts. Porcelain, pipe, and common potters' clay, are also productions occurring in this tract, and are largely shipped for the Staffordshire and other potteries: granite and roofing slate are also quarried in a few localities. This last forms the most important production in the corresponding rock formations of Wales, the quarries of Penrhyn and Llanberris, in Carnarvonshire, being the largest, and furnishing the finest slates in the kingdom. Some copper veins also occur in various parts of this group, though of very minor importance compared with those of Cornwall: in the Parys mountain, however, on the N. side of Anglesea, a very extensive deposit of that ore was discovered in the course of last century, and formed for a considerable period the most productive mine in the kingdom; it is still worked, though at present the produce is very limited. (See ANGLESEA.) On the W. side of the same island, Mona marble, or verd antique, is quarried for various ornamental purposes, at the termination of a large porphyry dike which traverses the district.

In the Cumbrian group, the most remarkable mineral production is the famous graphite, or plumbago, which occurs in an irregular pipe-vein at Botaller in Borrowdale. A few lead veins also occur, and are worked to a limited extent, on the NE. side of the range. At Coniston, copper veins are wrought on a small scale; and, near Ulverston, hæmatetic ore, which produces iron of a very ductile quality, which is used in the manufacture of carding-wire; a few quarries of roofing slate are also worked in the same neighbourhood. Beyond the limits of the three main groups we have been describing, similar rock formations occur in a few isolated ridges, of which the most prominent are the Malvern Hills, that traverse the cos. of Worcester and Hereford; the Lickie Hill, NE. of the last; the Charnwood range in Leicestershire; and a few intermediate rocks along the N. side of Warwickshire. Basaltic rocks also occur in the Wrekin and Caradoc hills, and along the limits of the mountain line, both in Derby and Durham: a large basaltic dike also traverses Yorkshire, from Middleton to the sea-coast S. of Whitby.

The mountain lime and coal formations are the next in order, being limited on the W. by those last described; and on the E. by the lias, which formation may be traced, by a waving but continuous line, through the kingdom, from the NE. coast (between the mouth of the Tees and Whitby), by Charnwood Forest, Evesham, Gloucester, Bath, and Axminster, to the SW. coast at Lyme Regis. All the mineral riches of the kingdom, as well as the greater part of its manufacturing establishments, are situated on the W. side of this line, by which the three lower of what are usually termed secondary formations are limited. In the mountain line of the Pennine range are the chief lead mines of the kingdom: in that part of it which extends through Allendale and Alston Moor, on the E. side of Cross Fell, the ore occurs in E. and W. veins, that are heaved and disturbed by N. and S. courses, as those in Cornwall. In the Derby portion of the range many lead mines also occur, that have been wrought from a very remote era; and others in the same formation in Flintshire, near the estuary of the Dee. The coal fields to which England, and, indeed, the empire, is mainly indebted for her manufacturing superiority may be thus briefly enumerated:—Those of Northumberland and Durham extend from the Tweed to the Tees, between the mountain line and the sea-coast: the most northerly has only been partially explored, and is worked, on a limited scale, chiefly for local purposes. The coal field of S. Northumberland and Durham extends about 50 m. N. and S., with an average breadth of from 12 to 15 m. The seams or beds dip SE., and crop out successively in an opposite direction, so that none of the beds extend through the entire limits of the district. The two thickest and best (high and low main) are 6 ft. thick, and are separated by strata of shale, sandstone, and smaller seams of coal, of the aggregate average thickness of 360 ft. The mines in this district furnish annually a vast quantity of coal, amounting to nearly one-third the produce of the United Kingdom. In the year 1864, there were raised from the mines of Durham and Northumberland not less than 23,248,367 tons of coal. (Hunt, Robert, Annual Report on the Mineral Statistics of the United Kingdom.) Various and very discordant estimates have been framed of the period that will probably be required to exhaust this vast deposit of fuel. But the district has not been sufficiently explored to admit of such estimates being framed on any thing like solid grounds; and, no doubt, were any deficiency in the supply of coal apprehended, methods would be found for materially diminishing the immense quantities now left in the mines, as well as for reducing the waste.

The Whitehaven is a small but valuable field, between the Cumbrian mountains and the Irish Sea, under which the adits of several of its mines are driven: the coal is exported in considerable quantities to Ireland and elsewhere. The Yorkshire and Derby fields extend N. and S. about 70 m., from Leeds onward; their breadth, between Halifax and Aberford, being about 25 m., but it diminishes considerably through the Derbyshire part, to its S. extreme, near Nottingham.

Most of the coal raised in Yorkshire is consumed in its extensive woollen, iron, and hardware manufactories, and in the domestic economy of its numerous population. The Derby field supplies, through the medium of canals, many of the midland cos. The Lancashire field is parted by a range of hills from that of Yorkshire, and extends along their base from Macclesfield to Oldham, thence N. to Rochdale and Colne, and W. to Prescott near Liverpool, having Manchester on its S. border. Coal is excavated in various parts of this extensive field, which affords all but inexhaustible supplies for the various uses of the most important manufacturing district in the kingdom. The produce of the Lancashire district, in 1864, amounted to 11,530,000 tons. S. of the above, occur some smaller fields in Leicestershire and Warwickshire, in the vicinity of Ashby-de-la-Zouch, Tamworth, Atherstone, and Coventry. The Staffordshire field extends N. and S. about 10 m., with a breadth varying from 5 to 7 m. Numerous beds of coal are worked in various parts of this field, which also furnishes potters' clay, and is the site of the potteries. The Wolverhampton and Dudley field, in the same co., extends about 14 m. N. and S., with an average breadth of 4 m., and is the most valuable of any in the central part of the kingdom. Two beds of ironstone, each of considerable thickness, also traverse the field, and supply the innumerable fur-

naces of the district. The whole rests on transition lime, abounding in beautifully preserved fossils. The total produce of coal of the districts of Staffordshire and Worcestershire amounted to 11,459,850 tons in 1864. A few small fields also occur in Shropshire and Herefordshire, of which the chief is that of Colebrook Dale, 6 m. long by 2 m. in breadth. This formation is also traversed by ironstone, and many furnaces and foundries are established in the locality, though of late years it has not maintained its former importance. The forest of Dean includes a valuable coal basin, which (geologically considered) is the most perfect of any; the different beds of coal and sandstone being regularly arranged in a rounded concavity, and resting on millstone grit and mountain lime: its extent is about 10 by 6 m. The most S. of the English fields extends about 25 m. with a breadth of 5 or 6 m., through the cos. of Gloucester and Somerset, on either side the Avon; but it is overlaid in many parts by more recent formations, and the coal seams are thin, and of inferior quality. The last of those valuable deposits now left to notice, and probably also the most extensive and important, is the great coal field of S. Wales, extending about 100 m. from the Usk, in Monmouthshire, through the cos. of Glamorgan, Carmarthen, and Pembroke, to St. Bride's Bay, and comprising an area of about 1,200 sq. m. There are 23 available seams, of the aggregate average thickness of 95 ft., arranged in a prolonged concavity, and dipping both from the N. and S. towards a central axis; the deepest part of the field being near Neath, where coal occurs 700 fathoms below the highest portions of the seams. The quality of the yield varies considerably; that on the W. side being mostly what is termed dry coal, and the other bituminous coking coal, adapted to the smelting of iron ore. The total produce of coal in the South Wales and Monmouthshire district, in the year 1864, amounted to 10,976,500 tons. Extensive beds of iron also occur in this district, which is now the seat of the greatest iron-works in the empire.

The new red sand occupies nearly all the remaining portion of the surface on to the lias: it consists of beds of clay, marl, gravel, sand, &c., of various texture—the débris of older rock strata. Extensive deposits of gypsum, and vast and all but inexhaustible beds of rock salt occur in this formation, which will be elsewhere noticed. The upper secondary strata occupy the surface from the W. limits of the lias, previously described, to those of the chalk formation on the E.; which last has the same general direction, though forming a much greater curve, which terminates at either extreme of the lias. The strata included within these limits are of very various character, and abound in fossil remains: in some parts they furnish fine freestone for building purposes; in others, lime, fullers' earth, and pipe clay. Their aggregate thickness has been estimated at between 2,000 and 3,000 ft., all formed by deposition in an oceanic basin, as the character and abundance of the fossil remains clearly indicate. The green sand formation rests on those of the oolite, and is succeeded by that of chalk, both abounding in marine testaceous remains; the average thickness of the latter, when fully developed, being about 1,000 ft. It occupies the S. coast, from the Reculver Cliffs to Folkestone, and from Beachy Head to Brighton, stretching inland from the former round the weald district, and from the latter inland towards Salisbury, and thence over the Hampshire and Dorset downs nearly to Dorchester. The Inkpen, in Hants (1,011 ft.), is the highest summit of the chalk. The general dip of all the strata, from the lias to the chalk inclusive, is SE. and very gradual: a line from the N. escarpment of the chalk in Berkshire to the Malvern Hills would intersect the Basset edges of the entire series. The deposits above these are chiefly limited to the SE. cos., and have little of variety or well-marked character to distinguish them; the chief are those of the London and plastic clays, occupying the basin of the Thames. Formations of similar character extend along the sea-coast, from Brighton to Southampton, and occupy a portion of the Isle of Wight. The sandy strata that occur in several of the S. cos., and known by the general name of Bagshot sand; the mixture of ferruginous sand and clay with chalk fragments (crag) that occupy the E. parts of Norfolk and Suffolk; and the still more recent alluvial deposits of Holderness, the Fens, and Romney Marsh; all obviously constituted of the débris of older rock formations, and the latter resulting from atmospheric, oceanic, and other presently existing influences now in active operation. There are other interesting geological phenomena; such as the boulders and fragments of rocks from the Cumbrian and Welsh mountains, that are strewed over some of the midland cos.; the beds of chalk, flint, and gravel, that occur at great distances from the main formations, and are found capping summits of others, wholly different; and the remains of mammiferous animals in the lime caverns of York and Devon; such as those of the extinct species of the elephant, hyæna, bear, &c., which must once have ranged over the districts in which these relics are deposited.

The only medicinal springs of importance are those of the cos. Derby, Gloucester, and Somerset, which will be found fully described under the heads of their respective localities.

Climate.—The British sky is truly said by Tacitus to be *crebris imbribus ac nebulis fœdum*, but also to be without the *asperitas frigorum*. (Vit. Agric., § 12.) The climate of England is chiefly characterised by the absence of extremes in temperature, by humidity, and by almost incessant variations within a limited range, peculiarities ascribable to the geographical position of the country, in contiguity with an extensive continent on the one hand, and a vast ocean on the other: the latter with nearly the same temperature throughout the year, and exerting an equalising influence over the contiguous atmosphere; the other with a varying temperature, above that of the ocean in summer, and lower during the winter months. Hence the origin and direction of the prevailing winds at different periods of the year, according to which ever of those great surfaces exert most rarefying power: those blowing from the continent being comparatively dry, whilst those from the ocean, being charged with its exhalations, bring the chief part of the rain that descends, 2–3ds of the whole of it falling on the W. side of the kingdom. Rains are more prevalent during the summer and autumnal months, when the higher relative temperature of the continent, and greater rarefaction of the atmosphere in contact with it, cause aërial currents from the ocean to set in that direction, in order to supply the comparative vacuum; whilst the E. and NE. winds, that frequently prevail in winter and spring, are attributable to the higher temperature of the sea at those periods. According to a series of observations made under the direction of the Royal Society, the SW. is the most frequent wind in every month of the year, but is more prevalent in July and August than in any other; the NE. prevails most in Jan., and from March to June, inclusive; whilst the NW. is most frequent from Nov. to March,

and least so in Sept. and Oct. It also appears, from the same observations, that rain is less prevalent in March than in Nov., in the proportion of 7 to 12; in April than Oct., in the ratio of 1 to 2; and in May than Sept., in the ratio of 3 to 4; hence the summer, autumn, and earlier part of winter, are the most humid portions of the year. The minor differences of climate that exist within the kingdom itself are wholly in accordance with the above views and observations. In Cornwall, the annual average quantity of rain falling is 45 in., and in the W. part of the kingdom, generally, it is found to vary from 30 to 51 in.; in the SE. counties, and also in the metropolis and its vicinity, the quantity is only from 20 to 25 in.; whilst Norfolk has, in all probability, the least humid climate in the kingdom. As yet, however, sufficient data do not exist to make other than an approximate calculation of the average that falls in any of the districts, and of course the general average of the whole can only be stated in the same qualified way. The estimate made by Dr. Dalton appears to be, on the whole, the most precise and satisfactory on this point; and he makes the whole annual quantity falling on the surface of England and Wales, 31 in.; to which he adds a depth of 5 in. supplied from the atmosphere in the form of dew, and calculates that 23 in. of the whole are carried off by evaporation, and the remaining 13 in. through the medium of the various rivers to the ocean. There has been previously noticed the limited range of the thermometer, which at the coldest period (Jan.) seldom falls much below the freezing point, and at the warmest (July and Aug.) as rarely rises higher than 80 Fahr., though occasional instances of greater variation may be cited. In the N. cos., from their contiguity to the sea on either side, the range is still more limited, rarely exceeding 75° or falling more than 3° or 4° below zero; so that their mean annual temperature is within 2° or 3° of those on the S. coast. In a general view, however, the influence of the ocean in tempering the atmosphere (as well as in the humidity it imparts) is greatest on the W. side of the kingdom, and most so within the limits of the SW. peninsula; the temperature of the ocean on that side being, during the coldest season, rarely so low as 50°, whilst that of the German Ocean, on the other, except in the height of summer, seldom exceeds 45 Fahr. On the whole, the most obvious difference that occurs in the local climates of the N. and S. parts of the kingdom is the lateness of spring in the former as compared with the latter; at an average about a fortnight between the cos. N. of the Mersey and Humber, and those of the S. and SW. The local effect of the W. mountain ranges is considerable, and tends to increase, in a greater ratio than would otherwise be the case, the quantity of rain falling in their vicinity; but, as a whole, the elevation of the surface is no where so considerable as to have any remarkable influence on the general character of the climate. The fens on the E. coast, and the wolds of Kent and Sussex, are the only tracts of any extent where the superfluous moisture would, but for artificial means, be retained long enough to generate miasma. In almost every other part of the country the surface has sufficient elevation and inequality to facilitate the free percolation of water, and to conduct the superfluity by natural means to the numerous streams that intersect it: so that no where can its physical structure be said to exert an injurious influence on the climate.

The more general enclosure and cultivation of the surface within the last century must also have greatly augmented these facilities, and improved the salubrity of the climate, which, however, as regards its chief characteristics, seems to be much the same as when Cæsar and Tacitus described it. There appears but little foundation for the notion once prevalent that the climate has deteriorated, and become colder; an inference from the fact of vineyards having once been cultivated to some extent in various parts of the country. The same accounts also prove that verjuice formed no inconsiderable part, and in some summers constituted the only produce of these vineyards. It is probable that a better result than this might be obtained in the present day, were favourable spots selected, and any probable advantage to be derived from the culture of the vine. The mean daily range of the thermometer on an average of the whole year has been estimated at 11° for the metropolis, 14° for the midland counties generally, and 8° for Cornwall; but the extent of the daily range of course varies with the different seasons, being greatest when the sun has most influence, and the processes of evaporation and radiation are in most active operation. The mean difference between the coldest and the warmest months of the year has been stated at, for London 26°, Cornwall 18½°, and England generally 24½°; but these, and similar calculations, can only be considered as probable approximations to the truth, deduced from such series of observations as exist; which, however, are far too few and limited to make further details or generalisations of any practical utility.

The great drawbacks upon the climate are the prevalence of cold, biting NE. winds in April, May, and June, which frequently render them the most disagreeable season of the year; and the occasional occurrence of wet summers and harvests. The crops in England are very rarely injured by droughts; but they not unfrequently suffer from excess of humidity. In Cornwall, where the climate is most equal, and the winters the mildest, the moisture and coolness of the summers are such that the fruit is inferior in flavour to that raised in the more E. and midland counties at the same time that it arrives later at maturity.

Vegetable Productions.—The Flora of the kingdom comprises between 1,400 and 1,500 indigenous species of phanogamous plants, of which upwards of 100 belong to the grass family: these, together with the furze (*Ulex europæus* and *nanus*), the three common heaths (*tetralix*, *cinerea*, and *vulgaris*), and the different kinds of rushes and sedges, occupy a very large surface, and perhaps characterise better than any other the nature and capabilities of the tracts they occupy. The oak (*Quercus robur*) is the king of native British trees, and supplies the timber of which our finest ships are built. Hence the oak is intimately associated with the maritime glories of England. Take it for all in all, it is probably the best timber of which we have any certain knowledge. Some is harder, some more difficult to rend, and some less capable of being broken across; but none contains all the three qualities in such great and equal proportions; and thus, for at once supporting a weight, resisting a strain, and not splintering by a cannon-shot, it is superior to every other timber. In favourable soils it will flourish at an elevation of 700 ft. The ash, alder, and hawthorn thrive, under similar circumstances, at 800 ft.; the fir (*P. sylvestris*—the only indigenous species) at 1,000 ft.; the mountain ash, and some of the smaller and prostrate varieties of the willow tribe, ascend nearly to the highest summits; whilst the hornbeam, lime, maple, poplar, and elm flourish only in localities much less elevated than any of

the preceding. The beech and sycamore reach 750 and 800 ft. respectively; but these, though long perfectly naturalised, are foreign introductions, as are also the larches, pines, chestnut, horse-chestnut, and many others that flourish and attain to considerable size in the extensive parks and plantations of the kingdom. Of indigenous fruits, the list is very scanty; the pear, crab, medlar, wild cherry, bullace, raspberry, blackberry, gooseberry, currant, strawberry, and cranberry, being nearly, if not quite, all that can be so called; and the greater part of these, in their natural state, can scarcely claim to rank as such in the more common acceptation of the word.

Every one is ready to admit that England is indebted to commerce, or to her intercourse with other nations, for a very large proportion of her superior wealth and comforts. But it will be found on examination that her obligations in this respect are really much greater than is generally supposed. England is not only indebted to foreign countries for mere luxuries and superfluities, but for the greater part of those plants and vegetables that supply the largest portion of the food of her inhabitants. England has received from abroad bread corns, potatoes, garden stuffs and fruits, with hops, turnips, and a vast variety of useful and ornamental vegetable products. But it is the good fortune of England that most of these are so admirably suited to the soil, that, unless the contrary were known, they might be supposed to be indigenous. Those species of fruits that require a powerful sun to bring them to maturity do not, indeed, answer in our climate, except artificial means be employed in ripening them. But the more useful kinds attain to perfection. '*Solum præter oleam vitemque, et cetera calidioribus terris oriri sueta, patiens frugum, fecundum; tardè mitescunt citó proveniunt; eademque utriusque rei causa, multus humor terrarumque cœlique.*' (Tacit. Agric. § 12.)

Of the smaller herbaceous plants it remains only to notice a few most characteristic of the features of an English landscape, or which are otherwise distinguished for their beauty and rarity. Of these, the various grasses that may almost be said to be in a state of constant growth, and to cover so large a portion of the surface, in a literal sense, with perpetual verdure, claim precedence: of flowers, the daisy, primrose, cowslip, violet, and lesser celandine, are the most common and most universal favourites; next which, perhaps, the woodbine, eglantine, hyacinth, harebell, and goldcups, contribute more largely to the adornment of the scenery. Of the less common kinds, the tamarisk, musk, gentian, and a few others, are limited to the SW. peninsula; the hop, briony, and pheasant eye, to the midland cos.; the juniper, parnassia, and a few others, to the more elevated regions of Wales and the N. cos.; and the water lily can only be considered in its native locality when expanding its fine flowers on the surface of the Cumbrian lakes. The foxglove, henbane, hemlock, nightshade (*Atropa*), and the *Cicuta virosa* of the Cambridge fens, are almost the only species that possess active medicinal qualities. The woad, madder, teazel, hop, flax, buckwheat, clovers, tares, and melilots; together with the carrot, parsnip, cabbage, sea kale, and asparagus, comprise the chief indigenous species available for economical purposes; whilst the misletoe and ivy claim a passing notice from traditional associations. Of cryptogamous plants there exist about 300 distinct species of moss, and upwards of 500 of *Algæ*, that is, lichens and sea weeds: two or three of the lichens are identical with those extensively used as dyes, but they scarcely occur anywhere in sufficient abundance to be worth collecting. Various species of sea weed are thrown abundantly on some parts of the sea-coast, and collected as a manure, but are seldom converted into kelp or barilla.

Zoology.—Without recurring to an older geological period, when the animals, whose bones are found in the limestone caves of Yorkshire and Devon, occupied the country, we find that, within a comparatively recent period, it was in a great degree overspread with vast forests, the abodes of many wild animals, which, as well as their coverts, have now wholly disappeared. The bear may be traced as an inhabitant of these down to A.D. 1057, and may have existed later: the beaver to 1188, when its habits were noticed and described by Giraldus Cambrensis, as witnessed by him on the Teifi: many notices of wolves occur so recently as the reign of Edw. I., notwithstanding the war of extirpation waged against them by Edgar. The New Forest in Hampshire was the latest resort of the wild boar, which must have been extirpated during the period of the last civil war: the wild cat has disappeared from its latest haunts—Cumberland and Westmorland—within living memory, but is still found in Scotland. The wild ox (*Urus*) has only escaped a similar fate, by having been preserved as a curiosity in Chillingworth Park near Berwick, and in one or two other localities, where this fierce and distinct breed (with cream-coloured hide, black muzzle, and downward-bent horns) may still be seen. The stag, fallow deer, and roe have also been saved by similar interference and protection. The indigenous quadrupeds now existent in a wild state are—the fox, badger, polecat, beech and pine martens, otter, weasel, stoat, hedgehog, mole, land and water shrews, squirrel, hare, rabbit, dormouse, field and water lemmings, black rat, common field and harvest mice, and six species of the bat tribe. Of cetaceous mammalia, the razor-back and porpoise are the only species that occur with any frequency, though such lists as comprise stragglers notice thirteen or fourteen others, as of occasional occurrence on the coasts. The Norway rat is an ascertained immigrant, which has warred with the indigenous species, and made it by far the scarcest of the two. The domesticated animals and poultry will be noticed under another head. The great bustard appears to be almost the only species of bird that has been banished from the kingdom by the extension of enclosures and cultivation; although the bittern and two or three others have become scarcer, and have wholly deserted many of their ancient haunts, yet they may still be met with, whilst the former has wholly disappeared from its latest locality, the Wiltshire downs. Pennant, in 1777, notices bustards as occurring in flocks of fifty or more, on most of the open tracts of the S. and E. counties, from the Dorset downs to the Yorkshire wolds. Of those species which are either indigenous or habitual visitors, 20 are birds of prey; of gallinaceous birds (grouse, pigeons, &c.) there are 80 species; of *insessores*, or the tooth-billed tribe (shrikes, ouzels, &c.), 83; of the conical-billed tribe (finches, &c.), 34; the climbers (woodpeckers, &c.) include 9 species; the *fissirostres* (swallows, &c.), 7; the wading tribe, 60; and the swimming water-fowl, 78 species. In all, 274 species have been enumerated; the numbers of land and water-birds being nearly equal—a singular circumstance, attributable to the insular position and extensive coast-line of England. Puffins' eggs on some parts of the Welsh coast, and in a few other localities, are objects of some traffic. The different species of fish frequenting the seas, lakes, and rivers of England, have been estimated at about 170; a large portion of

these, as well as of birds, are migratory. The more important species will be subsequently specified. There are between 450 and 500 species of *testacea*; of which the oyster, scallop, cockle, periwinkle, whilk, limpet, and muscle, are the principal edible kinds. The *crustacea* include the crab, lobster, crawfish, prawn, and shrimp; but the former are limited to the more rocky portions of the coast. Upwards of 10,000 insects have been enumerated by Mr. Stephens, whose catalogue does not however include the whole. Of these *diptera* (flies) comprise about 1,700 species, *hymenoptera* (bees, wasps, &c.) 2,000, *coleoptera* (beetles) above 3,000, and *lepidoptera* (butterflies, moths, &c.) about 1,900. None of the latter is of any great size; but several of the British butterflies can boast of considerable beauty and variety of hue. *Annelides* comprise the medicinal and horse-leech, &c. Radiated animals and *zoophytes* are abundant.

In the order of reptiles England is fortunately very deficient. The hawksbill turtle has occasionally been found wandering near our northern coasts, and two instances of the coriaceous turtle having been caught on the western shores are recorded by Borlase. Of the more elegant family of lizards, one species only, the *Lacerta agilis*, is admitted by some authors; others, like Ray, consider that under this name are included four or five distinct species (see Linn. Trans., vol. v. p. 49), a supposition much more probable than the first. The efts are common; two species inhabit our clear ponds, where they may be seen swimming about in summer, while the other is strictly terrestrial, and is met with at the roots of thick rank weeds, growing on the side of walls, or among rubbish. The only serpents are—1. the common snake; 2. the viper; and 3. the blind-worm. The first is harmless, and never exceeds 4 ft. in length. Although habitually inhabiting the land, it is yet known to enter the water, and to swim with facility. Considering its fecundity (it lays from 10 to 20 eggs), it is surprising that the snake is not more frequent; but it has a deadly enemy in the hedgehog, which feeds upon this reptile; thus establishing the fact that as the hedgehog, in its own tribe, represents the real hog in the order of *Ungulata*, so there should be some striking point of agreement between them. The viper is the only reptile in England whose bite is poisonous. There are three or four prominent varieties, which some have considered different species; but most modern naturalists regard them but as one. Lastly, the *Anguis fragilis*, or blindworm, is also of rare occurrence, and probably derives its name from the smallness of its eyes: the body is greyish, with two dark brown stripes upon the back; the belly also is brown; and the usual length of the animal is a foot. Of the batrachian reptiles, or true amphibia, the list is equally scanty, comprising only the frog, toad, and natterjack: all these are perfectly harmless, useful in the economy of nature, and serviceable even to man.

Population and Civil Divisions.—Since the days of the great Alfred, England has been divided into counties or shires, and these again generally into hundreds, and always into parishes. Sometimes, however, instead of being divided into hundreds, a co. is divided into wards, as is the case in the N. counties: sometimes it is divided into ridings (a corruption of trithings), as is the case with Yorkshire; and sometimes into lathes and sokes, as in Kent and Lincoln. The subjoined table shows, in alphabetical order, the whole of the counties of England and Wales, their area in statute acres, the number of inhabited houses, and the population (exclusive of army and navy) according to the census taken on April 8, 1861:—

	Area Acres	Inhabited Houses	Population Ap. 8, 1861
England and Wales	37,324,883	3,739,505	20,066,224
England . .	32,590,397	3,513,431	18,954,444

All information with respect to the number of people in England antecedent to 1801, when the first census was taken, is extremely vague and unsatisfactory. According to 'Domesday Book,' England, exclusive of Wales and the four N. counties of Northumberland, Cumberland, Durham, and Lancaster, contained immediately after the Conquest, 300,785 families, which, at an average of five persons to each family, will give about 1,500,000 individuals. Adding to this number 650,000 for the pop. of Wales and the excluded English counties, and other omissions, the entire pop. of the kingdom, at that epoch, will be 2,150,000. From the poll-tax returns in 1377, it appears that 1,367,239 persons paid the assessment levied upon every lay person, whether male or female, of 14 years of age, mendicants only excepted. But Wales, Chester, and Durham are not

included in these returns; and there are doubtless many omissions in the returns that were given in. Little dependence can, therefore, be placed on them: but Mr. Chalmers has thence concluded that the pop. at the period in question amounted to 2,350,000. Perhaps, however, this estimate is rather under the mark; for, in 1377, the country could hardly have recovered from the disastrous influence of the great pestilence of 1349; and it is highly probable that the children and persons under age then exceeded a third part of the pop. at which they are estimated by Mr. Chalmers. Harrison and Sir Walter Raleigh set down the number of fighting men in the kingdom in 1575 and 1583 at 1,172,000. But this was probably little better than a rough guess; and unless it included all the able-bodied individuals between certain specified ages, it would afford but slender means by which to estimate the pop. Perhaps, however, we may conclude, that it was then somewhere about 4½ or 5 millions. There is no reason to suppose that the pop. was materially affected by the civil war under Charles I.; and the period from the Restoration to the Revolution was one of considerable prosperity. Previously to the Revolution, a hearth tax had been imposed; and the celebrated Gregory King, founding on returns obtained under this act, estimated the pop. of England and Wales, in 1696, at 5,500,000; which probably was not far from the mark. A great deal of discussion took place in the course of last century with respect to the progress of pop., Dr. Price and others contending, on the one hand, that it was progressively diminishing; while Mr. Howlett, Mr. Wales, and others, contended, on the other, that there were really no grounds for this conclusion, and that, instead of diminishing, the pop. was steadily increasing. The census of 1801 put an end to these disputes, and showed that, supposing Gregory King's estimate to have been nearly correct, the country had gained an accession of about 3,373,000 inhab. in the course of the 18th century. The subjoined table shows the result of the seven official enumerations held in the present century, giving the date of each census, the number of the population (*inclusive* of army and navy) and the increase between each decennial period:—

Date of Census	Population	Increase Decen. Period
March 10th, 1801 . .	9,156,171	
		1,298,358
May 27th, 1811 . .	10,454,529

		2,018,972
March 31st, 1851 . .	18,054,170	
		2,174,327
April 8th, 1861 . .	20,228,497	
Total Increase 1801 to 1861 . . .		11,072,326

Until the year 1837, when a new system of registration was established under the direction of the registrar general, there were no means by which to form a correct estimate of the numbers of births and deaths. In 1538, the clergy were required to keep registers of these, as well as of marriages, in their respective parishes; and in 1603 the injunction was renewed; but the rite of baptism in the parish church being objected to by numerous sects of Dissenters, the registration of births has been at all periods very defective. The same was the case, though in a less degree, with respect to the registers of deaths, various classes of Dissenters having their own cemeteries, in which their own forms of burial were adopted; and it happened that in many places a reference to the parish registers merely supplied the means of making an approximate estimate of the number of deaths. The statute of the 26th Geo. II., which made registration indispensable to the validity of a marriage, having come into operation in 1754, the registers of marriages have been since nearly correct. The following table, compiled from the official returns, embraces the fullest information it has been possible to bring together with respect to the proportion of the two sexes in every year from the beginning of the century. The numbers are calculated, from the registration returns, for the middle of the year:—

Years	Total Population	Males	Females
1801	9,060,993	4,404,490	4,656,503
1802	9,129,636	4,441,131	4,688,505
1803	9,234,649	4,494,127	4,740,522
1804	9,366,826	4,559,230	4,807,596
1805	9,513,111	4,631,137	4,881,974
1806	9,656,119	4,700,476	4,955,643
1807	9,794,594	4,768,221	5,026,373
1808	9,924,001	4,831,985	5,092,016
1809	10,056,421	4,895,182	5,161,239
1810	10,185,578	4,957,559	5,228,019
1811	10,322,592	5,025,212	5,297,380
1812	10,479,871	5,103,251	5,376,620
1813	10,649,743	5,191,211	5,458,532
1814	10,820,112	5,280,331	5,539,781
1815	11,004,012	5,375,916	5,628,096
1816	11,196,156	5,474,848	5,721,308
1817	11,377,811	5,568,195	5,809,646
1818	11,555,054	5,659,313	5,895,741

1820	11,903,722	5,843,289	6,060,433
1821	12,105,614	5,946,821	6,158,793
1822	12,320,360	6,050,929	6,269,431
1823	12,529,518	6,153,157	6,376,361
1824	12,720,736	6,246,003	6,474,733
1825	12,903,059	6,333,955	6,569,104
1826	13,074,286	6,417,196	6,657,090
1827	13,247,277	6,500,546	6,746,731
1828	13,438,474	6,591,959	6,846,515
1829	13,625,045	6,681,424	6,943,621
1830	13,805,041	6,767,221	7,037,820
1831	13,994,460	6,859,085	7,135,375
1832	14,164,696	6,943,932	7,220,764
1833	14,328,471	7,023,322	7,305,149
1834	14,520,297	7,116,031	7,404,266
1835	14,724,063	7,213,625	7,510,438
1836	14,928,477	7,310,074	7,618,403
1837	15,103,778	7,392,191	7,711,587
1838	15,287,699	7,479,021	7,808,678
1839	15,514,255	7,586,593	7,927,662
1840	15,730,813	7,689,301	8,041,512
1841	15,929,492	7,784,883	8,144,609
1842	16,130,326	7,887,620	8,242,706
1843	16,332,228	7,990,370	8,341,858
1844	16,535,174	8,093,100	8,442,074
1845	16,739,136	8,195,776	8,543,360
1846	16,944,092	8,298,360	8,645,732
1847	17,150,018	8,400,820	8,749,198
1848	17,356,882	8,503,116	8,853,766
1849	17,564,656	8,605,212	8,959,444
1850	17,773,324	8,707,074	9,066,250
1851	17,982,849	8,808,662	9,174,187
1852	18,193,206	8,909,938	9,283,268
1853	18,404,368	9,010,866	9,393,502
1854	18,616,310	9,111,410	9,504,900
1855	18,829,000	9,211,528	9,617,472
1856	19,042,412	9,311,182	9,731,230
1857	19,256,516	9,410,334	9,846,182
1858	19,471,291	9,508,949	9,962,342
1859	19,686,701	9,606,982	10,079,719
1860	19,902,713	9,704,394	10,198,319
1861	20,119,314	9,801,152	10,318,162

The preceding table is condensed, and, at the same time, somewhat more fully illustrated in the following table, which gives the proportion of males to every 100 females in England and Wales

at each of the seven decennial periods when the census was taken :—

Years	Number of Males, including Army, Navy, and Merchant Service at home and abroad, to 100 Females	Number of Males, excluding Army, Navy, and Merchant Service abroad, to 100 Females
1801	97·425	94·583
1811	97·604	94·861
1821	97·932	96·555
1831	97·204	96·135
1841	97·076	95·588
1851	97·391	96·008
1861	96·585	95·008

The sexual proportion of the population may finally be illustrated by the following table, which shows the number of men in the army, navy, and merchant service abroad; the excess of females over males at home and abroad, and over males at home in England and Wales, 1801–61 :—

Years	Men in the Army, Navy, and Merchant Service abroad	Excess of Females over Males at home and abroad	Excess of Females over Males at home
1801	131,817	119,431	251,248
1811	145,136	126,773	271,909
1821	84,688	127,170	211,858
1831	76,221	199,216	275,437
1841	121,050	237,926	358,976
1851	126,561	238,598	365,159
1861	162,273	351,433	513,706

To complete this view of the proportions of the two sexes living at home, their ages must be taken into account. There is an excess of boys over girls living under the ages of 15; and an excess of men is provided all through the middle period of life; but that surplus is overdrawn by emigration, so that the women exceed the men in number to a considerable extent in the early, and middle, and still more in the advanced ages, when their longevity comes into play. The excess of the emigration of males over females accounts for the present difference in the proportions of the sexes. (Census of England and Wales, 1861, vol. iii.; General Report, 1863.)

Agriculture.—Tenures and Estates.—The tenures under which land is held have varied very much at different periods. At present, they may be divided into freehold, copyhold, and leasehold. By the first, an estate is held unconditionally, under the constitutional laws of the kingdom, liable to neither fine nor forfeiture. By the second mode, estates are held of corporate bodies, or of individuals, as portions of some manor or other possession, and subject to certain claims and customs. Leaseholds are either long, as for 1,000 years; life leaseholds, contingent on one or more lives, or subject to certain fines or conditions, but at all times giving a power of alienation or transfer to the lessor. Such leases as do not convey this power do not strictly come under the designation of tenures; they form, however, a large and important class of holdings, usually varying from terms of 7 to 14 years, and the conditions and stipulations in them have a powerful influence over agriculture and the value of property, in the districts in which they prevail. Lands held merely from year to year, at the option of either party, are said to be held at will, and form a large proportion of the lands of the country. The size of estates varies exceedingly; but, despite the great number of very large estates, it is still true that landed property in England is very much divided, by far the largest portion of the kingdom being portioned out into estates under 1,000*l.* a year. Dr. Beeke, in 1801, estimated the number of proprietors in England and Wales at 200,000; and supposing this estimate to be nearly accurate, and that the total gross rental of the kingdom amounts to 40,000,000*l.* a year, it will give 200*l.* as the average annual value of each estate. But as a great number of estates are much above this average, it follows that the majority must be proportionally below it.

According to the census of 1861, the total number of farmers and graziers, in-door farm servants, shepherds, and agricultural labourers, was 1,340,916. There was a considerable decline in the ten years, 1851–1861, for the census of 1851 showed the number to be 1,347,387. The total population connected with agriculture—called in the census reports the 'agricultural order'—was much larger than that above enumerated, embracing not only farmers and their assistants and dependents, but persons engaged in floriculture and horticulture, as well as land surveyors and makers of agricultural implements. The subjoined table shows the total number of persons engaged in these various branches of the 'Agricultural Order,' according to the returns of the registrar general, on the 31st of March, 1851, and on the 8th of April, 1861 :—

	1851	1861
Total of Agricultural Order .	2,011,447	1,924,110
Land Proprietor . . .	30,315	30,766
Farmer, Grazier . . .	249,431	249,735
Farmer, Grazier's Wife . .	164,618	163,765
Farmer's Son, Grandson, Brother, Nephew . .	111,704	92,321
Farmer's Daughter, Granddaughter, Sister, Niece	105,147	83,830
Farm Bailiff	10,561	15,698
Agricultural Labourer (out-door)	952,997	958,265
Shepherd (out-door) . .	12,517	25,559
Farm Servant (in-door) . .	288,272	204,962
Land Surveyor, Land, Estate, Agent	3,064	4,702
Agricultural Student . .	104	490
Hop Grower	30	33
Willow Rod Grower, Dealer .	60	35
Teazle Grower, Merchant .	85	81
Agricultural Implement Proprietor	55	236
Agricultural Engine and Machine Worker . .	—	1,205
Land Drainage Service (not in Towns) . . .	11	1,761
Colonial Planter, Farmer .	16	91
Others connected with Agriculture	128	117
Woodman, Wood Gatherer .	7,772	8,916
Others connected with Arboriculture . . .	236	10
Gardener (not Domestic Servant)	71,805	78,533
Nursery Man—Woman (Horticulturist) . . .	2,383	2,917
Watercress Grower . . .	39	55
Others connected with Horticulture	97	27

The decline which took place in many branches of the agricultural order, notably in that of in-door farm servants, in the ten years 1851–61, is not a little striking as well as suggestive.

Arthur Young, in 1770, estimated the capital employed in agriculture at 4*l.* per acre: at present it may, perhaps, be taken at about 6*l.*; which, on 31,000,000 acres, will give 186,000,000*l.* The rental of the land in England and Wales may be estimated at about one-fourth part of the value of the total produce. It amounted, in 1815, to 34,330,462*l.*; and it appears from the subsequent returns, that the present rental exceeds 60,000,000*l.* a year; the fall that has taken place in the interval

in prices having been everywhere partially, and in most parts more than fully countervailed by the spread of improvement, and the opening of new and better markets for all sorts of products. Under the property tax act the profits of the farmers are supposed to amount to half the rent; and though this rate be frequently most unjust in its application to individuals, it may not, at an average, be very wide of the mark; and supposing this to be the case, the aggregate profits of the farmers would exceed 30,000,000*l.* a year. Farmers holding lands let under 200*l.* a year, are exempted from the tax. Farms in England are of a medium size, their average being probably about 150 or 160 acres. Wheat, barley and oats, but especially the first, which may be emphatically said to be the bread-corn of England, are the principal crops. The best wheat, as well as the greatest quantity, is raised in Kent, Essex, Suffolk, Rutland, Herts, Berks, Hants, and Hereford. From 2½ to 3 Winch. bushels per acre are required for seed, and the average produce in the above cos. may vary from 26 to 40 bush. per acre. Barley is grown principally in the eastern and some of the midland cos., and chiefly for malting; oats are principally in demand for horses; and the increase of the latter has occasioned a proportional increase in the culture of oats. They are grown more especially in the N. and NE. cos.; in the midland cos. their culture is less extensive, but it is prevalent throughout most parts of Wales. Rye is scarcely at all raised for bread, except in Durham and Northumberland; where, however, it is usually mixed with wheat, and forms what is called *maslin*, a bread-corn in considerable use in the N. Peas and beans are important crops, and in some parts are pretty largely raised. The potatoe has, unluckily, become pretty general throughout the kingdom, but is most extensively raised in Lancashire and Cheshire, where it also comes to the greatest perfection. The introduction and general extension of the turnip husbandry has effected a revolution in the agriculture of England, second only to that which the inventions of Arkwright have effected in manufactures. They have now all but superseded fallows on the lighter lands. But the giving a valuable crop to the farmer, where there was none, without in any degree diminishing the facilities for clearing the land, is but a part of the advantages resulting from the turnip culture: for, while it enables the farmer to keep and fatten a much larger stock, it also enables him to accumulate a vastly greater supply of manure—of that invigorating power which adds to the productiveness of the best lands, and without which the middling and inferior would hardly repay the husbandman's toil. It is not easy to estimate the prodigious additions that have been, in this way, made to the productive capacities of the soil; and the recent introduction of guano, and the application of bone manure to turnip husbandry, have already had a wonderful influence, and, no doubt, will continue to become still more and more important. Rape is grown for its oil, or as food for sheep, in all parts except the cos. N. of Yorkshire; and cabbages and carrots are chiefly produced in the E. Flax and hemp are at present but little raised, being found less profitable crops than most of the foregoing. Hops are for the most part confined to Kent, to the vicinity of Farnham in Surrey, and to Herefordshire: their crop is the most uncertain of any, varying in the same localities, in different years, from 1 to 20 cwt. an acre. The apple orchards of Devon, Somerset, Gloucester, and a few other neighbouring cos., are important, on account of the cider they furnish. Perry is made chiefly in Worcestersh. Kent is famous for its cherries and filberts. The total assessment on real property, for the property and income tax (Schedule A.), amounted to 4,177,620*l.* in the year ending Apr. 5, 1862, and to 4,195,547*l.* in the year ending Apr. 5, 1863.

The best farmed counties are on the E. coast; and Northumberland, Lincoln, and Norfolk may bear a comparison with Berwickshire or E. Lothian. Such, however, is not the case in very many districts; and we believe it may be safely affirmed that the available produce of the kingdom might be *doubled*, were it generally cultivated on the principle, and according to the practice, followed in the best farmed districts. Winter wheat sowing usually takes place from Sept. to Nov.: drilling is more in use for barley than wheat, which is mostly sown broadcast. The grain harvest is commonly at its height in Aug. and Sept. Potatoes are taken up and stored for winter use in Oct. and Nov., which are also the chief cider months.

The farm implements in common use in England are decidedly superior to those of most other countries, though a good deal remains to be done in the way of their improvement. Perhaps few classes of people maintain their prejudices with such obstinacy as agriculturists, and especially agricultural labourers; and to this must be mainly attributed the continued use of the old-fashioned clumsy ploughs which are to be seen in some districts; and, what is far less excusable, the employment of 3, 4, 5, 6, and sometimes even 7 horses, to do what might be as well or better done by 2! The use of horses in farm labour is universal, except in Sussex, and some of the W. counties; and machines for thrashing, &c. have become common.

Britain has been celebrated from the era of Cæsar for the extent and excellence of her pastures, and the abundance of her cattle. A full half or more of the arable land of England is applied to grazing husbandry. The best grazing lands are in the vale of Aylesbury, the Fens, Romney Marsh in Kent, and some of the midland and W. counties. Hay is made from natural grasses, and from clover, rye-grass, and in the S. counties sainfoin and lucern; the natural sward yielding from 1 to 1½ tons an acre, and the artificial crops from 1 to 3 tons. The hay-harvest throughout the country takes place pretty generally in June and July.

There are several breeds of horses, the aggregate stock of which, at the present time, probably reaches 1,000,000 head, worth, perhaps, about 10,000,000*l.* sterling. Of this number it may be estimated that two-thirds are employed in agricultural labour. The old English road-horse is now nearly extinct: the large dray-horse, so admirably adapted for draught, which is believed to have been originally imported from the Low Countries, is bred in considerable numbers in some of the midland counties. Yorkshire is celebrated for its carriage horses, especially the Cleveland bays; and the farm breed of Suffolk is also excellent. The English race-horse, derived from the Arab, Persian, and Barb, is superior to every other breed in speed, and inferior to none in bottom and beauty. Mules and asses are very little used in England; the former are almost unknown, and the latter belong chiefly to the poor.

The stock of cattle may be estimated at little short of 4,500,000, about a fourth part of which are annually slaughtered. They are divided into long-horned, short-horned, and polled: the first division comprising the Lancashire; the second, the Holderness, Northumberland, Durham, N. Devon, Hereford, and Sussex; and the last, the Suffolk duns, &c. Butter and cheese are most important products: Epping Forest, in Essex, Cambridgeshire, and Dorset are the districts most

celebrated for the former; and Cheshire, Gloucestershire, Wilts, and other W. counties, and Leicestershire, for the latter. The rich and fine cheese, called Stilton, is made wholly in Leicestershire. Milk is an important marketable article in the vicinity of large towns, and the cows kept for the supply of this article to the metropolis have been estimated to amount to 12,000, yielding milk to the value of 700,000*l.* sterling a year. Sheep, the total number of which in England and Wales may be about 26,000,000, are divided into long-woolled and short-woolled; the former, including the Romney Marsh, Teeswater, Lincoln, and New Leicester breeds; and the latter (which far excel the former in the quality of the mutton), the South-Down, Dorset, Wilts, Hereford, &c. breeds. The merino breed, introduced from Spain towards the end of the last century, has been chiefly useful in crossing and improving the fleece of other breeds. In some parts of England sheep are kept on fallows, for the benefit of their manure. Great numbers are fed on the open chalk downs of the S. counties. The total annual produce of wool in England is estimated at about 470,000 packs of 240 lbs. each. Hogs are fattened on most farms, and are also kept with advantage by millers, dairymen, brewers, distillers, &c., whose refuse they consume. The Hants, Berks, Gloucestersh. and Herefordsh. are the best of the large breeds, and that of Suffolk is distinguished among the smaller ones. Yorksh. and Westmoreland are famous for their hams; Hants, Wilts, and Berks for their bacon. Poultry are reared on most farms, and by the majority of agricultural cottagers. Large flocks of geese are kept in the Lincoln fens, and plucked once a year for their quills, and four or five times for their feathers. Fowls are largely reared at Oakingham in Berks, and Dorking in Surrey has acquired a name for a fine and large five-clawed variety. Ducks are plentiful in Bucks, and pigeons in almost every co. Since the foundation of our W. India colonies, and the importation of sugars, the demand for honey has declined; this, however, has not affected wax, so that bees still keep their ground as appendages to almost every farm, and to many cottage gardens. Goats are not reared except in the few mountainous parts of England, and deer are now mere articles of luxury, kept in the parks of noblemen and gentlemen. There are still some extensive rabbit-warrens in Norfolk and Cambridgeshire, but they have greatly decreased. About 122,620 acres of land are occupied by the royal forests, 62,620 of which are enclosed for the growth of timber. As already observed, England is very well wooded, especially the S. and W. cos. Oak, the most valuable species, grows in the greatest perfection in the weald of Kent, Sussex, and Surrey. The oak-bark harvest takes place in May.

Agriculture received its first great impulse in England during the reign of Henry VII. from the policy of that monarch; and together with all kinds of commercial enterprise throughout Europe, it derived a stimulus from the great discoveries of the period. But the breeding of sheep was the branch of rural industry the first to extend, and throughout this and the succeeding reigns for a lengthened period wool was extensively exported. The first English treatise on agriculture was written in the reign of Henry VIII., and the hop, as well as several of the common garden vegetables, are introductions of the same period. Sir W. Raleigh has the credit of introducing the potato, which, in the early part of last century, appears to have been a tolerably frequent crop in Lancashire, from which its culture extended to other parts of the kingdom. Turnips seem to have been first cultivated on a large scale in Norfolk, also, in the early part of the same century. Pope speaks of 'All Townsend's turnips.' The old duties and restrictions on the exportation of corn were abolished at the Revolution, and a bounty was then also given on its export. During the latter years of the war with France prices were comparatively high in England; but on the renewal of the intercourse with the Continent, in 1814, vast quantities of corn being imported, prices suddenly gave way. This fall occasioned a good deal of agricultural distress, which, however, was but of temporary duration. In no long time improvements began to be prosecuted with greater vigour than ever; and from 1832 to 1837, a sufficient supply of corn was grown for home consumption. The subsequent recurrence of bad seasons and the failure of the potato, led to the modification and final repeal of the corn laws in the year 1846. The repeal took effect on the 1st of February, 1849, from which date only a nominal duty of one shilling per quarter was levied on corn.

Fisheries.—These are not commensurate, either in extent or importance, with the extent of coast, and have never been a principal source of national wealth. The herring fishery is the principal; but until the middle of last century most of the fish taken on the E. coast (its chief seat) were captured by Dutch smacks. Yarmouth bay is the principal resort of the herring, and about 100 smacks, of from 40 to 50 tons each, belong to the town of Yarmouth, where the fish, smoked for sale, have obtained some celebrity under the name of 'Yarmouth bloaters.' At Sunderland, Whitby, Scarborough, and Harwich, there are also extensive herring fisheries. The cod fishery, including that of haddock, whiting, ling, and hake, ranks next in importance. The pilchard fishery is exclusively confined to the coasts of Devon and Cornwall. A portion of the fish caught are used fresh or salted in those counties; and the rest, to the amount of about 17,000 hhds. a year, are salted and exported chiefly for the Italian markets. The pilchard fishery, by means of *seans*, employs about 1,500 hands, and that by *drift* nets employs from 900 to 1,000 men, and 230 boats, exclusive of the women assisting on shore in curing the fish. The total number of fishermen in England and Wales was stated in the census report of 1861 to be 17,227. Mackerel are very abundant, and extensively consumed during the season; sprats, which arrive in immense shoals on the E. and SE. coasts, are taken in great numbers for manure. Oysters, which meet with so rapid and extensive a sale in the markets of the metropolis and other large towns, are found on many parts of the coast; and are largely bred near Milton on the Kentish shore of the estuary of the Thames, at Whitstable and Herne Bay, and in the tideways of the creeks on the Essex shore, particularly in those between the Colne and Blackwater rivers, and in the neighbourhood of Mersea island, famous, from the time of the Romans, for this produce. Some very fine oyster-beds also exist at Emsworth, in Hampshire; others of a larger kind come from Poole and Jersey.

Mining Industry.—Coal stands at the head of the mineral products of England; and the country is probably more indebted to its inexhaustible supplies of this valuable mineral than to any thing else, for the extraordinary progress it has made in manufacturing industry. The coal-mines are all in the N. and W. parts of the kingdom; and these, consequently, are the great seats of English manufactures.

The following table shows the quantity of coal raised in the various mining districts of England and Wales in the year 1864:—

Coal Districts	Tons.
Durham and Northumberland . . .	23,248,367
Lancashire	11,530,000
Staffordshire and Worcestershire . .	11,459,850
South Wales and Monmouth	10,976,500
Yorkshire	8,809,600
Total	66,024,317

Iron ranks next in importance to coal. It was known to exist at a very early period; and the Romans, and perhaps, also, the Britons, had iron-works in the Forest of Dean, and elsewhere in the kingdom. Iron ore is very generally diffused; at present, however, all the great iron-works are situated in the coal districts, an abundant supply of coal being indispensable to the extensive production of iron. But in the infancy of the iron trade, when timber was the only fuel employed in smelting the ores, Kent and Sussex being the best wooded counties, were also those in which most iron was made. In 1740, the total quantity of pig iron made in England and Wales did not exceed the trifling quantity of about 17,000 tons, and we were then, and for a considerable time afterwards, mainly dependent on foreign supplies. But about this period coal began to be successfully substituted for timber in the preparation of iron, and its production was, in consequence, materially augmented. In 1750, the quantity produced did not, however, amount to 20,000 tons; but in 1788 it had increased to 68,000 tons, and in 1796, to 125,000 tons. The progress of the trade has since been rapid beyond all precedent. In 1806, a project was entertained for laying a tax on pig iron; and it was then ascertained that the production amounted to about 250,000 tons a year. In 1820 the produce had increased to about 400,000 tons; and in 1830, it was estimated at about 641,000 tons. But owing to the great demand for iron for railways and other public works, the increase of production continued on an enormous scale, and in the year 1864 amounted to—

	Tons
In England . . .	2,620,472
„ Wales . . .	988,729
Total . .	3,609,201

Of this immense quantity of pig iron produced in 1864, only 465,951 tons were exported; all the rest was converted into merchant iron. This was effected at 127 iron-works, where 6,262 puddling furnaces were in activity, and 718 rolling mills performing their herculean labours of producing bars and rails. (Report of Mr. Robert Hunt, keeper of Mining Records at the Museum of Practical Geology.)

It may be mentioned as evincing the extraordinary progress of the iron trade, that it could hardly be said to exist in S. Wales previously to 1760. So much, indeed, was this the case, that in 1755, the land and minerals for several miles round Merthyr Tydvil—then an inconsiderable village, but now the seat of the greatest iron works in the kingdom—were let for 99 years for a rent of 200*l.* a year.

Next to coal and iron, the most important minerals of England are copper, tin, and lead, the latter containing quantities of silver. There were obtained, in 1864, from 192 mines in South Western England, 214,604 tons of copper ore, producing 13,302 tons of metallic copper.

The production of tin is confined to Cornwall and Devonshire: these are also the great copper ores; but copper is likewise produced, though in smaller quantities, in N. Wales, and some other parts. The tin obtained from the mines of Cornwall and Devonshire in 1864 was in excess of that ever before procured, although the tin mines and stream works of this district have been diligently worked for more than 2,000 years. 15,211 tons of tin ore were raised by the miners, the largest quantity from very deep mines. This produced of metallic tin 10,108 tons. The price of tin during 1864 was lower than it has been during any year since 1853, and more than 14*l.* a ton below the price of 1859. The system of mining which prevails renders it imperative on the managers of mines to use every effort to satisfy the shareholders by the regular payment of dividends, or, at all events, to prevent a depreciation in the value of the shares by avoiding 'calls.' To obtain this end tin ore has been raised, 'dressed,' and sold in an already glutted market at whatever price the smelter could offer. Hence the value of the ore sold in 1864 was but 925,969*l.*, or upwards of 38,000*l.* less than the money value of the block tin sold in 1863.

Lead mines have been wrought in England from a very remote epoch. At present the most productive are in the N. cos. Lead, when first extracted from its ore, always contains a certain proportion of silver, varying from a few grains to 45 oz. or more in the ton. When the silver mixed up with the lead is sufficient to repay the expense, it is usual to separate it, which is effected by the process termed *refining*. The lead of some of the English mines, especially those of Cornwall, and also of the Isle of Man, contains very considerable quantities of silver. In the year 1864, no less than 94,433 tons of lead ore, principally galena, were dressed, sold, and smelted. This produced 91,283 tons of lead, and gave 641,088 oz. of silver.

Of zinc ores, nearly all being the sulphide of zinc (commonly called black jack), 15,047 tons were mined in 1864, producing 4,040 tons of metal.

Of iron pyrites—ores used for the sulphur they contain in sulphuric acid and soda works—there were procured, in 1864, 94,458 tons. In addition, there were raised small quantities of manganese and wolfram, together with arsenic, ochres, barytes, porcelain and pottery clays, and salt.

Salt, one of the most important of the British minerals, is procured in immense quantities from both fossil beds and brine springs, in Cheshire and Worcestershire. Previously to the discovery of the fossil beds, during the 16th century, and subsequently, a good deal of salt continued to be made by the evaporation of sea-water in salt pans at Lymington, near Portsmouth, and at other places; but the works at these places are now wholly abandoned, while the article in question has become greatly improved in quality; and instead of being imported, as formerly, is very largely exported. The consumption of Great Britain only, exclusive of Ireland, amounts to about 200,000 tons per annum, while the exports are of three times the amount. In 1859, the exports of salt were 565,644 tons; in 1861, they were 703,132 tons, and 624,785 tons in 1863. Before 1823, an oppressive tax of 15*s.* a bushel, or about thirty times the original cost price of the article, was imposed on salt; but in that year this enormous tax was totally repealed. Alum, fullers' earth, chalk, and lime are amongst the remaining useful minerals; clay for bricks, tiles, and earthenware, is also a product of considerable importance. Freestone is very abundantly diffused; but most English buildings being constructed of brick, its use is limited, except for pavements. Bath or Portland stone is that which has hitherto been mostly used for building. There

are granite quarries at Dartmoor, Haytor, and several other places.

Manufactures.—Of these the most ancient is that of woollen, the chief seats of which are the W. Riding of Yorkshire, and the cos. of Gloucester, Wilts, Devon, Lancaster, and Somerset. The first impulse towards the improvement of the woollen manufacture was given in the 14th century by Edward III., who invited a number of Flemish manufacturers to settle in England. But the manufacture laboured, down almost to our own day, under a number of vexatious and oppressive restrictions; and it did not begin to make any very rapid progress, or to participate in the wonderful improvements made in the cotton trade, till the introduction of the gig-machine, in 1802, and the repeal of the prohibitory acts of Edward VI. and Mary, in 1807. Leeds, Wakefield, Huddersfield, and Saddleworth, are the great centres of the broad cloth manufacture; Halifax is noted for its flannels and baizes, and Bradford for worsted spinning. Narrow cloths are made at and near Huddersfield; and blankets, flushings, &c., between that town and Leeds. At Dewsbury and Batley there are large establishments, called *shoddy mills*, in which old woollen rags are torn to pieces, respun, and manufactured, sometimes with and sometimes without an admixture of new wool, into various descriptions of coarse cloth. (See DEWSBURY.) Rochdale in Lancashire is also a great seat of the woollen manufacture.

Gloucestershire has numerous fine broad cloth factories; but Bradford in Wilts is the principal centre of the superfine cloth trade. The cloths of Somerset are of inferior quality. Serges, or long ells, are made in almost every town and village in the co. of Devon, and also to a considerable extent at Wellington, in the co. of Somerset. Carpets are principally made at Axminster, Kidderminster, Ashton, and Wilton. Salisbury is noted for its flannels, and Witney in Oxfordshire for its blankets; though most of what are called Witney blankets are in reality made in Wales. Norwich was long the principal seat of the worsted manufacture; but the command of coal, and the greater facilities for carrying on the business enjoyed in Bradford, and other places in the West Riding of Yorkshire, have given them a decided superiority. The manufacture of woollen and worsted stockings is principally carried on in Leicestershire, about 14,000 stocking-frames being supposed to be at work in that county. Coarse woollens and druggets are made in Cumberland, baizes in Essex and Suffolk, and a few articles are made in North Hants and Surrey; but the woollen manufactures of the S. cos. are comparatively unimportant. The total value of the exports of woollen goods and worsted goods and yarn in 1864 amounted (for the United Kingdom), to no less than 18,566,078*l.* The produce had more than doubled in the course of 15 years, amounting to 8,588,690*l.* in 1850; to 9,500,428*l.* in 1856; and to 15,489,564*l.* in 1863. There are no separate returns of the exports of England and Wales. According to the census reports of 1861, the woollen manufacture at that time employed 130,034 persons, and the worsted manufacture 79,242.

More important still than the woollen manufacture is that of cotton. Vast as this manufacture now is, it may be said to have almost entirely grown up since the accession of George III. in 1760. The first grand stimulus was given to it in 1767, by the invention of the spinning-jenny; and the subsequent and almost miraculous inventions of Arkwright, Watt, Cartwright, Crompton, and others, have carried it to the extraordinary state of improvement to which it has now arrived. Cotton goods of great beauty and excellent quality have been so much reduced in price, as to be within the command of all but the merest beggars. Hence the astonishing increase in the demand for them; the produce of the British manufacture being now widely diffused over the remotest countries of America and Asia. Lancashire is the grand seat of the English cotton manufacture; and next to it, but at a great distance, are Cheshire, Derbyshire, and Yorkshire.

Various estimates have been given of the value of this great manufacture, and of the number of persons employed in and dependent on it. The census returns of 1861, state the total number of persons engaged in cotton manufacture at 456,646. In fact, according to these returns, the people engaged in producing cotton fabrics are the third most numerous class in England and Wales—the first being agricultural labourers, and the second domestic servants. But, probably, the number actually engaged, in various ways, in cotton manufactures, is considerably larger than that shown in the census. Perhaps it will not be far wrong to estimate the total value of the various descriptions of cotton fabrics and yarn now annually produced at 35,000,000*l.*; and the total number of persons of both sexes, and all ages, employed in all departments of the business, at about 500,000. If right in this latter estimate, it will follow that from 1,000,000 to 1,200,000 individuals may be regarded as depending for support on this great manufacture.

Estimating the entire annual value of the cotton fabrics of Great Britain at 35,000,000*l.*, the value of those annually produced in Scotland may, perhaps, be estimated at nearly 5,000,000*l.*; for, as a large proportion of the fabrics made in Scotland are of a comparatively fine description, their value exceeds what might be inferred from the amount of yarn produced in Scotland as compared with that produced in England.

Subjoined are some statistics of factories for cotton goods, extracted from a return laid before Parliament in 1861:—

Cotton Factories	Number of Factories	Number of Spindles	Number of Operatives
ENGLAND:			
Lancaster .	1,979	21,530,532	315,627
York . .	369	2,414,898	27,810
Chester . .	212	3,373,113	40,860
Derby . .	79	682,008	12,965
Cumberland .	15	136,212	3,281
Middlesex .	10	5,834	323
Stafford . .	8	81,116	1,982
Leicester .	3	4,408	219
Nottingham .	26	36,000	2,183
Flint . .	1	21,800	190
Suffolk . .	1	—	52
Warwick .	7	—	445
Surrey . .	2	—	53
Gloucester .	1	66,004	1,514
Norfolk . .	2	—	94
Total . .	2,715	28,351,925	407,598

The above figures are probably incomplete, the number of operatives being given at nearly 50,000 less than in the census returns—the latter necessarily under the mark, owing to the vast subdivision of labour and the complexity of trades more or less connected with cotton manufactures. Altogether it seems most likely that there are at least half a million individuals directly engaged in the cotton trade.

The *linen manufacture* is seated chiefly in Yorkshire, Lancashire, Salop, Cumberland, Westmoreland, Durham, Dorset, and Somerset. In 1846 the linen factories employed 19,840 hands, and

the census returns of 1861 state the number of individuals engaged in the manufacture at 22,050. The silk manufacture is more important. The metropolitan district of Spitalfields, Manchester, and Macclesfield are the chief places in which broad silks and handkerchiefs are made. Coventry is celebrated for its riband factories. Crapes are made mostly in the E. cos.; but this branch of manufacture is declining. A great revolution was effected in the silk manufacture in 1825. Previously to that epoch the legislative enactments with respect to it were the most contradictory and impolitic that can well be imagined. The importation of foreign silks was prohibited under the severest penalties; but the advantage that this prohibition was believed, though most erroneously, to confer on the manufacturer, would, under any circumstances, have been more than neutralised by the imposition of oppressive duties on the raw material. This vicious system was productive of a twofold mischief; for, by teaching the manufacturers to depend on custom-house regulations for protection against foreign competition, it made them indifferent about new discoveries and inventions, while, owing to the exorbitant duties on the raw material, and the want of improvement, the price of silks was maintained at such a price as to restrict the demand for them within comparatively narrow limits. In 1825, however, a new and more reasonable order of things was introduced. The duties on the raw material were greatly lowered; at the same time that foreign silk goods were allowed to be imported on payment of a duty of 30 per cent. *ad valorem*. This new system was vehemently opposed at its outset, and it was confidently predicted that it would occasion the ruin of the manufacture; but the result has shown the soundness of the principles on which it was bottomed. The manufacturers were now, for the first time, compelled to call all the resources of science and ingenuity to their aid; and the result has been that the manufacture has been more improved during the last dozen years than it had been in the whole previous century; and that it has continued progressively to increase. In 1846 the duty was farther reduced to 15 per cent. *ad valorem*.

The total quantity of raw silk imported into the U. K. in 1864 amounted to 5,655,401lbs., being a decrease over imports of the preceding years, which, in 1862, amounted to 10,372,123lbs., and, in 1863, to 9,221,145 lbs. The total number of persons engaged in the silk manufacture in England and Wales was stated to be 101,678, in the census returns of 1861.

The *hardware manufacture* is one of the most important carried on in England; it comprises all kinds of articles, from the anchor of a man-of-war down to the delicate furniture of a lady's workbox. The more ponderous are wrought in Staffordshire, Colebrook Dale, and elsewhere; cutlery, and the finer kinds of articles, are made chiefly in Birmingham and Sheffield. In Birmingham steam engines of the largest size are also produced, and the whole tract to the NW. for a considerable distance is one immense field of smithies and forges, and the goods made in it and its immediate neighbourhood are estimated to be worth more than 3,500,000*l.* annually. Firearms, needles, &c., are made in great quantities in London. Watch and clock works are made especially in Lancashire. The total number of hands employed in this great branch of industry is probably upwards of 350,000, and the total value of the goods produced amounts perhaps to 17,000,000*l.* a year. The census returns of 1861 report that there are 125,771 persons engaged in England and Wales in the iron manufacture, as moulders, founders and similar workers, besides which 108,165 individuals are registered as blacksmiths, 60,862 as engine and machine makers, 26,130 as engaged in the sail manufacture, and 20,757 as clock and watchmakers. The value of the hardware exported in 1864 amounted to 13,214,294*l.* The manufacture of leather is nearly equal in importance to that of hardware. Worcester and Yeovil are the principal seats of the glove factories, and furnish together upwards of 800,000 pairs of leather gloves annually. Many more are manufactured in Woodstock, London, Nottingham, and Ludlow. Shoes, harness, and sadlery are made in most large towns, and especially in the metropolis. Boots and shoes are also made in great numbers in Northamptonshire and Staffordshire. The leather manufacture is estimated to employ, in all, nearly 234,000 hands, and to produce goods to the value of 13,000,000*l.* a year, or upwards.

The NW. part of Staffordshire is devoted almost wholly to potteries. British earthenware, so highly improved by the intelligence and ingenuity of Mr. Wedgwood in the last century, now rivals the best produced on the Continent in elegance and excellence, and is much superior in point of cheapness. Hence the earthenware and china of England are very widely diffused; and are the only varieties to be seen in most parts of the Continent and of America. China ware is made at Derby, Worcester, &c. The total value of the articles manufactured in both branches of the trade is estimated at about 2,500,000*l.* The number of persons engaged in the earthenware manufacture in England and Wales, is given at 38,072 in the census returns of 1861. The glass manufacture has grown up since the end of the 16th century, but has especially increased within the last 50 years. Bottle and crown glass are made chiefly at Newcastle and S. Shields; plate-glass exclusively at the former town, and at Ravenhead in Lancashire. There are numerous glass-works in the W. and NW. cos.; and the total produce of glass articles is valued at 2,300,000*l.* a year, their manufacture employing 50,000 hands. The census of 1861, however, only distinguished 15,046 as engaged in glass manufacture. This branch of industry has been materially injured by oppressive duties. But these, after being reduced in 1835, were finally repealed in 1845. Paper is made in Herts, Kent, Lancashire, Surrey, and Yorkshire. It is estimated that there are in all about 312 mills at work in England, employing about 25,000 individuals, and producing goods to the value of about 5,000,000*l.*, a year. Paper, like glass, has been subjected to oppressive duties; but these were reduced in 1836, and entirely repealed in 1861. Hats to the value of between 2,500,000*l.* and 3,000,000*l.*; bricks and tiles to an enormous extent; soap, candles, gunpowder, starch, vinegar, dyes, coaches, furniture, and straw plait, are amongst the remaining principal articles produced by the manufacturing industry of England. Extensive sugar-refineries are established in London, Liverpool, Bristol, and other towns.

The conversion of grain into fermented liquors gives rise to three very important and extensive branches of manufacture and trade, those of malting, brewing, and distilling. The breweries throughout England yield upwards of 5,000,000 barrels of beer of all sorts; and from 1,800,000 to 2,200,000 barrels are supposed to be annually supplied by the porter breweries of London, which are the largest and finest establishments of the kind in the empire, and, indeed, in the world. There is also a very large consumption of spirits, particularly gin, in England. But, notwithstanding the numerous allegations to the contrary,

there can be no doubt, comparing the consumption with the population, that it is decidedly less at present than it was in the reign of George II., and at more recent periods. This is established beyond all question by the statements made in parliament in the debates on the Gin Act in 1742, and by the details given in the tract of the celebrated Henry Fielding on the Increase of Robberies (London, 1752), and other authentic documents. No doubt there is still, in this respect, ample room for improvement. Nothing, however, can be more unfounded than the complaints so often put forth of the increase of drunkenness: that the lower classes are not so temperate as could be wished for, is most true; but they have improved, and are now less given to intoxication than at any former period of our history.

The subjoined statement shows the total quantities of spirits, both home-made and foreign, consumed in England and Wales in 1831 and in 1861, as well as the quantities consumed at the same periods in the United Kingdom.

British and Foreign Spirits.	1831 Galls.	1864 Galls.	Increase per cent.
British	7,434,047	11,098,252	49·2
Foreign and Colonial	4,697,882	5,715,091	21·65
Total	12,131,929	16,813,343	38·5
United Kingdom.			
British	21,865,531	20,496,100	7· Dec.
Foreign and Colonial	4,892,795	6,295,458	28.65
Total	26,758,326	26,791,558	0·13

It will be seen at a glance that the increase in the consumption of spirits has been less than the increase of population.

Internal Communication.—The turnpike roads of England are at present, perhaps, the best in the world. They are placed under the direction of trusts, and kept in repair by tolls levied on passengers and carriages, and rates, which the surveyors of roads are empowered to levy by the act 5 and 6 Will. IV. c. 50. Many of these acts, however, have recently been repealed, and in particular all the turnpikes near the metropolis have been abolished, the maintenance of the roads being left to the parishes, to be defrayed by local assessment. The construction of canals in England originated during the latter half of the last century. Most of them are in the NW. or manufacturing districts. The principal are the Lancaster canal, from Kendal to Wigan; the Liverpool and Leeds; Burnley and Skipton; Aire and Calder Navigation; Duke of Bridgewater's canal, from the head of the Mersey estuary to Manchester; those connecting Bolton and Bury with the latter town; the Rochdale from Manchester; Huddersfield, from Manchester by Ashton-under-Line; Peakforest; Trent and Mersey; Ellesmere; Hereford and Gloucester; Thames and Severn; Berks and Wilts; Arundel; Grand Junction from the Thames at Brentford to Northampton; and the Paddington and Regent canal, on the N. side of the metropolis. The total length of the canals traversing England exceeds 2,200 m. All have been constructed by private companies or individuals, and several exhibit splendid triumphs of engineering art; as, for instance, the Ellesmere, which in one place is carried over the Dee at an elevation of 125 ft. above that river, by means of a course of cast-iron plates supported on 19 pairs of stone piers. The Grand Junction has a tunnel, 3,080 yds. long, and the Duke of Bridgewater's canal is excavated subterraneously for a total distance of several m. But the extension of canals has been nearly suspended since railways came into use. These originated also in the latter half of the last century in the N. mining district. The construction of railways, following upon that of canals, has originated a new era in the industrial and social life of England. The wooden rails at first used gave way to others of iron. The Stockton and Darlington railway, opened in 1825, was the first intended for public use; but it was not till 1830, when the Liverpool and Manchester railway was opened, that the vast importance became manifest. The formation of railways would, however, have been of comparatively little value, but for the invention of locomotive engines, which being successfully introduced on the Liverpool and Manchester railway, made its opening a memorable æra in the history of internal communication. By means of these engines long trains of carriages, loaded with passengers and goods, are now impelled along railways at a speed varying from 25 m. to 60 m. or upwards an hour. Hence it is that time and space are nearly annihilated in as far as railway travelling is concerned. This extraordinary speed has also been attained with a great increase of comfort and security; the accidents by railways being very decidedly fewer, as compared with the number of passengers, than those arising out of travelling by common coaches. The latter, in fact, are almost wholly superseded on all the great lines of road.

The total length of railways open in England and Wales, together with the total paid-up capital, in each of the years 1854 to 1863, was as follows:—

Years	Length of Lines open at the End of each Year	Total Capital paid up (Shares, Loans, &c.) at the End of each Year
	Miles	£
1854	6,114	240,235,025
1855	6,210	249,805,306
1856	6,447	257,489,431
1857	6,773	263,198,206
1858	7,001	270,871,643
1859	7,309	277,665,518
1860	7,583	288,691,611
1861	7,820	299,446,182
1862	8,176	318,237,038
1863	8,568	333,514,818

The number of passengers, including the holders of yearly or season tickets, who were conveyed by railway in England and Wales, and the total traffic receipts in each of the years 1854–63, were as follows:—

Years	Total Number of Passengers conveyed (including Season-Ticket Holders)	Total of Traffic Receipts
	Nos.	£
1854	92,346,149	17,342,925
1855	99,175,923	18,363,369
1856	108,368,901	19,728,309
1857	115,858,806	20,527,748
1858	115,956,957	20,244,095
1859	124,881,202	21,723,926
1860	136,989,404	23,472,946
1861	145,831,425	24,021,928
1862	152,437,927	24,529,062
1863	173,648,476	26,212,822

The enormous increase of passengers, far more than that of mileage, within the ten years 1854–63, is very striking, and allows fair conclusions as to the increasing importance of this comparatively new mode of locomotion.

In close connection with railways, and scarcely less important, are the thousands of miles of telegraph wires which have spread over England like

a network in the course of little more than a generation. Without tracing the growth of this great auxiliary of modern locomotion, it may suffice to give the length in miles of telegraph wires in England and Wales, in the three years 1861–63.

Telegraph Companies	Length in Miles of Telegraph Lines		
	1861	1862	1863
Electric & International	6,727	7,597	8,230
British & Irish Magnetic	3,903	4,126½	4,196¾
South-Eastern Railway .	309½	314	316
London, Brighton, and South-Coast Railway	192	199½	212
London District . .	92¼	103	107
Submarine. (Telegraph to Calais, 24 miles; to Boulogne, 25 m.: to Dieppe, 78 m.; to Jersey, 30 m.; to Ostend, 70 m.; to Hanover, 80 m.; and to Denmark, 380 m.) .	887	887	887

The number of telegraph stations open to the public in 1863 was 1,707, while the number of messages sent in the same year amounted to nearly three millions.

Constitution and Government.—The legislative power, by the constitution of Great Britain, is vested in the great council of parliament, consisting of the King and the three estates; that is, the Lords Spiritual, Lords Temporal, and Commons.

The early history of the parliament of England is enveloped in great obscurity. This much, however, is certain, that previously to the Norman invasion it was usual to consider and debate matters of public importance in the *Wittenagemote*, or great council of the nation. After the Norman invasion, and the establishment of the feudal system, the king, as lord paramount, was assisted by a great council composed of the principal feudal superiors, or tenants *in capite*, whose concurrence was necessary in matters of general or national importance. In *Magna Charta*, signed by King John on the 15th of June, 1215, it is stipulated that 'no scutage or aid shall be imposed on the kingdom, beyond the ordinary liabilities of the feudal tenure, unless by the *common council* of the kingdom.' This shows that even at this early period the principle was recognised, that the nation should not be taxed except by its own consent. The great number of tenants *in capite*, or of those who, as they held directly from the crown, were entitled to a seat in the great council or parliament, and the disinclination and inability of many of them to attend, gave rise to the practice of summoning, by name, a few only of the most distinguished, or of those called the greater barons, whence originated baronies by writ; while the others, who were not summoned, adopted, in no very long time, the practice of sending representatives. The latter consisted of two knights for each shire, and of one or more burgesses for the three boroughs, or of those holding of the crown. Different opinions are entertained as to the period when these important innovations took place; but, at all events, there is undoubted evidence to prove that burgesses attended the parliament summoned by Simon de Montfort, earl of Leicester, in 1265. At this time, also, the clergy were summoned to attend by their procurators (proctors); but they struggled successfully to rid themslves of this burden (as it was then considered), and obtained the privilege of meeting in convocation for each of the two provinces, the bishops and mitred abbots only continuing to attend parliament. Under the reign of Edward I., knights and burgesses were regularly summoned; and in that of Edward II. parliament appears to have been divided into two houses; that is, into the House of Lords, consisting of the great feudal lords who directly attended; and the House of Commons, consisting of the representatives of the smaller tenants and burgesses. In the same reign parliament seems for the first time to have exercised, in a regular manner, the functions of a legislature. In the reign of Henry IV. we first find the right of the Commons to originate all supplies noticed, as an existing institution. From this period, the history of parliament is closely interwoven with that of the nation. The number of burgesses was gradually increased by the enfranchisement of fresh boroughs; and the popular influence in the legislature progressively gained strength with the increasing wealth and intelligence of the nation. But for a lengthened period the nature of the government was not well defined, and the rival powers of the crown and of parliament were frequently coming into contact. During the reigns of Henry VIII. and Elizabeth, the regal power attained to a maximum. But the growth of commerce under the latter, combined with the powerful influence of the Reformation, and other causes, not only gave a great accession of strength to the bulk of the people, but made them better acquainted with their rights, and less disposed to submit to their invasion. The princes of the House of Stuart wanted sagacity to appreciate the changes that had thus taken place in their position with respect to the public. Their maxims of government were as arbitrary as those of the Tudors, but they had neither their ability nor their power. Their attempts to govern without a parliament, and in defiance of principles that had been sanctioned from the earliest periods of the monarchy, produced, in the end, a civil war, that happily terminated in favour of the popular party. But it was not till the Revolution of 1688, when the Stuarts were finally expelled from the throne which they had shown themselves unfit and unworthy to fill, that the principles of the constitution were clearly established. The celebrated statute, called the Bill of Rights (1 Will. & Mary, sess. 2, 1689), declared that the suspension of laws, or their execution by regal authority, without the consent of parliament, was illegal; that parliament had the exclusive right to levy money from the subjects; that the debates or proceedings in parliament were not to be questioned in any court or place out of parliament; that it was the right of subjects to petition the king; that jurors were to be duly panelled and returned; and that parliaments should be held *frequently*. By the Triennial Act (1704) the duration of parliaments was limited to three years. In 1715 it was extended to seven, at which period it has continued fixed. The union with Scotland (1707) and Ireland (1800) increased the number of members to 658. We have elsewhere adverted to the circumstances that occasioned the passing of the Reform Act of 1832. (See Vol. I. p. 560.) This important statute made some material changes, by enfranchising some of the greater and disfranchising some of the smaller boroughs; and by modifying the electoral franchise, and creating a new right of voting in all occupiers of premises of the value of 10*l.* a year in boroughs throughout the three kingdoms.

The king, as a constituent part of the parliament, has the prerogative of giving a final assent or negative to any bill which has passed the two houses. But the royal veto, though conceded by

the theory of the constitution, has long ceased to be exercised; and the assent of the sovereign is now nothing more than a formality, necessary to give an act of parliament the force of law.

The descent of the crown of England is limited partly by customary law, partly by statute. By the Act of Settlement (12 & 13 W. III.) it is vested in the descendants of the Princess Sophia, youngest daughter of Elizabeth, queen of Bohemia, and granddaughter of James I., *being Protestants*; and every person marrying a Papist is rendered incapable of possessing or enjoying it. Subject to these limitations, the crown descends, as of hereditary right, first to the male, then to the female issue in succession. There is no minority in the case of an heir to the crown; and whenever a minor is likely to be called to it, it is usual for parliament to make beforehand a special provision for the emergency.

The House of Lords consists of the lords spiritual and temporal.

The *lords spiritual* are, the 2 archbishops and 24 bishops of England; with 1 archbishop and 3 bishops of Ireland, who succeed in rotation, and sit for a session only. Before the Reformation, 27 abbots and 2 priors sat in the English parliament. In consequence of the distinction between the two *estates* (spiritual and temporal), doubts were felt, even so late as the time of Coke, as to the validity of bills which might pass the House of Lords by the votes of one estate only, against or without the voice of all the spiritual or temporal peers. But such scruples are no longer entertained, and no distinction remains between the two estates.

The temporal lords of parliament are, 1. English peers, distinguished in rank as dukes, marquises, earls, viscounts, and barons. Peerages are said to be held by *tenure*, or created by *writ* or by *patent*. The former, which appears to have been the most ancient species of peerage, consisted in the holding of certain baronial estates or 'honours,' which are supposed to have entitled the owner to be summoned by name as of right to parliament. It has been in effect long obsolete: a few baronies are still asserted to be held by tenure, but it is doubtful whether the claim, if preferred, would be admitted. Creation by writ is a summons to the individual, by the name and style of the peerage conferred, to attend parliament. Creation by patent, at present the ordinary mode, is the grant of a peerage by the crown, with specific limitations as to the descent, usually, in modern times, to the heirs male of the body of the peer, with or without remainder to other branches. The right to a contested or claimed peerage is tried by the House of Lords. 2. Sixteen Scotch peers are elected every parliament by the whole peerage of that country. 3. Twenty-eight Irish peers are elected in like manner for life. Scotch or Irish peers, who have also English peerages, sit and vote in parliament by the title of those peerages. The chancellor, by virtue of his office, is speaker of the House of Lords. This house claims the privilege of originating all bills for the restitution of honours or blood.

The number of members of the House of Commons has been, since the union with Ireland, 658. The number of English representatives was fixed by ancient usages and charters, and that of Scotch and Irish by the respective Acts of Union of those two countries with England; but the distribution of members was materially altered by the changes introduced by the Reform Act of 1832. Aliens and denizens are disqualified from sitting and voting in the house; so are peers of parliament, and Scotch (but not Irish) peers, the clergy, and the holders of various offices: while other offices only render it necessary to vacate a seat in parliament, the holder remaining eligible. Bankrupts, persons attainted of treason, and felony, and outlaws (in criminal cases), are also excluded. Formerly the necessary qualification of estate was for counties, the possession of 600*l.* a year issuing out of land (held for the life of the member, or a greater estate); for boroughs, that of 500*l.* This property qualification for members was not disturbed by the Reform Bill; but, being of no great importance, and giving rise, moreover, to fraud, it was repealed by 21 & 22 Vict. c. 26, of June 28, 1858. There is, therefore, now no property qualification whatever for members, and a person may sit in Parliament who has not even a vote in the elections.

Of the English boroughs, 50 return 1 member each; London 4, the remainder 2: 6 counties return 2 members each; 7 return 3 members each; 26 return 4 members each, being 2 for each of the districts or divisions into which they were apportioned by the Reform Act. Yorkshire returns 6 members, being 2 for each riding. The Isle of Wight has 1 member. Welsh counties, 1 each; with the exception of Caernarvon, Caermarthen, Glamorgan, 2. Welsh boroughs, 1 each. Scotch counties, 1 each; boroughs, 1 each, with the exception of Edinburgh and Glasgow, which return 2. Irish counties, 2 each: boroughs of Dublin, Cork, Belfast, Limerick, Galway, Waterford, 2; the remainder, 1. The right of voting for county members, in England, is in all freeholders possessing land of the value of 40*s.* per ann., if of inheritance, or in actual occupation, and not acquired by purchase; the latter conditions being introduced to guard against the creation of fictitious votes. An estate for life of 10*l.* per annum is sufficient under any circumstances. Copyholders to a certain amount, and leaseholders to a certain amount and duration, are now also in the possession of the franchise; as are all tenants, whether with or without leases, who pay a *bonâ fide* rent of 50*l.* a year. In Scotland, besides certain votes on account of ancient rights of a peculiar description, termed superiorities, freeholders of 10*l.* per annum have the right of voting, and tenants nearly as in England. The right of voting for counties in Ireland is also fixed at 10*l.* per annum, for freeholders; leaseholders and copyholders nearly as in England.

In English boroughs a uniform franchise, created by the Reform Act of 1832, is possessed by the occupiers of a house or other building, or building with land, of the value of 10*l.* per annum. In cities that are counties of themselves, freeholders vote as in counties. Besides these, there are in all the boroughs, except such as were enfranchised by the Reform Act, certain ancient rights, reserved to those who were in the possession of the franchise at the passing of that act. These vary according to the usage of particular boroughs. Such are the ancient franchises of pot-wallopers, or pot-boilers, payers of scot and lot, freeholders, burgage tenants, and freemen admitted to the freedom of corporations. But in all these cases provision is made for the gradual extinction of the ancient franchises, no new claimants being registered unless they have acquired the right in certain excepted ways. In Scotland and Ireland, also, the occupiers of houses of the value of 10*l.* per annum in boroughs possess the franchise, with reservation of certain ancient rights in the latter country. Voters for the universities are such as have attained the degree of master of arts, and have kept their names on the books.

The following is, perhaps, a tolerably fair esti-

mate of the mode in which the present House of Commons is constituted. There may be still from 20 to 25 nomination boroughs; that is, boroughs the members for which are habitually appointed without opposition, by individuals, generally large landed proprietors in the neighbourhood, who possess a paramount influence over the constituency. There are 6 or 7 in which government exercises great or paramount influence. In the remainder, the local influences, as, for instance, of landed property, great manufacturing or mercantile establishments, vary in degree (frequently acting so as to counterbalance each other), according to the comparative 'openness' of the constituency, until in the greater boroughs they can scarcely be said to exist, unless in the case of freemen who are swayed by old corporation politics. Counties are generally, though with differences of more and less, governed by the landed aristocracy of their soil.

The House of Commons is summoned by warrant of the king to the lord high chancellors of Great Britain and Ireland, or to the keepers or commissioners of the great seal, to issue their writs for the election of knights, citizens, and burgesses. When a new parliament is summoned, forty days must elapse between the date of the writ and the return to it. On vacancies occurring during the session, the writ is issued to the clerk of the crown in chancery, on warrant from the speaker; and the speaker also makes out a writ on vacancy occurring during the recess. The writs are delivered to the sheriffs of counties and returning officers of boroughs, who are bound to give the proper notices. If the member or members be not elected by show of hands on the nomination day, a poll is demanded, and takes place on the next day but two in counties, and lasts two days; on the next day in boroughs, lasting one day only. Votes are publicly given and recorded. The name of every elector who is admitted to poll must (since the Reform Act) appear on the register of voters, which is constructed in a different manner, and by different officers, in the three countries. Where votes are equal, it is usual for the returning officer to make a double return. The validity of a return may be questioned by petition to the House of Commons, not only on the ground of irregularity in making it out, but also of riot, of treating or bribery by the member elected, and of the admission of unqualified votes or rejection of good ones. The trial is before a committee of the House of Commons, regulated in its appointment and proceedings by a variety of statutes.

The House of Commons claims the privilege of electing its speaker; and also that most important one, which is a fundamental principle of the constitution, the right to originate all bills imposing any tax or levy on the subject, technically called money bills, or bills of supply. Should the lords, in amending bills sent up from the commons, introduce clauses containing such impositions, they are invariably rejected by the latter, as infringing on their undoubted privilege.

By the Septennial Act (1 George I. 1715), a *new* parliament must be summoned every seven years; but as the crown has the prerogative of arbitrary dissolution, and as there is a dissolution also on the demise of the crown, the length of a parliament has rarely approached that limit. The sessions of parliament are annual. It does not appear that there is any statutable necessity for its being summoned oftener than once in three years; but as the supplies are annually voted, it is impossible to dispense with a yearly summons. The ordinary session of parliament lasts about six months, from January, or February, to August; but it has of late years been often of longer duration. Parliament is *adjourned* from day to day, or over a short recess (as at Easter), by the authority of each house separately. It is *prorogued* by the king's authority, and frequently in his presence, by the lord chancellor, at the close of the session; but, in practice, for two months only, at the end of which it again meets *pro formâ*, and is again prorogued, and so on to the commencement of the session. It is dissolved, as has been said, at the will of the crown, or by efflux of the seven years, or on the demise of the crown: in the latter case, it continues six months after such demise, unless sooner prorogued.

Privilege of Parliament is a comprehensive term, embracing both the personal privileges enjoyed by every member of the legislature, and also the general rights of the body. To the former class belongs the freedom from arrest in civil proceedings enjoyed by every member: to the latter, the freedom of debate, authority to punish for contempts, and the various other safeguards to the liberty and power of the legislative assembly, which have from time to time been acknowledged as principles of our law. The extent of these privileges, and the mode by which they are to be ascertained, are questions to which as yet no authoritative decision has been given. The assertion of those who rate the authority of parliament highest is, that when either house claims a privilege, other tribunals have no authority, either to reject such claim if the privilege be proved, or to decide whether the privilege be proved or not; parliament alone (that is, each house for itself) being the judge of its own privileges.

The great council of parliament possesses exclusive legislative authority. In this character it is said to be legally omnipotent; that is, that there is no recognised power in the constitution to check or overrule it. This legislative authority is commonly exercised, not only in matters of public interest, but also in the passing of laws at the request and for the benefit of private individuals or associations, to give them powers which without such authorisation they could not possess.
