## NETHERLANDS COLONIES.

TOTAL AREA, 830,473 square miles.
POPULATION, 37,861,923.

The possessions of the Kingdom of the Netherlands in the EAST INDIES (Administrative Capital *Batavia*, pop. about 130,000) are very considerable, comprising the whole of the SUNDA ISLANDS and Archipelago, *Sumatra* (area, 162,600 sq. miles), *Java* and *Madura* (51,032 sq. miles), *Netherlands Borneo* (179,000 sq. miles), *Celebes Island* (70,000 sq. miles), *Moluccas* (44,000 sq. miles), *Timor Islands* (18,000 sq. miles), with the exception of a portion of Borneo and Eastern Timor, together with WESTERN NEW GUINEA, with a total area of 758,000 square miles, and a population (1916) of 37,727,377, of whom as many as 30,098,000 live in the islands of Java and Madura. JAVA and MADURA (customs receipts, 1920, £1,879,960) produce a sufficient supply of food for a dense population, besides furnishing sugar, tobacco, tea, coffee, and other products for exportation to Europe. The "outlying" islands are frequently administered by their own princes, subject to the directions of a Netherlands Resident. There is (1916) a colonial army of 1,130 officers and 38,196 men. The colonial revenue for 1917 was estimated at 346,111,800 guilders, and was largely derived from the sale of coffee, salt bark, and tin, whilst the estimated expenditure was 404,357,117 guilders. The exports, for private account, amounted to 1913, for Java, Madura, and the other outlying islands, to 877,734,494 florins, while the imports for the same year amounted to 464,964,600 florins.

In South America the colony of SURINAM, or Dutch Guiana (imports, 1913, 8,445,886 guilders; exports, 6,949,325 guilders), embraces 49,845 square miles and contains (1913) 96,808 inhabitants, and in the West Indies, CURAÇAO (imports, £689,591; exports, £77,123; population, 32,985) and five other small islands belong to the Netherlands, having an area of 436 square miles, with a population of 21,884 (imports, £13,788; exports, £65,958).

Trade of Colonies with U.K.

| | 1915. | 1916. |
|---|---|---|
| Exports to U.K. | £14,684,292 | £19,080,280 |
| Imports from U.K. | 6,406,983 | 8,677,854 |

## NICARAGUA, Republic of.

*President* (1917–1920), Emiliano Chamorro.
*Minister in London* (vacant).
*Consulate in London*, 65 Bishopsgate, E.C.
*Vice-Consul*, Francis M. Voules.

The largest State of Central America, with a long seaboard on both the Atlantic and Pacific Oceans, situate between 9° 45′—13° N. lat. and 83° 40′—87° 38′ W. long., containing an area of 51,660 English square miles and a population of about 620,000 (1906), of whom about three-quarters are mixed blood and the rest Indians, besides the Mosquitos, who are mostly in a savage state. There are 172 miles of railway open, and 1,932 miles of telegraph. (5 gold *cordobas* = £1 sterling).

Diplomatic relations with Germany were broken off on 19 May, 1917.

*1st Secretary*, M. Hultfeldt.
*2nd Secretary*, R. M. Petersen.
*3rd Secretary*, A. H. C. O. Lundh.
*Military Attaché*, Maj. C. Gulbranson.
*Naval do.*, Comm. C. Bachiew.
*Consul-General*, H. A. W. Eckell, 22 Great St. Helens, E.C.
*Vice-Consul*, H. Ohlsen.

Norway, an independent kingdom, founded in 872 (fundamental law of 17 May, 1814), was united with Sweden under the same King from 4 Nov., 1814, to 7 June, 1905, when the union was dissolved. The Parliament of 123 members is called the "Storthing," which is divided into two sections, chosen by itself to discuss proposed Bills, called "Odelsting" and "Lagting." Norway, the western and northern portion of the Scandinavian peninsula, is about 1,100 miles in length, its greatest width about 250 miles. It is divided into 20 provinces, or amts, and comprises an area of 124,130 sq. miles with a population (1910) of 2,391,782. The coast-line is extensive, deeply indented with numerous fiords, and fringed with an immense number of rocky islands. The surface is mountainous, consisting of elevated and barren table-lands, separated by deep and narrow valleys. The cultivated area is about one-thirtieth part of the country, forests cover nearly one-fourth, the rest consists of highland pastures or uninhabitable mountains.

Agriculture, though pursued with some vigour of late, is unable to furnish sufficient produce for home consumption, hence it has been necessary to import considerable quantities of corn, meat, and pork. The fisheries give employment to a large part of the population throughout the year. The most important are cod and herring, the exports of these with other sea-products and fish-oil were valued at 48,218,000 kroner* in 1912. The mineral products are increasing of late. Timber-dressing, mechanical engineering, textile manufactures, ship-building, and pulp-making are the principal departments of Norwegian industry. The exports of produce of the forests were valued at 85,000,000 kroner in 1912. The imports consist chiefly of the necessary articles of consumption. The chief exports consist of timber, matches, fish, oil, and other products of the fisheries, pulp, paper, skins and furs, nails, minerals, stone, ice, calcium carbide, condensed milk, butter, margarine, tinned goods, &c.

The total value of minerals produced in 1912 was 22,725,000 kroner.

*Defence.*—Service in the National Militia is universal and compulsory. The war effective is about 120,000 of all ranks. In time of war all males between the ages of 19 and 25 are liable for service. The Navy consists of 4 ironclads, 2 coast defence monitors, 27 torpedo boats, 3 gunboats, 3 destroyers, 5 submarines, and a few smaller vessels.

*Education* is compulsory and free between the ages of 7 and 14, schools being maintained by local taxation with State grants in aid. The attendance is high. Secondary schools are provided by the State, by local authorities, and privately. There are 20 special schools and industrial and technical institutes. The University of Christiania was attended in 1913 by 1,300 students.

*Communications.*—The total length of railways open in 1906 was 1,473 miles, of which 282 miles were private lines. The length of telegraphs and telephones belonging to the State in June, 1908, was 24,090 miles. The mercantile marine, 1 Jan., 1916, consisted of 3,393 vessels, of 1,984,470 tons.

## OMAN

*Sultan, or Sovereign*, Sayyid Taimur bin Faisal, *born* 1888, *succ* 1913.

Oman (area 82,000 sq. miles, estimated pop. 200,000) is a Mohammedan State in S.E. Arabia with a coast-line of about 1,500 miles along the Persian Gulf, the Gulf of Oman, and the Arabian Sea from El Katar to Ras Sair The country, much of which is arid and desert, attains in Jebel Akhdar an elevation of 10,000 feet. The population is chiefly Arab, but includes also a considerable foreign element—Indians, Persians, Baluchis and Swahili negroes. The Sultan is in treaty relations with, and subsidised by, the Government of India, who have a political agent at his capital. In 1913, at the end of the reign of the last Sultan, the tribes of the Interior rose in rebellion, and, having elected their own Iman or Spiritual Ruler, have since administered the whole of Oman proper, the efforts of the Sultan to establish his control having been, up to date, unsuccessful This rebellion has, with the war, interfered with the prosperity of the country The Sultan is pledged not to cede territory to any Power but the British Government. Muscat has a considerable trade, amounting in 1913–16 to £431,181. Dates are the chief export, and rice, wheat, coffee, cotton and silk goods the chief imports.

CAPITAL, Muscat. Population, 24,000.

*British Consul and Political Agent*, Maj. Lionel B. H Haworth ... *per annum* Rs. 2,250
Transit, 17 days.

## PANAMA, Republic of.

*President* (1916–1920), Dr Ramón M. Valdés.
*Secretary of Government and Justice*, Dr Eusebio A. Morales.
*Foreign Affairs*, Don Narciso Garay
*Treasury*, Don Aurelio Guardia.
*Public Instruction*, Don Guillermo Andreve
*Public Works* (*Fomento*), Don Antonio Anguizola.

*Chargé d'Affaires* Don Carlos R. Zachrisson V
*Consul-General*, Don Juan B. Chevalier, Cooper Building, Church Street, Liverpool
*Consul in London*, Don C. R. Zachrisson V., 23a Finsbury Pavement House, E.C.
*Consul in Manchester*, F A Cortez Leigh.

One of the nine Départments of Colombia revolted in Nov 1903, and established a separate Government. The area of the Republic is 32,890 square miles, the population (1920) about 400,000. A railway 47 miles in length joins the two oceans.

Diplomatic relations with Germany were broken off on 10 April, 1917

Revenue (1913) ... ... $3,842,214
Expenditure (1913) ... ... 3,842,214
Revenue (1915) ... ...(U.S.Cy.) $3,375,288.92
(Government obtained a loan of $2,200,659.75 for Chiriqui Railway)
Expenditure ... (U.S.Cy.) $3,279,202.79
Imports (1912) ... ... 9,870,553
Exports (1912) ... ... 2,051,980
Imports from U K (1916). ... £5,279,349
Exports to U K. (1916) ... 34,346

Total value of exports from the Republic of Panama (excluding the Canal Zone) during 1915, $3,348,261.62 (U.S.Cy.)

Total value of imports during 1915 has not been published. During 1914 the total value of imports into the Republic of Panama (excluding the Canal Zone) was $9,920,434.71 (U.S.Cy.)

The total value of imports into the Canal Zone for the fiscal year ended June 30, 1916, was $15,640,366.22 (U.S.Cy.) of which $10,294,613.49 is for material for the Panama Canal and $5,605,252.73 for the commissaries. The exports consisted of scrap iron and other metals ($222,735.24), hides, bones, fats, castings, and other by-products of the slaughterhouses ($97,200), cacao ($8,108).

## PAPACY, The.

The office of the ecclesiastical head of the Roman Catholic Church is vested in the Pope of Rome, who is the sovereign pontiff of the western church, and claims temporal power over the Papal States which were incorporated with Italy from 1860 to 1870, the territory of the papacy now being confined to the palaces of the Vatican and the Lateran and the Villa of Castel-Gandolfo, which are guaranteed to the Pope (with a yearly indemnity of 3,250,000 lire) by the Italian Government.

*Sovereign Pontiff*, His Holiness Benedict XV (Della Chiesa), *born* 21 Nov., 1854, *elected* Pope 4 Sept., 1914.

*Envoy Extraordinary & Minister Plenipotentiary (Special Mission)*, Count de Salis, K.C.M.G. & C.V.O.

## PARAGUAY, Republic of.

*President* (1916-1920), Dr. Manuel Franco.

*Consul-General in London*, Alfred Jacob, 28 Eldon Street, E.C.

An inland State of South America, situate between 19°—27° S. lat. and 54°—62° W. long. Its area, exclusive of the Chaco territory, claimed by both Paraguay and Bolivia, is computed at 64,000 square miles, and contains a population of about 800,000. The chief products are tobacco, yerba maté, oranges, timber, quebracho extract, hides and cassava (manioca), maize, rice, sugar-cane, ground-nuts, and other tropical and sub-tropical plants. The forests contain many varieties of timber, but only cedar and a few of the best known hardwoods find a market abroad. Stock-raising is the chief industry. The chief articles of export are hides, timber, yerba maté, tobacco, quebracho extract, cattle and meat products, oranges, and petit grain oil. The Army numbers 2,000 to 3,000 men. A railway, 435 miles in length, which belongs to an English company, connects Paraguay with the Argentine railway system. The journey from Asuncion to Buenos Aires (985 miles) occupies 23 hours. Train ferries enable the rail to be accomplished without break of bulk.

*Envoy Extr. and Minister Plenp. in London*, Mirza Mahdi Khan, Mushir-ul Mulk, 47 Brechin Gardens, S.W.

*Consul-General in London*, Harry Seymour Foster, 82 Victoria Street, S.W.

*Do. for Scotland* (vacant).

Persia—called by the natives Iran—comprises an area of 636,000 sq. ms., with a population estimated at 10,000,000. By the Anglo-Russian Convention of Aug., 1907, Great Britain and Russia mutually engaged to respect the integrity and independence of Persia, while marking out certain regions in S.E. and N.W. Persia respectively in which each had, for geographical and economic reasons, special interests.

Persia is mostly an arid table-land, encircled, except on the east, by mountains, those in the north rising to 18,000 ft. The central and eastern portion is a vast salt desert. The only navigable river is the Karun, which was opened to foreign navigation from Mohammerah to Ahwaz in 1888. There are only 8 miles of railway open, and travelling is mostly by caravans, and transport by pack-animals. The cost of carriage is, therefore, very heavy. The chief products are cereals, cotton, gums, dried fruits, silk, tobacco, and opium. The minerals (little worked) are salt, iron, coal, copper, lead, sulphur, &c., with turquoises. Oilfields in Southern Persia have been successfully worked by an English company since 1901. The only important manufacture is that of woollen carpets (mostly a domestic industry), but shawls, silks, and cotton fabrics are also produced. There are extensive forests in the north and west. Sheep and goats are numerous, and good wool is produced. The principal towns are Tehran (pop. 210,000), Tabriz (180,000), Ispahan (80,000), Meshed (80,000), Kermanshah (30,000), Yezd (60,000), and Shiraz (60,000). The Persians are mostly Shiah Muhammedans, but there are many adherents of Babiism and Armenian Christians. The laws and popular education are based on the precepts of the Koran. Persia is divided into provinces, of which the principal are under Governors or Governors-General.

Owing to increasing popular discontent with a corrupt and incompetent administration and an extravagant Court, a nationalist movement began in Dec., 1905. In Aug., 1906, the Shah, admitting the need for reforms, granted a Constitution, but after much vacillation he was deposed by the National Council, and his son, aged eleven years, appointed to succeed him. In 1911 the ex-Shah, Mohamed Ali Mirza, invaded Persia from Russian territory, but was defeated and driven out.

The revenue (£1,480,980 in 1913-14) is derived from land tax, Crown lands, customs, opium, salt, and issue of monopolies. The foreign debt of Persia amounted (31 Dec., 1916) to £8,500,000. The total imports of merchandise into Persia in 1913-14 amounted to £1,772,000, and the ex-

ports to £8,418,000. Russia had about half of this imports and nearly three-fourths of the exports, the British Empire 33 per cent. of the imports and 6½ per cent. of the exports. Turkey and France were the other chief participators. The sea-borne trade of Persia passes chiefly through the ports of Bushire, Bander Abbas, and Mohammerah, and old Baghdad. The shipping of the Persian Gulf is principally British. Persia's chief imports are cotton piece-goods (mainly from England, India, and Russia) and sugar (from Russia and France), with tea, cotton yarn, metal wares, gold and silver, petroleum, and indigo. The principal exports are dried fruits, raw cotton, pearls, opium, rice, wool, fish, hides and skins, carpets, and silk cocoons.

Peru is a maritime Republic of South America, situated between 1° 30′ and 18° 20′ S. latitude and between 68° 6′ and 81° 20′ W. The territory between 19° 42′ S. and 23° 13′ S. is still occupied by Chile. The area of the Republic is estimated at 680,000 square miles, and the population at 3,550,000. It is bounded on the north by the republics of Ecuador and Colombia, as the latter claims a territory in the Amazonian basin, on the east by the Brazils and Bolivia, and on the south by Chile and Bolivia. The country is traversed throughout its length by the Andes, running parallel to the Pacific coast. The coast region is sandy desert, except where watered by transverse mountain streams, but capable of cultivation in the highest degree by irrigation. The valleys running to the coast are very fertile, and the mountains are rich in minerals, among which silver, quicksilver, copper, and coal (of inferior quality) are conspicuous, while in the departments of Tumbes, along the coast, there are important beds of petroleum. Gold is found in many districts, but especially in the province of Carabaya, where mining on an important scale is carried on. The eastern provinces are of vast extent and fertility with a tropical climate. The medicinal productions of that region are of great value, comprising cinchona, or Peruvian bark (of which little is now exported), sarsaparilla, copaiba, &c. India rubber is an important product of the country. Coca, cocoa, and coffee are grown on a small scale. Sugar is the staple agricultural article of the country. The Lobos and other islands on the Pacific coast yield guano. The principal imports are coal, cottons, woollen, linen and silk goods, drugs, earthen and stone wares, machinery, explosives, metals and manufactures thereof, oils, stationery, paper manufactures, timber, and wheat. The chief exports are sugar, copper and other ores, guano, gold, silver, cotton, llama and alpaca wool, rubber and cocaine. A small quantity of coffee is also exported.

The total length of the railways open (1914) was 1,324 miles. There is also steam navigation on Lake Titicaca and the River Desaguadero. The eastern rivers are also navigated to some extent by steam craft. Wireless telegraphy stations have been established in many places, and several are contemplated in the near future.

*Defence.*—The Army is recruited by voluntary enlistment, supplemented by conscription, and numbers about 4,000 of all ranks, the Navy

includes two swift cruisers built at Barrow, an armored cruiser bought from the French Government, a submarines, and certain auxiliary cruisers.

Diplomatic relations with Germany were broken off on 5 October, 1917

Portugal lies in 37°—42° N lat. and 6° 15'—9° 30' W long., being 360 miles in length from N. to S., and averaging about 100 in breadth from E. to W Continental Portugal contains an area of 35,490 square miles, with a population in 1911 of 5,960,056, and the Portuguese Colonies a total area of 804,821 square miles, with a population estimated at 9,675,000. The Azores and Madeira are regarded, not as colonies, but as a part of continental Portugal. The chief products are wheat, barley, oats, maize, flax, hemp, and the vine in elevated tracts, in the lowlands, rice, olives, oranges, lemons, citrons, figs, and almonds. There are extensive forests of oak, chestnut, sea-pine, and cork, the cultivation of the vine and the olive being among the chief branches of industry, the rich red wine known to us as "port" is shipped from Oporto. Its mineral products are important—copper lead, tin, antimony, coal, manganese, iron, slate and bay-salt, which last, from its hardness and purity is in demand Its manufactures consist of gloves, silk, woollen, linen, and cotton fabrics, metal and earthenware goods, tobacco, cigars, &c. The exports consist to the extent of 50 per cent. of wine, which is the chief industrial product of the country, others are cork, cattle, copper-ore, fruits, oil, sardines, and salt. The imports are manufactured goods—hardware, cotton and woollen stuffs, machinery wheat, sugar, dried fish, coal, &c. The commercial marine (1912) numbered 75 steam and 708 sailing vessels, with a tonnage of 108,336. In 1913, 7,826 vessels, of 13,443,000 tons, entered the ports of the Republic. Railways 1,760 miles in extent were open for traffic in 1909, and there were 6,267 miles of telegraph line in 1907 For many years the national income was considerably less than the expenditure, this deficiency has added to the national debt.

*Defence.*—Service in the militia is universal and compulsory The peace effective is about 30,000. War strength, about 130,000. The Navy consists of 1 coast-defence ship, 4 protected cruisers, some old pattern gunboats, 4 destroyers, and 1 submarine manned by about 4,850 sailors.

On 9 March, 1916, owing to the seizure of German ships in Portuguese harbours, the German Minister in Lisbon was instructed to ask for his passports, and at the same time the Portuguese Minister at Berlin was handed his, and war was declared by Germany Active hostilities have since ensued both in France and in the continent of Africa.

*Education* is free and nominally compulsory between the ages of 7 and 15, but is not strictly enforced, and over 75 per cent. of the population above 7 years old are illiterate. Secondary education is conducted in State lyceums. There are also military, naval and other special schools. The University of Coimbra (1913) had 1,120 matriculated students in 1912.

Lisbon, distance 2,110 miles transit, 50 hours.

PORTUGUESE COLONIES.

PORTUGUESE INDIA has a total area of 1,470 square miles, with a population of 603,000, and includes Goa, Damaun, and Diu. Revenue, 1909-10, £293,000, imports, £1,328,000 exports, £800,000.

MACAO, in China, on the Canton River, has an area of 3 square miles and a population of 80,000. Revenue, 1909-10, £27,300, imports, £1,500,000, exports, £1,700,000.

PORTUGUESE TIMOR (the northern portion of the island), in the Malay Archipelago, has an area of 7,450 square miles, with a population of 300,000. Revenue, 1910-11, £40,000; imports, £80,000 exports, £64,000.

CAPE VERDE ISLANDS, off the west coast of Africa, have an area of 1,475 square miles and a population of 150,000. Revenue, 1909-10, £90,000, exports, £70,000, imports, £320,000.

PORTUGUESE GUINEA, on the west coast of Africa, has an area of 14,000 square miles and a population of 400,000. Revenue, 1909-10, £62,000, exports, £90,000, imports, £180,000.

SAO THOMÉ and PRINCIPÉ ISLANDS, in the Gulf of Guinea (area 442 square miles, population 48,000). Revenue, 1909-10, £266,300, imports, £320,000, exports, £685,000.

PORTUGUESE WEST AFRICA (Angola and Kabinda) has a total area of 480,000 square miles, with a population of 5,000,000. Revenue, 1909-10, £482,000 exports, £700,000 imports, £1,130,000.

PORTUGUESE EAST AFRICA (Delagoa Bay, Gazaland, Inhambane, Mozambique, Nyassa, Quilimane, and Tete) has a total area of 300,000 square miles, with a population of 3,200,000. Revenue, 1909-10, £1,200,000, total trade (imports and exports), £6,000,000.

The Kingdom of Rumania contains an area of about 53,000 square miles, with a population (1899) of 5,956,690, (1913) 7,250,000. The dominating religion is that of the Greek Church. The soil is among the richest in Europe, and, but for the fearful summer droughts, would be also the most productive. The wheat crop for 1918 was estimated at 21,300,000 quintals, against 24,436,000 for 1913. The climate is extreme, for

summer heat and winter colds are intense. The agricultural produce consists of wheat, maize, millet, barley, rye, beans, and peas. Vines and fruits are abundant. The forests are of great extent and importance, but the riches of the country consist mainly in its cattle and sheep. Minerals and precious metals are said to be abundant, but only salt and petroleum are obtained. The imports are chiefly the manufactured goods of Western Europe the exports consist principally of wheat, barley maize, petroleum (1,500,000 metric tons in 1910), rock-salt, spirits, hides, wood, and cattle. The total length of railways is 4,250 miles (1910). An extensive scheme of railway construction has been undertaken at a proposed outlay of over £27,000,000. The work will be spread over a period of seven years, and there are 3,127 telegraph offices with 30,019 miles of wire

An International Commission, exercising sovereign powers over the navigation of the Danube, has its seat at Galatz.

*Defence.*—Service in the *Army* is universal and compulsory On a war footing the Field Army numbers 250,000, and with reserves Rumania can put at the utmost limit 700,000 men under arms. There is a small navy on the Black Sea (32 vessels) and on the Danube and 4 destroyers are building in Italy

On 27 Aug., 1916, Rumania declared war against Austria-Hungary, and Germany handed his passports to the Rumanian Minister at Berlin. At the present time (Nov 1917), a large part of the country is in the military occupation of the enemy In March, 1917, the British Government advanced a loan of £40,000,000 to Rumania.

*Education* is free and nominally compulsory, but owing to inadequate provision over 60 per cent. of those above 7 years of age are illiterate. Secondary education is relatively better and the schools are well attended. There are also special schools and Universities at Bucharest and Jassy A Government High School of Commerce was opened in 1913.

Rumania is not a Balkan State, and took no part in the operations of the *Balkan League* (Bulgaria, Servia, Montenegro, and Greece) against the Ottoman Empire in 1912-13 but during the second war (1913), when Bulgaria was in opposition to the remaining members of the League, Rumania was able to exact terms from Bulgaria at the Treaty of Bucharest, by which a "quadrilateral" of Bulgarian territory, containing 60 square miles, with a population of 286,000, was surrendered to Rumania. Principal towns, Silistria and Dobritsi.

## RUSSIA.

A Revolution, which took place in the early days of March, 1917, resulted in the abdication of the Tsar Nicholas II and the appointment of his younger brother, the Grand Duke Michael, as Regent. The new Government was recognised by the Allies on 22 March, 1917 On 14 Sept. 1917, however, a Republic was proclaimed, on a basis of Universal Suffrage, and a Provisional Government was appointed. The "Council of Five" was constituted as follows

*Premier*, M. Kerensky
*Foreign Affairs*, M Tereshchenko.
*War* Gen. Verkhovsky
*Marine*, Adm. Verderevsky
*Posts and Telegraphs*, M Nikitin

The newly born freedom of the country has not up to the present proved an unmixed blessing, as several opposing parties have arisen, rendering any settled form of administration impossible.

A new Cabinet was constituted on 9 Oct. 1917, on the basis of an agreement between the democratic and bourgeois parties, with M Kerensky as Premier and Commander-in-Chief.

This attempt at a definite Administration has since been upset and the reins of Government seized by W Oulianof Lenin, while the fate of Kerensky is at present uncertain. The new 'President of the Council of the People's Commissaries" has appointed a subaltern as "Highest Commander-in-Chief," with strict injunctions to at once institute measures to ensure an immediate peace. The Army is in a state of chaos, and the Allies are despatching no more material aid to Russia, while no recognition has been accorded to the regime. It is very doubtful how long the present quasi-administration may last, or what form of government may take its place, and any news coming to hand under the ruling conditions must obviously be looked upon with the greatest suspicion. In the meantime, Russia, as a belligerent, has ceased to exist.

*Chargé d'Affaires in London*,
Chesham House, S.W
*Councillor*, M. C Nabokoff.
*1st Secretary*, M B. Sabline.
*2nd Secs.*, M. G Wolkoff, M. L. Zarine, Baron G. Wrangel (*acting*), M T. Grossman (*acting*).

| Inland Lakes | 327,468 | |
| | 8,770,703 | 173,359,900 |

The largest towns in European Russia are Petrograd (2,018,996), Moscow (1,373,497), Warsaw (756,426), Riga (300,000), Odessa (449,673), Lodz (351,570), Kieff (329,000), Kharkoff (237,405), Vilna (160,670), Saratov (142,431), Kazan (143,707), Ekaterinoslav (133,982), Rostoff (119,882), Astrakhan (112,980), Tula (109,979), and Elisabetgrad (109,967), whilst Nijni Novgorod, Nikolaieff, Samara, and Minsk have populations between 90,000 and 95,000. In Asiatic Russia the Caucasus contains two towns with over 100,000 inhabitants, Baku (179,731) and Tiflis (160,645). Turkestan contains five large towns, Tashkend (156,000), Namangan, Samarkand, and Andijan, in Siberia Tomsk, Irkutsk, and Ekaterinburg have each about 90,000 inhabitants. Nijni Novgorod, though small, is a station on the Trans-Siberian Railway, and has annually the largest fair in the world.

*Nationalities* (1905).—The various nationalities were represented about as follows:—Russ, two-thirds of the whole population, or 69·3%; Poles, 6·7%, Lithuanians, 2·4% Germans, 1·6%, Armenians, 0·9%, Jews, 4·1%, Caucasians, 0·9%, Finns, 4·3% Turco-Tartars, 10·8% Mongols, 0·4%, various, 2·0%.

*The Census* for 1913 showed a total population of 182,182,600, an increase of 0·1 per cent. on that of 1914.

*Religious* (1905).—The established religion of the country is the Russo-Greek Church, officially called the Orthodox Catholic Faith. According to religious there were:—Orthodox, 69·3%; Mussulman, 10·8%; Roman Catholics, 8·2%; Protestants, 4·8%; Jews, 4·1%; other Christian beliefs, 0·6%; other non-Christian beliefs, 0·9%.

European Russia consists mainly of an immense plain, the Valdai hills in the west rise only to about 1,200 ft., and the Lithlo hills in the north west to about 1,200 ft. On the right bank of Lake Imandra, in the Kola peninsula, is an elevation of 3,200 ft. The Timanski range, in the province of Archangel, rises to about 3,000 ft., and Mount Lajaur-Ort in Finland to about 3,400 ft. In the Crimea and Caucasus various heights are over 4,500 ft., and the Obdorsk and Ural Mountains, which form the borderland between Europe and Asia, rise in many places to between 4,000 and 5,000 ft. In Siberia the principal ranges are the Altai, Sayansk, Baikal, Yablonoi, and Verkhoiansk mountains, with a volcanic chain in Kamtchatka. In Russian Turkestan are portions of the Tilan Shan range, and in Bokhara are the Pamirs, the "Roof of the World," and in all these ranges are heights of over 23,000 ft. The principal rivers are the Volga, Ural, Pechora, Dniester, Don, Dvina, Dniepr, and Neva. The Volga is the largest river in Europe, and is navigable almost to its source. In Siberia, the Ob, Yenisei, Lena, and Amur are each larger than the Volga, with many important tributaries. The river Amur, dividing Manchuria from Eastern Siberia, is navigable from its mouth to Chita, in the Trans-Baikal province, by shallow draught steamers, and is of importance, together with the Trans-Siberian Railway, in spreading Russian influence in the outlying portions of the Chinese Empire.

*Agriculture*.—A great portion of Russia is unfit for cultivation, in the north the *tundras* are almost constantly frozen, but in a short summer provide good pasture and certain berries fit for human food. In the south, round the head of the Caspian Sea, is an immense sandy desert steppe, whilst some of the interior provinces (to the extent of about 480,000,000 acres) and nearly the whole of Siberia are clothed with forests, in which the fir, pine, birch, oak, lime, maple, and ash predominate. The country between the Baltic and Black Sea, however, is eminently fertile, producing abundance of grain. The total area under cereals, potatoes, &c., in 1912 was 361,045,636 acres, of which 78,137,133 acres were under wheat, 72,243,480 under rye, 48,509,878 under oats, and 20,899,734 acres under barley. The harvest of cereals for 1912 is officially stated to be as follows:—wheat (spring and winter sown), 21,476,312 tons; rye (spring and winter) 25,842,936 tons; barley, 10,321,892 tons; oats, 23,569,348 tons; millet, 2,324,228 tons; maize, 2,867,128 tons. Hemp and flax are extensively cultivated, and of late years potatoes (37,392,464 tons in 1912) and tobacco (7,726,946 poods of 36 lb. in 1911).

*The Live Stock* in 1914 included 32,052,000 cattle, 72,873,000 sheep, lambs and goats, 14,995,000 pigs, and 34,973,000 horses.

*Minerals*.—The Obdorsk and Ural Mountains contain very great mineral riches, and, with the Altai range are the principal seat of mining and metallic industry, producing gold, platinum, copper, iron of very superior quality, rock-salt, marble, and kaolin, or china-clay. Silver, gold, and lead are also obtained in large quantities from the mines in the Altai Mountains. Russia is now the largest producer of petroleum in the world, the output amounting to 232,000,000 poods in 1914, and to 232,000,000 poods (of 36 lb.) in 1913. An immense bed of coal, both steam and anthracite, and apparently inexhaustible, has been discovered in the basin of the Donetz (between the rivers Donetz and Dnieper). The coal output for the whole of Russia in 1913 was 2,088,180,000 poods (of 36 lb.), and in 1914 2,060,340,000 poods. Other mineral products in 1910 were gold-ore (whilst), producing 2,292 poods of pure gold, platinum, 239 poods, pig iron (256,264,000 poods in 1912), steel and rails (1912, 274,446,000 poods), copper, 2,048,980 poods in 1912 (in 1913, 2,093,289), quicksilver (2,992 poods in 1908), salt (122,940,000 poods in 1912), and lead (75,384 poods in 1911).

*Ports*.—The principal ports are Petrograd, the naval depôt and fortress Kronstadt, Narva, Riga, Libau, Pernau and Vindau (Baltic), Hango (Gulf of Bothnia), Revel, Helsingfors and Wiborg (Gulf of Finland), Archangel and Ekaterinsk (Arctic and White Seas), Odessa, Nicolaieff, Sevastopol, Nova-Rossisk, Berdiansk, and Batoum, Taganrog, Mariupol, Rostoff and Kertch (Black Sea and Sea of Azov), Astrakhan Derbent and Baku (Caspian Sea), and Nicolaiefsk, Vladivostok, and Petropaulovsk in Kamtchatka (Pacific).

*Defence.*—Service in the *Army* is universal and compulsory, except in Finland and for the native races of Asia. Service lasts generally from the age of the 21th year. Infantry and foot artillery 3 years in active army, 15 years in the reserve, and 5 years in the territorial army. Cavalry, mounted artillery, engineers, &c. 4 years in active army, 13 in the reserve, and 6 in the territorials. The Cossacks serve one year in the preparatory class, 12 in active army, and 5 in the reserve. The *Navy* consists of the Baltic Fleet, the Caspian flotilla, and the Black Sea Fleet, the number of vessels being Battleships—Dreadnoughts, 6; pre-Dreadnoughts, 8; armoured cruisers, 3; protected cruisers, 10; destroyers, 117; submarines, 41.

*Education.*—With the exception of Finland, education is very backward, especially in country districts. Probably not more than 10 per cent. of the population have received instruction of any kind. The control and maintenance of primary schools is divided between the Ministry of Public Instruction and the Holy Synod. Conditions are, however, improving. Secondary institutions comprise gymnasia and good schools, but numbers and attendances are small. Special schools are increasing in number, especially in the European cities. There are universities at Kazan, Kiev, Kharkov Moscow, Odessa, Petrograd, Saratov Tomsk, Yuriev, and Warsaw.

*Communications.*—The total length of lines open for regular traffic on January 1, 1913, was 46,829 miles, inclusive of 2,347 miles in Finland, and 1,079 miles of the Eastern China Railway. New lines under construction in 1913 extended to 4,492 miles, of which 2,823 were Government lines, projected lines authorised (1–14 Jan., 1914) totalled 4,205 miles. In 1914 the gross revenue amounted to £122,213,000. The number of passengers carried was 235,179,382, and goods traffic amounted to 229,283,479 tons.

There were (1913), excluding Finland, 15,261 post-offices, carrying 2,683,900,000 letters, &c. Of telegraphs there were (1911) 8,423 offices, with 496,177 miles of wire, and 13 wireless stations.

*The sea-going commercial marine consisted in* 1914 of 1,044 steamers, with a total tonnage of 513,003, and 2,197 sailing vessels of 256,726 net tons. In 1911 the total estimated value of the steam fleet was £13,300,000 and of the sailing vessels £1,700,000. The steam fleet was manned by 17,137 persons and the sailing ships by 12,333 persons; the ocean shipping of Russia is comparatively insignificant, but the internal (lake and river) shipping is considerable.

Budget Revenue —

| | 1913. *Roubles. | 1914. *Roubles. |
|---|---|---|
| *Ordinary* ... | 3,240,599,206 | 3,321,697,282 |
| *Extraordinary* | 10,000,000 | 13,400,000 |
| Budget Expenditure — | | |
| *Ordinary* ... | 3,012,264,284 | 3,320,578,714 |
| *Extraordinary* | 288,294,722 | 294,583,783 |

The Budget for 1916 showed Revenue £320,114,000 and Expenditure £364,696,800.

*National Debt.*—The National Debt amounted on 1 (14) January, 1916, to Rs. 8,725,220,000. The total of gold in the State Bank at 1 (14) November, 1914, was 1,830,230,918 roubles.

*Trade and Commerce.*—The chief imports are cotton, tea, and other colonial produce, iron and machinery, wool, wine, fruits and vegetables; the principal exports are wheat and other cereals, raw and dressed flax, linseed, timber, hides and skins, hemp, tallow, wool, spirits, tow, and bristles.

| | 1913. | 1914. |

CAPITAL, Petrograd.* Population (1913), 8,018,598.

## FINLAND.

*Governor-General*, M Stakhovitch.

A province on the gulfs of Finland and Bothnia, which was conquered by Russia from Sweden and finally annexed in 1808. The area is 144,254 square miles, with a population of about 3,020,000 in 1917 of whom about 2,600,000 are Finns, 400,000 Swedes, 19,000 Russians, 3,000 Germans, and 2,000 Laps, leading a nomadic life in the north. Nearly all the inhabitants are Lutherans. There is a university at Helsingfors, with 2,312 students, of whom 918 are women. The leading crops are rye, barley oats, potatoes. Saw mills and paper manufacture provide the chief industry, and the forests are a great source of wealth, immense quantities of timber being prepared for export; dairy produce is also exported. There are 2,982 miles of railroad, and a merchant fleet of 3,617 vessels (mostly small), of which 900 are steamers.

The country was formerly governed by the Imperial Finnish Senate of 20 members, with a Diet of 4 estates elected by the people. This form of government gave way on 1 Jan., 1907, to a new Constitution involving a single Chamber elected by universal suffrage of both sexes. *Women are likewise eligible for election to the Chamber.* Finland is thus the first country to concede woman suffrage and representation, and it is noteworthy that it has been gained without agitation. The Finnish troops only exist in name, the Diet having voted £400,000 per annum to the Russian Treasury in lieu of furnishing Finnish recruits to the army or navy, and Finland has been made part of the Petersburg Military District. The revenue in 1914 was £6,364,130, and the estimated expenditure £7,425,703, the debt amounts to £5,996,410. The imports in 1913 were £23,136,400, and the exports £20,655,800 (of which 60 per cent. was timber). The capital is Helsingfors, population, 160,000 (including Russian troops).

## BOKHARA.

*Emir of Bokhara*, H.H Said Mir Alim Khan, b. 1880, *succeeded* 1911.

Bokhara is a vassal State of Russia in Central Asia, and has an estimated area of 85,000 square miles, with a population of 2,250,000, the majority being Muhammadan Uzbegs. The capital (Bokhara) is a station on the Trans-Caspian Railway, and has a population of about 75,000. The principal products are

* *Rouble* = 2s. = £1.

* The name St. Petersburg was changed by Imperial Order 1 Sept., 1914.

ries, wheat, fruit, hemp, cotton, and silk. Exports (mainly to Russia) are agricultural products and silk and cotton manufactures; imports are principally manufactured goods and sugar.

KHIVA.

*Khan*, H.H. Said Asfendiar, *b.* 1872, *succeeded* 1920.

Khiva lies between Bokhara and Russian Trans-Caspia, and has a total area of about 26,000 square miles, with a population of 800,000, of whom about half are nomads. The country occupies the fertile delta of the Oxus, and is highly productive. The capital (Khiva) has about 12,000 inhabitants.

Petrograd, *viâ* Calais, is 2,709 miles from London; transit, 7 days, *viâ* Scandinavia.

SALVADOR, Republic of.

*President* (acting until 1 March, 1923), Señor Carlos Melendez.

*Foreign Affairs*, Señor F. Martinez Suarez.

*Chargé d'Affaires and Consul-General in London* Dr. Arturo B. Avila, 7, Union Court, Old Broad Street, E.C.

Salvador extends along the Pacific coast for 170 miles, with a general breadth of 43 miles, and contains an estimated area of 7,225 square miles, with a population estimated at 1,271,396. It is divided into 14 departments, and has four ports Acajutla, La Libertad, La Union, and El Triunfo. The principal exports are coffee, indigo, tobacco sugar, silver balsam (known as balsam of Peru), rice, hides, cedar, and fustic. A British railway nearly 200 miles in length connects Acajutla with the capital and Santa Ana, the coffee centre and another line is in course of construction from the port of La Union to the capital. This has been completed to Encantadores (103 miles), whence a motor service to San Salvador has been organised. Earthquakes are frequent, and in June, 1917, a series of seven shocks nearly destroyed the capital, and ruined the towns of Santa Tecla, Armenia, and Apopa. The British railway was cut by the flow of lava, and Acajutla isolated from Salvador. The volcano on Mount Salvador was actually in eruption in Oct. 1917. There are 220 post-offices and 223 telegraph offices, with 3,200 miles of wire.

Salvador is 5,700 miles from London transit, ex days vi-l Puerto Barrios (Guatemala).

## SAN MARINO

A small Republic in the hills near Rimini, on the Adriatic, founded, it is stated, by a pious mason of Dalmatia in the 4th century, and governed by a Council of 60, of whom two are elected as Regents for six months (1 April and 1 October), being thereafter ineligible for office for three years. The area is 23 square miles, the population 12,000. There is an army of about 1,000. The city of San Marino (pop. 2,500) occupies the slope of Mount Titan, and has an impregnable castle, where King Berengar of Lombardy took refuge in 950 A.D. a fine church and Government palace and a theatre. Agriculture and viticulture flourish

*British Consul-General for San Marino*, M. Carmichael (Florence).
*Consul-General for San Marino in Great Britain*, Commendatore Arthur Serena, J.P., F.R.G.S., 34 Leadenhall Street, E.C.

## SERBIA.

*King* Peter I. (Karageorgevitch), *b.* 1844, elected 15 June, 1903, *married*, 1883, the late Princess Zorka of Montenegro.
*Heir Apparent*, Prince Alexander *b* 1888.
*Premier and Foreign Affairs* (24 June, 1917), M. Nikolas Pashitch
*Interior*, Lyouh Yovanovitch.
*War*, Gen. B. Terzitch.
*Justice and Agriculture* M. Djouritkitch.
*Public Works and Instruction*, Dr Momtchilo Ninkitch.
*Commerce and Agriculture* M Marinkovitch.
*Finance*, Stoyan Protitch.

*Minister in London*, M. Yovan M Yovanovitch.
*Legation*, 195 Queen's Gate S.W
*Secretary*, V Antonkivitch.

A Kingdom of Eastern Europe, separated from Hungary by the Danube and Save, and bounded on the east by Bulgaria, on the west by Albania and Montenegro and on the south by Greece. By the constitution of 1889 a "Skupshtchina," a parliament elected by ballot, represented the people; this constitution was re-established by the present king. By the Berlin Treaty, 1878, it received a large accession of territory, and in 1900 it had an area estimated at 18,987 square miles, with a population in 1900 of 2,911,701. In 1912 Serbia, as a member of the Balkan League (Bulgaria, Greece, Serbia, and Montenegro), waged a successful war against Turkey. In August, 1913, Serbia and Greece were attacked by Bulgaria, their former ally, owing to disputes concerning the division of the spoils. The second war collapsed in a few weeks through the threatened intervention of Roumania, and ended in the Treaty of Bucharest. Serbia also became involved with the Austro-Hungarian Monarchy on a question of the Albanian frontier, where desultory fighting had taken place for some months, but eventually the smaller Power with-drew from the disputed area. The outcome of this military operations was the unification of the whole of "Old Serbia" (the greater parts of the vilayets of Macedonia) within the Serbian boundaries, which thus embrace an area (1914) of close on 34,000 square miles, with a population estimated at 3,000,000. The cost of the wars to Serbia exceeded £18,000,000. The assassination of the Austrian Heir Presumptive in June, 1914, brought about an invasion of Serbia by the forces of Austria Hungary, and started the pan-European war that is now in progress. The whole country has since been overrun, and on 28 Nov., 1915, was still occupied by the forces of Austria, Germany and Bulgaria. On 28 Aug., 1916, the Serbian Parliament met at Corfu. The surface of the country is mountainous, containing the remains of formerly extensive forests and uncultivated heaths. Agriculture is carried on in a somewhat primitive fashion. The principal crops are maize for home consumption, and wheat for export, flax, hemp, and tobacco are also grown, and silk-culture is carried on to a limited extent. The imports consist mainly of cottons, sugar, and colonial goods, hardware, woollens, &c., the export, of dried prunes (25 per cent.), pigs, and wool, besides wheat, wine hides, cattle, and horses. The bulk of the trade is with Austria. There were (1912) 580 miles of railway, and (1908) 2,000 miles of telegraph, with 1,480 post-offices and 2,100 miles of telephone wires.

*The Army* on a peace footing consists of 30,000 officers and men, the war strength being about 250,000.

*The Navy.*—In 1906 Serbia acquired a destroyer, and each of the Allies presented her with two units to form the nucleus of a Serbian navy

*Education.*—Primary education is free and nominally compulsory, but the attendance does not exceed 25 per cent. of the young. The State also maintains Secondary and Girls' High Schools. The University is at Belgrade.

Belgrade 1,275 miles from London. Transit, 2½ days.

## SIAM.

*King*, Somdetch Phra Paramendr Maha Vajiravudh Mongkut Klao, born 1 January, 1880, *succeeded* 23 October, 1910.
*Foreign Minister*, H.R.H. Prince Devawongse.
*Envoy Extr and Min. Plen.* in *London*, Phya Sudhasi Maitri, 29 Ashburn Place, S.W
*Consul-General*, Sir John Anderson, 5 Whittington Avenue, E.C.

The Kingdom of Siam, or Muang Thai (area about 195,000 square miles, population, 1904, 6,150,000), is a buffer State between British Burma,

and French Indo-China, and its integrity is guaranteed by the British and French Governments by the Anglo-French Agreement of April, 1904. The upper part of Siam is mountainous, the lower flat. Siam contains many Chinese (largely engaged in trade and industry), besides Shans, Laos, Malays, Burmese, and Cambodians, and over 2,600 Europeans. The principal religion is Buddhism. Education is now under the Minister of Public Instruction. There are 394 public schools and 4,139 schools of all kinds, attended by 120,800 children. A University is in process of organisation. Bangkok is the only much-frequented port. Over two-thirds of Siamese sea-borne trade, which centres at Bangkok, is with the British Empire, and is largely in the hands of British firms or of Chinese trading from Singapore and Hong Kong. German shipping, which has held the lead in tonnage for many years past, has ceased to visit Bangkok since August, 1914, and, as a consequence, there has been a large increase in Norwegian and British shipping. The chief products of Siam are rice and teak. The area under rice has been much enlarged by irrigation. There is a large number of rice mills, mostly in or near Bangkok. The teak industry in the great forests of N. Siam is mainly in English hands. In 1915-16 rice constituted 63 per cent. and teak 5 per cent. of the exports; while hides and marine products are also exported in considerable quantities. Among imports are treasure, cotton goods and yarn, silk goods, provisions, gunny bags, kerosene, sugar, opium, metals and metal wares, machinery, &c. The general tariff rate is 3 per cent. *ad valorem*. Burma imports teak and cattle overland from Siam, and exports thither cotton and silk goods, &c. Except tin, wolfram, rubies and sapphires, there are no important mineral products. The King is an absolute monarch, and appoints his successor. There is an Executive Council of Ministers and a European general adviser, and, since 1895, a Legislative Council of State, consisting of the Ministers, eight royal princes, and over twenty members appointed by the King, who has an absolute power of veto. A number of English, French, Germans, Italians, Danes, and Japanese are employed in the various State departments. Siam has an army of nearly 30,000 men, and a few small gunboats; compulsory military service has been introduced. About 1,200 miles of railroads (mostly State-owned) are now open for traffic. Railways from Bangkok run to Korat (265 miles N.E.), Wakaun Lampang (400 miles N. of Bangkok), Petriu (100 miles S.), and Koh Lao, while the northern line is being extended to Chiengmai, and the southern line to Trang, on the west coast of the Malay Peninsula, was open to traffic along its whole length in October, 1918. Good roads are few. There are 3,000 miles of telegraph lines.

The currency is the silver tical, worth about 1s. 6d. The Mint was closed to the free coinage of silver in Nov., 1902. In N.W. Siam the Indian rupee is more or less current. The Government issues notes.

War against Germany and Austria was declared on 22 July, 1917.

*Councillor*, Conde de San Esteban di Calonge *and Secretary*, Marqués de Los Arcos.
*Attachés*, Fernando V. Ibargüen, Conde de Ell, Hernando Valdés, Marqués de Mos.
*Military Attaché*, Lt.-Col. Fernando Rioh.
*Consul-Gen.* Excmo. Señor Don José Congosto, 40 Trinity Square, E.C.

A Kingdom situate in the south-west of Europe, between 36° 43' 48" N. lat. and 4° 19' E.—9° 20' W. long., bounded on the south and east by the Mediterranean, on the west by the Atlantic and Portugal, and on the north by the Bay of Biscay and France, from which it is separated by the Pyrenees, and occupying the larger portion of the great Iberian Peninsula. Its coast-line extends 1,931 miles—712 formed by the Mediterranean and 619 by the Atlantic—and it comprises a total area of 196,000 English square miles, and an estimated population in Jan. 1914, of 20,256,000 —102·9 to the square mile. The interior of the peninsula consists of an elevated tableland surrounded and traversed by mountain ranges —the Pyrenees, the Cantabrian Mountains, the Sierra Guadarrama, S. Morena, S. Nevada, Montes de Toledo, &c. The principal rivers are the Douro, the Tagus, the Guadiana, the Guadalquivir, the Ebro, and the Minho. The Constitution upon which the present Government is formed is dated 30 June, 1876. The principal towns are Madrid (pop., 597,877), Barcelona (587,009), Valencia (233,348), Seville (152,368), Malaga (136,190), Murcia (108,380), Saragossa (111,190), Carthagena (96,980), Bilbao (93,238), and San Sebastian (90,314), and there are also twelve towns with over 50,000 inhabitants. Spain is rich in iron, copper, and lead; its mineral resources

are only partially exploited, and principally by foreign capital under foreign direction. The country is generally fertile, and well adapted to agriculture and the cultivation of heat-loving fruits—as olives, oranges, lemons, almonds, pomegranates, and dates. The agricultural products comprise wheat, barley maize, oats, rice, with hemp and flax of the best quality. The vine is cultivated in every province, in the north-west, Jerez, the well-known sherry and best wines are made in the south-east, the Malaga and Alicante. The principal articles imported are raw cotton, spirits, fish, wheat and flour, sugar, coal, timber woollen manufactures, machinery and railway materials, hides, &c. The principal exports are wine, copper and copper ores, lead, iron ores, olive oil, raisins, oranges, cork, esparto grass, wool, salt, quick silver, grapes, &c. Trade was for many years mostly confined to France and Great Britain, but Germany has since become a serious competitor, while the United States and Belgium share an increasing proportion of Spanish trade. Home manufacture is rigidly protected by high customs duties.

In 1914 there were 9,377 miles of railway open and 39,834 miles of telegraph line. The sea going mercantile marine on Jan. 1, 1915, consisted of 640 steamers and 219 sailing vessels over 50 tons, of a total tonnage of 904,727. In 1913, 18,445 vessels of 14,868,854 tons entered and 18,149 vessels of 13,542,050 tons cleared at Spanish ports.

*Defence.*—The authorised peace establishment, including forces in North Africa, was, in 1913, 73,500 officers and 122,000 men. War strength: Field Army, first line, 280,000. Second line, 120,000.

The Navy is being rebuilt and reorganised, and consists of 3 (13,000-ton) battleships and 3 modern cruisers, with 1 old battleship and 4 old cruisers; there are also 8 torpedo-boat destroyers, 24 torpedo-boats, 4 submarines, and 10 gunboats.

*Education.* *Primary*, is nominally compulsory and mainly free, and is State-aided, the public schools being maintained by local taxation. Many private schools are under clerical control, and supervision is lacking. *Secondary* High Schools are in each province, but the curriculum is defective. *Universities* at Barcelona, Granada, Madrid, Salamanca, Santiago, Saragossa, Seville, Valencia, and Valladolid.

The BALEARIC ISLES are an archipelago of 13 islands in the Mediterranean, the largest being Majorca, Minorca, Ivica, and Formentera, the total area is 1,935 square miles, with a population (1920) of 398,295. The archipelago forms a province of Spain, the capital being Palma in Majorca.

CEUTA, which forms part of the Province of Cadiz, is a fortified port on the Moroccan coast, opposite Gibraltar. The total area is 8 miles, with a population of about 13,000.

The CANARY ISLANDS are an archipelago in the Atlantic, off the African coast, consisting of 7 islands and 6 uninhabited islets. The total area is 2,807 square miles, with a population of 429,800. The Canary Islands form a Province of Spain, the capital being Santa Cruz in the island of Teneriffe.

SPANISH COLONIES.

The Spanish Colonies (exclusive of Ceuta and the Canary Islands, which form an integral part of the kingdom) consist of certain settlements and islands of Western Africa with a total area of close on 80,000 square miles, and a population exceeding 875,000.

**Fernando Po.**

FERNANDO PO (*Fernando Poo*) lies in the Bight of Biafra in 3° 22' N. lat. and 8° 48' E. long., about 20 miles distant from the west coast of Africa, and is a mountainous island (Pico de Santa Isabel, 10,800 feet), with forests of oil palm, ebony, mahogany, and oak, and sugar-cane, cotton, and indigo. Cocoa, coffee, sugar, tobacco, vanilla, and kola nut are cultivated and large quantities of cocoa and other products are exported. The capital is Basile, and the largest town Port Clarence (1,300 inhabitants). Dependencies of the island of Fernando Po are—

*Annobon Island* (*Anno Bom*), in the Gulf of Guinea, in 1° 25' S. lat. and 5° 38' E. long. The roadstead at the capital (San Antonio de Bata) is much frequented by passing vessels, which also obtain water and vegetables from the islanders.

*Corisco Islands*, consisting of Corisco, Bana, Elobey Grande, and Elobey Chico, lie in Corisco Bay, and export ebony, logwood, and other forest produce.

**Rio de Oro and Rio Muni.**

RIO DE ORO is a possession on the north-west coast of Africa, between Cape Bojador and Cape Blanco, or approximately between 21° 20'-26° N. lat., and extending eastwards to about 13° W. long. The territory is part of the waterless Sahara, with a sparse population of wandering Mahommedan Arabs. There are valuable fisheries off the coast, and cattle, sheep, and camels are bred where vegetation permits.

*Rio Muni* (or *Spanish Guinea*) is a coastal settlement of West Africa between Cameroon and French Congo (2° N.—0° 20' N. lat.), extending about 120 miles inland. The inhabitants are Bantu tribes, and the principal settlements are at the mouths of the Muni, Benito, and Campa rivers, and at Bata on the coast. Cocoa, coffee, and bananas are cultivated, and rubber, palm oil, palm kernels, and other forest produce are exported.

**Spanish Morocco.**

On the Moroccan seaboard are certain Spanish *presidios, formerly used as convict settlements.*

*Melilla* is a town on a rocky promontory of the Riff coast, connected with the mainland by a narrow isthmus. The population is about 9,000, and the settlement exports gumtahin, eggs, and beeswax, and imports cotton goods and provisions.

*Alhucemas* is a settlement on the bay of that name and includes six islands.

*Peñon de la Gomera* (*or Peñon de Velez*) is a fortified rocky islet about 40 miles west of Alhucemas Bay.

*The Chafarinas* (or Zaffarines) are a group of three islands near the Algerian frontier, about 2 miles north of Cape del Agua; population about 1,000.

*Ifni* on the Atlantic coast of Morocco, about 100 miles south of Agadir, affords access to the interior of south west Morocco, but has no great trade at present.

*Vice-Consul*, A. v. Platen.

Swedish Church, Harcourt Street, Marylebone Road, W

Sweden comprises the eastern half of the Scandinavian peninsula, and comprises the capital and 24 governments, "Län," with an area of 172,876 square miles, and a population, 31 Dec., 1910, of 5,521,613, nearly all Protestant. This area includes the great lakes of Hjälmaren, Mälaren, Vänern, and Vättern. Nearly 49 per cent. of the population are devoted to agriculture, about 298,000 being owners and 92,000 tenants of the land they cultivate. The country for the most part is flat, with pleasant undulations, rising in the north-west to the Kölen Mountains, which separate Sweden from Norway, and may be divided into three separate districts—the northern, forest central, mining, the southern, agricultural. The climate in the south is favourable for producing grain. The principal articles of cultivation are the various cereals—oats, rye, barley, wheat—and potatoes. The forests are very extensive, covering one-half of the surface of the country, and consisting of pine birch, fir these are of great importance supplying timber, pitch, and tar, and also the chief fuel The mineral products are extremely rich iron of excellent quality, that known as the Dannemora iron being converted into the finest steel gold and silver in small proportions copper, lead, nickel, zinc, cobalt, alum, sulphur, porphyry, and marble. There is a railroad opening up the rich iron-ore districts of Lapland, and mineral trains run from Gellivare and Kiruna to Luleå on the Gulf of Bothnia and to Narvik on the Atlantic. Considerable mines of coal are being worked in Scania. The chief imports are coffee, wine tobacco, and other ordinary colonial produce, coal, cloth yarn, wool, cotton, skins, manure, iron, fish, oils, wheat, rye pork, and machinery The chief articles of export are timber, butter, iron, steel, wood pulp, paper, matches, stone, iron and zinc ores, &c.

Commercial travellers in Sweden are compelled to take out a licence, costing 100 crowns a month, or they incur the risk of being fined.

Railroads 9,228 miles in length (of which 3,044 are the property of the State) were open on 1 Jan., 1916, and 21,700 miles of telegraph wires (exclusive of 19,121 railroad telegraph wires), 577 stations, and 1,729 railroad and 940 other telegraph stations (1912). There were at the same date 243,700 miles of telephone wires.

*Defence.*—Service in the Army is universal and compulsory The peace effective is about 60,000 trained men. The first line can be raised to war strength of about 120,000, second line, 84,000. The Navy consists of 92 fighting vessels (258 guns), 23 being ironclads, with submarines, submersibles, and some training ships, &c.

*Education.*—*Primary* Compulsory and free. Illiteracy rare. Maintained by local taxation, with State grants. Attendance good (B.) *Secondary:* Well-developed, schools numerous and efficient. (C.) *Special* schools make a feature of technics and navigation. (D.) *Universities* Lund, Upsala, and a few private faculties.

The Helvetia of the Romans, a Federal Republic of Central Europe, situated between 45° 50′—47° 48′ N lat. and 5° 58′—10° 30′ E. long. It is composed of 22 Cantons, of very dissimilar size, united under a Constitution dated 29 May, 1874, and comprises a total area of 15,950 square miles, with a population of 3,877,236 in 1913, who are divided between Roman Catholics, 40 per cent., and Protestants, 59 per cent., Jews numbering 7,402 and others 11,022. The population is formed by three nationalities, distinct by their language, 22 German 72 per cent., French 22 per cent., Italian 6 per cent., and Romansche (in the Grisons), 1¼ per cent The most important cities are Zurich, pop. (1913) 203,265, Bale 137,132, Geneva 136,688, Berne 98,200 (1912), and Lausanne 66,129. It is the most mountainous country in Europe, having the Alps, covered with perennial snow and glaciers, rising from 5,200 to 15,213 feet in height, not only along its southern and eastern frontiers, but throughout the chief part of its interior; and the Jura mountains in the north-west. Agriculture is followed chiefly in the valleys, where wheat, oats, maize, barley flax, hemp, and tobacco are produced, and nearly all English fruits and vegetables are grown. The forests cover about one-sixth of the whole surface. The manufactures consist chiefly of silks, cottons, linen, lace, thread, woollens, &c., clocks and watches have long been the staple products of Geneva and Neufchâtel, while leather, gloves, pottery, tobacco and snuff, cheese, &c., are made. Being an inland country, the direct trade with the United Kingdom is comparatively small. In 1914 there were 2,250 miles of railway in working order, 17,332 miles of telegraph line, 337,403 miles of telephone line and 2,029 post-offices.

The legislative power is vested in a Parliament, consisting of two Chambers, a National Council of 189 members, and a Council of States of 44 members, both Chambers united are called the Federal Assembly, and the members of the National Council are elected for three years, an election taking place in October The executive power is in the hands of a Federal Council of 7 members, elected by the Federal Assembly, presided over by the President of the Confederation. The President has a salary of 20,000 francs, the Vice-President and other members of the Federal Council 18,000 francs each. The members of the Federal Council are elected for three years, each year the Federal Assembly elects from this council the President and the Vice-President, they are elected for one year, the five other members for three years. Not more than one of the same canton may be elected member of the Federal Council.

*Defence Militia.* Active Army, 12 yrs., Infantry, 65-90 days. Subsequently 12 days per ann. 3 then Landwehr, 8 yrs.; 2 yrs., 12 days. for dismtd. branches only, then [Landsturm to age 48]. *War Strength*, 140,600, Landwehr, 65,200; Landsturm, 37,200.

*Education.*—Control by cantonal and communal authorities. No central organ. Illiteracy rare in Protestant cantons. (i.) *Primary* Free and nominally compulsory, but attendance is not strictly enforced in the essentially Roman Catholic cantons. School age varies. (ii.) *Secondary* Age 12–15 for boys. Schools numerous and well-attended, and there are many private institutions. (iii.) *Special schools* make a feature of commercial and technical instruction. (iv.) *Universities* Bâle, Berne, Fribourg, Geneva, Lausanne, Zurich, and Neuchâtel.

### TRIPOLI (Italian Colony)

This Vilayet of the Ottoman Empire, on the northern coast of Africa, was occupied by Italy in 1911–12, and under the Treaty of Ouchy (Oct. 1912) the sovereignty of the province was transferred to the King of Italy, the spiritual head-ship over the Muhammadan population being retained by the Sultan. Tripoli is the most easterly of the Barbary States, extending from the frontiers of Tunis to those of Egypt, a distance along the coast-line of nearly 2,200 miles, and inland to the south a distance of about 800 miles. The transferred territory comprises the four sub-provinces or Mutesarrifliks of Tripoli Khoms, Jabal el Gharb, and Fezzan, and also of Benghazi or Cyrenaica, a total area of 400,000 square miles, with a population of over 1,000,000. There are no rivers in the country and, the rainfall being precarious, a good harvest can only be reckoned on every four or five years. Barley, dates, olives, oranges, lemons, and vegetables are produced and the principal imports are metals, British and other European manufactures tea, beads, wine and spirits, besides a number of articles for barter in Wadai, Borun, and the Western Sudan, whither caravans proceed from Tripoli. The principal articles of exports are ostrich feathers, ivory, skins, sponges, hides, esparto grass, cattle, and horses. The ancient ruins in Cyrenaica, *i.e.* at Cyrene, Ptolemais, and Apollonia, are interesting to explorers, as well as those at Leptis Magna, which is close to Khoms, or 70 miles from the city of Tripoli. The town of Benghazi has a population of about 21,000, consisting of Arabs, Greeks, Maltese, and a few Levantines. The commerce in cereals, wool, cattle for Malta, and other agricultural produce, is considerable, when a sufficient rainfall causes good harvests.

| | Area (sq. miles). | Estimated Population. |
|---|---|---|
| Turkey in Europe . . . . | 10,600 | 6,792,000 |
| Turkey in Asia — | | |
| Anatolia . . . . | 192,800 | 9,178,000 |
| Armenia and Kurdistan | 72,600 | 2,500,000 |
| Mesopotamia and Syria | 244,400 | 4,685,000 |
| Turkish Arabia . . . . | 172,000 | 1,200,000 |
| Total . . . . | 694,800 | 20,280,000 |

Until the disastrous war of 1912–3 with the States of the *Balkan League* (Bulgaria, Greece, Servia, and Montenegro) the European dominions of Turkey extended westwards to the Adriatic and northwards to Bosnia-Herzegovina (Austria). Under the Treaty of London (30 May, 1913) the north west portion of Turkey was a line drawn from Enos, in the Ægean, to Midia, in the Black Sea, thus excluding Adrianople, which had capitulated to the Bulgarians after a prolonged siege. During the second Balkan War (Bulgaria against the other members of the Balkan States) Turkey took advantage of the military difficulties of Bulgaria and re-occupied Adrianople thus recovering a considerable portion of the vilayet of that name. In 1912–13 Turkey lost the remaining portion of her African possessions through the occupation by Italy of Tripoli and Cyrenaica, which were ceded under the Treaty of Ouchy (1912). Turkey joined forces with the Austro-Germans in November, 1914, and has attacked Russia and invaded Egyptian territory. Her doom as a European Power is now, in every probability, sealed.

EUROPEAN TURKEY consists of the Vilayets, or Provinces, of Adrianople and Constantinople, with the Mutesarrifat of Chatalja, and is separated from Asia by the Bosporus at Constantinople and by the Dardanelles (Hellespont) —about 40 miles in length, with a width varying from 1 to 4 miles. The only political neighbour being Bulgaria, on the north west. The principal towns of European Turkey are Constantinople, the capital, with a population of about 1,200,000, and Adrianople (200,000).

TURKEY IN ASIA comprises Anatolia, Armenia and Kurdistan, Mesopotamia and Syria, and Turkish Arabia —

*Anatolia*, which is practically identical with Asia Minor, consists of the Vilayets of Adana, Angora, Archipelago Brousa, Castamuni Konia, Sivas, Smyrna, and Trebizond with the Mutesarrifats of Bigha (Dardanelles) and Ismid. Of the total population (9,173,000) about 3,000,000 belong to the Orthodox Greek Church, over 4,000,000 are Muhammadans and the remainder principally Jews. The Archipelago Vilayet of Anatolia formerly comprised a number of islands with a total area of close on 3,000 square miles, and other islands were under Turkish suzerainty. In 1912–13 Italy occupied Rhodes, with the neighbouring islands, while in 1912–13 almost all the remaining islands of the vilayet, and Crete and Samos, were obtained by Greece. *Cyprus* (see p. 982) has been administered by Great Britain since 1878, and was formally annexed to the British Empire in 1914.

*Armenia* comprises the vilayets of Bitlis, Erzeroum, and Mamuret el Aziz, and Kurdistan those of Diarbekir and Van. Of the population (2,500,000) about 650,000 are Armenian Christians (the massacres of 1915 have, however, resulted in their practical extermination); 250,000 other Christians, and 1,600,000 Muhammadans. *Mesopotamia* (the land of the Tigris and Euphrates)

includes the vilayets of Bagdad, Basra, and Mosul, and part of the vilayet of Zor.

*The Bagdad Railway* starts from the Anatolia system at Konia. The Taurus section has been practically finished by the piercing of a tunnel through the mountains. South of the city of Bagdad is Kerbela, the sacred centre of the Shiite Muhammadans. H.H. the Grand Sherif of Mecca, in June, 1916, proclaimed the independence of that province of Turkish rule.

*Syria* includes the vilayets of Aleppo, Beyrout, and Syria, and part of the vilayet of Zor, with the Mutessarifliks of Jerusalem and Lebanon. The Biblical district of *Palestine* now forms the Mutessarifliks of Jerusalem (El Kuds), Lebanon, Acre, and Nablus. The total area of this cradle of Christianity is about 12,000 square miles, its present population being about 700,000, of whom 150,000 are Jews, and the remaining principally Muhammadans.

The principal towns of Asiatic Turkey are Smyrna (280,000), Bagdad (150,000), Damascus (150,000), Aleppo (128,000), Beyrout (120,000), Scutari in Anatolia (80,000), and Brousa (80,000).

A Republic in South America, on the east coast of the Rio de la Plata, situate in lat. 30°—35° S. and long. 53° 25′—58° 42′ W., containing an area of 72,210 square miles, and a population in 1908 of 1,198,818, of whom about 200 are British born. The Republic consists mainly of undulating grassy plains, there being no heights above 2,000 ft. The principal river is the Uruguay and its affluents, of which the Rio Negro is the chief. Wheat, barley, and maize are cultivated, but the export is at present prohibited. The wealth of the country is obtained from its pasturage, which supports large herds of horned cattle (9,000,000 in 1908) and sheep (26,000,000 in 1908), the wool of which is of excellent quality. Gold mines exist at Cuñapiró. The exports are entirely animal products, and include frozen and preserved meat, wool, hides, horn, hair, tallow, and jerked beef. The imports are principally machinery, textiles and clothing, food substances and beverages, coal, and bloodstock. Since the war the trade has declined enormously. The imports from the U.K. are numerous, the principal being woollen and cotton goods, hardware, and coals. There are 1,900 miles of railway open (1913), all in British hands, and 4,800 miles of telegraph in 1913, with 12,000 miles of telephones. There were 998 post-offices, dealing with 127,660,838 letters and packets.

Uruguay severed diplomatic relations with Germany on 5 Oct. 1917.

The most northerly Confederation of South America, situated approximately between 1° 40′ S. lat. and 12° 28′ N. lat. and 59° 30′—73° 25′ W. long. It consists of 20 States and a federal territories. The best authorities calculate the actual present area to be approximately 363,748 square miles. The census of 1891 gave the population as 2,323,527, it was estimated to be 2,756,448 at 31 July, 1914. The principal imports are cotton prints and shirtings and cotton drill, mainly from the U.K., and hardware, principally from the U.S. The principal articles of export are coffee (£2,297,830 in 1915–16) cacao (£2,900,000 in 1915–16) balata gum, goatskins, asphaltic, and hides. The U.S. is the principal customer.

| | 1915–16. |

| Debt (30 June, 1916) .. .. .. | 6,297,814 |

* £T = 18s.

| | 1913–14. |
|---|---|
| Total Imports | 3,303,698 |
| Total Exports | 4,963,688 |
| | 1913. 1914. |
| Imports from U.K. | £509,340 £409,760 |
| Exports to U.K. | 234,644 172,343 |

The Budget for 1916–17 was (estimated) Bs.44,180,000.

CAPITAL, Caracas. Estimated population, 80,000.

BRITISH LEGATION

*British Envoy Extraordinary and Minister Plenipotentiary*, H. H. D. Beaumont, £1,850

BRITISH CONSULAR OFFICES.

*Bolivar*—*Cons.*, R. C. Hart.

*Carenero*—*Vice-Consul*, T. Ilor Rees, £300 to £500

*Carupano*—*Cons. Agent*, A. Francesconi.

*La Guayra*—*Vice-Cons.*, M. Brewer

*Maracaibo*—*Vice-Cons.*, John Robertson.

*Puerto Cabello*—*Vice-Cons.*, P. Ramirez Tirado.

*Barrancas*—*Cons. Agent*, René Alexander

*Guiria*—*Vice-Consul*, E. J. Formoy

*San Felix*—*Cons. Agt.*, E. Matthison

Caracas, 4,780 miles, transit from London, *viâ* New York, about 21 days.

## Regulations respecting Passports.

1. APPLICATIONS for Foreign Office Passports must be made in the form printed on the back of the Regulations (to be had on application), and inclosed in a cover addressed to "The Passport Office, 39 Victoria Street, London, S.W. 1." They should if possible, reach the Passport Office not less than seven days before that on which the Passport is to be issued.

2. The charge for a Passport is 5s. Passports are issued between the hours of 10 and 4, except *on Sundays and Public Holidays*, when the Passport Office is closed. If the applicant does not reside in London the Passport may be sent by post, and a Postal Order for 5s. should in that case accompany the application. *Postage stamps will not be received in payment.*

3. Foreign Office Passports are granted (1) to natural-born British subjects, viz., persons born within His Majesty's dominions and to persons born abroad who derive British nationality from a father or paternal grandfather born within His Majesty's dominions, and who under the provisions of the Acts 4 George II., cap. 21 and 13 *George III.*, cap. 21, are to be adjudged and taken to be natural-born British subjects (2) to the wives and widows of such persons and (3) to persons naturalised in the United Kingdom, in the British Colonies, or in India.

A married woman is deemed to be a subject of the State of which her husband is for the time being a subject.

4. Passports are granted (1) in the case of natural-born British subjects and persons naturalised in the United Kingdom, upon the production of a Declaration by the applicant in the form printed at the back of these Regulations, verified by a Declaration made by a member or official of any *Banking Firm* established in the United Kingdom, or by any *Mayor, Magistrate, Justice of the Peace, Minister of Religion, Barrister-at-law, Physician, Surgeon, Solicitor, or Notary*, resident in the United Kingdom, the applicant's Certificate of Birth and other evidence may also be required in certain cases, (2) in the case of children under the age of 16 years requiring a separate Passport, upon production of a Declaration made by the child's parent or guardian in a Form (B), to be obtained upon application to the Foreign Office, (3) in the case of persons naturalised in any of the British self-governing Colonies, upon production of a letter of recommendation from the *High Commissioner or Agent-General* in London of the State concerned and in the case of natives of British India, and persons naturalised therein, upon production of a letter of recommendation from the India Office. Persons naturalised or ordinarily resident in any of the Crown Colonies must obtain a letter of recommendation from the Colonial Office.

5. If the applicant for a Passport be a Naturalised British subject, his certificate of naturalisation must be forwarded to the Foreign Office with the Declaration or letter of recommendation. Naturalised British subjects, if resident in London or in the suburbs, must apply *personally* for their Passports at the Foreign Office. If resident in the country, the Passport will be sent, and the Certificate of Naturalisation returned, to the person who may have verified the declaration for delivery to the applicant. Naturalised British subjects will be described as such in their Passports, which will be issued subject to the necessary qualifications.

6. Foreign Office Passports are not available beyond two years from the date of issue. They may be renewed for four further periods of two years each, after which fresh Passports must be obtained. *The fee for each renewal is* 5s.

7. A Passport cannot be issued on behalf of a person *already abroad*, such person should apply for one to the nearest British Mission or Consulate. Passports must not be sent out of the United Kingdom by post.

## GREAT SHIP CANALS OF THE WORLD.

| Canal. | Opened, year | Length miles. | Depth, feet | Width * feet | Cost. |
|---|---|---|---|---|---|
| Corinth (Greece) | 1893 | 4 | 26 25 | 72 | £5,000,000 |
| Kronstadt-St. Petersburgh (Russia) | 1890 | 18 | 20 30 | 200 | 10,000,000 |
| Elbe and Trave Germany | 1900 | 41 | 10 | 70 | 3,850,000 |
| Kaiser Wilhelm or Kiel (Germany) † | 1895 | 61 | 45 | 230 | 34,848,000 |
| Manchester Ship (England) | 1894 | 35 5 | 28 | 120 | 75,000,000 |
| Panama (U.S.) | 1914 | 50 5 | 45 | 300 | 375,000,000 |
| Soulte Ste. Marie (U.S.) | 1855 | 1 6 | 22 | 100 | 10,000,000 |

# Geographical Record, 1916–17.

In addition to the limited amount of geographical work done within the past year, some earlier events, of which information has only lately come to hand, may also be recorded.

*Europe.*—The enemy successes in the Balkans have opened the way to German and Austrian savants, who have undertaken scientific researches in the conquered territory. Geological and other explorations have been carried out in Albania, Serbia, and Macedonia by Drs. Kreiss, Haberlandt, Kossmat, and others. Several important undertakings for the improvement of European communications have either made progress or been projected. They include a canal to unite the systems of the Danube and Rhine by way of the Main, a canal and railway to give access from Marseilles to the Rhone by the Etang de Berre (with tunnel on the canal 4½ miles long), and a maritime canal in Sweden (opened early in 1917) connecting Lake Vener with the Kattegat.

*Asia.*—The Austrian geologist Dr F Schaffer has explored some of the less-known mountainous districts of northern Asia Minor, and before returning to Germany, the Germans Niedermayer and Hentig completed an adventurous journey from Persia to Kabul and back by Russian Turkestan and Khorasan. Journeys in N W China and Tibet have been described by the British travellers Teichman and Farrer, and in S. China by Mr H. C. Wilton. The Austrian Baron von Handel Mazzetti has continued his explorations, begun before the war, in the Chino-Tibetan borderlands, and has reached the extreme headwaters of the Irawadi. Herr Rödiger, leader of a German expedition to the borderlands between Se-chuan and Tibet (also begun before the war), returned home in May, 1917.

*Africa.*—Surveys on the northern and southern watersheds of the Congo basin have been described by Majors C. Christy and E. A Steele respectively, the latter having been British Commissioner for delimiting the boundary between Rhodesia and the Belgian Congo. Important surveys in N Uganda by the late Capt. Leeke have been published. The Imatong Agora Mountains east of the Upper Nile, on the Uganda-Sudan boundary, have been explored by Mr H. P Wright. The military operations in German East Africa have improved our knowledge of certain areas, one of which—the Uru gara Mountains—has been described by Lieut. Bovill. In the French Sahara good work has been done by Major Tilho, who had started before the war to take up his military duties in the region N E. of Lake Chad, and has partially explored the Tibesti highlands and made a map of the whole region. The French geologist M. Hubert has completed important researches into the economic geology of the Western Sudan, from Dahomey to the Senegal. In S.W Africa the German traveller Dr F Jaeger has continued his researches in the northern part of the former German colony, in spite of its occupation by the Union forces. A journey by a British officer, Capt. Douglas, in the High Atlas of Morocco has lately been described.

*America.*—The Canadian mountaineer Prof Coleman has made a first ascent in the Torngat Mountains of Labrador, the most rugged and little-known range of the eastern half of N America. A new examination of the Churchill River, which flows into Hudson Bay, has shown that it can be of little use as a waterway. The results of surveys in connexion with the International Boundary near the Lake of the Woods have been published. The long-standing dispute as to the boundary between the States of Michigan and Illinois was settled by an agreement in 1915, and commissioners have since marked the boundary by a line of granite monuments.

The acquisition by the United States of the Danish West Indian Islands became an accomplished fact on Jan. 17, 1917, when ratifications of the treaty were exchanged. It is proposed to name them the American Virgin Islands.

Dr Hamilton Rice, who in 1916 undertook a new expedition in Northern Brazil, returned to New York in April, 1917, having curtailed his operations owing to the entry of the United States into the war. He had executed surveys on the Rio Negro and Upper Amazon. A new American scientific expedition to Peru has been undertaken by Mr P A. Means, with the support of the Smithsonian Institution and other bodies. The old boundary dispute between the Brazilian states of Parana and Santa Catharina was settled in 1916 by an agreement, ratified on Oct. 20, affecting a compromise between the extreme claims of both sides. In its western half the new line follows the divide between the Upper Iruguay and Iguassu Rivers.

*Australasia.*—In New Guinea Dr Arthur Wade has continued his surveys in Southern Papua, and has collected valuable information on the country at the head-waters of the Vailala River, inhabited by the almost unknown Kukuku tribes. For the further exploration of the interior of the great island an aerial expedition is proposed by the Swedish savant Dr Eric Mjöberg. Mr and Mrs. Scoresby Routledge have given an interesting account of their expedition to Easter Island, from which they returned in 1916.

*Polar.*—The American Arctic Expedition under Prof. Macmillan, which had been stranded for three years in the Smith Sound region owing to the failure of the relief ships to reach North Greenland, returned home in Aug. 1917. During the last two seasons good work had been done in Ellesmere Island and the lands further west. No recent news has been had from Mr Stefánsson, who has continued his explorations in the unknown area north of the Beaufort Sea. A report received early in 1917 suggested the possibility of his return by the north-east passage. Capt. Amundsen, who was to have started in 1917 on his long planned expedition across the North Polar basin, has been forced to postpone it until after the war. The intrepid Danish explorer Rasmussen started in the spring of 1917 on a new expedition to Peary Land, in North Greenland.

In the Antarctic Sir E. Shackleton, sailing in the *Aurora*, commanded by Capt. J. K Davis, succeeded in rescuing seven out of the ten men stranded in the neighbourhood of Ross Island through the drift of their ship. Of the three others one had succumbed to the hardships endured, and two (including the leader, Capt. Macintosh) had been lost owing to the break-up of the ice when crossing from Ross Island to the mainland. Sir Douglas Mawson has obtained financial help from the Governments of South Australia and New South Wales for the publication of the scientific results of his expedition.

# Meteorological Summary (British Isles), 1916–1917

THE results in the table below are for London (Westminster and South Kensington)—barometer above Mean Sea Level, 70 feet.

| | Temperature | | Rainfall | | | Pressure (Station Level) | | Wind | Sunshine |
|---|---|---|---|---|---|---|---|---|---|
| Month. | Mean. | Diff. from normal. | Days. | Amount. | Diff. from normal. | Mean. | Diff. from normal. | Prevalent Direction. | Percentage. |
| | | | | inches. | inches. | inches. | inch. | | |
| 1916 November | 45·0 | 1·4 above | 13 | 2·67 | 1·32 above | 29·72 | 0·26 below | SW | 20 |

# The Year's Weather (British Isles), 1916–1917.

1 NOVEMBER, 1916, TO 31 OCTOBER, 1917.

(1916) *November* was variable, often wet and stormy, sometimes cold, but mostly mild. The highest wind velocities were reported on the 5th, when Plymouth experienced 81 miles per hour (36 metres per second) and Dover 78 miles (35 metres per second). Much damage was done at Bournemouth and at other places. Temperature on the whole was above the average, and maxima of 60° F and upwards were reported in nearly all districts. The highest reading was 66° F (29·2° Absolute) at Hodsock on the 11th, which is the highest reading recorded in November at an English station since 1906. The lowest readings occurred at most places in England on the 26th, when temperatures down to 20° F (28·6° A.) were reported. In Scotland the coldest day reported was the 28th. Rainfall was in excess except in England N W and Scotland W. Most of the rain fell during the first week and about the 18th. Between the 8th and the 17th many stations were rainless. In Dublin the total for the month was more than double the average. At War-Hugham, Surrey, on the 7th, in two showers, lasting together 15 minutes, more than 1¼ ins. of rain fell. Sunshine was below normal in most places in London however it was in excess. Fog was prevalent, and was particularly dense in London on the 13th and 21st. Aurora was observed on nine days. Thunderstorms were frequent.

*December* was cold and inclement, but with few gales and no very strong wind. The strongest gusts reported were 69 miles per hour (31 metres per second) at Scilly on the 23rd, and at Edinburgh on the 28th. Temperature was low in all districts, the defect being greatest in Ireland. The highest readings came in all parts between the 28th and 31st, when 59° F (28·5° A.) was reported from Rhyl and Shaftesbury. In the Channel Islands the highest reading was 55°. The lowest reading was 11° F (28·0° A.) at West Linton and at Garforth on the 20th. On some days and at many stations the day maximum was below freezing point. Rainfall was in excess in the eastern districts and in the English Channel, but in defect elsewhere. Records taken at 29 stations, mostly on the south coast, show that considerably more rain fell at night than during the day. Sunshine was in defect in the eastern districts, but above the average elsewhere. The English Channel was the sunniest district, with a daily average of 2½ hours. Salcombe was the sunniest station, with a daily average of 2¾ hours. Aurora was observed on three days. Fog was frequent on all coasts and was dense about the 18th. Thunderstorms were rare. Glazed frost was reported in several places and in Dublin on the 19th, three hundred cases of accident due to the slippery roads were treated in the hospitals.

(1917) *January* was cold, with much snow in many parts. The only general gale was on the 7th–8th, when wind velocities up to 63 miles per hour (28 metres per second) were recorded. Higher velocities were, however, recorded at certain stations at the end of the month, the highest being 83 miles per hour (37 metres per second) at Falmouth on the 29th. Although temperature was unusually high during the first few days, the month as a whole was cold. The district means were below the normal in all cases. The highest readings were 59° at Colwyn Bay and Kilkenny on the 2nd. In the Channel Islands the highest reading was 56°. The lowest readings were 11° at Rangour on the 20th, and 12° at Clongeeswood (Co. Kildare) on the 26th. Rainfall was very variable. It was in excess in the eastern districts, but in defect over the greater part of the kingdom. At Scarborough and Rounton the total fall was more than twice as much as usual. At places in the west and south-west it was less than one third of the normal, and the month was the driest January for over 30 years. Sunshine slightly exceeded the normal in Scotland N and England S.W, but was deficient elsewhere. At some stations it was only one-third of the average. The sunniest station was Haverfordwest, with a daily duration of 3½ hours. A brilliant aurora was observed on the 4th. Coastal fogs were common except on the east coast.

*February* was quiet and dull, but very dry and cold. The strongest gust recorded was 58 miles per hour (26 metres per second) at Falmouth on the 24th. Temperature was below the normal in all parts, and lower readings were recorded than in any February since 1895. The highest reading was 57° at Killarney on the 25th. In the Channel Islands the highest reading was only 52°. The lowest readings were −5° F at

Beeston, near Wallingford, and −3° F at Welbington, on the 6th. In Scotland the lowest reading was 2° at West Linton on the same day, but farther north it was warmer, and at Aberdeen the lowest reading was 20°. Rainfall was less than the normal in all districts, but the deficiency was most marked in Scotland N., where the *total fall* was less than one-third of the usual amount. The period from the 9th–23rd was dry very generally, and at some stations the dry spell lasted for 21 days. Bright sunshine, though variable, was, on the whole, deficient, the deficiency amounting to more than one hour per day in England E. At Birmingham the average daily duration was only 17 minutes. The sunniest station was St. Aubins, Jersey with nearly 4 hours per day. In the east of Scotland, Aberdeen reported 3¼ hours per day. Aurora was observed on the 4th, 24th, and 25th. Fog was prevalent, especially on the eastern coasts.

*March* was very cold and unsettled, with frequent snow. There was a good deal of strong wind, though the maximum gust velocity did not exceed 65 miles per hour (29 metres per second). Temperature was below the normal at every station, the deficiency exceeding 5° F at several stations. The highest reading recorded was 62° at Foynes, Co. Limerick, on the 26th, whilst the lowest was −3° F at Braemar on the 5th, which is the lowest temperature recorded in Scotland in March since the observations began (in 1856). The lowest reading reported from an English station was 8° at Alnwick Castle on the 5th. At Totland Bay the month was the coldest March since the record started in 1886. Rainfall was less than the normal in Scotland and in Ireland S., but in other districts it was in excess. At Norwich the total fall was nearly twice as much as usual. Bright sunshine was slightly above the average in Scotland E., but was in defect elsewhere, the deficiency in England E. and S.E. and in the English Channel being over one hour per day. The sunniest station was Falmouth, with a daily average of more than 4½ hours. Aurora was observed on four days. There was much fog on the west coast till after the 20th, and on the south and east coasts between the 8th and 17th.

*April* was very cold, with frequent snow at first, then drought. During the first half of the month the conditions were very unsettled, and there was a good deal of strong wind up to 69 miles per hour (31 metres per second) at Scilly on the 11th. For the remainder of the month the winds as a rule were moderate. Temperature was low in all parts. In Scotland the month was the coldest April for 60 years, and at Gordon Castle, where the observations date back to 1820, it was still the coldest April on record. The highest reading was 69° at Crathes on the coast, and at Camden Square on the 30th, the lowest reading was 9° at Newton Rigg on the 2nd. In the English Channel the temperature did not fall below 32°. During the first half of the month rainfall was experienced nearly every day with, in many districts, heavy falls of snow, causing great loss of lambs and sheep. At Blackwood, on the West Coast of Ireland, there was a snow storm on the 1st that within two hours caused drifts up to 20 ft. deep, while Broadford, Co. Clare, was cut off for two days by drifts. Bright sunshine was deficient except in England S.W. and the English Channel. The sunniest station was Guernsey with a daily average of nearly 8½ hours. Aurora was reported on several days. Sea fogs were frequent on the western coasts at the end of the month.

*May* was fine and warm, but with many thunderstorms. There was but little strong wind and very few gales. The highest gust velocity was 49 miles per hour (22 metres per second). Temperature was above the average *in all districts*. The day maxima varied much at different times, but the nights were uniformly mild except about the 7th, when frost was general, and a minimum of 19° F was recorded at Garforth. The maximum reading in a louvred screen was 82° at New Malden on the 29th, on the same day at Camden Square, London, 84° was recorded in a Glaisher screen. In the English Channel the highest reading was 78° on the 26th. Rainfall was less than the normal in the northern and eastern districts, but was in excess elsewhere. The drought which began about April 23rd lasted well into May, but there were many thunderstorms and some heavy falls both of rain and hail. At Liphook, Hants, on the 29th the hail was very heavy, and being swept by the rain into heaps over 2 ft. deep, did not disappear for three days. Sunshine was less than usual in most parts, but in England E. it was in excess by nearly 2½ hours per day. Copdock in Suffolk was the sunniest station, with a daily average of nearly 8¾ hours. Fogs were common on the western coasts, and often dense.

*June* was sunny, but with frequent thunderstorms and, in places, unprecedented rainfall. There was not much strong wind, and the highest gust velocity was 54 miles per hour (24 metres per second) at Eskdalemuir on the 1st. Temperature was in excess except in Ireland, where it was normal or slightly in defect. The greatest excess was in England E., where the daily mean was 4° F above the average. The highest readings were 93° on the 27th, at Reading and at Little Massingham, Norfolk. In Ireland the maximum was only 77°. The lowest reading reported was 29° at Balmoral and West Linton on the 30th. Rainfall varied greatly in different places due to the prevalence of thunderstorms. Exceptionally heavy falls were experienced, especially in London on the 28th, and in Somerset on the 28th. At Bruton (Som.) the fall in 24 hours was 5·8 ins., which is the highest daily fall on record in the United Kingdom, floods were caused and much damage was done. On the 23rd at Ushaw (Durham) over half an inch of rain fell in 6 minutes. Sunshine was in excess in all districts, by as much as 2½ hours per day in Scotland E. The sunniest station was Totland Bay, with 9¼ hours per day.

*July* was warm and bright, wet in the east and south-east of England, but dry elsewhere. Winds were mostly light or moderate and gales were few. The highest gust velocity was 56 miles per hour (25 metres per second) at Falmouth on the 28th. Temperature was above the average in all districts, but not to any great extent. The highest reading recorded was 89° at Southend on the 24th. The lowest readings were 29° at Garforth and 30° at Balmoral on the 20th. In the English Channel the lowest reading was 50°. Towards the end of the month temperature was very low for the time of year, and maxima below 60° were common. Rainfall was in defect generally, but in England E. and S.E. there was a considerable excess, due to heavy falls at the end of the month. At many places in and around London the total fall was more than double the average. At Isleworth the month

was noted as the wettest July since 1882. On the other hand, over large areas in the North the total fall was not more than half the usual amount. Sunshine was in excess except in England S.E. and the English Channel, in the latter district the defect was nearly one hour per day. Morecambe was the sunniest station, with nearly 9 hours per day. Fog was rather prevalent along the western seaboard.

*August* was very dull and excessively wet, with cool days, warm nights and much strong wind. The highest gust velocity was 78 miles per hour (34 metres per second) at Dover during a wide-spread gale on the 26th. The unseasonable weather interfered greatly with the harvest. Temperature for the whole month was normal in England S.W., slightly below the normal in England S.E. and the English Channel, but in excess elsewhere. The excess was greatest, nearly 3°, in Scotland N. As a rule, however the excess was due to the mildness of the nights, the day readings generally being in defect. The highest reading was 84° at Nairn on the 6th, and the lowest 36° at Balmoral on the 29th, and at Kilkenny on the 27th. Rainfall was in excess in all districts, in Ireland S. the total fall was more than twice the average. Heavy falls were common, and quite a number of stations reported falls exceeding 2 ins. in 24 hours. Sunshine for the month was slightly in excess in Scotland N. and in Ireland N., but over the country as a whole it was markedly deficient, the loss ranging up to 2¼ hours per day in Scotland E. Guernsey was the sunniest station with a daily duration of nearly 7 hours. Aurora was observed on several days.

*September* was dry, with warm nights and much wind, but with few gales. The winds were persistently westerly, but were never very violent, the strongest gust velocity being 63 miles per hour (28 metres per second) at South port on the 20th. Temperature was above the normal in all districts, the excess in England N.E. being 2½° F. Maxima of 70° or upwards were reported from all districts except Scotland N. and Ireland N. The highest readings were 78° at Ardingly (Sussex) on the 5th, and at Southend on the 19th. The lowest of the minima were 28° at Braemar and 29° at Balmoral and Kingussie, on the 10th. At no other stations did the temperature fall below freezing point. Rainfall was largely in excess in Scotland N., but was in defect elsewhere. In some parts the totals were only one-quarter of the average. Dew appears to have been unusually abundant. Sunshine was more than usual in the eastern districts, but less than usual in other parts. The sunniest stations were Felixstowe and Ramsgate, with an average daily duration of 5¾ hours. Brilliant aurora was observed in Scotland and Ireland on the 28th. Sea fogs were rather frequent in the west and south. There was a severe thunderstorm over the London district on the 9th, during which 0·47 ins. of rain fell in 10 minutes at New Malden.

*October* was cold, with frequent rain and snow. Winds of gale force were reported from one or more stations on as many as 18 days. The most violent gale of the month occurred on the 29th-30th, when the observer at Holyhead reported "a storm," or force 10 on the Beaufort Scale. The highest gust velocity at Holyhead was 83 miles per hour (37 metres per second) on the 29th, but at Ballycastle (Queensbury) a gust of 92 miles per hour (40 metres per second) was recorded on the 30th. Temperature was below the average in all districts, the defect being 2° north as 4·3° F. in Scotland N. The first three days, however, were mild in all parts, and the highest readings of the month occurred in that period. The maximum reported was 75° F. at Southend on the 2nd, while the lowest reading was 26° F. at Braemar on the 29th. Sharp frost was experienced in all districts except the English Channel, where the minimum did not fall below 39° F. In Scotland, as a whole, the month was the coldest October during the past 60 years, with the exception of 1898. Rainfall was in excess in all districts except England N.E. The excess was due rather to frequent rains than to exceptionally heavy falls. In numerous instances precipitation was recorded on from 25 to 31 days. In Scotland N. the total fall was almost double the average, and at Rothesay the rainfall was the heaviest experienced for October for at least 100 years. In spite of the rainy days sunshine was in excess except in Scotland N. and the English Channel. Over the greater portion of the eastern part of the country the daily excess was one hour and upwards, and in England E. the excess exceeded 1½ hours per day. The sunniest station was Felixstowe, with a daily average of 5·3 hours. There was fog on the western coasts during the first eight days. Aurora was observed at many places in Scotland on the 23rd, and locally also on the 24th and 30th.

## THE YEAR'S WEATHER AND THE CROPS.

1 Nov., 1916, TO 31 Oct., 1917.

(1916) *November* was wet nearly everywhere, and comparatively little progress could be made with autumn work. Barely three-fifths of the area intended for wheat had been sown by the end of the month, and only on light land or when sown early had the plant appeared above ground. Root-lifting was late, and large areas still remained out as the month closed. Live stock did well during the month.

The *Autumn* was warm and dull with more than the average amount of rainfall, and more rainy days than usual. In Ireland S., out of 92 days in the 13 weeks, Sept. 3 to Dec. 2, 70 days were noted as rainy days, while the total amount collected during that period was 90 per cent. in excess of the normal. Sunshine was deficient in all districts, and in Ireland N. the average daily duration was less than 2¼ hours.

*December* weather, at first, allowed of progress being made in some places, but as a whole the month was stormy and cold, and work on the land was greatly hindered. At the end of the month the total area sown with wheat was nearly 25 per cent. less than at the corresponding date last year. The early-sown wheat was quite satisfactory, but that sown later was poor. Seeds were healthy and vigorous, but the frosts at the end of the month checked growth. The condition of ewes was satisfactory, and other live stock was doing well. Turnips and swedes were keeping well, and there was a sufficiency of home-grown winter keep.

(1917) *January* was unfavourable for cultivation, but the hard frosts enabled farmers to cart manure. At the end of the month the early-sown wheat looked well, in spite of some damage by keen winds and frost, that sown late was generally a poor plant. Winter oats were, as a rule, a stronger plant than wheat, and many were generally satisfactory. Bean had done

...ability well, and planting prospects were favourable. In the latter districts crops were pondered [illegible] with regard to live stock.

February was characterised by severe frosts, and very little could be done by farmers until about the last week, when a certain amount of wheat was got in. At the end of the month cultivation generally was very backward. Seeds had been cut by the frosts, but were recovering. Much late-sown wheat had not germinated, and where the plant had appeared it was generally poor. Bees had had a trying time. Early flocks were, however, lambing, and the fall so far appeared to be nearly average. Live stock had done well, but considerable inroads had been made in the supplies of winter keep. A good many roots in the fields were lost through the frost.

The Winter was cold in all parts. The "Mid land Counties" was the coldest district, though the difference from normal was greatest in England S.W. Rainfall was very generally in defect, the deficiency being especially marked in Scotland N and W. Sunshine was deficient in the eastern districts, but was generally in excess on the western side. The number of rainy days was nearly everywhere less than usual.

March weather was unfavourable for operations in the field, yet a good deal was done in preparation of the land for crops. A little spring corn was got in, and here and there a commencement was made with planting potatoes. At the end of the month the area sown with wheat was estimated at 8 per cent. below that of last year. Early-sown wheat was satisfactory, though backward, but the late-sown was thin and a poor plant. Seeds had suffered a good deal from frosts. The fall of lambs was up to the average, but much mortality was reported among both ewes and lambs.

April was cold and snowy at first, but the last [illegible] days were very favourable, and excellent progress was then made. The land worked well and a good seed bed was almost universally obtained. At the end of the month wheat was rather a poor plant, winter oats had been a good deal damaged, spring corn was just showing in many districts, but a good deal of sowing, both of oats and of barley, remained to be done, especially in the northern districts. Good progress had been made with potato planting in the south and in Lincolnshire. Pastures were bare, and live stock were in poor condition. The fall of lambs was up to average, but bad weather caused many losses.

May was favourable for farm work, and an earliest progress was made. Wheat improved, but prospects could not be said to be more than moderate. Potato planting was mostly finished by the end of the month, and the young crops, where through the ground, were very promising. In this crop the area sown showed an increase of about 10 per cent. over that of last year. Mangolds were satisfactory, turnip sowing was [illegible] forward, but there was a good seed bed. Hops were also backward, but very strong and healthy. Pastures had improved greatly, and an average yield of hay was furnished. Live stock had benefited much. The prospects both for orchard and small fruits were for heavy crops.

The Spring was cold in all parts of the kingdom, and the [illegible] temperature of the winter, namely, 37° F., was exceeded in the week ended March 31, [illegible] was [illegible] than the average [illegible] [illegible] and 9° [illegible] [illegible] parts the season was considerable. The number of rainy days did not, on the whole, differ much from the normal. Sunshine was less than usual in all districts except England S.W., but the daily deficiency nowhere exceeded one hour.

June was favourable for farm work, and with the warmth and rains the prospects of most of the crops improved. At the end of the month barley was the best of the cereal crops, but always was generally short. Turnips and swedes had suffered from the dry weather in the early part of the month and from the fly, and much had to be re-sown. Potatoes had done well. The hay harvest was backward and promised to be below average. Pastures had improved and live stock had done well. Fruit prospects had gone back somewhat owing to attacks by caterpillars. Taking 100 to represent an average crop, the probable yield was as follows:—Wheat, 95; barley, 98; oats, 95; beans, 88; peas, 94; potatoes, 103; mangolds, 101; seeds hay, 97; meadow hay, 98; hops, 100.

July was generally favourable to the crops, especially in the west. The rains at the end of the month were everywhere beneficial. On the seventh wheat, barley, mangolds and potatoes improved somewhat, but beans, hay and hops deteriorated. Much hay was secured in very good condition in the west and north the yield of hay was up to the average, but in other parts of the country, especially in the east, it was very short. Small fruits had yielded well and orchard fruit promised everywhere to be abundant.

August was wet and windy and the weather interfered greatly with work on the land. Much corn was laid, restricting the use of the machines in cutting, and a good deal of hay was still lying out. Sprouting of grain was reported from most parts. Potatoes had suffered from the wet, but at the end of the month the promise was still for an over-average crop. The orchards suffered a good deal from the gales, but the quantity of apples, pears, and plums was still large. Pastures which were bare at the beginning of the month became well covered, but the grass in many cases was sodden and of poor quality. Sheep suffered a good deal and live stock did only moderately well. Indicating an average crop by 100, the prospect at the end of August was as follows:—Wheat, 93, barley, 97, oats, 90, beans, 80, peas, 91, potatoes, 104, turnips and swedes, 96, mangolds, 103, hops, 99.

The Summer was warm in all districts. Unusual heat prevailed at times, and in the week ended June 29 temperatures up to 92° F. were reported. Rainfall was in excess except in Scotland E. and W., where it was slightly in defect. In England S.E. the total for the period was more than half as much again as usual. The number of rainy days was less than the average in Scotland and in England N.W., but was in excess elsewhere. Sunshine was more abundant than usual in most parts, but the differences from average were not great except in Scotland E., where the daily average was more than an hour in excess.

September weather was favourable in the eastern districts, and over a great part of England the corn was secured in a satisfactory condition by the end of the third week. In the west, however, bad weather caused delay, and when the month closed some corn remained to be cut or carted, while much had been [illegible] in a damp condition. In south [illegible] districts grass had been [illegible] in fitting [illegible]

the west and south-west this work was backward. On the other hand, turnips and swedes were poor in the eastern and north-eastern counties, but were good in the west. Mangolds looked well everywhere. Preparation for autumn sowing was forward in the east, and some wheat and oats had been got in. Seeds promised well, and pastures were full of keep, though the grass was not of good quality. Live stock had done well.

*October* in many parts was fairly favourable for cultivation, especially on light land, and a considerable breadth of corn was sown. In some districts, however, much less had been done, and in the western half of the country autumn cultivation was generally backward owing to the bad weather. At the end of the month some early-sown corn was already up and was looking well; the bulk of the potato crop had been raised in a satisfactory condition, with less disease than had been feared; the lifting of mangolds, turnips, and swedes was backward; seeds on the whole were strong and vigorous. Live stock had done fairly well, and the prospects for winter keep were good in the west, but not so good in the eastern districts.

## Storms and Floods in 1916–1917.

(1916) *November*—19. Violent storm in Marmara; many vessels sunk. 22. Cyclone at Madras; £40,000 damage to harbour works, 24 lighters sunk. 28. Cyclone in Pondicherry; nearly 300 lives lost. Heavy floods in Spain, water 20 ft. deep in Carcagente; thousands of people destitute. In Victoria, N.S.W., the month ranks as the wettest November on record. Cyclone in South Arcot, India, causing nearly 2,000 deaths.

*December*—1. Floods in Spain, notably in the province of Valencia. 10. Avalanche near Bergamo, Italy ten deaths. 14. Severe hailstorm in New South Wales, destroying much wheat. 20. Violent storms in Italy, with floods in Rome. 28. Tornado in Arkansas, U.S.A., 17 deaths, £20,000 damage. 27 Floods in Queensland, water 28 ft. above Clermont Bridge 200,000 sheep lost, damage to public works estimated at £300,000. 28. Heavy floods in Orange district of New South Wales.

(1917) *January*—3. Cloud burst in Tasmania Launceston River rose 26 ft. in 20 minutes damage estimated at £30,000. 28. Heavy snow in Derbyshire, drifts 15 ft. deep. 31. Cyclone at Chinde and Quilimane Portuguese East Africa loss estimated at £30,000.

*February*.—4. Very heavy rains in Queensland, Charleville district under water. 6. Floods in North Auckland, New Zealand. 23. Tornado in Alabama, causing 26 deaths and much damage. 24. Severe gale in California, wind reported 100 miles per hour, rainfall 20 ins. in 24 hours, great damage. Destructive cyclone in New Caledonia, much damage to shipping.

*March*.—5. Heavy floods in Tennessee, U.S.A. damage estimated at £200,000. 8. Great storms and floods in Spain. 12. Serious floods in Queensland. Tornado at Newcastle, Indiana 20 lives lost, damage said to be £200,000. Tornado at Cincinnati, damage estimated at £60,000 of one of the houses destroyed half the roof was blown 200 ft. to the N.W., while the other half was carried 300 ft. to the S.E.

*April*.—12. Heavy snow in England, traffic hindered in the northern counties, and hundreds of sheep and lambs lost. 29. Avalanche at Davos, railway train struck, two carriages carried 250 ft. from the track, and the rest of the train buried under 30 ft. of snow.

*May*.—29. Drought over Central and Northern China, especially in the province of Honan. 27. Tornado in Southern Indiana and Illinois, causing loss, it is feared, of 300 lives. 29. Floods in Thames Valley, water in a main road at Kingston-on-Thames being 6 ft. deep.

*June*.—19. Serious floods in Hawke's Bay district of New Zealand. 19. Heavy floods in Victoria, N.S.W., 3,000 sq. miles under water, great damage done. 28. Unprecedented rainfall in Somersetshire, where, at Bruton, 9·84 ins. fell in 24 hours. This is the heaviest daily rainfall on record in the British Isles.

*July*—20. Heat wave in Mesopotamia, temperature in the shade at Bagdad 129° F.—the highest reading on record there. 28. Heavy rains in Western Australia, railway lines destroyed and lives lost. 29. Hurricane in Western Germany causing great damage.

*August*.—2. Violent storms in Lake Como district of Italy destroying life and causing much damage. 19. Violent thunderstorms in West Suffolk, four soldiers injured, two being killed. 29. Gales and floods in British Islands, causing much damage.

*September*—28. Storm at Sydney, causing great damage though loss of life was small. 29. Heavy rains in Dutch East Indies, causing many landslips, much damage to property, and seven deaths. 24. Hurricane in Jamaica, causing great damage on north side of island. 26. Hurricane in Poland 3,000 trees uprooted near Lodz; damage estimated at £100,000 several lives lost. 28. Very serious floods in North China, causing great destruction and many deaths; 20,000 square miles under water.

*October*—2. Typhoon in Tokyo Japan, 900 lives lost, 3,000 houses swept away, 200,000 persons rendered homeless. A small island off Formosa completely disappeared and its 300 inhabitants perished.

### AN INCH OF RAIN.

The statistics concerning rainfall are expressed in "inches," and are based upon observations recorded at the Royal Observatory, Greenwich. The expression "an inch of rain" refers to the marks upon a standard rain-gauge, the amount of rain equivalent to this distance between two such marks being represented by nearly 100 tons over an acre of land, as follows:—

An inch of rain on the surface of an imperial acre = 43,560 sq. feet × 1·6 cubic feet = 100 tons.

(1 Nov. 1916 to 31 Oct. 1917.)

MANY changes in the organisation and personnel of the Board of Admiralty have occurred during the past twelve months, and it is not expected that the latest, announced as recently as Nov 1, will prove by any means to be the last. On Nov 27, 1916, Sir John Jellicoe struck his flag as Commander-in-Chief of the Grand Fleet (his successor being Sir David Beatty, with the acting rank of Admiral), and on Dec. 4 was appointed First Sea Lord in the place of Sir H Jackson, while the former second in command of the Grand Fleet, Adm. Sir Cecil Burney, became Second Sea Lord. A week later Sir Edward Carson was appointed First Lord, Mr Balfour going to the Foreign Office, but it was not until five months later that drastic changes in organisation began to disclose themselves. On May 14 Sir Eric Geddes was appointed Controller, and to be a member of the Board to which were added as additional members Vice-Admiral Sir H. F Oliver and Rear-Admiral A L. Duff, who had previously been respectively Chief of the War Staff and Director of the Anti-Submarine Division of the Staff. Under the new arrangement the First Sea Lord became also Chief of the Staff, with Oliver as Deputy and Duff as Assistant. Sir Eric Geddes rapidly reorganised the Controller's department, which deals with the supply of material for the Fleet, and on July 16 was announced to have succeeded to the office of First Lord. It was recognised that this was a prelude to changes of the first importance in the higher organisation of the Admiralty, and these—or at least a large preliminary instalment of them—were explained by the First Lord on Nov 1. The Board of Admiralty was split into two committees, Operations and Maintenance the First Lord acting as ex-officio chairman of both, and the Deputy First Sea Lord (Vice-Adm *Sir Rosslyn Wemyss*) as liaison officer between the two. It had long been demanded that on the Board of Admiralty, the functions of war direction and supply should be sharply differentiated. This had in fact, always been the case, since the First Lord and the First Sea Lord alone, advised by the War Staff, were given any voice in the operations of the Fleet: but under the new system everyone's duties were made perfectly clear in a way that did not obtain, for instance, during the initiation of the Dardanelles campaign. The Naval Staff was strengthened by the additions of Directors of Plans, or Training, and of Mercantile movements, the last named being responsible for all work connected with convoy, escort and the fixing of routes for merchant ships. These and other changes, no doubtedly making for the more effective exercise of sea power, not unexpectedly failed to satisfy the entrenched and established critics of our naval administration, whose attitude was based to a greater extent upon personal antipathies than upon anything else

Throughout the year there has been nothing approaching the dimensions of what could properly be described as a naval battle. At the northern end of the North Sea swift enemy destroyers, operating from Zeebrugge, made several raids upon the N.E. coast in the winter and the early spring, but these were soon suppressed by the activities of the Dover Patrol. One attempt was intercepted off the Schouwen Bank on Jan. 23, 1917, one destroyer being lost on either side; on the night of April 2-3 our forces picked up a German flotilla and chased it back to Zeebrugge, sinking the destroyer G88 on the way, and a further attempt on April 20-21 was stopped by the flotilla leaders *Swift* and *Broke*, which, in a fine display of in-fighting, routed six enemy destroyers and sank two of them (G42 and G88). This was the last recorded attempt of the enemy down to the time of going to press, but if fast destroyers are still based on Zeebrugge there is no reason why they should not make an occasional "successful" raid when the conditions are favourable. The heavier vessels attached to the Dover Patrol have made frequent attacks on the German positions along the Belgian coast, but practically no information on this point has been issued officially

So far as the North Sea is concerned, the most dramatic incident of the year occurred on Oct. 17, when two "very fast and heavily armed" German raiders attacked a convoy of merchantmen crossing on a line from Norway to the Shetlands, and sank nine of the twelve neutral merchantmen of which it was composed, and also the anti-submarine escort of two destroyers (*Mary Rose* and *Strongbow*). The incident gained a certain amount of artificial significance because it followed upon a German success in the Baltic and a series of air raids over England, but its principal interest lay in the fact that it was the first time such an incident had occurred in the North Sea in over three years of war. Our lines of patrol cruisers had been penetrated five times before—four times by the *Möwe*, which made two voyages out and home, and once by the *Seeadler*, which was lost in the Pacific after doing some effective work. No surface raider had previously ventured to attack merchant shipping high in the North Sea, and the criticisms levelled at the Admiralty in connection with this incident would have led one to believe that the North Sea patrol was the simplest thing imaginable, whereas, in comparison either with past history or present conditions, it had been one of the most arduous and successful. The escort actually provided for the convoy (two destroyers) was, of course, totally inadequate against the force which attacked it, but the anti raider patrol lines were considerably to the south and when these had been successfully evaded the escort, designed for protection against craft normally capable of dodging the patrol (*i.e.* submarines), was helpless against vessels apparently of the general type of light cruisers. The affair was represented by the established critics of the Admiralty as a conclusive proof of official incompetence, but as it was the first of its kind in over thirty-eight months of war and as it was on all fours with the bombardments of east coast towns in 1914, 1915, and 1916 with the exception that ships instead of towns were the enemy's objective, it is hard to understand how any personal or political capital can honestly be made out of it by critics who have the benefit of a naval training. What was evidently another attempt on the part of a German raider to get to sea was frustrated by our forces in the Kattegat on Nov 2, the enemy ship being sunk.

### The Outer Seas.

The nearest of the outer seas is the Baltic, and it is there that naval action—as distinct from the exercise of sea power—has come, apart

practically into play during the year under review. On Nov. 20, 1916, a flotilla of German destroyers made a raid on Baltic Port, near Reval, but, according to Russian official statements, retired with the loss of "four of 6 to 9" modern destroyers. No further activity was manifested in this theatre until after the Russian revolution, but in the middle of April the Russian General Staff announced that the Germans were preparing for a combined sea and land attack in the Baltic, and appealed to seamen, soldiers and workers to concentrate their energies on the defeat of the approaching offensive. Nearly six months elapsed before the offensive developed, but when it began comparatively little opposition was offered. The Russian naval defence of the Gulf of Riga—which had been so magnificently and successfully held in Aug., 1915—was entrusted to destroyers and old battleships, and although these were handled and fought with splendid courage and efficiency they were overwhelmed by the superior strength of the enemy, who occupied in force the islands of Oesel and Dago. The Russians suffered relatively little loss at sea, losing only the battleship *Slava* and the destroyer *Grom*, while the Germans were claimed to have had put out of action ("though their ultimate fate is not known") a Dreadnought, a cruiser, 12 torpedo-boats, a transport (torpedoed by a British submarine), and numerous mine-sweepers. The fact that the Allies made no attempt to enter the Baltic or to create a diversion in the North Sea was the subject of much comment; but it has to be remembered that, owing to the state of affairs in Russia, any fleet sent to the Baltic would have had to draw the whole of its fuel, stores and ammunition from England, 2,500 miles distant, the whole route lying practically across the mouths of the German submarine bases. It is not impossible that the whole operation was designed by the German Staff in the hope that a powerful British fleet would force its way into the Baltic, thus weakening our squadrons in the North Sea, and presenting the Germans with a more favourable opportunity than they are otherwise likely to obtain for launching a raid of some magnitude upon our coasts. Criticisms of the aloofness of the British Fleet rarely or never took note of the equally marked aloofness of the main body of the Russian Navy, which comprising four battleships with 12 12-in. guns, four battle cruisers with 12 14-in., and two older battleships with four 12-in. and 14 8-in., took no part in the Riga campaign.

Commerce raiding on the high seas by surface-navigating ships has been carried out on a fairly considerable scale, though as its details have been made known rather in the bulk than in the form of a narrative it has failed to attract very much attention. Towards the end of 1916 the Admiralty announced that a German raider had been sighted in the North Atlantic on Dec. 4, but nothing further was heard of her until Jan. 23, when the Japanese steamer *Hudson Maru* arrived at Pernambuco, having on board 350 men from ships the raider had destroyed. The enemy proved to be the *Möwe*, Commander Count Dohna-Schlodien, which, under the same officer, had previously made a successful commerce cruise in the Atlantic. From this, her second expedition, she returned safely on March 23 with 449 prisoners on board and a record of 26 ships (29 British) destroyed. In addition to these total, the steamer *Yarrowdale* had been retained as a prize, and, with 189 prisoners on board, succeeded in running through our patrols and reaching a German port. Eight days after the return of the *Möwe* a French vessel arrived at Rio de Janeiro with 1181 to the number of 284, representing the crews of ships sunk by another raider, the *Seeadler*, a 2,500-ton ex-American vessel with auxiliary motors, that had been taken prize by the Germans while carrying a cargo of cotton to Archangel in 1916. The names of only 22 vessels sunk by this ship have been made public, but it was claimed for her in Germany that she had destroyed shipping and cargoes to the value of some eight millions sterling. In Aug., 1917, being then in a foul condition and, of course, unable to dock, her commander ran her ashore on Mopelia, one of the Society Islands, so that the growths might be scraped from her hull, but while lying there she was caught by a tidal wave, thrown on to a reef, and completely wrecked. On Mar. 23 the Japanese authorities announced that a German raider had been sighted in the Indian Ocean, and on June 24 the P. and O. liner *Mongolia* was sunk off Bombay by a mine stated by the British Admiralty to have been part of a field laid by a German raider named *Wolf*. On Feb. 9 the transport *Tyndareus* had been mined off the South African coast. The mine responsible for this was possibly laid by the *Möwe*, whose operations extended from the Cape to the S.E. coast of America. Nothing further has been heard of the *Wolf*, or of the *Pfeil*, *Ritz*, *Vineta* or *Vineta*—names possibly assumed at various times by the *Möwe* or the *Seeadler*. The naval authorities decline to make public what they know of the doings or fate of these ships—assuming them to have had individual existences—the *Wolf* certainly did—on the ground that it would convey useful information to the enemy.

For the rest, and apart from the submarine campaign, there has been no conspicuous naval activity, though in May some light forces of the Austrian navy made a daring attack on one of our lines of drifters in the Adriatic, and sunk fourteen of them before withdrawing at the approach of heavier British and Italian forces. The feebly-armed drifters stood up magnificently to the heavy odds opposed to them, and answered with their guns when invited by the enemy to surrender. The commander of the *Queen Lee*, Skipper Joseph Watt, was awarded the V.C. for his conspicuous gallantry on this occasion, being the first of his rank to win the decoration. The light cruiser *Dartmouth*, which, with the *Bristol*, chased the enemy off, was torpedoed by a submarine on her way back, but made port under her own steam. Flotillas of gunboats have been rendering excellent aid to the Army in Mesopotamia, the Royal Naval Division has greatly distinguished itself on the Western front, particularly at the taking of Beaumont Hamel; and the work in Russia of the armoured car divisions under Commander Oliver Locker-Lampson, R.N.V.R., has won the highest praise. The R.N. Air Service has been incessantly busy in the neighbourhood of the Belgian coast, and also in the Eastern Mediterranean.

The greatest interest on the naval side of the war centred in the submarine campaign, which, indeed, remains in the most vital phase of the war. On Feb. 1, 1917, there came into existence what the Germans called an unlimited or unrestricted campaign, the whole of the

approaches to the Allied nations being, in effect, declared prohibited waters. The principal object of this was probably to deter neutral seamen and shipowners from trafficking with England, and for a time this object was actually brought about. It soon became evident, however, that the new campaign differed but little from the old, and things quickly recovered what we may call their normal condition. From Feb. 29 onwards the Admiralty issued a weekly return showing to a certain extent the progress of the U boat offensive. Down to the time of going to press these returns had been issued for 36 weeks, and in the following table they are summarised into twelve periods of three weeks each. The following abbreviations are used in the heading: Under "Ships Sunk," A = ships of 1,600 tons and over, B = ships under 1,600 tons, or sailing craft, C = total sunk. Under "Attacks," A = vessels attacked but not sunk, B = total number of ships attacked, sailing craft excluded.

| | Ships Sunk. | | | Attacks. | |
|---|---|---|---|---|---|
| | A. | B. | C. | A | B. |
| 1. | 43 | 18 | 61 | 42 | 103 |
| 2. | 88 | 29 | 84 | 80 | 178 |
| 3. | 77 | 26 | 103 | 88 | 158 |
| 4. | 73 | 38 | 114 | 74 | 188 |
| 5. | 88 | 24 | 88 | 49 | 115 |
| 6. | 70 | 27 | 97 | 78 | 167 |
| 7. | 44 | 12 | 56 | 42 | 97 |
| 8. | 60 | 9 | 69 | 40 | 109 |
| 9. | 49 | 12 | 61 | 51 | 91 |
| 10. | 38 | 27 | 65 | 57 | 93 |
| 11. | 35 | 8 | 43 | 57 | 70 |
| 12. | 43 | 16 | 59 | 11 | 70 |
| Total | 640 | 230 | 870 | 905 | 1,397 |

No ships belonging to Allied or Neutral Powers are included.

The relative fierceness of the 1917 campaign may be judged by comparing the above figures with the fact that somewhat similar returns issued for 35 weeks (only) of 1915 showed a total loss of 233 ships—an average of five per week as compared with an average of 14 for the 36 weeks covered above. There is also issued with the 1917 returns a figure showing the arrivals and sailings of ships at United Kingdom ports, the only craft excluded being fishing vessels and those engaged in estuarial traffic. The weekly average under this head ranges around 5,000, but in 1915, when the figure included only vessels of 100 tons and over engaged in overseas trade the weekly average was 1,414. It will be observed from the above table that as the campaign progressed the ratio of large ships to small ships sunk increased considerably, being, for example, 2·4 to 1 and 1·9 to 1 in the first two periods, and 4·4 to 1 and 2·7 to 1 in the last two. The number of sinkings, and the number of ships attacked diminished considerably, especially if one starts with the fourth period, but on the whole the percentage of ships which, when attacked, succeeded in escaping, did not change, and this in spite of the steady progress made in equipping merchantmen with guns, over 3,000 having been armed by the late summer of 1917. Of fishing craft, not included above, a total of 139 were sunk in the 36 weeks, 106 in the first and 43 in the last 18 weeks.

The authorities have found it difficult to present a consistent view of the submarine campaign to the public, which tends to be elated or depressed according as to whether the weekly returns show a fall or a rise in the sinkings. No definite information has been forthcoming as to the number of U-boats destroyed, but Sir Eric Geddes stated that in Aug.–Oct., 1917, as many had been accounted for as in the whole of 1916. Nevertheless, as recently as the previous August Mr Lloyd George had stated that the number of enemy submarines was increasing. On the same occasion he stated that our loss in tonnage had been 350,000 in April, but only 200,000 in July, and that the net reduction in the tonnage of our merchant fleet had averaged 250,000 monthly in the six months Feb.–July. He also gave the following figures relating to our output of new shipping:—1917, 687,000 tons, 1918, 938,000 tons, 1919, first half, 484,000 tons, second half, 1,250,000 tons, purchased, 350,000 tons, total, 2,034,000 tons. It was estimated that in 1918 we should complete 4,000,000 tons, which, while just above double our best year's output in peace, is considerably below what Germany claimed to be sinking. The production of standard ships has not so far proceeded at the rate anticipated by the Government, and the seriousness of the position is best illustrated by the warning given to the U.S. in October by Sir Joseph Maclay, Shipping Controller, that America's military effort would be crippled from the start unless she could turn out 6,000,000 tons of new merchantmen in 1918. On Sept. 21 there was issued on official authority a statement which included the following: "The sinkings will continue, but the submarine is defeated. If the public knew what we know they would not have the slightest anxiety, and the criticisms of naval methods would stop at once." In face of the facts, this was an absurd statement to make. In the six weeks following its issue U-boats caused us the loss of 222 British merchantmen and four war-ships, the latter-three totalling over 32,000 tons.

An Anti-Submarine Division of the War Staff was formed at the Admiralty, in place of the Submarine Committee in Dec., 1916, its first chief being Capt. Frederic C. Dreyer, a gunnery expert who had commanded the *Iron Duke* when Admiral Jellicoe's flag flew in that ship in the Grand Fleet. He was shortly transferred to the Office of Director of Naval Ordnance, being succeeded by Rear Admiral Alexander Duff, who had commanded a division of the Grand Fleet; but on this officer being appointed Assistant Chief of the War Staff, the directorship of the Anti-Submarine Division was given to Captain William W Fisher who had commanded a Grand Fleet battleship for over three years. Seaplanes, small airships, and, in particular destroyers, are being rapidly multiplied for use in the campaign, but no novelty has yet been produced to make any big impression upon it. The trend of German development is unknown save to the authorities, but the following statement was made on Sept. 22 by Admiral W S. Benson, U.S. Chief of Naval Operations: "The Navy has no positive evidence that Germany is using super-submarines, but it is believed such boats—some as large as 3,000 tons—are in the (German) Admiralty's service." Submarines of this size have existed, but only on paper, since 1912, when a Russian engineer named Shurovsky projected a vessel to have a maximum speed of 25 knots, a cruising radius of 18,000 miles, and an equipment of five 4 7-in. guns, 32 torpedo-tubes, and 250 mines. Our own naval authorities occasionally issue improvement accounts of [illegible]

fleets with enemy submarines, but a name which stands out in this connexion is that of Captain Gordon Campbell, who, in addition to receiving two special promotions from the rank of Lieut.-Commander, which took him over the heads of about a thousand seniors, has also been awarded the V.C. and D.S.O. with two bars.

### AMERICA'S NAVAL EFFORT

The United States declared war on Germany on April 6, 1917, and extensive preparations were immediately put in hand for actively participating in the operations afloat. On May 4 a powerful flotilla of American destroyers arrived in British waters to join in the organised submarine hunt, Vice Admiral W. S. Sims being appointed commander in chief of American forces in European waters. The U.S. authorities are throwing a tremendous amount of energy into the campaign against the U-boats. Three hundred "chasers" had been ordered down to the late autumn, but the trials of the first ship used that they were too small and too slow for their work, and not sufficiently strong to carry the armament for which they were designed. No more orders for these are therefore to be given, and in their place destroyers to the value of 30 millions sterling are to be built with all possible rapidity, the last of them, it is expected, being ready for service by the end of 1918. A tremendous effort was also decided upon in regard to merchant ship construction, though in the early stages considerable delay was caused by differences of opinion as between steel and wooden ships. This difficulty was solved by the resignation of the two principal parties to the dispute, and the appointment of Rear Admiral Capps to be chairman of the Emergency Fleet Corporation; and by the end of Sept. 1917, he was able to state that the Corporation had commandeered 440 ships of over a 500,000 tons and contracted for 636 of 3,134,000 tons. It was then estimated that in little more than a year the U.S. merchant fleet would have grown from 3,500,000 tons (including 900,000 tons of ex-German and Austrian ships) to 9,500,000 tons. Many of the finest German ships which had been held up in U.S. ports since Aug., 1914, were converted for use as transports, a few of the principal (with their old and new names and troop-carrying capacity) being: *Vaterland (Leviathan)*, 8,800; *George Washington*, 4,500; *Kaiser Wilhelm II (Agamemnon)*, 2,830; and *America (America)*, 4,500. Down to the moment of writing there had been no shipyard dedication of the larger American ships taking immediately an active part in the war but the tremendous accession of strength which the adhesion of the U.S. represents at sea must inevitably bring about a changed view regarding the employment of the naval forces of the Allies.

### *PRINCIPAL WARSHIP LOSSES*

In continuation of the list given in the ALMANACK for 1917

Batt. = battleship, Ar Cr = Armoured Cruiser, Cr = Cruiser; Ar Ld = Armed Liner, Aux. = Auxiliary, T B D = Destroyer

| Date. | Type. | Name. | How lost. |
|---|---|---|---|
| **British.** | | | |
| 22.12.16 | T B D. | Not stated | Collision. |

| **Austrian.** | | | |
| 4. 6.17 | T B D. | Not stated | By Italian sub. |

As might be expected, all developments of aeronautics in the past year were inseparable from military operations. Chief progress was made with heavier than air machines, the use of the lighter than air type (navigable and captive balloons) being confined to scouting and observation purposes. Airships of the Zeppelin type were found useful for patrolling the waters around our coasts, acting as scouts for the Navy, and employed in the detection of enemy submarines attacking our mercantile marine. Captive balloons of the "sausage" type were extensively used on the fighting front for spotting enemy batteries and general observation work.

It was in aeroplane construction that the greatest development was to be noted. It had at length become recognised that supremacy in the air meant supremacy of the artillery, the most valuable part played by airmen being the taking of photographs of enemy lines, trenches, batteries, and positions. The output of aeroplanes from our factories was speeded up as much as possible by the Ministry of Munitions, first under Dr Addison, and then under his successor, Mr W. S. Churchill. Even then the wastage from losses on the front was large, and the defence of our coasts and cities necessitated constant renewals and increased supply. Owing to the use of aircraft for attacking military positions by bomb dropping, a larger type of machine was gradually evolved. Practically three types were employed—(1) the two-seater for reconnaissance, photographic work, gun spotting, and fire control; (2) a large machine for bomb carrying; and (3) a fighting machine for attack on enemy squadrons and the protection of the first two classes. The bomb-dropper was a large machine (on the German side called the "Gotha") with powerful twin engines, and capable of carrying a ton of explosives. The speed was from 85 to 92 miles an hour. Type 3, the fighting machine, was of lighter construction, and so built that it was able to climb quickly—from 10,000 to 15,000 feet in less than a quarter of an hour. In all these types improvements were made in construction. Engines were more efficient and reliable, stability and control were far better, whilst the visibility, eliminating "blind spots" (so that the pilot might see in every direction), was brought to a maximum.

As an instance of the enormous wastage of machines it is only necessary to quote the statistics of losses on the Western front in September last, a month of very great activity in the air partly due to Sir Douglas Haig's great offensive in Flanders. According to the German official reports, the Allies lost 432 machines and admitted the loss of three of their own. These figures are utterly unreliable. Sir Douglas Haig reported that 143 enemy machines were brought down, 120 driven down out of control, whilst 112 British machines were missing. The French reported 92 enemy machines brought down and 79 driven down in their own lines. These figures would give a total of 304 aeroplanes brought down in one month, which exceeds by nearly 300 the figures of August, and compares with 487 in July, 273 in May, and 227 in April.

While Britain and the Allies generally were using the aeroplane as a means towards prosecuting the war, the Germans developed their policy of raiding England, the object being to terrorise and create a panic favourable to an atmosphere of peace. Daylight aeroplane raids on the South Coast had been frequent in 1916, but it was not till Nov 28 of that year that a single enemy machine appeared at mid-day over London and, after dropping its bombs, got clear away. No one was killed, and not much damage was done, but the visit was of importance, for it suggested to the enemy the practicability of sending a large squadron over to bombard London. During winter large bombing Gothas were built ready for the spring and summer campaigns.

In March and April South Coast towns in Essex and Kent were bombed, but these affairs were not serious till May 25, when the S.E. Coast suffered heavily, the official death-roll being 76 killed and 234 injured. That was the prelude to the attack on London. The attack came on June 13, when an enemy squadron got over the East End and several adjacent districts. One bomb killed 20 and injured about 30 children in a school, and the total casualty list was 104 killed and 432 wounded. This experience created much feeling against the authorities, who appear then to have set to work to strengthen the defences. Official warnings of approaching raids were instituted and other measures taken to secure the safety of the citizens.

Despite these measures, the enemy came again on Saturday, July 7. About 20 or 24 machines, in triangular formation, were plainly visible flying over London at about 11 o'clock in the morning, which was brilliantly fine. From a height of 13,000 to 15,000 feet, according to the official report, they dropped their bombs, the result being a death roll of 57 with a list of 192 injured. The justifiable outcry of the public forced the military to act at once. A new defensive aerial barrage of guns was created in a ring around London. This was an application of systems used in Paris and on the battlefields of the West front. Doubtless these measures were not unknown to the enemy for though several daylight raids occurred subsequently, they were either beaten off or confined to the coast towns and the estuary of the Thames and the Medway.

Then followed the moonlight raids. As in the case of the day raids, there was a trial trip. This took place on the night of May 6–7, when in bright moonlight one aeroplane dropped bombs in a northern district of London. Only one projectile was fatal, killing a man and his wife in their bed. This was a warning of what was coming for on Sept. 2, at full moon, the Kentish coast was invaded, on Sept. 3 Sheerness and Chatham area, and on Sept. 4 London. Only a few machines got through the London barrage, but there was a heavy death-roll in the Chatham Sheerness area, where a bomb fell on a naval establishment, killing 107 and wounding 86.

The country was now thoroughly roused to the menace of moonlight raids. Again the defences of London were extended and strengthened, and when the harvest moon, in the fourth week of September came round, the metropolis was not caught napping. For over a week London by night was a beleaguered fortress. Thousands of people took safety in the "tubes," and thousands more left for the country. Raids often on

Monday and Tuesday, Sept. 24 and 25. On the Wednesday and Thursday no raids were attempted. On Saturday, Sunday, and Monday (Sept. 29, 30, and Oct. 1) larger squadrons came over, portions of which managed to elude the barrage, which was intense. After that the moon waned, and the weather became too bad for further attempts. The death-roll of the week was 92 killed and 297 injured, some of the latter succumbing to their injuries.

Another raid by seven groups totalling 32 aircraft was made on the last day of October, when the moon was at the full, but only three aeroplanes got through the inner defences of London.

The following is a list of aeroplane raids in 1917, compiled from the official reports issued to the newspapers :—

| Date. | Locality | Killed. | Wnd'd. | Tot'l. |
|---|---|---|---|---|
| Mar 1.— | Broadstairs | — | 1 | 1 |
| ,, 16.— | Westgate | — | — | — |
| April 6.— | Kentish Coast | — | — | — |
| May 7.— | S.E. London | 1 | 1 | 3 |
| ,, 25.— | S.E. Coast | 76 | 174 | 250 |
| June 5.— | Medway | 12 | 36 | 48 |
| ,, 13.— | East London | 104 | 432 | 536 |
| July 4.— | Harwich | 11 | 36 | 47 |
| ,, 7.— | Isle of Thanet and London. | 43 | 197 | 240 |
| ,, 22.— | Felixstowe and Harwich | 13 | 26 | 39 |
| Aug. 12.— | Southend and Margate | 32 | 43 | 75 |
| ,, 22.— | Kentish Coast | 11 | 26 | 37 |
| Sept. 2.— | ,, | 1 | 6 | 7 |
| ,, 3.— | Sheerness and Chatham area | 108 | 92 | 200 |
| ,, 4.— | London | 11 | 62 | 73 |
| ,, 24.— | ,, | 23 | 70 | 93 |
| ,, 25.— | ,, | 7 | 23 | 30 |
| ,, 28.— | ,, | — | — | — |
| ,, 29.— | ,, | 11 | 82 | 93 |
| ,, 30.— | ,, | 9 | 42 | 51 |
| Oct. 1.— | ,, | 10 | 36 | 46 |
| ,, 22.— | ,, | 8 | 21 | 29 |
| | Total | 484 | 1,420 | 1,894 |

Of the September attacks, one was stopped en route. One or two of the raiders were shot down at the coast, but none in the London district.

For some time before this there had been a public outcry for reprisals on German towns. While the British and French airmen had been active in bombing military positions, and the French had adopted the policy of reprisals, bombing Freiburg, Baden, Frankfort, and other German towns. The British War Cabinet at length were compelled by the strength of public opinion to acquiescence, though with reluctance, in this policy, and an announcement to this effect made by General Smuts was received with general satisfaction. The formation of an Air Ministry was also announced by the Government.

Zeppelin raids on England became less frequent in 1917. There were one or two attacks on the coasts of the east and north-east counties in the first half of the year, but London was not attacked for twelve months. Then, on the night of Oct. 19, about 12 o'clock, Zeppelins sailed over our coasts, five or six of them making for London. The defence was left principally to our airmen, but owing to a high haze the Zeppelins could not be found. One drifted silently across London, three bombs being responsible for much damage. The total casualties of the raid were 34 killed and 98 injured. But though not a single raider was brought down in England, Nemesis overtook the Armada. Flying at a great height to avoid shells, eight of the Zeppelins were driven into France by an aerial storm, though the air was calm near the earth. The French airmen and gunners in broad daylight accounted for four, one—L 49—being captured whole. A fifth was driven out into the Mediterranean, and is believed to have been lost. This is the greatest air disaster that Germany has experienced.

In continuance of the list in last year's ALMANACK of Zeppelins destroyed, the following have to be recorded :—

1916.

Nov 25.—(Unknown) shot down off Durham.

1917.

Mar 17.—L 20 shot down by French at Compiègne.

May 14.—L 22 destroyed by British Navy in North Sea.

June 14.—L 43 destroyed by British Navy in North Sea.

,, 17.—(Unknown) brought down in East Anglia.

Aug. 21.—(Unknown) destroyed by Navy off Jutland.

Oct. 20.—L 49, L 50, and two others brought down in France. A fifth driven out to sea and lost.

The Compiègne Zeppelin was returning from a raid on England, and had been driven out of its course by a sudden storm. The Jutland Zeppelin coincided with a raid on the East Coast.

Perhaps the most notable air exploit of the year was that of an Italian airman, the Marchese Giulio Laureati, who, accompanied by a mechanic, flew from Turin to Naples and back without descending. The distance from Turin to Naples is about 480 miles in a straight line, so that the distance covered without a stop would be 960 miles. The time taken was 10 hours 33 minutes. He piloted a new model S.I A aeroplane with a Fiat motor of 200 h.p. This was in August and next month the same airman made a non-stop flight from Turin to Hounslow, a distance of 692 miles, in 7 hours 20 minutes. He crossed the Alps by the old railway route, Susa Valley, Mont Cenis, Modane Valley, St. Jean de Maurienne, Chambery, and Culoz. His maximum altitude was 11,500 feet. This machine was subsequently presented by the Italian Government to the British Air Board.

Of the commercial development of aeronautics it is impossible yet to do more than speculate. So vast have been the improvements in engines and machines that commercial transport is a certainty of the near future. To visualise a regular aerial service between Great Britain, the Continent, the United States, and Canada is no vain thing. When the war is ended there will be a great boom in this most glorified toy of the generation, rendered possible by the inventive genius, diverted by the exigencies of war.

*If* the war could be won on finance alone the Allies would have been victorious long ago. There is a heavy drain in the form of an arithmetical progression on the economic resources of both sides, and it is a well-recognised fact that the Allies are spending much more than the enemy. During the past year economy in all things has been steadily preached, but the practice has left much to be desired. It does not seem to be realised that the faster we spend on private and individual concerns, the greater is the difficulty of our Governments to meet satisfactorily the calls upon the National Exchequers.

*Raising Money.*—The cost of the war has been met in two ways, *taxation* and *borrowing*. An unprecedented call has been made for Revenue. The estimate for the year 1917-8 is £655,600,000, and the balance (£1,651,761,000) of the anticipated cost of the year's war (£2,290,361,000) has had, and is, to be raised by loans.

*Loans.*—The 5 per cent. War Loan at 95 and the 4 per cent. free from Income Tax Loan at £100 were issued between 22 Jan. and 26 Feb. 1917. The publicity campaign, which could have been improved, helped to push the loans, with the result that applications were received as follows:—

| | |
|---|---|
| Bank of England. | £219,986,000 |
| Post Office | £30,715,000 |

At the same time short-dated Treasury Bills were transferred to the War Loan in the sum of £130,721,000, and, during the five weeks of the Loan, War Savings Certificates to the extent of £19,300,000 were sold. The actual number of subscribers was 3,289,000. Large sums of the 4½ per cent. War Loan and 5 and 6 per cent. Exchequer Bonds were converted into the new Loan.

*Bonds.*—The issue of 6 per cent. Exchequer Bonds was withdrawn on 30 Dec. 1916. They were followed after the 5 per cent. Loan on 23 April 1917 with 5 per cent Exchequer Bonds. This issue could not be considered as popular. For some reason the publicity campaign did not catch on, and from the point of view of getting large sums into the Treasury the bonds failed. The 5 per cent. Exchequer Bonds were withdrawn on as high. The latest and, up to the present, best form of borrowing has been the 5 per cent. National War Bonds, beginning with 1 Oct. 1917. The Bonds were for 5, 7 and 10 years, and repayable at £100, £103 and £105 per £100 Bond, according to the date of maturity. At the same time 4 per cent. issue of *free from Income Tax* National War Bonds, repayable at par in 1929, has been made. It is hoped by means of these Bonds to finance the war until its successful conclusion. The sum £37,582,250 was received for the new Bonds in the first eleven days.

*War Savings Certificates.*—The War Savings Committee has done good work throughout Great Britain in encouraging the habit of thrift and the taking up of these Certificates, under which the sum of 15s. 6d. deposited is repayable on £1 at the end of five years, no Income Tax having changed on the interest. They are growing in popularity, thanks to continued boosting. The amount issued up to 28 Nov 1916 was £48,248,658. At the beginning of Oct. 1917 the total had grown to £120,000,000, of which only £2,000,000 had been withdrawn.

*War Expenditure Certificates.*—These were issued at 6s per cent., repayable at the end of two years. These were withdrawn at the end of 1916 and not re-issued.

*Treasury Bills.*—An issue was in progress on 1 Nov 1916 at 5½ per cent. for 3, 6 and 12 months' Bills. These high terms lasted until 4 Jan. 1917, when they were withdrawn in preparation of the War Loan. On 23 Mar. 1917 it was decided to issue further Treasury Bills and revert to the old system of tender. The rates for the first issue were from 4¾ per cent. to 5 per cent., or ⅛ per cent. and ¼ per cent. lower than the rates in force three months earlier, the intervening War Loan notwithstanding. The method of tendering continued until 2 May 1917, when the rates were fixed at 4½, 4¾, and 4¾ per cent for 3, 6, and 12 months Bills. A further alteration was made on 1 July 1917 to 4¾ per cent. for 3 and 6 months Bills. The 4¾ per cent. rate was in force in Oct. 1917.

*Currency Notes.*—Although these were issued to take the place of gold coin, and provide greater freedom of currency, the notes in themselves form a Government Loan without payment of interest. The notes are due on demand in gold at the Bank of England, and have a reserve of £28,350,000 in gold allocated to them. The *total* issued has risen from £177,168,193½ of 1 Nov 1916 to £283,218,761 of 10 Oct. 1917.

*Foreign Exchanges.*—One of the most important tasks of the Government has been the maintaining of reasonable rates of exchange with the U.S.A. and neutral countries. We get much of our food and munitions from these, and the higher value placed by the traders in these countries upon our currency, the *lower* is the price we have to pay for our supplies. Naturally, as we are larger buyers than sellers, the exchanges are bound to be slightly against us. To remedy the deficits, gold and negotiable securities have been sent to these countries, and loans arranged in them. The extent to which gold has poured into the neutrals can be gauged by these statistics:—

| Bank | Before war £ | Oct. 1917 £ |
|---|---|---|
| Denmark | 4,000,000 | 11,000,000 |
| Holland | 13,000,000 | 56,000,000 |
| Norway | 3,000,000 | 7,000,000 |
| Spain | 22,000,000 | 77,000,000 |
| Sweden | 6,000,000 | 11,000,000 |
| Switzerland | 7,000,000 | 13,000,000 |

*Exchange Rates.*—The following comparisons will show how well the British Government has worked:—

| | Normal. | Nov 1916. | Oct 1917. |
|---|---|---|---|
| Amsterdam | 12 09 | 12 6¢ | 11 05 |
| Madrid | 27 30 | 23 40 | 20 78 |

The German figures are:—

| | | | |
|---|---|---|---|
| Amsterdam | 20 05 | 42 40½ | 32 80 |
| Berlin | 205 40 | 90 80 | 84 20 |

*Mobilisation.*—Scheme A was closed on 27 Dec. 1916, and holders given permission to transfer to B. A penal tax of 2s. in the £ was inflicted by the Government on holders who refused to surrender their stocks. On 25 Jan. 1917 the Treasury decided to requisition certain investments and published the first list of stocks on 19 Feb. A second list of 319 bonds was dated 6 Mar., other lists being posted on 3 April and 7 May.

U.S.A. Assistance.

The Chancellor of the Exchequer on 22 Sept. 1917 admitted publicly that "but for the assistance of the U.S.A. the financial position of the Allies would now have been very disastrous." Up to the declaration of war by the U.S.A. in April 1917, the Allies were dependent upon loans raised by American bankers and the gold and securities they could remit across the Atlantic for the payment of goods purchased. The raising of loans was made more difficult because bankers required collateral security in the form of negotiable bonds, and in Nov. 1916 the Federal Reserve Board objected to the banks taking up short-term British Treasury Bills.

*Loans.*—The change was fully realised when the U.S.A. offered to loan the Allies £600,000,000 out of their own first War Loan of £1,500,000,000. Mr. Balfour, accompanied by the Governor of the Bank of England, visited the U.S.A. in April, 1917. On 9 May the U.S.A. decided to provide £40,000,000 weekly if necessary for the Allies. Between 25 April and 12 May the sum of £324,000,000 was borrowed by the Allies for loan spending. Two big Loans were issued. The first Liberty Loan of £400,000,000 was over subscribed 50 per cent. in June 1917, and a second was in progress during October. It was believed that £1,000,000,000 would be obtained. The American Treasury are budgetting for the year ending 30 June 1918 for £4,500,000,000 as war expenditure, of which the Allies have been earmarked £2,400,000,000.

Germany.

The sixth German 5 per cent. War Loan closed on 19 April 1917, when without conversions subscriptions are said to have been received for £658,500,000. This followed 9 Vote of Credit in Feb. 1917, to make the total expenditure on the war to £5,250,000,000. The seventh War Loan was in issue during October and reached £600,000,000. German Loans are fast becoming mere paper transfers. Gold in the Imperial Bank has been reduced slightly during the twelve months. Germany has been despatching some of her gold to neutrals in order to remedy her exchange rates.

| | | |
|---|---|---|
| Nov 1916..... | £ Gold | £125,594,000 |
| Oct. 1917 " | " | £120,207,500 |

Austria Hungary has increased note issued sevenfold during war to kr 13,000,000,000. The seventh loan, at 5½ per cent., was opened in early November, 1917.

Generally

France has kept too tight hold on the Bank's gold, with the result that exchanges have been considerably against the country. Freer use is now being made of the great resources. Borrowing has been confined mainly from the Bank of France. A Loan of £400,000,000 at 5½ per cent. net was floated in Nov., 1917. Russia has issued two internal Loans with success. London exchange rates have been manipulated evidently by gamblers. The rate rose from 23½ roubles (£20) in Nov 1916 to 30 on 22 Sept., 1917. It fell to 27½ on 22 Sept., but was 32½ on 27 Oct. 1917. Italy's income of £180,000,000 of 1916-7 is sufficient to pay the interest on much heavier borrowing. War is costing Italy £1,000,000,000 annually. Japan has been repaying in sums of £500,000 old Loans in London. She has raised Internal Loans for Great Britain, France, and Italy. Indebtedness to her in the U.S.A. has been transferred to us by means of Loans to Great Britain and France.

# The Cost of the War to the United Kingdom.

So far as the United Kingdom is concerned, the following figures show how the cost of the war has grown and is likely to grow until demobilisation after Peace is completed. The ultimate allocation of the cost of the war between the whole of the belligerents will depend upon the nature of the victory gained by the Allies. One suggestion has been made that the whole of the world's war and rebuilding costs be turned into an international currency. The following figures refer *only* to the United Kingdom. Every other country in the world, neutral as well as belligerent, has been called upon to meet additional charges consequent upon the war.

Official figures (given June 25, 1917) for nine weeks, Oct. 8—Dec 9, 1916, as cost per day — £5,774,000

YEAR 1917-8.

*Votes of Credit* —

| 1917 | £ |
|---|---|
| Feb. 12 | 250,000,000 |
| May 9 | 300,000,000 |
| July 24 | 650,000,000 |
| Oct. 30 | 400,000,000 |
| Total for part year | £1,900,000,000 |

Total Credits since Aug. 6, 1914 £5,892,000,000
Budget (May 2, 1917) estimate for expenditure 1917-8 was £2,299,381,000
Total Votes of Credit for 1917-8 will not be less than £2,300,000,000
Average cost per day (1917-8) £6,300,000
Official daily averages for certain periods —

| 1917 | £ |
|---|---|
| April 2-May 5 | 7,457,000 |
| May 6-June 9 | 5,989,000 |
| April 7-June 9 | 6,723,000 |
| April 6-July 24 | 6,725,000 |
| April 2—Oct. 27—210 days (unofficial) | 6,412,000 |

Total cost of War from Aug 6 1914, to April 5, 1918 £6 000,000,000
Average cost per day throughout £4,660,000
(*N B*—The figures for 1917-8 are very likely to be increased, and total years expenditure will reach £2,300,000,000. The figures for average cost per day in 1917-8 will then be £6,850,000, total cost of war, £6,292,000,000 average per day throughout £4,810,000 Since the Budget was introduced on May 2, 1917, much additional and then unexpected payments have had to be made.)

As payment for the war is not being met from Revenue, and mainly has to take the form of borrowing (for details see article on War Finance), experience shows that every six months the war continues the sum of at least £1,000,000,000 will be added to the National Debt With interest at 5 per cent per annum (in some cases we are paying more and in others less) on this borrowed money, an additional interest or debt charge has to be met from taxation of £37,500,000 yearly This figure assumes that the Allies and Dominions will pay full interest on the sum of £250,000,000 that is loaned to them every six months, and included in the total of £1,000,000,000 mentioned above The official estimate of the actual increase in the Consolidated Fund services (payment of interest on National Debt) is £250,000 daily between the years 1916-7 and 1917-8. These figures do not take into consideration the necessary sinking fund of 1 per cent (minimum) to buy stock in open market in order to maintain a good price, or the establishment of a large sinking fund with which to repay the loans Of course some of the war money has been spent on machinery and factories, and the realisation of these will reduce in a small way the actual cost of the war On the other hand, there is an ever increasing pension list

## LANGUAGES OF THE WORLD

Of the 1,646,000,000 inhabitants of the globe about 600,000,000 speak the principal European tongues, of which English has the largest number of adherents through the predominance of that tongue in the British Dominions and in the United States of America. The principal European tongues are divided approximately as follows:—

| Language | People. |
|---|---|
| English | 180,000,000 |
| German | 120,000,000 |
| Russian | 100,000,000 |
| French | 70,000,000 |
| Spanish | 50,000,000 |
| Italian | 32,000,000 |
| Portuguese | 25,000,000 |

# Organised Labour and the War.

It would be a mistake to take the notes that follow, in so far as interruptions of output are concerned, to represent the feeling of that giant army of labour that is working steadfastly and in cordial co-operation with the men in the fighting line. Men and women have not hesitated to sacrifice their pleasures on the altar of the factory bench in order that the troops might be amply supplied with the *material* necessary to defeat that arch-enemy of democracy—autocratic brutality. There is danger lest this work be lost in the political movement known as Organised Labour that has held back important work often over petty things. A strike of 1,400 Swansea steelworkers lasted two days in Sept., 1917, in order to demand the reinstatement of a dismissed foreman; the foreman was reinstated pending inquiries. That is the kind of dispute that could and can be easily avoided. As for the aggregate disputes of the nine months Jan.–Sept., the following figures are sufficiently nauseating:—

| | 1916. | 1917. |
|---|---|---|
| No. ... | 414 | 448 |
| People involved | 187,388 | 446,085 |
| Days lost ... | 2,119,200 | 3,505,400 |

Meanwhile, soldiers were facing the horrors of warfare at 1*s.* for a twenty four hours day.

*Labour Party.*—The 16th Conference was held in Manchester Jan., 1917. Membership was 2,000,784, as compared with 1,915,672 in 1916. The acceptance of office in the Government by Labour Leaders was approved by 1,849,000 votes to 307,000. The resolution demanding that the Government "declares its readiness to enter into immediate negotiations for peace" was rejected by 1,627,000 to 550,000. During Oct., 1917, the National Executive decided to reorganise the Party throughout the country.

*Trade Cards.*—Compulsory enlistment and dilution have been the cause of much unrest in the workshops, especially engineering. First of all, a badge system was introduced, so that the men on war work should not be recruited. That proving unsatisfactory, trade cards were introduced. The unions on war work applied to the Ministry of Munitions and cards were issued to members stating they were on war work and not liable for military service.

*Scheduled Occupations.*—Cards proving unsatisfactory also, occupations were listed according to the [illegible] years of [illegible] experience. Those men who could claim as listed and were over a stipulated age were supplied with Scheduled Occupation Certificates. No worker could leave any munition factory without permission in the form of a leaving certificate. Leaving certificates gave rise to considerable friction, and were withdrawn on 24 Oct., 1917. Men were afraid that the plan for dilution would mean the loss of much that they had gained through their trade unions in the past, and were very suspicious of the working of the Acts and proposed Acts dealing with munition factories.

*Engineers.*—Trouble arose at Barrow on the premium bonus system, and on 20 March engineers came out on strike. Notwithstanding an appeal from the First Lord of the Admiralty to "carry on," the dispute continued into April. The Government were forced to take action to end the dispute. The A.S.E. was not responsible for the strike.

In April an agreement was signed between the employers and workmen in the engineering and allied trades under which wages and bonuses were increased, and an arrangement made for the reconsideration of conditions every four months.

Trouble was brewing with the shop stewards. On 21 May, the Government found it necessary to issue posters against any general "downing of tools." On 24th, the Minister of Munitions said, "The gravity of the interruption of output does not seem to be fully understood." However the strike continued, and the shop stewards saw the Premier on 29th, when a satisfactory solution was found. Four days later, the prosecution that had been instituted against the leaders was withdrawn.

*Labour Commissions.*—Mr Lloyd George announced, following the strike, in the House of Commons, that the Government had appointed eight Commissions to investigate the causes of unrest in various parts of the country. The reports from the Commissioners were issued to the public on 28th July, and their substance was a wonderful collection of labour grievances. Many of the suggestions made by the Commissioners were carried out. In the meantime, Dr Addison was succeeded by Mr Churchill at the Ministry of Munitions. The difficulties that have arisen with the munition workers seem to be due mostly to a lack of sympathetic knowledge of labour conditions by officials.

*Miners.*—Whilst the general body of miners have been working earnestly, a small and advanced section has done its utmost to create discord. South Wales has been notorious in its continued threats of unrest. During Jan.–Sept. the miners succeeded in getting an average increase in wages of just under 8*s.* weekly.

*Stockholm.*—Following the German attempt to create a peace atmosphere by means of an international Labour Congress at Stockholm, a special Labour Conference was held in Westminster on 28 Aug., when by 1,846,000 votes to 550,000 the meeting decided to send representatives. The Labour Conference met again on 21 Aug. when the resolution to send delegates was sustained by a bare majority, 2,271,000 being for and 1,991,000 against. The Trade Union Congress met on 4 Sept., and by 2,849,000 votes to 91,000, decided to abandon Stockholm and attempt to get a general agreement amongst the working classes of the Allies.

*Cost of Living.*—According to the *Labour Gazette*, the increase in the cost of living from July, 1914, to Sept., 1917, has been equal to 97 per cent. To meet this increase bonuses and higher wages have been given. Whether the ratio between cost of living and actual wages has remained steady is open to question. A large amount of overtime has been worked, and the payment for this has tended to hide the general question. The actual changes in wages between Jan. and Sept., 1917, have been given as 47,000,000 weekly for 4,250,000 people. The Government might have supplied prices from the start and saved much of the consequent dissatisfaction.

An adequate supply of suitable, well-built and healthy dwellings, available at rents within the earning capacity of working-class families, is of vital importance to the State. Estimates have been made as to the present shortage of houses, varying from 250,000 to 2,000,000. Whatever the real figures, they are certainly unparalleled, and are growing at an alarming rate, building having practically ceased. Fortunately the position will be known, probably before this article appears, for when all replies to the Questionnaire issued in *July last, for return by October* 15th, have been tabulated, the Local Government Board will possess accurate particulars and other essential information. Statistics of new houses built in ten years ending March, 1914, were privately obtained from officials of 50 great towns having an aggregate population of about 13,000,000—approximately 30 per cent. of the whole country. These were submitted to the Local Government Board in September, 1918, and were—for five years ending 1910, 289,996, and for five years ending 1915, 87,634. Housing difficulties in rural districts are even greater than in towns, and the shortage is proportionately higher. Hitherto provision by house builders has been impossible on business lines, as economic rents were not obtainable. The wages of workers on the land, happily, are now considerably increased, and will, it is anticipated, lead to improved housing conditions. Over 30 per cent. of the existing rural shortage is estimated as due to failure by the State, County Councils, Local Authorities, Railway Companies, &c., to meet their obligations to provide dwellings for their own employees. These conditions, and also the "week-end" cottage habit, have led to agricultural workmen being deprived of cottages built solely for them. Various causes have contributed to the existing and growing urban housing shortage. Practical men associated with the building and finance of urban working-class dwellings are almost unanimous in declaring that the foremost, and easiest to remove, of these are the taxing provisions of Part I. of the Finance (1909-10) Act, 1910. Credit and confidence in such property as a leading national security have been gravely affected, and there appears little prospect of private enterprise again taking material part in building houses for the working classes, except these legislative provisions are removed. Other obvious causes include (a) the general effect of the War on the financial resources of the country, (b) the higher and still increasing cost of materials and labour, and the growing scarcity of both, (c) the increasing burden of local taxation, with no general rise in rents charged to tenants where local rates are paid by the owner—a pernicious principle which applies to probably 70 per cent. of all working-class dwellings, (d) the failure of the Government to redeem pledges to relieve local rates, by transferring to the exchequer a greater proportion of the continually growing cost of purely national services; and (e) emergency legislation which has limited, and latterly, in effect, forbidden the building of houses, except in munition areas for schemes subsidised by the State.

Efforts continue to be made to induce the Government to redeem its pledges to amend the legislation generally regarded as the principal difficulty. In this connexion the Right Hon. Walter Long, in replying to a deputation on September 20th, 1918, made this statement and possibly historic pronouncement:—"My sympathies, I need hardly say, are heartily with the proposals. I regard the Government as pledged to carry a measure of reform, and I hope when it comes it will be complete, because I am confident that it is necessary."

Mention may also be made of a remarkable conference held in November, 1918, attended by upwards of 200 representatives of 40 leading institutions and associations of national character and standing, interested or connected with working-class housing. The following resolution was passed, and has since been adopted by numerous associations and conferences throughout the country:—"This conference views with deep concern the present unparalleled shortage of houses, particularly for the working classes, which is daily increasing, and being of opinion that the original and principal cause of so grave a state of things is both directly and indirectly due to the effects of the provisions of Part I. of the Finance (1909-10) Act, 1910, as regards Increment Value Duty, Undeveloped Land Duty, and Reversion Duty, which has largely destroyed the confidence of investors in, and leaders upon, this property, previously regarded as the premier national security, urges His Majesty's Government to take prompt steps to remove the legislative provisions referred to and to give in every possible way their encouragement and support to private enterprise and co-operative effort in the provision of healthy dwellings for the people."

Less than 20,000 dwellings have been provided under Part III. of the Housing Act, 1919, and the total built by the 60 Societies of Public Utility is approximately 6,000. The aggregate provision from these sources is barely four months' normal supply. Capital for Local Authority housing is borrowed from public fund. Many schemes are not self-supporting, and involve a charge on local rates. For schemes carried out by Societies of Public Utility approximately 65 per cent. of the cost has been advanced from public funds.

How, and by whom, dwellings can be provided in sufficient numbers having regard to present abnormal conditions, financial and otherwise, constitutes a problem of grave complexity. Unfortunately, there is little probability of improvement in these conditions in the near future; nor is it possible that the cost of building will ever again be as low as before the War. Leading builders of great specialised experience in cottage production officially state that a cottage of substantial character produced and sold before the War for £200—site and street expenses included—will cost £700 under conditions likely to prevail immediately after the War and for several years. They anticipate when "after the War" normal conditions obtain—probably three or five years hence—a similar cottage may be produced by private enterprise and sold for £450.

Seeing that generally cottage building by Municipalities has cost probably 25 per cent. more than dwellings of equal accommodation provided by private builders, the effect on the economic rent which must obviously be charged for dwellings, if provided by the State or Local Authorities at post-war prices, will represent an increase in rents prevailing for existing houses possibly of 40 per cent. to 50 per cent. A striking illustration of the substantially increased cost of municipal housing appeared in a scheme recently adopted by a great Northern city. The Estates Committee estimate that for some parts

at least 2,500 new houses must annually be provided, and advise the Municipality to itself build five houses yearly for the next five years. The preliminary programme sanctioned by the Council provides for 500 cottages at an estimated cost of £202,277 13s., or £405 per dwelling, exclusive of land for 127 houses. The lowest rate of interest now charged by the Public Works Loan Board for municipal housing schemes is 3½ per cent. On this basis, and providing for upkeep insurance, administration, etc., the weekly economic rent would be about 10s net. With local rates, &c., additional, this means a rent approximating to 13s. 6d. per week.

The Royal Commission on Scottish Housing have recently issued Majority and Minority Reports. The former states "The standard of accommodation we recommend is that the houses to be built should have not less than three rooms, with all sanitary and domestic conveniences. At present (that is, subject to War conditions) such houses cost about £450 and upwards. 'We think it safe to assume that on an average during the next 15 years the houses will not be built for a less cost than £300 each.'

Inland Revenue reports indicate an increase of private dwellings in *England and Wales* between 1901–1911 of 1,020,833. During this period the population increased by 2,547,428, requiring, at five persons per dwelling 509,500 new houses. Apparently, therefore 990,833 houses were built in this decade in excess of the needs of the increased population. The number of dwellings closed or demolished, for all purposes, was far less than this excess production, and as it is known that in agricultural districts and in a few urban areas insufficient houses were built, it follows that overbuilding for several years was enormous in most urban localities, particularly in great cities.

Overcrowding is generally assumed to be solely due to a shortage of dwellings. This is fallacious, and such view is less justified than is generally believed. Since 1900 unfit dwellings have been demolished, voluntarily and otherwise in much larger numbers. Reliable information of the total thus destroyed is not, however available. Very substantial progress has also been made, under various Acts and voluntarily, in the remedying of sanitary defects and thorough renovation of existing dwellings. The Local Government Board Report for 1916 indicates that, in twelve months ending March, 1915, no fewer than 39,108 dwellings in England and Wales were thus satisfactorily dealt with at the cost of the owners, in 1,600 of 1,800 districts concerned. An analysis of the latest Inland Revenue Report indicates that in *England and Wales* the total number of private dwellings charged to or exempt from inhabited house duty was, in March, 1915, 7,225,632. No fewer than 4,720,730 were of the annual value of £20 or less, and consequently may be regarded as working-class dwellings. Earlier reports give particulars of dwellings in *Great Britain* of the annual value of (a) under £10, (b) £20 and under £25, (c) £25 and under £30. These totals in March, 1914, were 3,230,201, 1,210,819, and 1,221,311 respectively.

It thus appears there were then, at net weekly rents corresponding to the annual values, more than 40 per cent. of all working-class dwellings at 5s. net or less, more than 40 per cent. between 5s. and 7s., and more than 13 per cent between 7s. 9d. and 9s. 10d. This enormous number of dwellings, except as to less than 2 per cent., has been provided by private enterprise, and the type of house thus produced has greatly improved during the last 20 years as the natural result of the growing desire for larger and better dwellings. The aggregate annual value of all working-class dwellings in Great Britain was in March 1915, £66,405,315. Eminent authorities estimate, taking the country as a whole, the capital value represents 20 years purchase. This gives the stupendous total of £1,328,107,600, i.e., more than twice the amount of the National Debt previous to the outbreak of war and roundly £200 per dwelling. Except as to, say, £6,000,000, the probable cost of public schemes, this, or approximately this, colossal sum has been privately raised and invested in housing the working classes.

Frequent press references indicate that the Government are fully alive to the urgency of the whole question of housing and of the necessity for energetic and active measures to deal with it.

During May Lord Rhondda received several deputations at Whitehall, possibly the most important of all being that officially representing institutions and associations of national character and standing connected with the production of working-class dwellings by private enterprise. Associations and individuals of known experience have also been afforded opportunities of stating their views in writing. It was announced in Parliament shortly afterwards that an expert Committee had been appointed to confer and advise upon the whole position. Following the earlier deliberations of this Committee, and possibly as the result of its recommendations, the Right Hon. W. Hayes Fisher, who had meanwhile succeeded Lord Rhondda, again brought the subject of housing before the War Cabinet, and was authorised to announce That the Government recognises that it will be necessary to afford substantial financial assistance from public funds to those Local Authorities who are prepared to carry through without delay at the conclusion of the War a programme of housing for the working class a which is approved by the Local Government Board." This was notified to all Local Authorities in Great Britain and a clear intimation given that such assistance would "only be available for a limited period" and that neither the form nor the extent could then be indicated. It further states –"In thus addressing himself at the outset to the Local Authorities, Mr Fisher is fully conscious that the complete solution of the problem is not likely to be accomplished except with the co-operation of private enterprise, including Public Utility Societies, and that in order to secure the full advantage of their help it may be advisable for the State to offer them assistance in one or other of the directions which are now under the consideration of a conference sitting at the Local Government Board." On July 28th Mr Fisher appointed a further Committee "to consider questions of building construction in connexion with the provision of dwellings for the working classes of England and Wales, and report upon matters of material economy and despatch in the provision of such dwellings.

The colossal task ahead can best be met by the whole-hearted co-operation and co-ordination of any and every agency able and willing to share the essential work of building good and better houses for the people.

## THE TURF

Of sporting generally there was little during the year. Team games such as football and cricket were played, but merely as recreative exercises for youthful soldiers, and with a view to week-end amusement for the masses of munition and other workers throughout the country. Of indoor games, billiards had some vogue, the principal features being the improvement shown by such professors as H. W. Stevenson and Thomas Reece, both of whom, though they did not dispute the championship, were able to take down the number of the champion, Melbourne Inman. Cricket, the summer game, was confined to public schools, Army teams, and the M.C.C.

No flat-racing was permitted at all in England between the first week in May and July 25, though it continued in Ireland. Various reasons were given, officially and semi-officially, for this. It was alleged that there was a scarcity of oats for feeding horses, that the permitting of racing would make an undesirable inroad upon petrol stores, and finally that 'racing was opposed to public opinion.' The latter theory was soon disproved, for 'public opinion' in favour of racing forced the Government to remove their ban. It was generally conceded that the blood stock breeding industry is one of the most important in Britain, and that without the aid afforded by the racecourse it could not be carried on. It may be taken therefore, that the resumption of horse racing was sanctioned when proper investigation had proved that it was in the national interests. At the same time when it was resumed, its value as a recreation for the working classes was partially recognised by the granting of a few fixtures to places such as Brighton, Windsor, Stockton, Manchester, and Ayr (the first time racing has taken place in Scotland for three years) but London did not participate for reasons not altogether unconnected with military exigencies.

The season opened in April at Newmarket, and it is curious that at that meeting both Gay Crusader, the best three-year-old of his season and Phalaris who afterwards proved to be the champion sprinter, suffered defeat. Phalaris was beaten a length when trying to concede 5lb. to Verdun over the six furlongs of the Brethy Stakes Course and Gay Crusader failed by three parts of a length to give 11 lb. to Cinq D'Or in the Column Produce Stakes (£1,028). Gay Crusader a son of Bayardo and Gay Laura had not properly come to hand then, however. Henceforward his career was one of distinguished success. His next appearance was in the Two Thousand Guineas at Newmarket on May 2, when, with S. Donoghue in the saddle, he started favourite at 9 to 4 against and won in a field of fourteen. Even that performance was not really convincing, for he only beat Magpie, ridden in splendid fashion by G. Madden, by a head, and was palpably "all out." Athdara was a further three lengths in the rear, and subsequent running proved him a colt of quite moderate quality. When it came to the New Derby (£3,050), run on July 31 at Newmarket, however Alec Taylor, the Manton trainer, had worked wonders with Gay Crusader. It was palpable that the horse was in magnificent condition, and although the field numbered twelve, 7 to 4 was the best offer against the Crusader, who, with Donoghue again riding, came striding away from the Plantation and defeated Dansellon by four lengths, with Dark Legend beaten a head for second place. That the form was good was proved by the pressure in the unplaced lot of Diadem, who, in May, had won the One Thousand Guineas (£4,030) with easy from Sunny Jane, Nonpareil, and eleven others. On Aug. 2 at Newmarket, Sunny Jane turned the tables on Diadem in the New Oaks (£873). Diadem was favourite at 7 to 4, and 4 to 1 was on offer against Sunny Jane. Many who witnessed that race were of opinion that the half length by which Sunny Jane won was largely due to the fine riding of Madden. Moravia was third, four lengths away and there were eight other runners.

The impression created by Gay Crusader in the New Derby was so good that the September Stakes (£2,654), decided on Sept. 12, after attracting quite a good entry, dried up, only Kingston Black and Dansellon opposing the Manton crack, on whom odds of 11 to 2 were betted. Donoghue allowed the favourite to make the whole of the running, and he defeated Kingston Black by six lengths, Dansellon being a long way further in the rear. Having won all the classic races, or their war-time substitutes, Mr. Fairie decided to let his colt commence his career as a cup horse, and Gay Crusader made a successful début in that character on Sept. 28, when he secured the Newmarket Gold Cup (£8,930) over a distance of two miles and a half. Perox and Kingston Black were his only opponents, and odds of 100 to 8 had to be betted on the Crusader, who, ridden as usual by Donoghue, beat Perox by fifteen lengths. This performance was followed up by victories over Booket, Nassorian, and Kingston Black in the Newmarket Champion Stakes (£5,960), and in the Lowther Stakes (£7,210) at Newmarket in the middle of October, Dansellon being his only opponent in the latter event. Much more could be written, but quite enough has been set down to prove that Gay Crusader easily dominated the three-year-olds in 1917.

Of the two-year-olds, the best were Benevente, a chestnut filly by Polymelus—Fearnaria, Fressia, a ch. filly by Lochryan—of an Orby mare, Wilton, a bay filly by Symington—Will Rogers, Itamask, a bay filly by Lemberg—Dagmar, Violinist, ch. colt by Neil Gow—Cyrene, Georgia, bay filly by Jingling Geordie—Una, Prince Chimay, ch. c. by Chaucer—Galaretta, Skyrocket, ch. c. by Sunstar—Maid of the Mist; Gainsborough bay colt by Bayardo—Rosedrop, and Syndrian, by Sunder—Polkerris. Benevente opened her winning career at Newmarket on May 2, when, with J. H. Martin in the saddle, she easily won the Wilbraham Plate (£1,016) for fillies from Fairy Orb, Herself, and twenty-two others. This was followed by another easy victory in the New Coventry Stakes (£630) on Aug. 2 the Clare colt and Sonsme Kiss being her nearest opponents in a field of eleven, whilst at Stockton towards the end of August the filly beat Lady Bayardo by a length and a half, Miss Richard, and seven others, giving lumps of weight to all, in the Lanchton Plate (£1,216). She experienced an unexpected check in the Rous Memorial (£897) at Newmarket in October, when, with odds of 11 to 10 betted on her, she was only fourth of nine to Violinist, Georgia, and Pandion, but made amends later in the same month by winning the Middle Park Plate by a length from Herself, Skyrocket, and three others.

Reference has been made to the Rous Memorial Stakes victory of Violinist, but perhaps

his Rosebery Plate (£1,000) received at Kirkconnel in August was even better, for it was easily achieved, and the field included Stalwell, Gainsborough, and nine others. Georgie's successful coltage headed the Fitzwilliam Stakes (Div 1.) (£1,277) at Newmarket in April, in which she beat fifteen opponents; the Home Bred Plate (£1,000) at headquarters in July, for which there were 26 entries; and the Tuddenham Plate (Div 1.) (£1,277) at the same place in August, when thirteen went to the post. None of these victories, however, were of quite the same class as those achieved by Benevento. Prince Chimay accomplished a smart performance when he won the Bottom Mile Nursery (£1,000), the second week in September, although he only got home a neck in front of *Old Drury* but the latter was receiving 14 lb., Hillhampton was third, and there were fourteen other competitors. Skyrocket won the Princess Plate (£1,000) from Sunning, Hillhampton, and twenty others at Newmarket in July, but was all out, and was subsequently beaten in the Chesterton Nursery Handicap by Manaka colt, but the winner was in receipt of 22 lb. Perhaps the best performance by any two-year-old, bar Benevento, was that of Gainsborough in the Autumn Stakes (£1,850) at Newmarket, the second week in September. Ridden by Madden, he beat Fresnia soundly by two lengths, Roldeer being another length behind, whilst Violinist was amongst the beaten lot. Gainsborough was generally conceded to be one of the best looking and best built youngsters ever seen, and great things were predicted of him.

With the season severely curtailed and the Newmarket programmes admittedly framed on lines best calculated to further the breeding interests, the older horses had few opportunities of an important character. One that stood out by himself, as a sprinter at all events, was Lord Derby's four-year-old Phalaris, a bay colt by Polymelus—Brumma. He failed, by a length, to concede Verdun 22 lb. in the Crawford Handicap in April, but in May gave lumps of weight to thirteen opponents in the Bredby Stakes (£1,000). After being allowed to walk over for the historic Whip, he carried 10 st. 2 lb. to victory in the Chesterfield Course Stakes (£1,000) and in September successfully shouldered 9 st. 5 lb. in the St. Ives Handicap (£1,000), his nearest opponent, Fiction, being in receipt of 15 lb., whilst some of the fifteen rivals were giving him 5 lb. With 9 st. 7 lb. up he won the Surrey St. Leger Stakes easily from Rodipt (received 3 lb.), and Pilasella (received 3 lb.), the Derby and Oaks winner of the previous season and in October cantered away with the Newmarket Challenge Stakes (£1,350), for which there were only three runners.

By the end of the first week in November Phalaris had won six races of the value of £11,988, but of course Gay Crusader headed the winning horses list with half a dozen races, value £10,119. Diadem, 3 yrs., by Orby—Donnette, came second with 3 races, value £4,782, Benevento was third, 4 races, value £3,852, then Phalaris, next Fresnia, 4 races, £2,378. Wilton, 2 yrs., b. f. by Symington—Will Return, was sixth with 2 races, value £1,869 and of the older horses Roscius, 4 yrs., b c by Rochester—Minstrella, won 4 races, value £1,243, Bramble Twig, 4 yrs., b. c. by Chancer—Bramble Jelly, secured 2, value £1,021 Frustration, 4 yrs., b c. by St. Frusquin—Princess Mary, 3, value £998 and Bay D'Or, 4 yrs., b. c. by Bayardo—Dame D'Or, 2, value £694.

At the time of writing the struggle amongst the leading jockeys was very close. S. Donoghue led with 37 wins out of 197 mounts, J H Martin being second with 29 out of 180. A feature of the riding of the season was furnished by A. Smith an apprentice in Jarvis's stable, who boasted 28 winners out of 196 rides, and was third when these notes were penned. W Smyth, 26 out of 168. Rickaby, 25 out of 213, and Madden 26 out of 172, were next in order

Mr Fairie headed the list of winning owners, his figures being 3 winners of 8 races, value £20,321, Lord Derby, 9 winners, 20 races, £14,983, same next, Lord D'Abernon, 2 winner, 3 races, £4,782, was third, Lord Londonderry, 4 winners, 7 races, £3,512, fourth, Sir W J Tatem 7 winners, 8 races, £2,792, fifth, Mr Sol Joel, 8 winners, 8 races, £2,392, sixth, and Mr E Hulton, 8 winners, 22 races, £2,641, next. Of trainers, Alex. Taylor, aided by Gay Crusader, had a great time, his 19 winners securing 22 races of the value of £26,342. The Hon. G Lambton turned out 13 winners, who between them secured 27 races of the value of £10,892, whilst the comparatively small stable provided over by F B. Darling had 12 winners of 19 races, value £4,470.

## EMIGRATION FROM EUROPEAN COUNTRIES.

| Country | Number of Native Emigrants | Destination of Greatest Number |
|---|---|---|
| United Kingdom (1914) | 223,000 | Canada, 91,480, U.S., 90,818, Australasia, 48,023, North Africa, 21,124. |
| Austria-Hungary (1912) | 296,300 | U.S., 178,880; Canada, 24,300. |
| Belgium | 29,758 | 26,341 to European countries, 3,427 to countries out of Europe. |
| Denmark | 8,636 | U.S., 5,965. |
| German Empire | 28,945 | U.S., 17,906. |
| Italy | 711,448 | 294,971 to European countries, U.S., 267,699; Argentina, 71,767. |
| Norway | 11,030 | U.S., 7,774. |
| Portugal | 88,903 | Brazil, 70,880. |
| Spain | 240,033 | North and South America, 190,076, Central America, 42,926, Africa, 34,305. |
| Sweden | 23,869 | U.S., 13,892. |
| Switzerland | 5,691 | U.S., 4,000. |

CLOSE SEASON FOR GAME, WILD BIRDS, &c.

It is illegal to pursue the different kinds of game between the following dates (inclusive), but during the war some of these periods have been shortened:—

| GAME. | ENGLAND. | SCOTLAND. | IRELAND. |
|---|---|---|---|
| Black Game or Heath Fowl. | 11 Dec. to 19 Aug. (31 Aug. in Somerset, Devon, and New Forest). | 11 Dec. to 19 Aug. | 11 Dec. to 19 Aug. |
| Bustard | 1 Mar. to 31 Aug. | None. | 11 Jan. to 31 Aug. |
| Deer, Male | None. | None | 1 Jan. to 9 June. |
| " Fallow Male | None. | None. | 1 Nov. to Michaels. to 9 June. |
| *Grouse or Red Game | 11 Dec. to 11 Aug. | 11 Dec. to 11 Aug. | 11 Dec. to 11 Aug. |
| *Hare | None. | None | 20 Apr. to 12 Aug.† |
| *Heath or Moor Game | None. | As "Muirfowl." | 11 Dec. to 11 Aug. |
| Landrail, Quail | As "Wild Birds." | As "Wild Birds." | 11 Jan. to 19 Sept. |
| *Muirfowl, or Ptarmigan | None. | 11 Dec. to 11 Aug. | 11 Dec. to 19 Aug. |
| *Partridge | 1 Feb. to 31 Aug. | 1 Feb. to 31 Aug. | 1 Feb. to 31 Aug. |
| *Pheasant | 1 Feb. to 30 Sept. | 1 Feb. to 30 Sept. | 1 Feb. to 30 Sept. |

† Subject to variation in various counties e.g. Tyrone 1 Apr to 12 Aug., Dublin, 1 Mar to 20 Sept.

It is also unlawful to kill the game marked * on a Sunday or Christmas Day.

In England hares, rabbits, woodcock, snipe, quail, landrail, and heath or moor game (and the eggs of swan, wild duck, teal, and widgeon) are protected under the Game Laws, though no close time is fixed for them by those laws. In Scotland the same remarks apply to deer and hares, to the first four birds, and to wild duck, in Ireland to all these five birds, with the further addition of widgeon, teal, and plover. The close-time for all these birds (except quail and landrail in Ireland, for whose close-time see above) is, under the Wild Birds Protection Acts, able to spell, from 1 March to 31 July, both inclusive. Otherwise this close-time applies to all wild birds throughout the United Kingdom. The penalty for killing any wild bird in such close-time, or for selling or having in possession between 1st March and 31 July, both inclusive (unless the killing can be proved to have occurred at a time and place to which the Act does not apply), is a reprimand and costs for the first offence, and £1, and costs for each bird for every subsequent offence, or, in the case of the undermentioned birds, £2 for each bird for each offence. In any case the Court may also order the forfeiture of any bird (or egg, where protected—as sent aforesaid) in respect of which the offence was committed. In the Island of St. Kilda the close-time period and St. Kilda were are deemed to be contained in the following list, and the birds specified in it are protected.

| | | |
|---|---|---|
| American quail. | Kittiwake. | Scout. |
| Auk. | Lapwing. | Sea-hirk. |
| Avocet. | Lark. | Seamew |
| Bee-eater | Loon. | Sea parrot. |
| Bittern. | Mallard. | Sea-swallow. |
| Bonxie. | Marrot. | Shearwater |
| Colin. | Merganser | Shaldrake. |
| Cornish chough. | Merre. | Shoveller |
| Coulternob. | Night-hawk. | Skua. |
| Cuckoo. | Night jar | Snaw |
| Curlew | Nightingale. | Snipe. |
| Diver | Oriole. | Solan goose. |
| Dotterel. | Owl. | Spoonbill. |
| Dunbird. | Ox-bird. | Stint. |
| Dunlin. | Oyster-catcher | Stone curlew |
| Eider-duck. | Peewit. | Stonehatch. |
| Fern-owl. | Petrel. | Summer snipe. |
| †Fulmar | Phalarope | Tarrock. |
| †Gannet. | Plover | Teal. |
| Goatsucker | Flovers page | Tern. |
| Godwit. | Pochard. | Thicknee. |
| Goldfinch. | †Puffin. | Turkey |
| Grebe. | Purre. | Wasp. |
| Greenshank. | †Razorbill. | Widgeon. |
| †Guillemot. | Redshank. | Wild duck. |
| Gull (except black backed) | Reeve or Ruff | Willock. |
| | Roller | Wimbrel. |
| Hoopoe. | Sanderling. | Woodcock. |
| Kingfisher | Sandpiper | Woodpecker |

Offenders refusing their names and addresses are liable to a further penalty of 20s., but the Acts do not apply to any person shooting on his own land, or authorising anyone so to shoot, any wild bird not included in the above list.

On the application of the local authorities, the Secretary of State in England and Wales, the Secretary for Scotland in Scotland, or the Lord Lieutenant in Ireland, has power to vary or abolish the close-time for any bird or birds in any county by order to be published in the *Gazette*. They may also direct that the above enactments shall apply to any wild bird not specified in the list, and may further prohibit the taking of the eggs of any wild bird in any county or part thereof. The Secretary of State in England and Wales, or the Secretary for Scotland, may also on the application of the local authorities make an order providing that in any specified area the taking or killing of any particular kinds of wild birds shall be illegal during any period specified in the order. These various powers have been exercised in many cases—too numerous to recapitulate here.

Penalties are imposed on persons setting springs, gins, &c., on poles, trees, mounds, &c., so as to injure wild birds. Persons permitting such acts are equally liable. The use of a hook or like instrument for taking wild birds is forbidden.

## HUNTING AND GROUND GAME.

There is no statutory close-time for fox-hunting or rabbit-shooting, nor is there, except in Ireland, for deer or hares, but there is an "unwritten law" which the sportsman respects as much as he does the enactments of Parliament. 1 November is the recognised date for the opening of the fox-hunting season, which continues till the following April. Otter-hunting lasts from mid-April to mid-September. The period for deer-hunting or stalking varies from about 20 Aug. to 20 Oct. for stags, and from 20 Nov to 20 end of March for hinds. By an Act passed in 1880 the sale of hares or leverets in Great Britain is prohibited from March to July inclusive under a penalty of a pound. This does not apply to

foreign hares. The statutory close season for hares in Ireland has been varied for some counties by order of the Lord Lieutenant, and it is now mostly from 1 April to 22 August.

## CLOSE-TIME FOR SALMON

### I. England and Wales

Under the Salmon Fishery Acts, salmon (including all migratory fish of the *genus* salmon) are protected, and a close-time is fixed for England and Wales (including the Esk in Dumfries, during which fishing for any of such fish is prohibited. The close time for nets begins on 1 Sept., and for rods on 1 Nov for both nets and rods it ends on 1 Feb. By an Act of 1907 the Board of Agriculture and Fisheries may make provisional orders varying the law on these and other points. Nine of such orders have been made. The close-time may also be varied by a bye-law by local boards of conservators provided it begins for nets not later than 1 Nov with a minimum of 154 days and for rods not later than 1 Dec. with a minimum of 92 days. For putts and putchers the annual close season is from 1 Sept to 1 May except where altered by bye-law. The statutory dates have been varied as follows —

| Close time for | Nets. | Rods. |
|---|---|---|
| Adur | 1 Sept to 1 Feb. | 1 Oct. to 1 Feb. |
| Hampshire†† | 31 July to 1 Feb. | 1 Oct. to 1 Feb. |
| Severn §§§ | 26 Aug to " ** | " |
| Wye | " to " ** | 16 Oct. to " |
| Taff and Ely | 31 Aug. to 30 Apr | 15 Nov to 30 Apr |
| Teify | 1 Sept. to 15 Feb. | 2 Nov to 31 Mar |
| Dart | 17 Aug. to 28 Feb. | 1 Oct. to " |
| Ayrim | — | 15 Nov to 14 Feb. |
| Yorkshire | — | 16 Nov to 26 Feb. |
| Exe | *1 Sept to 1 Mar | 20 Oct. to 1 Mar |
| Solent | " " | 1 Nov to " |
| Tamar & Plym | | |
| Usk, Ellaile | | |
| Weart | " " | 1 Nov to |
| Teign | " to 1 Mar | 1 Nov to 1 Mar |
| Towy | " to 1 Apr | 15 Oct. to 1 Apr |
| Dee | " to 31 Mar | 14 Oct. to 31 Mar |
| Ouse (causes) | to 1 Apr | 1 Nov to 1 Apr |
| Rhymney | " to " | 1 Nov to 1 Apr |
| Conway | " to 30 Apr | 1 Nov to 30 Apr |
| Stour (Kent) | " to 1 May | 1 Nov to 1 May |
| Lune | " to 1 Mar | " to 1 Mar |
| Solent | 16 Sept. to 20 Feb. | 16 Nov to 15 Feb. |
| Dovey | 14 Sept to 30 Apr | 1 Nov to 30 Apr |
| Taw & Torridge | " | " to 31 Mar |
| Kent & Bela | 15 Sept to 31 Mar | " |
| Dwyfach | " to 1 Mar | 15 Nov to 1 Mar |
| Erwent (Cum.) | " to 20 Mar | " to 20 Mar |
| Cleddy | " to 31 Mar | 1 Nov to 1 Feb. |
| Cynnet | " to 15 Mar | " to 31 Jan. |
| W. Cumberland | " to 31 Mar | 14 Nov to 20 Mar |
| Cynnon | " to 30 Apr | 15 Nov to 30 Apr |
| Clwyd & Elwy | " to 15 May | " to 15 May |
| Axe | 1 Sept. to 30 Apr | 20 Nov to 30 Apr |
| Avon (Devon) | 1 Sep to 1 May | 30 Nov to 1 May |
| Camel | 27 Sept. to 4 Apr | 1 Dec. to 30 Apr |
| Exeny | 30 Nov to " | " " |

* Except above Woodbury Sand Station, 1 Sep to 25 April. † Above S. Middleton. Below Old Impassable for nets. For rods these dates do not apply to R. Eden above Fishing Point, or to R. Cannon. ‡ Below Lost Wildcat only. § Except R. Brue, 30 Sept. (ends 30 Nov.) to 24 April. ¶¶ 1 June to 1 Feb. above Workington Weir to 25 Aug. to 24 April for putts and perchers. ** Above Leominster, 1 Dec. to 1 April. †† Mouth of Needles Light Bearing due South and — for nets, 1 Sept. to 15 Feb.; for rods, 16 Oct. (Hamble, Exeter, 30 Oct.) to 1 Feb.

No fresh salmon may be sold between 2 Sept. and 1 Feb., except such as come from parts beyond the seas, or as have been taken, if in the United Kingdom, by legal netting. During that period all packages containing salmon consigned by any common or other carrier must be clearly marked with the word "Salmon." Salmon, dried, pickled, or cured abroad, or, if within the United Kingdom between 1 Feb. and 3 Nov., may be sold after that date. The onus of proof that the fish were caught out of the United Kingdom, or, if within the kingdom, that they were caught during the legal netting season by legal means, or that, if pickled, they were pickled between 1 Feb. and 3 Nov., lies with the person selling or exposing for sale. The exportation of salmon from any part of the United Kingdom is prohibited between 2 Sept. and 20 April, unless caught at a time at which its sale in the place where it was caught would be legal, if in the United Kingdom the same prohibition lies on the person exporting. The capture and sale of "unclean" salmon, i.e., salmon recently spawned or full of spawn, are prohibited under heavy penalties. Roe may not be used as a bait in salmon angling.

*Net-fishing for salmon is prohibited* in England and Wales from noon Saturday to 6 a.m. Monday. This has been varied by conservancy boards in most districts, and extended to 48 hours, with certain changes in the hour of commencement.

### II. Scotland

In Scotland the annual close-time must not be less than 168 days. It is for nets, from 27 Aug. to 20 Feb., and, for rods, from 1 Nov. to 20 Feb. except as follows —

| Close-time for | Nets. | Rods. |
|---|---|---|
| Tay* | 21 Aug. to 4 Feb. | 16 Oct. to 14 Jan.* |
| Add, Aray, Eckaig, N. A. Esk Fyne, Ruel Shira | 2 Sept. to 23 Feb. | 1 Nov to 15 Feb. |
| Annan | — | 26 Oct. to 25 Jan. |
| Awe, Beauly, Spey | — | 16 Oct. to 20 Feb. |
| Dunbeath, Lossie | — | 1 Oct. to 20 Jan. |
| Halladale, Strathy | — | 1 Oct. to 20 Jan. |
| Naver, Borgie, Helmsdale, Brora | — | " |
| Hope, Polla | — | " |
| Forth | — | 1 Nov to 31 Jan. |
| Bervie, Carradale, Fleety Garnock, Girvan Howmore | 20 Sept. to 24 Feb. | 1 Nov to 20 Feb. |
| Inner, Ioma, Irvine & rivers of Islay, Orkney, Harris & Uist | " | " |
| Annan, Ritechar, Ugie | ditto | 26 Nov to 20 Feb. |
| Rivers of Shetland | ditto | 26 Nov to 31 Jan. |
| Nith, Urr | ditto | 1 Dec. to 24 Feb. |
| Rivers of Bute | 2 Sept. to 25 Feb. | 25 Oct. to 25 Feb. |
| Thurso | — | 4 Oct. to 20 Jan. |
| Findhorn | — | 11 Oct. to 20 Feb. |
| Ness | — | 20 Oct. to 1 Feb. |
| Tweed | 25 Sept. to 24 Feb. | 1 Dec. to 31 Jan. |

* Except Earn, nets, 1 Nov. to 31 Jan.

The weekly close-time for nets is between 6 p.m. Saturday and 6 a.m. Monday, and, for rods, on Sundays. The Esk, in Dumfries, is included under the English Salmon Acts.

In Scotland the law as to the sale of salmon differs somewhat from that in force in England.

### III. Ireland.

In Ireland the close-time applies to both capture and sale of salmon and trout. The netting close-time must never be less than 168 days, but many variations have been made, of which it is impossible to specify all the details here the following list shows the general close time (all dates inclusive) in force in the various districts, in parts of some of which, however, it is different. The second column gives the point of delimitation on the coast between the districts, which include all rivers, &c., within their respective coast limits.

| District. | Coast Limits. | Cl. T. Net. | Cl. T. Rod. |
|---|---|---|---|
| Dublin | Skerries to | 26 Aug. to 1 Nov. to 1 Feb. | 31 Jan. |
| Wexford | Wicklow to | 16 Sept. to 31 Mar. | 1 Oct. to 14 Mar. |
| Waterford | Kilm Bay to | 16 Aug. to 31 Jan. | 1 Oct. to 31 Jan. |
| Lismore | Helvick Head to | 31 July to 1 Feb. | 30 Sept. to 1 Feb. |
| Cork | Ballycotton H. to | 16 Aug. to 29 Feb. | 1 Oct. to 29 Feb. |
| Skibbereen | Galley Head to | 30 Sept. to 30 Apr. | 1 Nov. to 1 Feb. |
| Bantry | Mizen Head to | 16 Sept. to 31 Mar. | 1 Nov. to 16 Mar. |
| Kenmare | Crow Head to | Do. | 1 Nov. to 31 Mar. |
| Waterville | Lamb Head to | 16 July to 31 Dec. | 15 Oct. to 1 Feb. |
| Killarney | Bray Head to | 1 Aug. to 16 Jan. | 1 Nov. to 16 Mar. |
| Limerick | Dunmore Head to | 30 July to 31 Jan. | 1 Nov. to 31 Jan. |
| Galway | Hags Head to | 1 Sept. to 15 Feb. | 16 Oct. to 31 Jan. |
| Connemara | Cashla Coast-Guard Stn. to | 16 Aug. to 31 Jan. | 1 Oct. to 31 Jan. |
| Ballinakill | Slyne Head to | 1 Sept. to 15 Feb. | 1 Nov. to 31 Jan. |
| Bangor | Pigeon Point to | Do. | 1 Oct. to 30 Apr. |
| Ballina | Benwee Head to | 15 Aug. to 15 Mar. | 16 Oct. to 31 Jan. |
| Sligo | Cromanore to | 16 July to 31 Dec. | 1 Oct. to 31 Jan. |
| Ballycastle | Mullaghmore to | 29 Aug. to 29 Feb. | 16 Oct. to 29 Feb. |
| Letterkenny | Rossan Point to | 29 Aug. to 3 Feb. | 1 Nov. to 31 Jan. |
| Londonderry | Malin Head to | 1 Sept. to 24 Apr. | 16 Oct. to 31 Mar. |
| Coleraine | Downhill to | 29 Aug. to 3 Feb. | 1 Oct. to 29 Feb. |
| Ballycastle | Portrush to | 29 Sept. to 16 Mar. | 1 Nov. to 31 Jan. |
| Dundalk | Donaghadee to | 15 Aug. to 15 Feb. | 16 Oct. to 29 Feb. |
| Drogheda | Clogher Head to Skerries | Do. | 16 Sept. to 15 Feb. |

In Ireland the weekly close-time is fixed at 36 hours, commencing 6 a.m. Saturday.

### Close-Time for Trout and Char.

The capture of trout and char in England and Wales is prohibited between 2 Oct. and 1 Feb., except (x) in the Thames and Lee, where the close season is from 15 Sept. to 31 March, and (z) in the cases noted below, where, under an Act of 1896, the close-time (for rods and nets, except where specified) has been varied by bye-law by local boards of conservators. In the districts marked * the close-time, as altered, applies only to trout. The sale of trout and char is absolutely prohibited throughout England and Wales from 2 Oct. to 1 Feb. —

| *Conquet | 1 Nov. to 3 Mar. (ditto). |

In Scotland there is a close time for trout from 15 Oct. to 29 Feb. In Ireland the close-time for trout is the same as for salmon. For pollen the close-time is from 24 Nov. to 31 Jan.

Between Sept. 3 and Feb. 1 all packages in England and Wales containing trout or char must be distinctly marked with the word "Trout" or "Char," as the case may be.

### Close-Time for Freshwater Fish.

By the Freshwater Fisheries Act, 1878, a close time for catching, selling or buying freshwater fish (which are defined for this purpose to include all kinds of fish, other than pollen trout, and

† River Avon between Amesbury and Pickhorn only; above Amesbury 25 Oct. to 31 Mar.

‡‡ By order of Norfolk Fisheries Freshwater Order under observance in Norfolk close-time for nets is Sept. to 29 Feb.

other, which live in fresh water, except those kinds which migrate to or from the open sea) is fixed from 15 March to 15 June, both inclusive, for England and Wales except small parts of Norfolk and Suffolk, under a penalty of £5 for a first and £5 for a subsequent conviction. The close-season, however, does not apply to eels taken otherwise than by angling, or to freshwater fish other than grayling taken in certain private waters by leave of the owner, or to angling in public waters by leave of a board of conservators, or in private waters by leave of the owner, or to taking fish in certain cases for bait or for scientific purposes. Fishery districts may be wholly or partially exempted from this close-time with the sanction of the Board of Agriculture and Fisheries. The Axe, Avon (Devon), Wye, Rden, and Towy districts have been so exempted, also the Kent and Bela and Severn as regards pike, the Usk as regards eels, and parts of the Severn as regards fish other than grayling. For eels a separate close-time exists (so far as regards fixed engines in salmon rivers) in England from 1 Jan. to 24 June, in Ireland, with one or two exceptions, from 11 Jan. to 30 June. In the Severn, elvers, or eel fry, are protected between 1 Jan. and the last day of Feb., and between 15 May and 30 June. Certain other local close-times exist for freshwater fish, under local Acts or bye-laws.

PROTECTION OF CRABS AND LOBSTERS.

Under the Fisheries (Oyster, Crab, and Lobster) Act, 1877, it is prohibited to buy or sell crabs under 4½ inches, measured across the largest diameter of the back, or lobsters under 8 inches, measured from tip of beak to end of tail when spread out flat. The capture of "soft" crabs and crabs with spawn is also prohibited. By local bye-laws of Sea Fisheries Committees (*vide infra*), the minimum size of lobsters and crabs that may be lawfully taken in different parts of the territorial seas has been increased, and in some cases the taking of lobsters with spawn is prohibited, or a close season fixed.

CLOSE-TIME FOR OYSTERS.

There are also local regulations for the protection of oysters, and by the Fisheries (Oyster, Crab, and Lobster) Act, 1877, a close-time for the capture and sale of "Deep-Sea Oysters" is fixed for England and Scotland, but not for Ireland, from 15 June to 4 Aug., and for all other kinds of oysters—except oysters taken in the waters of a foreign state—from 14 May to 4 Aug. By the Sea Fisheries Act, 1888, taking for oysters is prohibited from 16 June to 31 Aug. in the English Channel between lines drawn (1) from North Foreland to Penkirk, and (2) from Land's End to Ushant—the territorial seas of England and France being excepted. This close-time, however, cannot be enforced till the Convention between England and France, included in the Act, is ratified, until that is done, the Convention concluded in 1839, which prohibits oyster-fishing in those limits from 1 May to 31 Aug., remains in force so far as French fishermen are concerned. But both Powers usually agree to suspend the close season till 15 June in each year. In Ireland, taking oysters from licensed beds is lawful, and by 5 & 6 Vict. cap. 106, no oysters may be taken between 1 May and 1 Sept., though this close-season has been varied in the *following cases*:—

| | |
|---|---|
| Estuary of Suir .. .. | 1 Jan. to 30 Sept. |

| Galway Bay and Carlingford Lough .. .. .. .. | 1 Jan. to 30 Nov |
| Strangford Lough .. .. | 1 Mar. to 31 Aug. |
| Achil Sound, Clew Bay .. .. | 1 April to 30 Sept. |
| Sligo, Ballisodare and Drumcliffe Bays .. .. | 1 May to 31 May |

## Licences for Shooting and Fishing.

GAME AND GUN LICENCES.—A licence is required by every person who hunts, shoots, or takes game, except persons (in Great Britain) taking woodcock and snipe with nets or springes, rabbit-warren proprietors, or others, on enclosed land, killing rabbits persons hunting deer, or hares, with hounds, owners or occupiers, or their servants, killing deer on their own land, beaters and others, not holding guns, attending holders of game licences. Occupiers of enclosed land, or owners, having the right to kill game, may themselves kill hares, or authorise others to do so, without a licence, but such authority must be limited to one person at a time in any one parish, and must be registered with the clerk of the Petty Sessional Division in which the land is situate. Even when the quarry is not what is legally known as "game," a "gun" licence is necessary. A game licence, however, covers a gun licence. Soldiers, sailors, volunteers, or constables, on duty, or at practice, need not take out a gun licence, nor need occupiers of land scaring birds or killing vermin on such land, or persons so acting under the orders of occupiers holding a licence. Unless, however, the occupier is himself licensed, he cannot authorise any unlicensed person to carry a gun. "Scaring" birds is not to be regarded as including killing of any birds, and "vermin" does not include rabbits. The rates of duty are given at p. 718.

FISHING LICENCES.—In all fishery districts in England and Wales, and in Ireland, a licence to fish for salmon is necessary, and in most English and Welsh rivers a similar licence is necessary for trout or char, except that a salmon licence includes the latter. In the Lune, Derwent, Severn, and Wye licences for "freshwater fish" are in force. In Scotland no licence is needed. A licence is available only in the district, and for the season, in which it is issued, except that in Ireland rod licences are available in all parts of that country. The rates on salmon nets and other like instruments range from £20 downwards in England and Wales, and from £5 downwards in Ireland. In the latter country the rate on draft nets, the kind most commonly used, is £3; in England and Wales it varies from £3 to £2. The licence duty on a salmon rod and line is £1 in Ireland. In England and Wales different rates are charged in different districts as follows (an asterisk signifies that lower rates of duty are chargeable for short periods, or for certain parts of the district) —

"Dee, £2/, "Eden, "Derwent, "Esk, Hampshire, "Wye, "Usk, 20/-, Taw and Torridge, 10/-; "Lune, "Ribble, Clwyd & Elwy, "Conway, "Dovey, "Teify, Avon (Devon), "Dart, "Tolan, Frome, Stour (Kent), "Yorkshire, "Tees, "Tyne, 10/-; "Dwyfach, Towy, 21/, "Solent, Avon, Bure & Yarmouth, "Camel, "Fowey, 15/-, Claddy, Taff & Ely, Ogmore, W. Cumberland, 10/6; "Kent & Leven, Rhymney, "Ayrshire, Severn, Axe, Trent, Tamar & Plym, 5/-; "Esk (Yorkshire), 7/6, Ouse (Sussex), Wear, Clwyd, Cardiganshire, Meifod, Ithel, &c., 2/-.

ENGLAND AND WALES.—The administration of the laws of close season, &c., for salmon and freshwater fish is placed by the Salmon and Freshwater Fisheries Acts, 1861 to 1907, and the Board of Agriculture and Fisheries Act, 1903, in the hands of local boards, with the Board of Agriculture and Fisheries as the central authority. The districts may be formed and Boards of Conservators appointed, and the following districts have been formed, including generally all rivers running into the sea between the points named. Except in the cases marked † they also include the sea for three miles from the shore, or to the mid-channel in estuaries.

These Boards of Conservators consist mainly of three classes of members—those appointed annually by the Councils of the various counties through which the rivers flow, ex-officio members, qualified by ownership of lands or fisheries of a certain value, and representative members, elected annually by persons who have paid licence duty on instruments other than rod and line for salmon taking in public waters. In certain cases, under local Provisional Orders, there are also members representative of fresh-water anglers. Districts where Provisional Orders are in force are marked thus *

There are also certain bodies created by local statutes, having authority over the fisheries, e.g., the Thames Conservancy Board, Port of London Authority, Lee Conservancy Board, and Conservators of the Medway.

The above-mentioned Boards have power to make bye-laws, not only for the regulation of the fisheries for salmon and freshwater fish, but also, in certain cases, for the regulation of pollu-

# Canals and Navigations: the Need for Improvement.

WHEN, in the early part of last year (1917), it was announced that the Government had appointed an Executive Committee to take control of the canals of the United Kingdom, other than those owned *by* the railway companies, there was general rejoicing among those who in good and evil report have continued to believe in the commercial value of these long-neglected water ways. The following is a list of the non-railway owned canals which came under Government control on March 1, 1917, to remain there for the period of the war :—

| | Miles. | | Miles. |
|---|---|---|---|
| Aire and Calder .. | 85 | Severn ... ... | 42 |
| Birmingham ..... | 159 | Sheffield and South Yorkshire | 60 |
| Bridgwater ... .. | 38 | Shropshire Union | 202 |
| Coventry ... ..... | 36 | Staffs. and Worcestershire .. | 92 |
| Gloucester and Berkeley ..... | 17 | Trent .. .. .. | 84 |
| Grand Junction | 189 | Warwick and Birmingham | 43 |
| Leeds & Liverpool. | 145 | Warwick and Napton .. .... | 14 |
| Leicester .... | 26 | Weaver ..... .. | 20 |
| Loughborough .. | 9 | Worcester and Birmingham .. .. | 30 |
| Newark .. .. | 4 | | |
| Oxford .. | 80 | | |
| Regent's ... .. | 11 | | |
| Rochdale | 34 | | |

The total length of these waterways is about 2,230 miles. While some portions of them are under railway control they are not railway owned. The total length of the canals in the United Kingdom is 4,673 miles, of which 3,642 are in England and Wales, 784 miles in Scotland, and 248 in Ireland. Of the total mileage, 2,244 miles are owned by railways and 229 are controlled by them.

It is too early yet to say what has been the effect of placing our inland waterways under a single administration, but if the analogy of the railways, where the pooling of stock has worked with admirable success, holds good, a step of great commercial value has been taken, from which there ought to be no retreat when we settle down to trade after the war. It cannot be denied that in the matter of canal traffic we are deplorably behind France, Belgium, and even Germany. The last generation has seen the building of the Manchester Ship Canal, but with this exception we are in the same position as we were a hundred years ago. Perhaps the position is really worse, for the canal passenger service has disappeared with the extension of the railway, and although on certain sections—such as the Aire and Calder Canal—traffic has been maintained and extended, the fact remains that our waterways, as a whole system, have not shared in the commercial progress of the last century, while many of them, as the Salisbury Avon Navigation and the Kennet and Avon Navigation, have been allowed to become almost derelict and disused.

There is a popular and apparently well-founded opinion that the present backward position of the canal system is due to railway ownership. As the railways opened their canal feeders were the land the competition with the waterway was encountered, and that competition was checked by buying up the canals to at least a third of their length. It may be asked why the remaining two-thirds of our canals, independently owned, have not been able to put up a fight and defeat the plan of the railway companies. The answer is this: that the railway companies own the *key sections* of the canals, the most important links. It is impossible, for instance, for any canal-borne traffic to enter or leave the Birmingham district without passing over water owned by a railway company. It was given in evidence before the Royal Commission on Canals and Waterways that of 7,000,000 tons of traffic on the Birmingham Canal Navigations, only 1,000,000 tons were *outside* it. "*It is difficult* to believe," said the Commission in their report, "that this proportion could have obtained had a canal in this commanding position been in the hands, not of a railway company, but of an independent administration pushing trade by water as heavily as railway companies push trade by their rails."

A glance at the canal map of England shows that the system is in the hands of various proprietors. So are the railways, it may be urged, but there is this difference—that on the railways there is some attempt at standardisation in regard to engines and rolling stock, so that a train may travel from Penzance to Thurso without encountering a break of gauge, while there is also an attempt, by means of through tickets, to establish a community of working between the different companies' lines. As regards the canal system it may be said that standardisation and through workings are unknown. Take the question of locks, bridges, and tunnels. No uniform plan has been observed in building the one or boring the other, and with nine different waterways owning the canals between London and Liverpool, one can imagine what the result has been. Here the boat is a few inches too long for the lock, there it is a few inches too wide, at another point the bridge is too narrow to permit of its passage. A writer in the "Times Engineering Supplement," dealing with this important point, states that "Only a narrow boat with an extreme limit of 70 tons capacity can be loaded in London for the Birmingham area. The great Birmingham canal system owned by the London and North-Western Railway, consisting of 159 miles of waterways, is narrow throughout, extremely complicated in character, and has no locks except on the *small* scale. There are several long tunnels, one of nearly 4,000 yards, and owing to the altitude of the canals, there are difficulties in connection with water supply. Narrow boats alone can pass from the Birmingham district to the estuaries of the Mersey, the Severn, or the Humber. In spite of these handicaps a large traffic is handled by the Birmingham canals." Trust, but how much larger the traffic might be if the handicaps were removed! "Sometimes the difficulty arises from want of required depth of water or long stretches of locks with their attendant loss of time, or the dimensions of tunnels, or the height of overbridges." The remedy is the same: the requirements of modern traffic can be met only by a very large expenditure

and declining revenues have in the case of ten-twenty of the independently-owned waterways left no surplus for improvement or even adequate maintenance."

There are through tickets on the railways, but there are few through tolls on the canals, so that even if a boat were able to load up in Limehouse and discharge in Liverpool, it would be impossible to pay the way leave charges in one lump sum. In their report the Royal Commission pointed out that in Germany the larger or "free" rivers, and in France both the rivers and canals, "are as free from tolls as are the roads in England," and are maintained at the cost of the State. In Belgium the tolls were so low as not to meet the cost of current maintenance or working expenses, and both in France and Germany there was, in the legislation respecting future waterways, provision for levying tolls, and that the policy in Germany was to make the new canals eventually entirely self supporting. It is, and it should be, an easy matter to make one consignment note carry one load of goods to whatever part of the canal system it was sent, and to establish a canal "clearing house," after the custom of our railways and our banks, where the claims of the various canals over which the load has travelled could be adjusted.

When the opponents of canal reform are faced by developments on the Continental waterways, they advance two arguments in favour of maintaining the existing British system. They say that we cannot achieve results similar to those obtained in Central and Western Europe as we have no wide, slow-flowing rivers, and that Continental canals run through level countries, while our waterways serve our industrial centres through hilly districts. Mr Frank Impey, the Secretary of the Waterways Association, has met these arguments by the assertion, backed by statistics, that the water-transport system of France is not flourishing because of her rivers, but because of her well-constructed canals. In 1880, he says, the traffic in ton-miles on the 4,270 navigable miles on French rivers was 4,650,000,000, on the 2,170 miles of French canals it was 884,000,000. Twenty-five years later the rivers had increased to 7,300,000,000, but the canals to 7,800,000,000. On the point that Continental water transport has the advantage of a flat country, he states that the heaviest traffic is in districts similar to, if not worse than, the industrial districts of England. "The Canal St. Quentin, from Chauny on the Oise to Cambrai on the Escaut, has 39 locks in 98 miles, with two tunnels on the summit 6,200 yards and 1,600 yards long. Here transport has been so successful, 5,025,000 ton-miles circulation, that before the war a lateral canal, the du Nord, was commenced with 29 locks in 39 miles and a tunnel of 4,300 yards. Another canal surmounting great physical difficulties is the de la Marne au Rhin, Vitry le François to the German frontier—198 miles with 113 locks, three tunnels 3,600 yards, 92 yards, and 492 yards, and three aqueducts over the Meuse, the Moselle, and the Sarre-Alte. Here between 1893 and 1909 the traffic increased 92 per cent. Other canals overcoming great heights are de Briare, with 36 locks in 32 miles, and de l'Est, northern section, with 82 locks in 98 miles. Everywhere, the traffic [illegible] in the twenty years ably to show."

Continental Powers, it can easily judge, from the reports which have been published during the war, are practically agreed on the extension of the canal system as one of the means of increased trade when hostilities have ceased. Russia has in contemplation a scheme for regulating the western portion of the River Dwina from Riga to Vitebsk, cutting a new channel, fifty miles long, across to Orsha on the Dnieper, and then regulating the latter river to Kherson, a short distance from where it falls into the Black Sea. The total length would be 1,272 miles, the cost, at pre-war prices, would be £18,000,000, and not the least of the advantages would be that goods would be carried from the Baltic to the Black Sea in twelve days. Less than a year ago the Bavarian Diet passed the new Danube-Main Canal Bill. The proposed route will follow the River Main from Aschaffenberg to Bamberg, whence a new canal will be constructed across to the Danube at Stepperg. The Danube will be regulated as far as Passau, on the Austro-Hungarian frontier. The waterway will be 270 miles long, and the estimated cost of construction is £23,000,000.

At home there is a big project for a Mid-Scotland Ship Canal, to unite the Forth and the Clyde. Two routes are in contemplation; the first—the "direct" route—would cross the isthmus from Grangemouth on the Forth to Yoker on the Clyde while the second would pass from Grangemouth to Bodrick (near Balmaha) on Loch Lomond, from Tarbet to Arrochar on Loch Long, and thence to the Clyde. Engineers and commercial men may differ as to the way, but all are agreed on the enormous importance of avoiding the dangerous passage of the Pentland Firth, and of shortening the distance between various Scottish ports, and between Scottish and other ports. The distance from Glasgow to Leith would be reduced by 184 miles, to the Humber by 384 miles, to London by 233 miles, and to Hamburg by 312 miles. Leith and Liverpool would be brought nearer by 400 miles.

If Russia, Bavaria, and Scotland are prepared to spend millions on new canal schemes, the question is whether England will lag behind. The Royal Commission on Canals and Waterways which sat a decade ago inquired into the cost of improving two routes—from Birmingham to Brentford, and from Norton Junction to the Humber. One of the chief features of the recommendations of Sir John Barry, and Professors, who were entrusted with the investigation, was the substitution of single lifts to take the place of numerous locks. Their plans would have reduced the length of the Birmingham-Brentford Canal from 129 to 108 miles, and instead of the 160 locks there would be 32 new locks and 19 lifts. Improved locks and the construction of lifts were also recommended on the route between Norton Junction and the Humber. In this case the length of the new waterway would be 144 miles against 197 miles, and instead of 97 existing locks there would be 28 new locks and six lifts. The cost, it was estimated, would be £4,270,440 on the Birmingham-Brentford canal, and £4,292,130 on the Norton-Humber route. The total cost of the two schemes was placed at £8,562,570, at the moment of writing an expenditure more than that equated every day [illegible] the war.

*Acetone from Wattle Wood.*—The Imperial Institute has conducted a series of distillations of wattle wood and olive wood from British East Africa, with the object of discovering its value as a source of acetone, of which enormous quantities are used in making explosives. Before the war it was customary to use any cheap supplies of waste wood from foreign countries that were available. The results of the experiments show that the yield of acetone and acetic acid from both wattle and olive wood is satisfactory. It is proposed to erect a factory in Natal for distillation on a large scale wattle wood being used as raw material. A good yield of acetic acid has also been obtained in Ceylon from the distillation of cocoanut shells.

*Anchor Ice in Running Streams.*—The formation of anchor ice in ground ice, which sometimes occurs in this country, is the subject of an article in *Engineering* by Mr J MacAlister assistant engineer at the Greenock Waterworks. Anchor ice has been found in the Greenock "cut," an open aqueduct 5 miles long and situated 300 ft. above sea-level, where the water has a velocity of 3 ft. per second. In January, 1917 the formation of ground ice was general throughout the Greenock Waterworks, for the first time in the history of some of the reservoirs. Mr MacAlister thinks that the formation of ground ice in this "cut," which has a rough bottom, is due to the cooling of the whole mass of water and the ice first forming in the comparatively still water encountered in the lee of stones. The process is probably accelerated by radiation as the portions of the aqueduct where the ice usually forms first are situated at comparatively open spaces and have low banks.

*Artificial Coal at £1 a Ton.*—Mr. E. Goulburn Lovell, in a paper read before the Society of Architects, described a process which he had invented, in co-operation with Mr C. M. Hughes, for producing coal from concreted breeze saw dust and ashes. In producing a satisfactory fuel, he said, the objects aimed at should be non-friability, good flare, non-caking, good coking, good incandescence and non clinkerable. These results could not be reached on any one uniform plan. The waste products of each locality must be carefully studied, and the use to which the fuel has to be put must be considered. Mr Lovell demonstrated how excellent coal could be produced from coal slack coke dust, or sawdust, with a simple plant, without pressure. Household ashes and municipal destructor ashes could also be made into cheap flaring coke. The waste products, he declared, could be converted into fuel by man in twenty minutes, while Nature's better but longer process required twenty million years. He estimated that all industrial concerns consuming more than ten tons of coal a day could reduce their bill by at least one-third, and use their accumulating waste products, and that this work could be done by existing machinery and unskilled labour. The fuel could be sold at, roughly, £1 per ton.

*Australian Transcontinental Railway.*—The "Times Engineering Supplement" contains an account of the Australian Transcontinental Railway which is now completed, after five years' work. The new section runs from west to east, and for the first time puts Western Australia in direct railway communication with the other States of the Commonwealth. It passes from Kalgoorlie, in Western Australia, to Port Augusta, in South Australia—a distance of about 1,051 miles, and its course is, roughly, parallel to the coast of the Great Australian Bight, but always well away from it. The highest elevation attained is 1,354 ft. The *standard gauge of 4 ft. 8½ in. is adopted.* It is hoped that the first through train on the completed line will be run about the end of August, 1918. By that time between 300 and 400 miles only of track will have been ballasted, but it is proposed to make the journey between Kalgoorlie and Port Augusta in 35 hours, or at an average speed of 30 miles per hour. When ballasting is completed, in 1919, it will be possible to make the journey at an average speed of 40 miles per hour, thus reducing the time taken to about 26 hours. The advantage to overseas travellers is that the line will reduce by two or three days the time required to travel between London and the eastern States of Australia. Other sections are under construction which will carry forward the great scheme on the eastern side of the continent until it reaches to Cairns, in Northern Queensland, adding a further 900 miles.

*British Association.*—The annual meeting of the British Association which was to have taken place at Bournemouth, was abandoned owing to restricted railway facilities and other causes due to the war, but special arrangements were made for carrying on the current work of the Association. It was decided to continue Sir Arthur Evans in the Presidency for another year, while Sir C. A. Parsons, who would have presided over the 1917 meeting, will do so at the meeting which it is hoped will take place at Cardiff in 1918. Bournemouth has repeated its invitation and the Association will meet there in 1919.

*Cabbage-Flies and Tarred Paper.*—Mr J. T. Wadsworth has carried out a series of experiments for the Manchester University Department of Agricultural Entomology on the value of tarred felt discs for protecting cabbages and cauliflowers. Thirty years ago Professor Goll and Professor Tracy established the fact that tarred paper discs prevented the cabbage fly (*Phorbia brassicæ*) from gaining access to cabbage roots for the purpose of egg laying, but cultivators in the United Kingdom have usually ridiculed the method. Mr Wadsworth is convinced of its value. From his experiments he finds that 63 per cent. of unprotected cauliflowers and 23 p. per cent. of unprotected cabbages are lost, as against 3.1 per cent. and 0 p. per cent. respectively of these plants when the tarred discs are used.

*Caterpillar Plague.*—In the "Journal" of the Board of Agriculture are several reports on the invasion of the uplands of the High Peak and other parts of the Peninsula as far north as Westmorland by the caterpillars of the antler moth. The damage was confined to the rougher growths of grass at a height of 900 ft. or more above sea-level, but its extent may be judged from the fact that on one farm alone on Scotsburgh Moor 200 acres were ruined. The principal grass attacked was "bent" grass, while cotton grass suffered less severely. The more succulent and finer grasses escaped attack, as did also bilberry, white bedstraw, heather, and bracken. The writers, with the object of preventing future inroads of the kind, suggest the cutting of permanent transverse trenches, or a series of trenches, across each upland pasture, with vertical sides, so that little labour would be needed to trim them when

severe infestation is threatened. They urge strongly that careful study should be made of the correlation of insect outbreaks and weather conditions. After a severe winter it is advisable that warning should be sent to farmers of any pests that may be anticipated. Such trenches as those recommended proved effective in controlling an infestation of an allied noctuid caterpillar known as the "army worm" in Canada in 1904. They were cut by ploughing and then dug out to a depth of 14 in. By trimming both sides of the trenches vertical the caterpillars are trapped whichever way they move. A single trench to each 15 acres of grass land is said to be sufficient. Spraying with Paris green or arsenate of lead is not recommended, because the herbage on these pastures is not thick enough to hold the poisoned weed.

*Chemistry of War in France.*—Before the war France was dependent on Germany for her coal tar products—benzene, toluene, xylene, phenol, and naphthalene, and there was only one factory in the country capable of turning out certain colouring matters. The war has changed all that, according to the Paris correspondent of the *Times* who states that as quickly as possible France laid down nitration plants in many new works arrangements being made for the supply of enormous quantities of benzene and toluene, and shells were soon being manufactured. France's position as regards sulphuric acid is now so good that there may be a difficulty in utilising all that produced. From the product of the phosphate mines of Tunisia and Algeria, together with the superabundant sulphuric acid, it will be possible to supply French farmers with cheap superphosphate. The Germans knew, when they first made use of asphyxiating gases that liquid chlorine was not produced in France but within a year several works had commenced liquefying the gas. After the war these works can be employed in making bleaching powder and colouring matters, which France has hitherto had to import.

*Compass Deviation in South Africa.*—Professor J. C. Beattie, of Cape Town, has prepared a paper and map on the deviation of the compass from true north and of the magnetic dip at nearly 700 stations in South Africa. He finds that the lines of equal deviation run across country from north-west to south-east, the greatest deviation—27° to the west—being near Cape Town, and the least—14° to the west—at Beira. The lines of equal dip run from south-west to north-east in the south-eastern portion of the country, and tend to run more nearly east and west in the northern districts. The dip is nearly 62° south near East London, and dip notches to 50° south in the neighbourhood of the Victoria Falls. During the last ten years the deviation to the west has decreased a degree and a half to two degrees, while the dip has increased by a degree or a degree and a half.

*Connaught Tunnel on the Canadian Pacific Railway.*—A regular service of trains has now begun to run through the Connaught Tunnel, the longest tunnel yet built in North America. It is situated near Glacier Station, in the Selkirk Range, about 80 miles west of the Great Divide, and has been constructed in order to avoid the difficulties of the traffic on the original main line of the Canadian Pacific Railway where it crosses Rogers Pass, one of the most costly sections of the line to operate. The tunnel, 5 miles long, runs under Mount Macdonald, and at its greatest depth is a mile under the surface. Work was commenced in January, 1907, and in two years the bore was complete from end to end, and within another year the tunnel to its full dimensions of 22 ft. wide and 24 ft. high was completed. The tunnel shortens the route by nearly 3 miles, and it lowers the altitude at which heavily laden trains have to travel from 4,300 ft. to 3,900 ft. The cost was £2,500,000.

*Death Tested by Muscular Irritability.*—Dr Shiro Tashiro, instructor in physiological chemistry in the University of Chicago, has suggested a new test of death in the course of a monograph dealing with the chemical signs of life. He states that of all the signs of living processes one of the most universal is irritability, the inherent power of the living to react against a stimulation. If a tissue is alive mechanical crushing will produce a metabolic response; if it is not alive there is no response. If of two seeds or two similar pieces of animal tissue the crushed portion gives off more carbon dioxide than the other the seed or the tissue is alive. By means of his biometer Dr Tashiro claims to be able to make this distinction within a few minutes, or at all events within an hour or two.

*Diving Work at Increased Depths.*—Mr E. F. Leavitt, of Toledo, Ohio, has invented a diving suit, composed of metal cylinders, which are capable of resisting the high pressures experienced at great depths while they are so flexibly joined as to allow of movement on the sea bottom. The helmet, shoulders, body, and feet pieces are made of manganese bronze, and the leg pieces of flexible copper tubing strong enough to resist a pressure of 2,500 lbs. to the square inch. The armour is hermetically sealed, and the diver works at the same pressure as the ordinary atmosphere the respiration being carried on by means of an oxygen and carbonic acid plant within the apparatus. A flexible steel cable containing a telephone wire communicates with the vessel on the surface. At a demonstration of the apparatus in Traverse Bay Michigan, it was shown to be possible for a diver to descend and ascend much more quickly than when using an ordinary diving dress, to go to greater depths, and to remain under water for a longer period. Mr Leavitt himself descended to a depth of 362 ft., and remained below for 45 minutes. The value of attaining this greater depth is apparent when one considers the enormous amount of wrecked shipping that at present lies beyond the reach of the ordinary diver.

*Electric Power for Bombay.*—An account appears in *Engineering* of the Tata power scheme by which Bombay is supplied with electric energy over a distance of 43 miles. By means of masonry dams three artificial lakes have been constructed in the Western Ghauts, known as Lonawla (986 acres), Lake Walwhan (1,536 acres), and Lake Shirawta (3,134 acres), and capable jointly of storing 60,000 million gallons of water. Lakes Walwhan and Shirawta are connected by a tunnel through the rocks 5,000 ft. long, and the waterways are designed for a water capacity of 120,000 horse-power, with a minimum velocity of 5 ft. per second. The lakes will be dependent for supply on the heavy rainfall in the district. As much as 45¼ ft. has fallen in the catchment area during a single monsoon, of which 36½ ft. fell in 92 consecutive days.

*Electric Torch as Naval Lamp.*—A novel electric torch, principally for home use, has been invented by Mr W. R. Smith. It consists of a

wide-mouthed bottle into which is fitted a perfectly water-tight rubber stopper. Rods of zinc and carbon are inserted through the stopper until they project down the bottle for nearly a third of its length. On the top of the cork a small electric lamp is mounted, and connected with the zinc and carbon rods. The bottle is then filled to within an inch of the free ends of the rods with a mixture of sulphuric acid, bichromate of potash and water. When the bottle is standing upright nothing happens, but when it is turned upside down the mixture then surrounding the rods converts the apparatus into what is practically a bichromate cell, and produces sufficient current to light the lamp.

*Fish Test for Poisoned Water.*—In a communication to the Société Médico-Chirurgicale Militaire de la XIVe Région, MM. Barral and Ricard describe a simple and rapid process of discovering whether water has been poisoned. Fish are employed for the purpose, and, roughly, any water in which fish die in less than four hours may be considered dangerous. A few fish, such as gudgeon, are put in the water to be tested. Two drops of nicotine per litre, it is found, kill the fish in less than a minute, two drops of cocaine paralyse them in six minutes and kill them in eight; one decigram of solanine kills in one and a half hours, the same quantity of cocaine in one hour and the same quantity of strychnine in ten minutes. One milligram of aconite kills in three and a half hours; twenty drops of sanitine in one and three-quarter hours, seven milligrams of digitalin only take effect in four hours. One decigram of potassium cyanide kills the fish in two minutes, two decigrams of corrosive sublimate in ten to twelve minutes, two grams of lead acetate in five hours, five grams of zinc sulphate in two hours, two grams of copper sulphate in forty-five minutes, and thirty-five centigrams of picric acid in five hours. Veratrine does not appear to have any effect, and the fish were not inconvenienced by atropine, morphine or arsenical salts.

*Flavine—a New Antiseptic.*—Investigation in the research laboratory at Middlesex Hospital has shown that the coal-tar dye known as flavine may be used as an antiseptic, and has been successfully employed in a great number of cases. The discovery was made by Dr C. H. Browning and his colleagues. Sir John Bland Sutton, in describing the work, said that medical men had for years been desiring an antiseptic that would destroy the bacteria in wounds without damaging the tissues or injuring the patient, and it was found that flavine possessed the necessary qualities. A solution of 1 in 1000 had twenty times the antiseptic power of perchloride of mercury—a deadly poison. There were three septic conditions admitted to hospitals almost daily—acute appendicitis, acute inflammation of the gall bladder, and acute disease of the middle ear. He had used flavine in these cases with good results, and after that experience he found that in ophthalmic surgery it could be used without damage even to the delicate tissues of the eyes of a baby.

*Fog-Signals.*—In an address on the acoustic efficiency of fog-signal machinery before the Franklin Institute, Professor L. W. King, of McGill University, described his own measurements in connection with the fog-signal plant at Father Point, Quebec. The sound-producer there is a compressed-air siren using 18·42 lb. per square inch and giving a note of fifty-six per second. During the emission of the sound 200 horse-power is used. By measurement of the temperature of the issuing air when sound was produced and when not, it was found that only about a 4 horse-power was converted into sound. The intensity of the sound at points on the water up to eight miles from the source was tested by the sound-meter of Prof. A. G. Webster, which depends on the motion of a small mirror mounted on a mica diaphragm at one end of a resonator. Zones of silence were found, on both sides of which the sound was distinctly heard. It is suggested that these zones are closely connected with the direction of the wind and to a less extent with the weather.

*House-Sparrows and Crops.*—Dr Walter E. Collinge contributed to *Nature* an article on house-sparrows, in reply to the protest against the order of the Board of Agriculture that these birds should be destroyed. He is in full agreement with the order, and believes that if carried out it will be of great benefit to the agriculturist and the horticulturist. As the result of the examination of 730 adult birds and 470 nestlings, he finds that (*a*) the house-sparrow is far too plentiful, and requires drastic reduction in agricultural and suburban areas; (*b*) that to a lesser extent it should be reduced in fruit-growing areas; (*c*) that in agricultural districts the food of 75 per cent. of the sparrows consists of corn; (*d*) that, apart from the nesting season (when it feeds its young on caterpillars), the house-sparrow does far more harm than good, its depredations on cereal crops alone entailing a most serious loss to the farmer. As the result of the destruction of the house-sparrow, Dr Collinge thinks we shall see a marked increase in the number of fruit insectivorous birds of use to the fruit-grower.

*Kinematograph and Ship-Launching.*—Mr P. A. Hillhouse and Mr W. H. Riddlesworth, in a paper read before the Institute of Naval Architects, suggested that an accurate record of the motion of a vessel during the process of launching might be obtained by means of the kinematograph. They recommended the use of two machines, one placed near the stern of the vessel when on the slip, and the other a little less than the length of the vessel further aft. Both would stand at a convenient distance away from the vessel's side, with their axes at right angles to the middle line of the berth. Two uprights would be placed as near to the vessel's side as possible, and on each upright a vertical scale of feet would be marked in black and white. On the ship's side would be painted a continuous longitudinal white line crossed by short vertical lines numbered from either end. As the vessel moved the cameras would record the movements of the white line in relation to the ship and to the water level and ground ways, and the whole motion could be reconstructed.

*Largest Locomotive in the World.*—What is claimed to be the largest locomotive in the world has been built for the Virginia Railway at the Baldwin Locomotive Works at Philadelphia. It weighs 220 tons, and carries six cylinders, arranged in three pairs, each of them driving four pairs of wheels coupled together. The boiler measures 90 ft. in length and 10 ft. in diameter, and the firegrate is 12 ft. by 8 ft., and a mechanical stoker is employed to supply the coal to the enormous furnace. The water-space has a capacity of 11,000 gallons. At a speed of 30 miles an hour this mighty engine can develop

3,000 horse-power, which can be developed for short spells. The locomotive has been built chiefly for hauling coal-trains up heavy gradients at high speeds.

*Largest Stone-Crusher in the World.*—An American engineer has invented what he asserts to be the largest stone-crusher in the world. It is capable of reducing stones 5 ft. across to ½-in. pieces at the rate of 2,000 tn. an hour. The holding-bin has a capacity of 65 tons. The machine is driven by a 300 horse-power electric motor. As the broken stone leaves the machine it is conveyed to revolving screens, where the smaller pieces are sorted out for further crushing.

*Marine Fibre from Australia.*—An account of the marine fibre industry of Spencer Gulf and St. Vincent Gulf, near Adelaide, is published by the Department of Chemistry of South Australia. Fifteen years ago attention was first called to this subject, and now three companies are at work raising the fibre from the sea, and cleansing and preparing it so that it may be used for the manufacture of bedding or for insulating purposes. The fibre is derived from *Posidonia australis*, a marine plant of the family Naiadaceæ, to which our own pond weeds (Potamogeton) belong. The fibre consists of the remains of the plant which have been accumulating for centuries, and have become naturally retted through the decay of the soft parts. It is estimated that the workable deposits cover some 240 square miles, and at a yield of 6 tn. of fibre per cubic yard, and an average depth of deposit of 7 ft., this means a yield of 12,000 tons of air-dried fibre per square mile.

*Monazite Deposits in Ceylon.*—The last chapter in the long story of the struggle to rescue the incandescent gas-mantle industry from German hands is told in the discovery of beach deposits of monazite sand in Ceylon which will usefully supplement the supplies of thoria required in the industry. Formerly the monazite deposits in Brazil were the only commercial source of supply of thoria, and these were controlled by the German Thorium Syndicate. The Brazilian monopoly was broken by the discovery of extensive deposits of monazite in the native State of Travancore, in India, so rich that samples examined by the Imperial Institute were found to contain nearly twice as much thoria as the Brazilian monazite. The German syndicate, however, obtained control of the company formed to work the Indian deposits, and maintained their influence until the outbreak of the War, since when the company has been given a British character. The work of the mineral survey has shown that Ceylon can furnish several other thoria minerals besides monazite. Among these is thorianite, the richest known source of thoria. At present it is arranged that the Government of Ceylon shall work the new monazite deposits.

*National Physical Laboratory.*—At the annual meeting of the General Board of the National Physical Laboratory it was reported that the principal work of the year had been gauge-testing. Nearly the whole of the gauges required for the inspection of munitions are now obtained there, to the average number of 12,000 per week. A new building has been specially erected for the work. The number of optical and electrical tests for the Admiralty has also increased, and special attention has been given to the testing of luminous dials for various instruments. Aerodynamical work of great importance has also been carried on. The William Froude National Tank has done much work for the Admiralty, which has been greatly appreciated in official quarters. In the metallurgical department researches on *light alloys* and on optical glass have been continued. Various investigations have been in progress in the engineering department; hardness tests, methods of impact testing, the fatigue resistance of materials under combined bending and twisting stresses, the transmission of heat from surfaces to fluids flowing over them—as in the flow of air over an aeroplane engine—are among the questions examined. The observations on the rate of growth of cracks in the buildings of the Tower of London have been continued: no serious disturbances have been detected. During the year the staff was largely augmented, and no fewer than 100 women were employed in the Laboratory.

*Nettles for Textile Fabrics.*—In consequence of the shortage of cotton the old industry of cultivating stinging nettles for textile purposes has been revived in Germany and Switzerland. To obtain fibres of the best quality the nettles are grown in rich soil and thinned out when necessary. In the spring, when they are about a foot high they are cut down and the young tops eaten like spinach. Much better fibres are produced in the second growth, and the stems are cut when they are about 4 ft. high, which happens in June or July. A third crop can be obtained in September, and in the following month the shoots are dried, when they lose their stinging qualities, and may then be used for fodder. The suggestion is made that stinging nettles in this country may be put to a similar use.

*Nickel Paper for Books.*—The advantage of paper and paper-making materials has led Mr. Edison to suggest that books should be made of thin leaves of steel, copper or nickel. He considers that nickel is the best metal for this purpose, and claims that he can produce sheets only one twenty-thousandth of an inch in thickness, which will be tougher, more flexible, and cheaper than ordinary book paper. In his own laboratory he has produced a sheet of nickel paper with an area of 5 sq. ft. in 90 seconds. Among the advantages claimed for metal paper is that it will not take fire, cannot be damaged by water, and occupies far less space than ordinary paper.

*Paper from Lalang Grass.*—Recognising the need of fresh paper making materials, the Trade and Industry Committee of the Royal Colonial Institute has experimented with the grass lalang, which is found in large quantities close to the coast of Malaya. Chemical analysis has shown that the grass will yield a good quantity of cellulose quite suitable for the manufacture of paper. The pulp is of good colour and uniform in quality, and is held to be quite suitable for the manufacture of paper for printing purposes. A strong, high-class wrappering may be obtained, it is stated, by mixing together lalang grass pulp and cotton in equal proportions. The tests made at the Imperial Institute on the suitability of Natal wattle-bark (see par. "Acetone from Wattle Wood" on p. 726), after it has been discarded by the tanners, for the manufacture of paper, show that a good quality brown paper can be made from the spent bark. The paper bleaches readily to a cream tint, and has been pronounced suitable for newspaper purposes, and with further treatment may be made serviceable writing-paper.

*Pneumonia in South African Mines.*—Dr F. S. Lister has made a further experimental study of pneumonia in South African mining communities, a disease which contributes from 30 to 80 per cent. of the mortality among native labourers. He has found that several races of pneumococci are associated with pneumonia in the Rand, and that rabbits inoculated three times with killed pneumococcal vaccine in suitable doses are resistant to at least eight times the lethal dose of living pneumococcus for an untreated rabbit. For the prevention of the disease in man he recommends that three inoculations, at seven-day intervals should be employed each dose consisting of 6,000 million pneumococci of each strain against which immunity is desired. In this connexion one may mention the investigations of Dr Watkins Pitchford and Dr Main into the nature of the particles of mineral matter found in the lungs of miners suffering from phthisis. The lungs of a native who had never worked in the mines were estimated to contain 100,000 million particles of foreign matter, whereas the lungs of a miner contained no fewer than twenty to thirty million of million particles.

*Preventing "Corn."* The evil results of panic legislation in regard to the fauna of a country are illustrated in recent complaints from Australia. For the last generation compulsory poisoning laws have been in force, but the Island Continent is learning that they were not built on wisdom and know-edge. The *Scientific American* states that as a result of these laws the carrion hawks, crows, and native carnivora have been nearly wiped out. As a consequence decaying bodies are left to be demolished by blow flies, which have now so increased as to threaten the sheep with destruction, the animals becoming "fly-blown" and infested with the larvæ of this dangerous insect. Similarly the *Victorian Naturalist* related that early last year wheat buyers had been at their wits' end to protect the immense wheat stacks at country stations from mice which have increased to an incredible extent. Most of the stacks have now been enclosed by sheets of galvanised iron, openings in which are left to correspond with kerosene tins, sunk in the ground and partly filled with water. It is no uncommon occurrence to capture 10,000 mice in this way in a single night. At Minyip the catch for two nights weighed rather more than a ton. The real remedy would appear to be in a realisation of the part actually played by the birds that have hitherto been poisoned.

*Prehistoric Man in the Transvaal.*—Mr R. H. Haughton, of the South African Museum has published an account of the remains of prehistoric man discovered during the making of a drain at Kolonies Plaats, Boskop, in the Potchefstroom district of the Transvaal. They consisted of a large portion of the calvaria (the horizontal part of the left ramus of the mandible, the greater part of a temporal bone, and some pieces of the limb-bones. The skull showed a kind of flattening, the like of which is not to be found in any skull in the South African Museum, although it has been seen on some negro skulls, and also on a Nanaquas skull in the Paris Museum. Professor Elliot Smith has expressed the opinion that the Transvaal remains are of the type of the immediate ancestors of the men of the Upper Palæolithic (or Neanderthoic, as he calls it) age, modified in the course of southern migration. "It probably represents the earliest (not necessarily in actual age) known phase of *Homo sapiens* in the course of his transformation from a condition analogous to that of Neanderthal man to that of Cro-Magnon."

*Seaweed as a Source of Potassium.*—The United States Department of Agriculture has made arrangements for experiments of the production of commercial potash from seaweed. It is estimated that nearly 400 square miles of seaweed-beds exist along the American Pacific Coast, and according to an official estimate 50,000,000 tons of seaweed might be cut annually, from which 2,000,000 tons of potassium chloride could be made. An appropriation of 175,000 dollars has been made for this important work, and a plant capable of dealing with about 200 tons of wet seaweed per day will be erected, probably at Santa Barbara or Long Beach in Southern California. From these 200 tons a daily yield of about 4 tons of potassium chloride is expected.

*Tidal Power in Ireland.*—Mr A. W. Brown has prepared a scheme for using the tide which flows in and out of Strangford Lough to manufacture electricity for industrial purposes. He would construct a dam across the entrance of the Lough, which is only half a mile wide in places, and instal turbines and generators which would be worked according to the state of the tide. It is estimated that 200,000 horse-power could be obtained in this way every 12 hours out of the 24 and the electricity thus made could be transmitted to Belfast, where it would relieve the necessity of importing such large quantities of coal. It is suggested that by dividing the Lough up into several reservoirs the supply of electricity could be made continuous.

*Tobacco Smoking and 'Soldier's Heart.'*—Dr John Parkinson and Dr Hilmar Kasped contributed to the *Lancet* an account of their experiments on the immediate effect of cigarette-smoking on healthy men and on cases of 'soldier's heart.' Their investigations were made at the Hampstead Military Hospital for Heart Cases, on 30 soldiers, of whom 20 were cases of "soldier's heart," and 10 were healthy men. Their observations, they state, show that the smoking of a single cigarette by an habitual smoker usually raises the pulse-rate and the blood pressure perceptibly, and these effects are a little more pronounced in cases of 'soldier's heart.' Moreover the smoking of a few cigarettes can render healthy men more breathless on exertion, and did so in a large proportion of the patients. In their opinion excessive smoking is not the essential cause of 'soldier's heart,' but it is an important contributory factor in the breathlessness and præcordial pain of many of them.

*Travelling on Silent Railway Wheels.*—Mr E. C. Madden, Third Assistant Postmaster-General in the United States, has invented a wheel for railway coaches and tramcars which is said to reduce noise to a minimum. The silent wheel consists of a wheel within a wheel, with a cushion of springy rubber between the inner and outer sections. There are three recesses in the inner portion, which are intended to prevent any "creeping" either backwards or forwards, while side strain is prevented by cases which at the same time keep out dust and grease. The effect of the rubber cushion is to lessen the jar and to deaden the sound that is produced by either the pounding of the tyres or by the clapping of the flanges on the rails. It is anticipated that the Madden wheel is good for

passenger miles. It has already been tried in Portland, Maine, on a street car which goes so silently that it is known as the "ghost car."

*Tobacco Smoking and Arithmetic.*—Mr C. S. Berry, in an article in the *Psychological Bulletin*, describes a number of experiments on the effect of tobacco-smoking on his ability to add figures with speed and accuracy. Each evening, half an hour after dinner he added 100 figures arranged in 20 columns of 10 figures each, the length of time taken to perform the operation being noted, and also the number of errors. On alternate evenings he smoked one cigar immediately before performing the test, and he kept records for 20 days. The results of the experiment gave, contrary to his expectation, an improvement of 7.7 per cent in the time taken on the "smoking" days, the differences in the number of errors made were so slight as to be negligible.

*Tungstenless High-Speed Steel.*—A new tool steel to which the name exhibitorum is given, is said to possess special features which make it eminently suitable for milling cutters, twist-drills, and screw-cutting and finishing tools in general. It is claimed that the steel retains its cutting properties when raised during the process of cutting to a red heat, this property being obtained without the use of tungsten as an ingredient. The substituted element is cobalt, which is used in conjunction with a carbon-chromium formula, the resulting steel containing approximately from 1 per cent. to 6 per cent. cobalt. It is said to melt at a lower temperature than tungsten high-speed steel is easily cast can be annealed in the ordinary way to a degree of softness which admits of its being readily machined, while it can be hardened by merely heating up to 1,100 deg. C., and cooling off in still air without the aid of an air blast. Another claim made for the new steel is its high resistance to abrasion.

*Volcanic Sources of Electricity.*—Owing to the shortage of coal Professor Luigi has been experimenting with a scheme to harness the power of the volcano, and has already achieved considerable success with the natural gas escaping from the volcanic craters in Tuscany. He has harnessed the gas so as to make it work three electric generators, each of a capacity of 3,000 kilowatts, and has divided the current between Florence and other Tuscan towns. As the crater region covers many square miles of ground about Lardarello he hopes to find many sources of power which may be tapped with equal success.

*Vultures in South Africa.*—According to Mr R. A. Masterman, who writes in the "Journal" of the South African Ornithologists' Union, Kolb's vulture has entirely disappeared from the district of Humansdorp, Cape Province. Not a single bird has been seen for 15 years in an area where it formerly used to breed with regularity. According to the farmers the vulture was exterminated from having feasted on the flesh of cattle which died of rinderpest during the great outbreak of that disease. It is pointed out that Captain Selous commented on the absence of *Kolb's vultures from the battlefields of Rhodesia* during the Matabele war, and ascribed it to the same cause.

*Wolfram Mines in Cornwall.*—Wolfram is in enormous demand for the production of tungsten, which constitutes about 20 per cent. of the modern high speed cutting tools. In order to increase the home supply an extensive scheme of mining development is being conducted on the estate of the Duchy of Cornwall, a few miles to the west of Tavistock. At Kit Hill a number of lodes of wolfram have been discovered, the largest disclosed being about 20 ft. wide. Another area of exploration is on Hingston Down, and the third on a steep bank on the Tamar, a mile from Hingston Down Mines.

# The Drama

WHILE theatrical enterprise during 1917, as in the case of the two preceding years, was necessarily restricted to some extent the war cannot be said to have had any direct and serious effect upon the British drama, apart from a tendency by authors to introduce the vast struggle and its varied problems into new plays. The successful production of whatever character, enjoyed a long run, the poor play failed to attract, as in times of peace—though, perhaps, in the latter event the failure was more pronounced and more speedily noticeable. The theatres in the West End of London, however, had to conform to war conditions in one respect—in periods when hostile air-raids were to be anticipated, particularly during the last quarter of the year the majority of the evening performances had to be abandoned (or played to half-filled houses) in favour of daily matinées.

Generally speaking, the lighter form of entertainment met with the greatest success, as was only to be expected, while straightforward melodrama also experienced a slight "boom." The popularity of revues seemed at the close of the year to be on the wane, and the autumn witnessed an attempt, which met with encouraging success, to introduce musical plays of a rather higher class. A good example of this was the "operatic cameo" *Carminetta*, an adaptation which passed its hundredth performance at the *Duke of York's* without exhausting its popularity. Another interesting instance was a musical version of *The Magistrate*, Sir Arthur Pinero's early play which, under the title of *The Boy*, was produced at the Adelphi in September. Earlier in the year *The Maid of the Mountains* had confirmed the reputation of Daly's Theatre for providing comic opera of excellent quality, and no change of programme was required throughout the year, while at the Gaiety *Theodore and Co.*, a musical comedy of the type associated for many years with its home, and founded on the old Criterion farce *Post Obits*, ran until nearly the end of the year. To illustrate the decline in the rage for revue, it is interesting to place on record the fact that two music-halls previously devoted to this form of entertainment, the London Pavilion and the Palace, were given over to the production of plays in the autumn, in the former case to a straight comedy. The invasion of the smaller theatres by revues may thus be said to have been avenged.

Two plays that were drawing crowded houses when the year opened continued to attract throughout the twelve months. These were *Romance*, the sentimental comedy in which Miss Doris Keane achieved a remarkable success at the Lyric, and which was played for the 800th

time in September; and Miss Chute (then an unrivalled picture of Western life, with which, added by some talented pupils, Mr Cissy Aston and Miss Lily Brayton filled His Majesty's Theatre for so long that "a new edition" was required in the autumn. Of the plays produced in 1915, one of the most successful was *General Post*, a war play of the drawing-room type by Harold Terry, which "scored" 300 performances at the Haymarket and promised to increase the total appreciably. *Seven Days' Leave*, a typical Lyceum melodrama by Walter Howard, was another war play, but of a widely differing variety that had a long run, while a third success was *Inside the Lines*, an American-made, visible "spy" play which brought big audiences to the Apollo for some months. Strange contrasts to these, but almost as successful in a quieter way, were translations of two of Bisson's "sermons"—*Damaged Goods* and *The Three Daughters of M Dupont*—the condemnations of "the social evil" and the French *dot* system respectively contained in each, apparently appealing to a public desirous of considering problems unconnected with the war, and of enjoying the fine acting that marked the productions at the St. Martin's and the Ambassadors. The success of the former resulted in grants amounting to £6,000 being made to charities whose labours were associated with the subject-matter of the play.

With the exception of a sketch designed to bring home to music-hall patrons the necessity of restricting expenditure in order to lend money to the State for war purposes, Sir Arthur Pinero was silent during the year. His old success, *Trelawney of the Wells*, however, obtained the dignity of a revival, while an earlier play was transformed into a musical comedy. Mr Henry Arthur Jones gave the stage a new effort, *The Pacifists*, which was regarded as a hit at that small section of the community which opposes the war, but it did not meet with favour, and after a very brief run was withdrawn, and that favourite from the same pen, *The Liars* was substituted. Sir James Barrie was happier in hitting the public taste, and both in his short play, *The Old Lady Shows Her Medals*, and in his more ambitious production, *Dear Brutus*, he showed that fantastic charm and delightful humour which are now expected from the author of *The Admirable Crichton*. Mr Haddon Chambers was near his best in *The Saving Grace*, and Mr. Galsworthy, Mr Louis Parker, Mr Vachell, Mr Jerome, and Mr Carton were represented on the list of productions. There was a large number of American-born plays, and on the whole these were of a distinctly better quality than has usually been the case with importations from the other side of the Atlantic.

No review of the year from the theatrical standpoint would be complete without a reference to the loss sustained by the stage by the sudden death of Sir Herbert Tree. The distinguished actor did not appear on the stage in England in his last months, for he had not long returned from the United States when a slight accident led to his death. A second actor removed from us was Mr. W. H Kendal, who had retired some years earlier. Another and more pleasant personal incident was the reappearance of Sir Johnston Forbes-Robertson and Mr. H. B. Irving were busy during the year.

The following is a list of the principal productions of the year:—

ALDERSHOT.—*Sept. 14. The Boy*, a musical version of Sir Arthur Pinero's *The Magistrate*, by Rud Thompson, music by Lionel Monckton and Howard Talbot (Messrs. W H. Berry and Donald Calthrop, and Miss Billie Carleton).

ALDWYCH.—*Jan. 3. Romeo and Juliet*, Gounod's opera, by the Beecham Opera Company. *Jan. 22. Louise*, a musical romance by Gustave Charpentier, produced for the first time in London in English during the Beecham Opera Season. *Feb. 26. La Tzigane Supreme*, a play by Isidore de Lara. *Feb. 29. The Spring Song*, a farce by Sydney Blow and Douglas Hoare.

AMBASSADORS.—*March 16. Gossamer*, a comedy by Pierre Veber. *April 24. The Three Daughters of M Dupont*, by Bisson, adapted by St. John Hankin (Mr C M. Hallard and Miss Ethel Irving).

APOLLO.—*Jan. 6. The Private Secretary* revived (Messrs. Charles Wallace and Roy Byford). *Feb. 7. Monty's Flapper*, a farce by Walter W Ellis. *April 3. Double Dutch*, a farce by Laurence Cowen. *May 29. Inside the Lines*, a "spy" melodrama by Earl Derr Biggers (Mr Ellis Norwood).

COLISEUM.—*Jan. 13. Mr Lisemore's Dream*, a one-act thrift play by Sir Arthur Pinero, to assist the work of the War Savings Committee.

COMEDY.—*May 3. Bubbly*, a musical entertainment or revue by J Hastings Turner, music by Philip Braham.

COURT.—*Jan. 8. The Amazons*, Sir Arthur Pinero's farce, revived (Messrs. Stanley Cowie and Percy Foster, and Mrs. A. B. Tapping). *Where is He?* a one-act play from the Welsh by D T Davies. *Feb. 29. Rosie*, a comedy by Harry Wall. *Feb. 28. The Immortal Memory*, a comedy by Robert R. Whittaker (both by J T. Grein's London Repertory Theatre). *March 5. Partnership*, a comedy by Elizabeth Baker. *May 3. Hush*, a comedy by Violet Pearn.

DALY'S.—*Feb. 22. The Maid of the Mountains*, a musical play by Frederick Lonsdale, lyrics by Harry Graham, F Clifford Harris and Valentine, music by Harold Fraser-Simson and J W Tate (Messrs. Thorpe Bates, Lauri de Frece and Bertram Wallis, Mesdames Mabel Sealby and Joan Colli(es).

DRURY LANE.—*Feb 24. Young England*, a musical play, revived. *May 30.* Sir Thomas Beecham opened his season of Grand Opera in English with *Otheilo*. *May 31. The Girl of the Golden West*, Puccini's opera, performed for the first time in English. *June 8. Fair Maid of Perth*, by Bizet. *Sept. 22.* Sir Thomas Beecham opened his autumn season of opera with *Juan the Terrible*, by Rimsky-Korsakov.

DUKE OF YORK'S.—*July 29. What a Catch!* a farcical comedy by J H. Darnley. *Oct. 26. The Thirteenth Chair*, a mystery play by Bayard Veiller (Messrs. James Carew and Charles Rock, and Mrs. Patrick Campbell).

GARRICK.—*March 22. Petticoats*, a comedy by H. F Maltby. *March 28. Wonderful Jones*, a comedy by Louis N Parker and Murray Carson. *April 24. Diplomatic*, a comedy by Brieux, presented by the French players. *May 3.* Carl Rosa Company opens season. *June 6. Revels*, a revue by Albert de Courville and Will Hay, music by Frederick Chesterfield. *Oct. 20. The Rocking Horse*, a comedy by C. Haddon Chambers (Messrs. Charles Hawtrey and A. E. George, and Mesdames Mary Jerrold and Irene Rooke).

GLOBE.—*March* 1. *The Man Who Went Abroad*, a play by Leoboone Worrall and Harold Terry (Mr Kenneth Douglas and Miss Iris Hoey). *March* 29. *Sweetie*, a musical affair by Austen Hurgon and George Arthurs, music by Max Darewski, lyrics by George Arthurs. *July* 24. *Julyana*, a comedy by Sara Jeannette Duncan (special matinée). *Oct.* 22. *The Willow Tree*, a Japanese play by Beerbino and Harrison Rhodes (*Mr Owen Nares and Miss Renee Kelly*).

HAYMARKET.—*Feb.* 26. *Pelts Gets a Month*, a whimsical comedy by Tom Gallon and Leon M Lion. *March* 24. *General Post*, a comedy by J E. Harold Terry (Mr. Norman MacKinnel, and Mesdames Lilian Braithwaite and Madge Titheradge).

KINGSWAY.—*April* 28. *Ghosts*, Ibsen's drama, revived. *May* 13. *Luck of War*, a play by Gwen John, and *The Quitter*, a play by Sewell Collins, produced by the Pioneer Players. *Aug* 28. *Cook*, a farce by Jerome K. Jerome (Messrs. H B. Irgnett and Charles Groves, and Miss Irene Rooke), and *The Invalid*, a one-act comedy by Frank G Layton. *Oct.* 22. *One Hour of Life*, a comedy by Captain Desmond Coke (Miss Lilian McCarthy). *Nov* 17. *When Knights Were Bold*, Charles Marlowe's farce revived (Mr Brember Chellenor).

LONDON PAVILION.—*Oct.* 2. *A Kiss or Two*, a comedy by H. V Esmond (Messrs. H V Esmond and Eric Lewis, and Miss Barbara Hoffe).

LYCEUM.—*Feb* 14. *Seven Days' Leave*, a play by Walter Howard

NEW.—*Feb* 6. *The Land of Promise* revived *April* 7. A triple bill consisting of *The Old Lady Shows her Medals*, a "sketch" in one act by Sir James Barrie, *Seven Women*, a one-act comedy by Sir James Barrie, and *Wurzle-Flummery*, a light comedy by A A. Milne. *June* 23. *His Excellency the Governor*, Captain Robert Marshall's comedy revived. *Sept* 7. *Trelawny of the Wells*, Sir Arthur Pinero's comedy, revived (Messrs. Dion Boucicault and Ben Webster and Mesdames Irene Vanbrugh and Hilda Trevelyan).

PALACE.—*Oct.* 14. *Cash on Delivery*, a musical farce by Seymour Hicks, music by Haydn Wood (Mr. Seymour Hicks, and Mesdames Ellaline Terriss and Gwendolline Brogden).

PLAYHOUSE.—*April* 9. *The Passing of the Third Floor Back*, by J K. Jerome, revived. *May* 9. *Wanted a Husband*, a comedy by Cyril Harcourt (Miss Gladys Cooper). *Sept* 22. *The Yellow Ticket*, a Russian drama by Michael Morton (Messrs. Allan Aynesworth, Sydney Valentine and Arthur Wontner, and Miss Gladys Cooper).

PRINCE'S.—*Feb.* 27. *The Catch of the Season* revived (*Mr Seymour Hicks*). *May* 2. *Good Boys*, a farce adapted by George Egerton from *La Belle Aventure* (Messrs. Seymour Hicks and Ben Webster, and Mesdames Mary Rorke and Ellaline Terriss).

PRINCE OF WALES'S.—*Feb.* 1. *Anthony in Wonderland*, a comedy by Mouckton Hoffe (Mr Charles Hawtrey and Miss Winifred Barnes). *May* 28. *Pouncy Wins*, a farcical comedy by Mary Stafford Smith. *Aug* 22. *Carminetta*, an operatic cameo by Andre Borde and C. A Carpenter, adapted by Mouckton Hoffe, additional numbers by Herman Finck and Herman Darewski (M Leon Morton, Mr Dennis Neilson-Terry, Miss. Alice Delysia and Miss Mary Blanche).

QUEEN'S.—*Feb.* 4. *The Cleansing Stream*, a play by Jose Echegaray, translated by Manuel Gonzales and Christopher Sandeman (Pioneer Players). *Feb.* 22. *The Double Event*, a comedy by Sydney Blow and Douglas Hoare (Mr Allan Aynesworth and Miss Ethel Irving). *July* 4. *Mrs. Pomeroy's Reputation*, a comedy by Horace Annesley Vachell and Thomas Cobb. *July* 29. *Fratricide*, a one-act melodrama by E. P Clift. *Sept.* 29. *The Off Chance*, a comedy by R. C Carton (Messrs. J H. Barnes and Paul Arthur, and Miss Compton). *Nov.* 3. *Brewster's Millions*, revived (Mr Percy Hutchison, and Mesdames Lilian Earle and Kate Carew).

ROYALTY.—*March* 3. *Rosemead*, a play by Michael Morton and D Nicodemi (Mr Dennis Eadie and Miss Marie Lohr). *June* 26. *The Foundations*, a comedy by John Galsworthy, dealing with post-war problems, with *Bar B*, a comedy by Cosmo Gordon Lennox, and *The Magic Pipe*, a wordless play by Jules Delsarc. *Aug* 22. *Billetted*, a comedy by F Tennyson Jesse and H. M Harwood.

ST. JAMES'S.—*Jan.* 24. *The Aristocrat*, a play by Louis N Parker (Sir George Alexander, Messrs. Lennox Pawle, Dennis Neilson-Terry, Charles Glenney and Vivian Reynolds, and Mesdames Genevieve Ward, Miriam Lewes, Helen Ross and Mary Glynne). *June* 29. *Shelia*, a comedy by Githa Sowerby (Mr Aubrey Smith and Miss Fay Compton). *Sept.* 4. *The Puritists*, a "parable in a farce," by Henry Arthur Jones (Mr Lennox Pawle and Miss Ellis Jeffreys). *Sept* 29. *The Liars*, by Henry Arthur Jones, revived (Mr Aubrey Smith, and Mesdames Marie Hemingway and Mary O'Farrell). *Nov* 6. *Ghosts*, by Ibsen, revived (Messrs. Charles Groves and Maurice Elvey, and Miss Catherine Lewis). *Nov* 22. *Loyalty*, an anonymous patriotic play (Messrs. Aubrey Smith, Fisher White, Morand and Randle Ayrton, and Miss Viola Tree).

ST MARTIN'S.—*March* 17. *Damaged Goods*, a play by Brieux, translated by John Pollock. *March* 24. *The Hired Girl*, a tragi-comedy by Herman Heijermans, translated by Christopher St. John. *June* 5. *Rosenkavalier*, Ibsen's play, revived for a few performances.

SAVOY.—*April* 28. *Hamlet* revived by Mr H B. Irving. *May* 29. *The Bells* and *A Story of Waterloo* revived by Mr Irving. *June* 24. *Humpty Dumpty*, a comedy by Horace Annesley Vachell (Mr H. B. Irving and Miss Hilda Trevelyan). *Aug* 23. *The Invisible Foe*, a drama by Walter Hackett (Mr H. B. Irving).

SHAFTESBURY.—*June* 4. Carl Rosa season of Grand Opera in English. *Aug* 27. *Ariette*, an operetta, translated by Josh Levy and adapted by Austen Hurgon and George Arthurs, music by Jane Vlon and Ivor Novello, lyrics by Adrian Ross (Messrs. Joseph Coyne and Stanley Lupino, and Mesdames Adrah Fair and Winifred Barnes).

STRAND.—*Jan* 17. *Under Cover*, a play by Roi Cooper Megrue (Messrs. Matheson Lang and James Carew, and Miss Jessie Winter). *May* 8. *The Jew*, Richard Cumberland's play rearranged by Gertrude and Jack Landa (matinée). *June* 22. *The Tidings Brought to Mary*, a drama by Paul Claudel, translated by Louise Morgan-Sillor, produced by the Pioneer Players. *July* 22. *Three Weeks*, a comedy adapted by Roy Horniman from Mrs. Elinor Glyn's novel. *Oct.* 25. *Wild Heather*, a comedy by Dorothy Brandon (Mr. Lyn Harding and Miss Edyth Goodall).

WYNDHAM'S.—*Sept.* 2. *A Pair of Spectacles* revived (Sir John Hare, Mr Gerald du Maurier, and Miss Kate Rorke). *Oct.* 27. *Dear Brutus*, a comedy by Sir James Barrie (Mr Gerald du Maurier, and Mesdames Jessie Bateman, Doris Lytton and Faith Celli).

# The Redistribution Proposals.

CLOSELY allied with the reform of our electoral laws and the extension of the franchise proposed by the Representation of the People Bill, which was based on the recommendations of the Speaker's Conference, was the question of redistribution. Early in the consideration of the measure, the subject was referred to Boundary Commissioners, with instructions to frame a new map of the constituencies upon lines strictly laid down as to size and population. After several months' work and a large number of local inquiries, the Commissioners presented their report for the approval of Parliament. The effect of their proposals was to increase the membership of the House of Commons by 32, 29 of the new members being given to England and one each to Wales and Scotland.

Among the general rules upon which the work was conducted was the broad principle that every county or borough (with the exception of the City of London) with a population of less than 50,000 should cease to have separate representation, and that a municipal borough or urban district with a population of 50,000 should become a separate Parliamentary borough. To retain its two members, a county or borough was to have a population of 120,000, while a member was given for a population of 70,000 and for every multiple of that population.

The following table illustrates how the new constituencies have been divided up in England, Wales, and Scotland —

| | Old Membership. | New Membership. |
|---|---|---|
| English Counties | 231 | 230 |
| London Boroughs .. | 59 | 62 |
| Other English Boroughs | 208 | 193 |
| Welsh Counties. | 22 | 24 |
| Welsh Boroughs | 11 | 11 |
| Scottish Counties | 30 | 38 |
| Scottish Burghs. .. | 31 | 33 |
| Totals .. .. .. | 560 | 592 |

As regards England, under the schedules 29 boroughs will cease to have separate representation and become merged in county constituencies. They are Bedford, Bolton, Bury St Edmunds, Canterbury, Chester, Colchester, Dover, Durham, Grantham Gravesend, Hereford, Kidderminster, King's Lynn, Maidstone, Penrys and Falmouth, Peterborough, Pontefract, Salisbury Scarborough, Shrewsbury, Stafford, Stalybridge Taunton, Warwick and Leamington, Whitehaven, Winchester, and Windsor The new boroughs outside London are Accrington, Barnsley, Blackpool Bootle, Bournemouth (replacing Christchurch), Bromley (Kent), Ealing East Ham (two members), Eccles, Edmonton, Hornsey, Ilford, Kingston-on Thames, Leigh, Leyton (two members), Medway Boroughs (two members, replacing Chatham and Rochester), Morley, Nelson, Richmond (Surrey), Rossendale, Rotherham, Scarborough Southend-on-Sea, Southport, Tottenham, Wallasey Wallsend, Waltham stow (two members), Willesden (two members), and Wimbledon. In a few cases such as Bath and York, the membership was reduced, while in others an increased representation was proposed. For instance, Birmingham was allotted 10 members in place of 7, Liverpool 11 instead of 9, Manchester 10 instead of 6, Sheffield 7 instead of 5, Leeds 6 instead of 5, and Bradford and Kingston-upon-Hull 4 each instead of 3 each.

So far as London is concerned, the City, under a special instruction, retained its two members, despite the small electorate. The chief change made was in giving five members to Wandsworth instead of one each to Wandsworth and Clapham. To Camberwell, Islington, and Lambeth four members were allowed, three each were suggested for Hackney, St. Pancras, Southwark, and Stepney, two each for Battersea, Bermondsey, Bethnal Green, Finsbury and Holborn, Fulham Hammersmith, Kensington, Lewisham Paddington, Poplar, Westminster, and Woolwich, and one each for Chelsea, Deptford, Greenwich Hampstead, St. Marylebone, Shoreditch, and Stoke Newington.

There were a number of changes in the counties, a net decrease of one resulting from various readjustments due partly to the creation of new boroughs. Increased representation was given to Bedfordshire, Cheshire, Derbyshire, Durham, Hampshire, Hertfordshire, Kent, Lincolnshire and Rutland, Middlesex, Nottinghamshire, and Surrey and decreased representation to Cambridgeshire Cornwall, Devonshire, Gloucestershire Huntingdonshire, Lancashire, Norfolk, Northumberland, Oxfordshire, Somerset, Westmorland, and Worcestershire while the Isle of Ely was formed into a new county constituency An interesting decision of the Commissioners concerned the nomenclature of county divisions as a rule, they selected a place name rather than a compass name, and avoided the alternative designations which have hitherto been commonly employed

Although the net change in the representation of Wales (including Monmouthshire) was an increase of only one, several alterations were recommended by the Commissioners. Five of the boroughs or districts—Carmarthen, Denbigh, Flint, Montgomery and Pembroke and Haverfordwest were extinguished, a new borough of Rhondda, with two members, was created, Cardiff was given three members instead of one, and Monmouth District was replaced by New port. Under the general rules as to population, the Prime Minister's constituency Carnarvon District, would also have ceased to have separate representation but as the result of strong representations the district was preserved, and one member taken away from the county, instead of extinguishing the former and retaining the two county divisions. The two counties Brecon and Radnor were combined with one member, while Glamorgan was given seven members instead of five and Monmouthshire five instead of three.

With regard to Scotland eight small burghs were merged in the counties—Dumfries, Elgin, Hawick, Inverness, Kilmarnock, Perth, St. Andrews, and Wick—while Stirling and Falkirk were amalgamated Two new burghs, Dumbarton and Dunfermline, were created Glasgow was given eight additional members, making the city's representation 15, and Edinburgh's divisions were increased from four to five. Among the counties, Berwick and Haddington and Caithness and Sutherland were combined, thus saving two seats and a third was obtained by forming Kirkcudbright and Wigtown into one division, to be called Galloway Against this reduction, Lanark was given an extra seat, making seven, and the Outer Hebrides, formerly in the two Parliamentary counties of Inverness and Ross and Cromarty, were constituted as a separate constituency, the Western Isles.

## PROPORTIONAL REPRESENTATION

THE system of voting known as Proportional Representation has become a question of practical politics as a result of the introduction of the Representation of the People Bill, and has found an increasing number of adherents, not only in this country, but in the Overseas Dominions and elsewhere. The Speaker's Conference on Electoral Reform, the recommendations of which formed the basis of the measure which was before Parliament last year, reported unanimously in favour of applying 'P.R.' to Parliamentary elections in the densely populated areas, such as London the large boroughs and contiguous boroughs, and in Universities. However, when the question was left to the House of Commons, the proposal was rejected by 200 to 169, the majority of 31 being much smaller than in any previous division on the question. Later it was decided to apply "P.R. to Universities, while the House also agreed that if there were more than two candidates at an election for one member the contest should be on the principle of the alternative vote which in some respects resembles "P.R."

The system is simple once the essentials are grasped. It aims at ensuring the representation of all classes or parties in proportion to their voting strength by means of a transferable vote. To make this possible, a number of constituencies in a particular area are grouped so as to be large enough to return several members. Each elector has only one vote which he gives primarily to the candidate whom he desires to see elected. He does this by placing the figure 1 against that candidate's name. If he wishes he need do no more, but he is given the power to indicate his further preferences by placing the figures 2, 3, 4, &c., against the names of other candidates in the order of his choice. The vote is first credited by the returning officer to the candidate marked with the figure 1. Then what is called the "quota" is ascertained. This is the proportion of the votes which for a certainty secures the election of a candidate, and can be obtained by dividing the total number of votes polled by one more than the number of seats vacant, the addition of one showing the "quota." If a candidate has obtained more than a "quota" of votes, the returning officer carries forward the surplus votes to those candidates marked on the ballot papers as the voters next preferences, or to the third choice if these additions are not needed to make up the 'quota." The transferred votes are added to those originally obtained by a candidate, and when his total reaches the "quota he is elected. If, after all the surplus votes have been transferred, there still remain vacancies to be filled, the candidate at the bottom of the poll is declared defeated, and his votes are transferred to the candidates marked as the electors second choice on those particular papers.

By this plan the supporters of "P.R." claim that the nearest approach to the principle of 'One vote one value' is obtained, while it secures the fair representation of all classes, and obviates the return of a minority member, as frequently happens in a triangular contest under the existing method. For example, it might give the Liberals a member in Birmingham and would provide the Unionists with a fairer representation in Scotland.

## NATIONAL HEALTH INSURANCE

UNDER the National Health Insurance Act, which has now been in operation for over three years, a vast State scheme of sickness benefit and medical attendance was set up for employed manual workers and all other employed persons earning less than £160 a year and between the ages of 16 and 70. From the wages of every man and woman coming within this description—with certain exceptions on account of small pay or nature of employment—a weekly levy of 4*d*. and 3*d*. respectively is compulsorily deducted by the employer who adds a further contribution of 3*d*. for each person, the collection being made by means of stamps. To the sum provided in this manner, the State adds the equivalent of 2*d*. a week for each person. For these payments an insured person is entitled to medical treatment by a doctor previously selected by the patient from a "panel" of practitioners in his district, together with the necessary medicine or appliances within certain limits and, when incapacitated from work, to sickness benefit (after the first three days of incapacity) of 10*s*. a week for a man and 7*s*. 6*d*. a week for a woman. These payments, which are lower for unmarried minors and other specified classes, are paid to the insured persons by "approved societies," formed by trade unions, friendly societies, and industrial insurance offices, to administer the Act. In a case where an employer assumes the responsibility of paying insured persons in his employ during sickness, his weekly contribution is reduced. Should incapacity last for a longer period than six months, an insured person is entitled to disablement benefit at the rate of 5*s*. a week up to the age of 70, provided that he or she is unable to obtain employment.

To every woman, married or single, an insured person herself, or the wife of an insured person, who gives birth to a child within the United Kingdom, maternity benefit of 30*s*. is given, which sum is doubled if she be an insured person belonging to an "approved society" on condition that she abstains from remunerative work for four weeks after the birth. A married woman may continue to pay 3*d*. a week and thus become entitled to medical benefit and sickness and disablement benefits under certain conditions, while if she does not continue her payments she is entitled to draw on a sum equal to two-thirds of her reserve, the remainder being set aside to enable her to buy the right of re-entry. Special provision is made for sufferers from tuberculosis, including treatment by specialists and admission to sanatoria provided at the expense of the local authority, the sickness benefit being available for dependants. Under the Act, a large sum was set aside for the building of sanatoria, but there is still insufficient accommodation. Persons who are compulsorily insured, but are not accepted by an "approved society" owing to bad health, or for other reasons, become deposit contributors, and can only draw on the amount standing to their credit, a fixed sum being deducted from their payments for medical benefit and the remainder utilised as sickness benefit until it is exhausted. In Ireland, no medical benefits are provided, and the weekly payments by stamps are lower, while special arrangements are made for the Navy and Army.

# Co-Partnership.

DEFINITION.—The basis of labour co-partnership is an agreement freely entered into by which the employee receives a fixed proportion of the profits made by the concern for which he works. That share may take the form of either immediate cash, deferred payment, allotment of share capital with or without actual control.

GAS COMPANIES.—The chief exponents of co-partnership are the gas companies. On 31 Dec., 1916, there were 38 companies, with a total share and loan capital of £85,359,747 and 25,300 employees sharing in the schemes, that had co-partnery in active operation. The oldest is the South Metropolitan, which dates back 27 years. In 1916, the 6,492 employees within the scheme divided £14,287, the equivalent of 2½ per cent. on their wages. The total divided profits since the start are £743,283, and the shares held and deposits made by the employees stand at £492,300. The largest is the Gas Light and Coke, with a capital of £29,469,473 and 9,356 interested employees, with a divided profit of £267,727 since the establishment of the scheme nine years ago.

STATISTICS.—Officially, there were 132 firms employing 129,534 persons with some form of co-partnership in operation on 30 June 1914. Altogether, 324 firms have tried co-partnery and at least 180 have abandoned it. One draper's of Bath had a scheme in force for 41 years before dropping it in 1916. In most cases the withdrawal of the scheme has been due to bad trade.

PORT SUNLIGHT.—One of the best examples in modern business is that of Lever Brothers, Ltd., which distributed on 30 Sept. 1917, the sum of £89,947 in co-partnership certificates. New members were admitted to the extent of 481 to bring the total up to 4,600. The numbers then standing in the trust deeds under the scheme were 645,975 ordinary and 38,250 preference certificates.

STRIKES.—It is the rule to find employees under a co-partnership scheme less likely to strike. Lord Leverhulme stated the case plainly on 29 July, 1917, in "Often enough the employer faced with such a weapon (strikes) refuses a demand for an advance in wages out of a recollection of certain contracts he has to fulfil. Under a co-partnership scheme he might well be in a position to offer an advance of wages before even it was asked for. And if he could not agree to such a request he could explain to his intelligent audience of partner-workmen why."

For a description of the various kinds of co-partnership the reader is referred to the article in the ALMANACK of 1914, p. 606.

## U.S.A.

At present there are only 60 U.S.A. firms in which proper co-partnership is being carried out. It is part of a wider movement to reduce or stop the disputes between employers and workers. Two of the profit-sharing schemes date from 1886, and one-third of the whole from 1913.

METHODS.—In 75 per cent. of the plans the distribution varies with the net profits of the business. In the majority of cases about 10 per cent. is so divided. One firm that has enjoyed the benefits of co-partnership for 20 years has explained its position thus: "The employer invests his capital and labour its energy. The first gets his return in the shape of interest on the investment—a legitimate percentage of profit (6 per cent.)—and the second gets his return in the form of wages. These two factors must be paid out of the gross receipts. The profits, after allowing for all other expenses are divided between the shareholders and wage-earners."

STATISTICS.—The profit-sharing in 75 per cent. of the cases takes the form of actual cash payment. Of the rest, two credit profits to savings accounts, and in one case only is payment made in stock or shares.

The largest firm has 7,398 employees, of whom 6,466 (88 per cent.) participate in profits. The amount divided yearly is about £53,300, which is equivalent to 5 per cent. of the wages. The second in point of size has 88 per cent. (2,269) of the total employees within the scheme, with dividends of 7 9 per cent. of the pay roll (£230,000).

OPINIONS.—In the successful establishments, the objects attained, according to U.S.A. business men, have been elimination of waste, increased efficiency, improved relations between employer and workers. And men have been inclined to remain in one job.

## THE KING'S BODYGUARD OF THE YEOMEN OF THE GUARD—(1483).

# The League of the Empire (Founded 1901).

The League is entirely non-political and non-sectarian. Its practical work has been to promote co-operation between the different Countries and Colonies of the Empire, mainly in affairs connected with education, and to afford full and correct information regarding them, so that the duties of citizenship may be better understood and appreciated, and personal and active interest inspired in the great problems connected with our Empire's conditions and progress. The relation of the League to the Education Departments and Governments throughout the Empire has been regularised (*a*) through the recommendation of its work to the Governments concerned by the Colonial Office of the Imperial Government and by the Agents-General in 1902-3, (*b*) by the active and widespread acceptance of its schemes by the different Educational Authorities and Governments. In 1907 the League carried through the first Conference between the Education Departments of the Home and Colonial Governments. One of the effects of this Conference was that the Imperial Government undertook to call the Imperial Conference on Education in 1911. In 1911 the first Imperial Conference of Teachers' Associations was held by the League and in 1913 was inaugurated the Imperial Union of Teachers. In 1916 the second Imperial Conference of Teachers' Associations should have been held in Toronto by invitation of the Government of Ontario, but had to be postponed owing to the war. An annual meeting of the Imperial Union of Teachers takes place each July. The League, through the liberality of the late Mr Louis Eglinel, has published a graded series of text-books on the Empire, under the editorship of Professor A. F. Pollard (*a*) "The British Empire—Its Past, Its Present, and Its Future" (a book of reference); (*b*) "The British Empire and Its History" (for Secondary Schools), (*c*) "The Story of the British Empire." In 1907 the League helped to establish a lace industry in St. Helena. Useful acknowledgment of the services of the League have been made by the Colonial Office by His Excellency the Governor, and by the workers. A number of teachers from all parts of the Empire have been accredited to the League for courses of lectures and study in the schools. The School Affiliation and Comrades Correspondence Sections were established in 1910-11. The latter numbers now over 36,000 members. Other work undertaken are the giving of lectures, the establishment of a bureau of information, essay competitions, exhibitions, and the furthering of the keeping of Empire Day. In 1913 through the generosity of Sir Robert Loone Tooth, the League established a Club for home and overseas members at 28 Buckingham Gate.

During the war the League has distributed from its depôt, 28 Buckingham Gate, over a million articles to the hospitals and troops, besides helping prisoners and others in distress. The League has also given colours and a shield to the several overseas contingents now fighting for the Empire. These tributes have been presented by H.M. Queen Alexandra and other Royal personages. To all totally disabled soldiers also souvenir volumes of Shakespeare (in memory of Lord Kitchener) are being presented.

The Patrons are H.M. Queen Alexandra and H.R.H. Princess Louise (Duchess of Argyll). The Hon. President is H.R.H. The Duke of Connaught, the President the Right Hon. Sir Frederick Pollock. Amongst those who are Vice-Presidents and Councillors are many Overseas Governors and high officials.

*Chairman of Council*, Sir Philip Hutchins, K.C.S.I.
*Hon. Treasurer*, Sir Richard Burbidge, Bart.
*Hon. Secretary*, Mrs. Ord Marshall.
*Organ of the League*, "The Federal Magazine."
*Address*, 28 Buckingham Gate, Westminster, London, S.W. 1.

# War Medals and Decorations.

THE war medal, as we understand it, is only a century old. Waterloo (1815) was the first occasion upon which a medal was issued to officers and rank and file also. The award was not made spontaneously by the Regent or his Ministry. Much petitioning was necessary, the Duke of Wellington in his application putting forth the plea that the medal would have a good effect upon the Army. The medal, which was given to survivors, was of silver, with the head of the Prince Regent on the obverse and a design of Victory on the reverse, and was hung from a ribbon of blue with red edges. The Prussian Waterloo medal had a ribbon of blue, yellow, and blue stripes. From Waterloo, every successful British campaign has been marked by the distribution of a medal, but never since has a medal been struck for one particular battle.

*Early Medals and Distinction.*—Ancient Rome is said by some (experts differ) to have awarded medals in bronze, silver, and gold to her famous soldiers. However, it is not until the fourteenth century that the military medal is really met with. Possibly the division of the spoil amongst the victors was considered sufficient mark for service. The knighthood conferred upon the field of battle, the flag, and war cry may be taken as the precursors of the medal proper. China is said to have had military medals during the Han dynasty (1–see A.D.). A medal is defined as a piece having no place in the currency struck to commemorate some event or person.

*Armada.*—The defeat of the Spanish fleet (1588) was made the occasion by Elizabeth of an issue of gold and silver medals. The design gave the medals the name of "Ark in Flood." They were issued with gold and silver rings and chains, with which they were worn. James I. continued the idea. In 1643 Charles I. authorised medals to be given to his followers if the Commander-in-Chief considered "faithful service in the forlorn hope to have been rendered. And Cromwell followed with a medal (his shape was oval not circular) for those who took part in the Dunbar "crowning mercy." Medals were handed to the volunteers in Holland during 1688–9. Gustavus Adolphus of Sweden provided a military medal in 1632.

*Prize Money.*—For a long period gold medals were given to successful commanders. Parliament decided in 1802 that one-tenth of all naval prize money should be set apart for medals and other awards. But the men did not share in the distributions. It was thought "expedient" to institute a naval medal following Earl Howe's victory of June 1, 1794. Marlborough's wars did not bring him or his warriors medals. The Seven Years' War and that of American Independence were entirely without medals. The first *Indian* medal (the *Deccan*) awarded to all ranks dates from 1784.

*Naval Medals.*—For all naval victories between 1793 and 1814 only 132 medals were conferred by the Government during those years. However, the survivors of Nile and Trafalgar were not permitted to go empty-handed. Two men, Davison and Boulton, whose business was connected with the Navy, found the funds to buy medals for the men. Many years afterwards (1847) Queen Victoria instituted the Naval General Service medal, and had an issue made to the survivors of the glorious years of 1793–1815.

*Army.*—At the same time, the Peninsular medal made its appearance, and was given to the survivors of the Napoleonic campaign. The ribbon (red, with blue edges) carried twenty-eight clasps, the first being Egypt, 1801. Gold medals had been conferred upon officers taking part in the Peninsular battles, and the Government, on ascertaining that some officers would be entitled to two or three decorations, ordered that for all medals over one a clasp only should be given for those subsequent. Separate medals were struck for Indian battles (1799 onwards), Kaffir (1853–5), and Acre (1840). A star suspended by a rainbow ribbon was issued for the Gwalior (1858) fighting. This star was known by the writer to be worn as late as Sept., 1915, by Private Adams (ret. 35). Medals and grants began to be issued in 1850 for long service and good conduct. Then followed Meritorious Service (1845), Conspicuous Gallantry (Navy), 1854, Distinguished Conduct on the Field, 1854 (ribbon has red, blue, and red stripes).

*Order.*—War medals are worn on the left breast for saving life in peace, on the right. Their order from the centre of the breast is first those for bravery (V.C.), then orders of knighthood, British war medals in order of receipt, foreign orders, and foreign war medals. The clasp for the earliest engagement is worn nearest the medal. If a second or third war takes place in a country and a medal and ribbon is in existence for the first, that is adopted usually for the others, holders of the early medal get clasps for the additional battles. The frontier campaigns of India are marked by clasps to one of the four Indian General Service medals.

*Ribbons.*—The principal medals and ribbons issued for recent campaigns are as follows. The ribbons for the V.C. and other orders will be found earlier in this volume under Orders of Knighthood. (Contraction s. = stripe.)

Naval General Service (1793)—White, with crimson borders and two crimson s.

Indian Gen. Ser (1908)—Dark blue, edged green.

Thibet (1903–4)—Purple, edged green and white.

China (1901, 1857–60, 1842)—Yellow, red centre.

Transport (1899–1902)—Red, two black s.

Boer (1899–1902)—
Victoria Red, blue, orange, blue, red s.
Edward Green, white, orange s.

Indian Gen. Ser (1854–1908)—Red, two green s.

African Gen. Ser. (1902–8)—Red and yellow halved.

Sudan (1896)—
British Yellow and black divided by red s.
Khedive Yellow, blue, and yellow s.

Ashantee Star (1896)—Yellow, two black s.

Indian Gen. Ser (1854–95)—Green, red borders.

Matabeleland (1896)—Four orange and three blue s.

E. and C. Africa (1897–1904)—Brown, white, black.

Burmah (1887–9, 1889–92)—Red, two blue s.

Canada (1866)—Light blue with two red s.

Egypt (1882–1915)—
British Blue, white, blue, white, blue s.
Khedive (Star) Blue.

Afghanistan (1878–80)—Green, with red edges.

Kandahar March (Star)—Rainbow

South Africa (1877–8–9, 1879–81, 1884–5, 1901–2)—Orange, with two wide and two narrow blue s.

Ashantee (1873–4)—Black, yellow, narrow black, yellow, narrow black, yellow, and black s.

## THE NEW EMPIRE HONOURS

THE manifold services rendered by the men and women of the British Empire in various fields of war-work at home and in the Overseas Dominions, either in the performance of acts of bravery and devotion or in the display of resource and skill, were recognised by the King in June by the institution of two new Orders—the Order of the British Empire and the Order of the Companions of Honour—differing in some respects from those already in existence. The most notable innovation was the inclusion of women among the recipients of the honours on exactly the same grounds as men, those who were given the higher classes of the former Order being accorded the privilege of prefixing the title "Dame" to their names in place of the Knighthood conferred upon men. The two Orders were specially created in connexion with the war, but there is no intention to restrict their bestowal to the duration of hostilities, the expectation being that they will fill an important gap in the hierarchy of awards of honour for public services at the hands of the Sovereign.

The Order of the British Empire, the more interesting, of the two, provides His Majesty with a method of rewarding good work accomplished for the Empire at home and abroad. It follows the precedents of older honours in being divided into classes. Of the five grades, those of Knight Grand Cross (G.B.E.) or Dame Grand Cross (G.B.E.) and Knight Commander (K.B.E.) or Dame Commander (D.B.E.) carry the honour of Knighthood or the title of "Dame." The other classes are styled Commanders (C.B.E.), Officers (O.B.E.), and Members (M.B.E.) in the case of both men and women. For badge, the members of the first three classes are given a silver-gilt cross, enamelled pearl grey, with a representation of Britannia seated within a crimson circle, upon which are the words "For God and the Empire," the motto of the Order. Officers and Members receive badges differing only slightly. Knights and Dames Grand Cross and Knights and Dames Commanders are also provided with an eight-pointed silver star, in the centre of which is the same device as appears on the badge.

The Prince of Wales was appointed Grand Master, and the first recipients numbered over 250, of whom about 60 were women, headed by the Queen, and among whom were several representatives of Labour of both sexes. At the same time, the Medal of the Order of the British Empire was presented to over 90 men and women for services of special merit in manual and other work done for the war, such as resource and presence of mind or devotion to duty. The idea is that, in future, the workers themselves may recommend those of their comrades whom they consider to be deserving of this distinction.

The second of the new Orders carries with it neither title nor precedence, and consists of only one class. The first 17 Companions of Honour, among them four ladies and a similar number of Labour leaders, were the first of a limited number of persons for whom this special distinction appears to be the most appropriate form of recognition, constituting an honour dissociated either from the acceptance of title or the classification of merit.

## TRADE ORGANISATION

CONSTRUCTIVE work of the highest importance has been undertaken with enthusiasm by the Board of Trade as a result of the war, and the Commercial Intelligence Branch of the Department is now very definitely attempting the organisation of British trade. The headquarters of the Branch are at 73 Basinghall Street, London. The Branch supplies generally information on such subjects as contracts abroad open to tender, demand for particular articles abroad, lists of importers and agents, methods of distribution, lists of home manufacturers of special articles, statistics, and the various conditions affecting foreign trade. A special Advisory Committee on Commercial Intelligence has been appointed, which includes official representatives of the Dominions. A good reference library is available for consultation, and valuable commercial information is published from week to week in the *Board of Trade Journal*. A special register is compiled, and firms paying a fee of one guinea to the Board receive, in addition to the Journal of the Board, special confidential information on the branches of trade in which they are interested, either as manufacturers or exporters. A British Industries Fair similar to the Leipzig Fair, has been organised since the war, and the following steps have been taken to assist British firms to capture trade formerly in the hands of German and Austro-Hungarian competitors:—

(1) The collection and exhibition of samples of German and Austrian goods from abroad.

(2) The inauguration of "exchange meetings," trade by trade, for the exhibition of goods hitherto obtained from Germany and Austria-Hungary, at which British manufacturers have been able to meet former dealers in such goods.

(3) The issue of special memoranda giving information regarding possible developments in certain important trades.

(4) The issue of lists of articles in respect of which inquiries have been received for the names of

(α) Manufacturers, and
(β) Buyers.

The names of the firms concerned are furnished upon application to the Branch.

(5) The formation of a loan collection of foreign catalogues in the various trades, designed to show British manufacturers what steps have been taken by foreign firms with a view of pushing their trade in overseas markets.

Trade Commissioners have been appointed to S. Africa, Australia, New Zealand, and Canada to foster United Kingdom trade with these Dominions. They answer inquiries from manufacturers, and periodically visit the United Kingdom to interview firms interested in trade with the countries in which they are stationed. In the spring of 1915 Mr Hamilton Wicken, H.M. Trade Commissioner in Canada, visited this country, and gave interviews to nearly 2,000 firms.

After the war more importance will attach to every improvement in National Education. The country which best applies the resources of science to trade and industry, and organises upon the soundest, widest, and most progressive lines, will forge ahead of other commercial competitors.

At the annual meeting in 1914 of the Head Masters' Conference, a resolution was passed that the provision of scholarships and exhibitions to enable students of slender means to enter and complete their courses in Universities and other places of higher education was very inadequate and they welcomed the announcement that the "consultative committee had been requested by the Board of Education to consider what measures are necessary and practicable for developing a system of such scholarships and exhibitions in organic relation to a system of National Education."

The scholarships and exhibitions awarded by the Public Schools chiefly call for a knowledge of Classics, Mathematics, Modern Languages, Science, or Music, and are of more interest to those entering the professions than to those intended for commercial careers.

Preliminary training is imperative for the Royal Navy, Army, Merchant Service, Church, Law, Medicine, Music, Engineering, Architecture, Accountancy, &c., and the different examinations indicate the necessary qualifications.

In the Civil Service situations are filled by (a) open competitive examinations, (b) competition after having obtained nomination, (c) nomination with a qualifying examination.

Every boy requires a sound general education, no matter what business he is intended for or may adopt. *Specialisation at too early a stage* at the expense of the general education must be avoided, but in too many cases a boy is schooling finishes without anything having been settled as to the business opening he shall try for.

To ensure a boy being provided with an educational outfit suitable for a particular business, *Commercial Service Scholarships* should be established. Under such a system those who are going for a business career would *specialise* before they leave school in the same way as is now done for the professions.

In connexion with business openings it is impossible to define off hand a course of study and training which ought to be followed in each case. In addition to *Banking and Insurance, Manufacturers, Merchants and Retailers, Rail ways, Shipping and Transport, Printing, Publishing and Advertising*, there are a number of special trades and agencies. It is, therefore, an easier matter for the head of a firm to indicate what, in his opinion a boy at school had better concentrate upon to render himself of the most value to his firm in the quickest time after having obtained an opening with them in the form of a Commercial Service Scholarship offered by the firm.

It might be of interest here to refer to what is now being done to keep our merchant service supplied with junior officers.

Many of the large steamship companies take cadets from the *Worcester* as apprentices without premiums, the P and O., Royal Mail, British India, &c., take them direct from the *Worcester* as supernumerary officers. The future of the cadets upon the *Mersey* and *Port Jackson* (ocean training ships) is secured by arrangements with well-known shipping lines who give preference to boys so trained.

The P and O has established a system of cadetships, applicable only to selected boys trained on the *Worcester*, which enables boys to adopt the sea as a career who would otherwise be prevented owing to insufficient funds.

The P and O pay one-half of the *Worcester* fees for three years, and the premium upon a sailing vessel, or the boys can enter the company's service direct as apprentices without payment of any premium.

The establishment of Commercial Service Scholarships upon a national basis would supply definite openings for which boys could be trained.

This would increase the usefulness of those agencies which are now promoting commercial education, and the practical development of existing school courses would be facilitated.

The list of the City Companies covers most branches of trade and commerce, and a scheme for Commercial Service Scholarships ought to be organised which would command their support.

*The University of London* award School Commercial Certificates when the pupil leaves school to candidates who have completed their sixteenth year and who pass their examination.

*The London Chamber of Commerce* also hold their own examinations and issue Senior Commercial Certificates and Junior Commercial Certificates, the value of such certificates would be increased if business openings were arranged for under a comprehensive scheme of Commercial Service Scholarships.

The future interests of the country will demand the inclusion in the Government of men of business, and the appointment of a Minister of Commerce will follow.

Our Public Schools must cease to look down upon business. The upper classes will have to gravitate more and more to trade, and business will become elevated to a career for which boys will be specially prepared at schools.

The extension of our national trade will prove to be of supreme importance to counteract the effects of the war. The best brains of the community will be required to compete successfully against the well trained intellects and highly organised industrial institutions of other countries.

Our Universities ought, therefore, to inaugurate a special course and degree for *Commerce*.

The Board of Education should appoint a Department—

(a) To co-operate with Chambers of Commerce and trade institutions to secure an adequate supply of Commercial Service scholarships, embracing in a general way the interests of the business world.

(b) To arrange for examinations and the issuing of certificates to all who qualify, irrespective of their obtaining at the time one of the openings competed for.

(c) To ascertain from the Foreign Office and Board of Trade in what industries greater efforts are required for expansion or consolidation, and to secure from those branches of trade concerned an extra number of Commercial Service Scholarships.

With these objects in view the plan for the organisation of Commercial Service Scholarships should be drafted by a small joint committee appointed by the Board of Education, the Head Masters' Conference, and the London Chamber of Commerce.

## LIQUOR TRAFFIC.

In a variety of ways evidence has been forthcoming of the satisfactory results achieved by the restrictive orders and progressive reforms of the Central Control Board (Liquor Traffic) which was set up under the chairmanship of Lord D'Abernon after the war had been in progress for some months, with the object of regulating the sale of alcohol, particularly in areas where munition work was carried on. By limiting the hours during which licensed premises are permitted to sell liquors to five and a half a day—divided between the early afternoon and the evening—prohibiting "treating," the cause of so much indulgence, closing redundant houses in particular districts, and opening healthy inns under conditions in which the sale of intoxicating liquor forms a minor part of the business transacted, the Board has materially reduced drunkenness in most parts of the country, improved the standard of health of the community, assisted and stimulated the habit of thrift, and appreciably reduced the waste of child life.

The last mentioned is unquestionably one of the most important aspects of the Board's operations, in view of the vital necessity of preserving and strengthening the coming generation after the terrible loss of man-power that has accompanied the world war. Sir Arthur Newsholme, the Medical Officer of the Local Government Board, recently called attention to the appalling mortality among children. During the four years 1911 to 1914 no fewer than 379,076 deaths occurred at ages under five, or more than a quarter (28·1 per cent.) of the total mortality at all ages. Sir Newsholme declared without hesitation that intemperance either in husband or wife was an important factor in causing the excessive infant mortality in many large towns, where the death-rate up to the age of five was from 250 to 299 per 1,000 deaths, and he expressed the view that if abstinence from alcoholic drinks could be enforced in such towns there would be a rapid improvement.

While this has not been possible, the regulations of the Control Board have gone some way towards effecting this urgent reform. Sir Arthur in a subsequent report announced that during 1916 the rate of infant mortality was the lowest on record, and there is no doubt that an important step along the road to a better state of affairs has been taken. During 1914 the total convictions for drunkenness in the scheduled areas of England and Wales numbered 176,672 (140,138 males and 36,534 females), or a weekly average of 3,388. In the following year the number had fallen to 131,439 (98,746 males and 32,693 females), a weekly average of 2,527 while in 1916 the total had been reduced to 82,799 (60,039 males and 22,760 females), the average being 1,544. The figures for 1917 were not complete, but the weekly average up to Aug. 25 had declined to 999. As the drop in convictions is nearly as pronounced among women as among men, the reduction is not due simply to the fact that a large proportion of the male population is now with the Colours. Further testimony was offered by the Prison Commissioners, who, commenting upon the reduction in 1916–17 in the number of committals for offences which are frequently the result of alcoholic excess, remark that this may in some degree be attributed to the operation of the restrictive orders of the Board.

## THE PRICE OF SILVER.

During the summer of 1917 an extraordinary rise occurred in the price of silver bullion. Certainly, the world supply was not equal to the demand, but whether the high prices were justified is doubtful. The powers possessed by the Government were strong enough to have permitted control of the London silver market, and it is surprising that the Treasury did not take over silver in the same sense as it has done with various articles of munitions of war.

China and India are absorbing silver continuously. The war has introduced a new demand for silver coinage at home and abroad. Wherever troops have gone, large quantities of silver coinage have been required. The actual turnover of money has been much greater than in pre-war times, thus calling for small change.

The shortage has been felt throughout the world. In Aug., 1917, the U.S.A. were exchanging paper money for the silver coin of Panama. On 6 Sept., 1917, the export and import of silver was prohibited by the Government of India. The rise in price has had a corresponding effect on Exchange rates between London and the Far East. At the end of 1915 the value of a Hong Kong dollar was 2s. 2d. On 29 Sept., 1917, it was worth 3s. 3d. On one occasion, the price of silver fell in London 9¼d. per oz. in 12 days (28 Sept.–8 Oct.). Naturally, with high prices for bullion, the Mint has not been able to make so much profit on the silver coinage produced.

Here are the chief prices of silver in London. A date in brackets signifies that on which the same price was reached previously:—

## POST OFFICE SAVINGS BANK.

In every town and in nearly all villages in the United Kingdom any sum from 1s. upwards may be deposited, but not fractions of 1s., except in the case of deposits of Societies, Penny Banks, &c. Any person over the age of 7 may become a depositor, *and accounts may* be opened on behalf and in the names of children under 7 years of age Trustees, duly registered Industrial and Provident Societies, Charitable Societies, Penny Banks, Corporate Bodies, Committees of the estates of insane persons, Rectors and Vicars of Parishes in England and Wales, may deposit their accounts (application first being made to the Controller of the Savings Bank). On opening an account the depositor must state his full name, occupation, and address. He must also sign a declaration that he takes no benefit from any other account in the Post Office Savings Bank or in a Trustee Savings Bank. Every deposit is entered into the depositor's book if this should be lost notice should *at once* be given to the Controller A cheque or Postal Order is accepted, if not crossed to a particular Bank. Bills of Exchange are not accepted. An ordinary depositor can withdraw any sum not exceeding £1 on presentation of his deposit book at any Post Office Savings Bank. If exceeding £1 a form of withdrawal, obtained at any Post Office Savings Bank, must be filled up and sent to the Controller *No application* for withdrawal of the whole or part of a deposit should be made until 4 clear days have elapsed from the date of deposit. Forms of application for claiming the deposits of deceased persons are obtainable at any Post Office Savings Bank. *Interest*, 2½ per cent. per annum on every complete £ standing to the credit of a depositor Once a year, on the anniversary of the day of the first deposit, the depositor should forward his book to the Controller of the Savings Bank. All deposits standing in the sole name of a married woman domiciled in England and Ireland are deemed to be her separate property Deposits may be *transferred from one account to another*, or a name may be added to the title of an account. A depositor not under 16 years of age may nominate a person or persons to receive any sum not exceeding £100 from the amount due to him at the time of his death Certificates of birth, marriage, or death, if required in connexion with a Post Office Savings Bank account, can be had if made on a special form obtained from the Controller at the reduced rate of 1s. The names or particulars of the accounts of depositors are not allowed to be disclosed by any officer of a Post Office. Special facilities are also afforded to depositors in the Post Office Savings Bank for making investments in Government Stock, for purchasing Annuities, or for *effecting Life Insurances.*

## THE WORLD'S COTTON CONSUMPTION

## SLANG TERMS FOR MONEY

In addition to the ordinary terms there are others which, although puzzling to a foreigner, *are tolerably well understood in this country* In Scotland a man who flies "kites" may not be worth a "bodle," and in England not worth a "mag"—coins which no one ever saw Such a man will toss you for a "bob." He, of course, would be shunned by the lady who lost a "pony" on last year's "Oaks," and by her husband who lost a "monkey" on the Derby two days before. A gentleman who is worth a "plum" (£100,000) need never be short of "tin," while the outcast who begs a few "coppers," in order to procure a bed generally, has no "blunt." The following words are commonly in use:—

*Kd.* = Fadge, farden, scrope.
*½d.* = Bawbee, brown, Saloh, mazy.
*1d.* = Pollard, saltee, and (sometimes) brown
*3d.* = God-dropper, thrums, tiddy
*4d.* = Flag, grunt, joey
*6d.* = Lord of the manor, tanner, tiny, spud.
*1s.* = Bob, bratlet, tooth-ache, twelver
*2s.* = Scotchman.
*2s. 6d* = Coach-wheel, half-dollar slat.
*5s.* = Bull, bull's-eye, cart wheel, *dollar, Oxford.*
*10s* = Half-bean, half-a-thick 'un, smelt.
*20s.* = Bean, canary, canter, dragon, George, gingle-boy, grinder, James, jimmy o' goblin, mag, monarch, portrait., quid, shiner, thick 'un, yellowboy, yellowmould.
£5 note = Abraham Newland, fiver, flannup.
£10 note = Double-flannup, tenner
£20 = Pony
£100 = Century
£500 = Monkey
£1,000 = Caw
£100,000 = Plum
£1,000,000 = Marigold
Bill = A bad bank-note, or a bad bill
Money generally = Blunt, boodle, brass, bunce, chips, clink, ditto, dust, family plate, mopusses, oof, pewter, ready, ready John, shekels, splash, spondulicks.
Filthy Lucre = Scottish well-worn £1 notes.

## THE WORLD'S PRODUCTION OF PETROLEUM

| Japan | 73,000 | 75,000 | 90,000 |
| Mexico | 36,000 | 31,000 | 35,000 |
| Peru | 24,000 | 32,000 | 42,000 |
| Russia | 32,000 | | |
| United States | 526,000 | 646,000 | 882,000 |
| Other Countries | 63,000 | 64,000 | 73,000 |

## THE WORLD'S PRODUCTION OF IRON

| — | 1913. | 1914. | 1915. |
|---|---|---|---|
| | Tons. | Tons. | Tons. |
| United Kingdom | 10,680,030 | 9,130,000 | 8,990,000 |
| Canada | 1,132,000 | 760,000 | 950,000 |
| Austro-Hungary | 2,370,000 | 2,000,000 | |
| Belgium | 2,480,000 | 1,360,000 | |
| France | 5,200,000 | 5,030,000 | |
| Germany | 29,320,000 | 14,300,000 | |
| Italy | 430,000 | 300,000 | |
| Russia | 4,550,000 | 4,000,000 | |
| Spain | 480,000 | 440,000 | 420,000 |
| Sweden | 730,000 | 640,000 | 770,000 |
| United States | 31,480,000 | 23,710,000 | 30,390,000 |
| Other Countries | 530,000 | 500,000 | 480,000 |

## THE VISIBLE HORIZON

THE limit of vision at any given point varies with the height at which the spectator is placed. The greatest distance at which an object at sea-level (or on the surface of a plain) can be seen by a person whose eyes are at a height of 5 feet from the same level is 2¾ miles, and at 20 feet the distance is increased to 4 miles; at 30 feet to 4½ miles. The radius of vision does not increase in the same proportion as the height, the increase between the visibility at 5 feet and 6 feet being half a mile, but between 19 and 20 feet only one-sixth of a mile. The following table shows the *approximate* range of vision at different heights:—

| | | | | | |
|---|---|---|---|---|---|
| At a height of | 5 | feet the radius is about | 2¾ | miles | |
| " | 10 | " | " | 4 | " |
| " | 20 | " | " | 5½ | " |
| " | 30 | " | " | 6¾ | " |
| " | 100 | " | " | 12¼ | " |
| " | 500 | " | " | 27½ | " |
| " | 1000 | " | " | 38¾ | " |
| " | 2000 | " | " | 54¼ | " |
| " | 3000 | " | " | 67 | " |
| " | 4000 | " | " | 77½ | " |
| " | 5000 | " | " | 86½ | " |
| | 5280 | feet (1 mile) | | 89 | |

Objects which are themselves raised above the level are visible at proportionately increased distances, according to the height at which they stand.

## THE FRENCH REPUBLICAN CALENDAR.

THIS although reckoned from the 22nd September 1792, was not introduced until the 24th November 1793. It remained in use only till the 31st December 1805. The Gregorian Calendar was restored January 1st, 1806 (Nivôse 10th, Year XIV.). The months varied in different years, thus Nivôse commenced December 21st in 1793, December 22nd in 1795, December 23rd in 1796, December 22nd in 1799, December 23rd in 1803, and December 22nd in 1804 and 1805. The following are the dates for the year 1804, the last complete year of the Calendar:—

| | | | | | |
|---|---|---|---|---|---|
| Vendémiaire | (*Vintage*), | 23 Sept. to Oct. 22 | Germinal | (*Budding*), | 22 Mar. to Apr. 21 |
| Brumaire | (*Fog*), | 23 Oct. to Nov. 21 | Floreal | (*Flowers*), | 22 April to May 20 |
| Frimaire | (*Sleet*), | 22 Nov. to Dec. 21 | Prairial | (*Pasture*), | 21 May to June 20 |
| Nivôse | (*Snow*), | 22 Dec. to Jan. 21 | Messidor | (*Harvest*), | 21 June to July 19 |
| Pluviôse | (*Rain*), | 22 Jan. to Feb. 20 | Thermidor | (*Heat*), | 20 July to Aug. 18 |
| Ventôse | (*Wind*), | 20 Feb. to Mar. 21 | Fructidor | (*Fruit*), | 19 Aug. to Sept. 18 |

The months were divided into three decades of ten days each; but to make up the 365, five were added at the end of September (*Franciade*), dedicated to Virtue; (*Dioclès*) to Genius; (*Tricté*) to Labour; (*Quartidi*) to Opinion; and the 5th (*Quintidi*) to Rewards. To Leap Year called *Olympic*, a sixth day, the 22nd or 23rd September (*Revolution*), "Jour de la Révolution," was added. This variation of dates has led to considerable confusion, but those who may wish to trace the fourteen years will find some very elaborate tables in the English edition of Bourrienne's "Life of Napoleon." Bentley.

# Tithe Commutation.

The average Tithe Rent Charge for the first fifty years from 1836 was £100 9s. 9½d., and for the past eight years (1910–1917) £77 2s. 9½d.

| Years. | Wheat. s. | d. | Barley s. | d. | Oats. s. | d. | Tithe Rent Charge. £ | s. | d. |

## *AVERAGE WEEKLY EARNINGS OF RAILWAY SERVANTS.*

THE following table shows the *average wages per head* of workpeople employed in the coaching, goods, locomotive and engineering departments of the 29 principal Railway Companies of the United Kingdom during the first (or second week in December in each of the years 1901–1913. The Companies included in the table employ over 90 per cent. of the total number of Railway servants.

In the first half of the seventeenth century [illegible] has been cited as the best approach to a definite date) we meet with the earliest mention of the introduction of *rails* for the lessening of friction upon roads. Beams of wood, some six or seven inches in breadth, were about this time laid down to facilitate the draught of the waggons in the vicinity of some of the coal mines at Newcastle, and as a matter of necessity the addition of "sleepers" had speedily to follow. In 1738, at Whitehaven, it is stated that iron was first substituted as the *material* of the rails, and in 1767 it appears established that this revolution was adopted at Coalbrookdale, being followed nine years later at the Sheffield Colliery. As yet, however, only thick plates of iron were fastened to the surface of the wooden rails, and it was not till 1789 that "edge rails" were introduced, the credit of their adoption being assigned to William Jessop, on the Loughborough and Nanpantan line. James Watt had conceived the idea of utilizing steam for locomotion, and there is a record of a model locomotive having been used in Cornwall in 1784. George Stephenson, however, in the year 1814, was the first to bring the *project* fairly into practical shape.

The first Act obtained for the construction of a railway was that of the Surrey Iron Railway Company in 1801, for a line 9½ miles long from Wandsworth to Croydon. In 1804 an Act was passed "for making and maintaining a railway or tramroad from the town of Swansea into the parish of Oystermouth, in the County of Glamorgan, and for the hauling or drawing of waggons or other carriages passing upon the said railway or tramroad with men, horses, or otherwise." On the 21st of February, 1804, Trevithick's *patent locomotive steam engine* was tried at Penydarran, near Merthyr and conveyed along a tramroad 10 tons of bar iron, and about 70 persons, a distance of 9 miles. The application passed the third reading as a railway or tramroad. The word "otherwise" was evidently intended to cover the use of Trevithick's engine, and this Act may therefore be considered the first in which steam was contemplated as the motive power. The line is now known as the Swansea and Mumbles Railway. Then followed the Kilmarnock and Troon, the Severn and Wye the Gloucester and Cheltenham, Plymouth and Dartmoor, Stratford-on-Avon and Moreton, and other small undertakings, about twenty five in number altogether, with an aggregate of 393 miles, and an authorized capital somewhat over a million. It is almost unnecessary to add that animal power only was contemplated in their working. The Stockton and Darlington Act was obtained in 1821, with a capital of £100,000, and it is remarkable that, while animal power was to be relied upon for working the line, the clause in the Act states "with men and horses *or otherwise*." George Stephenson came upon the scene immediately after this Act was obtained, and was appointed engineer of the line, and at his urgent request, Edward Pease, the promoter, applied for a new Act empowering the company to work the railway with locomotive engines. Great opposition was encountered, but the Bill finally passed in 1823, and the line, which was 25 miles in length, was opened on the 27th of September, 1825. The Monkland and Kirkintilloch Railway, a colliery line near Glasgow, opened in 1826, was *really* the first to follow the example of the Stockton and Darlington, and several other small lines—many of them worked partly by fixed and partly by locomotive engines—quickly adopted the new traction power. The inauguration of the Liverpool and Manchester line in 1830, attended as it was with a tragic result, was the first to impress upon the people that a revolution in travelling had really taken place. Leicester to Swannington came next, but that from London to Birmingham was the largest that had yet been projected. A great struggle took place with landowners and other influential personages, opposed not only to this Bill in particular, but to the introduction of railways generally. Undaunted courage and perseverance on the part of the promoters prevailed, and the Bill, which was rejected in 1832, passed in 1833, but not until landowners and others had been conciliated by having the price originally estimated for their land, &c., doubled and even trebled. The expenses of carrying this Bill, which was probably the most momentous Parliamentary campaign in the history of railways, were over £70,000. The line was opened throughout in 1838, and the first train accomplished the distance at an *average speed of* over twenty miles an hour. The tide of public opinion was now fairly turned, and ran as strongly in favour of railways as it had before been against them. The Grand Junction, the London and Greenwich, London and Southampton, the Great Western, Birmingham and Derby, Bristol and Exeter, Eastern Counties, Manchester and Leeds, Midland Counties, North Midland, South Eastern, London and Croydon, Birmingham and Gloucester, together with a large number of small Bills, were all passed in four years from the passing of the London and Birmingham Bill, and before that line was opened.

Up to 1840, inclusive, 299 Acts, authorizing the construction of 3,020 miles of line, had been passed. The inevitable reaction set in, and in 1841-2-3 only a few small Bills were passed by the Legislature but as the Liverpool and Manchester, the London and Birmingham, and other leading concerns were paying 10 per cent. dividends, and some of the smaller lines were yielding even larger returns, attention was naturally drawn to the remunerative character of this class of property, and the supply of railway shares became far below the demand. A flood of *new projects* appeared before the public, and the Legislature even, labouring apparently under the general excitement, encouraged promoters by relaxing or withdrawing the general opposition which had previously been offered. In 1844, 727 miles were authorized, in 1845, 2,883 miles, and in 1846, the prodigious total of 4,790 miles, under no less than 272 Acts, obtained Parliamentary sanction. The succeeding years saw some abatement, but still there were 1,863 miles passed in 1847, and 500 in 1848. These figures illustrate the rise and fall of the great fever known as the "railway mania."

The Railways Regulation Act of 1840, the first of the General Acts, provided for a month's notice being given to the Board of Trade before opening, for returns of traffic to be made by the companies, as also of accidents involving personal injury, for Government inspection of works, for the approval of bye-laws, &c. Afterwards were passed Acts for their better regulation, and for the conveyance of troops, 1844, the Railways Further Regulation Act of 1844, the Railways Clauses Consolidation Act, 1845, and the Canal and Railway Carriage Act of the same session,

There followed legislation on the leasing and sale of railways, on the gauge, on cheap trains, passenger duty, &c.

When war was declared, the Government took over the home railways. The following is an extract of announcement being issued from the War Office —

"WAR OFFICE, Aug. 4th, 1914.

"An Order in Council has been made under Section 16 of the Regulation of the Forces Act 1871 declaring that it is expedient that the Government should have control over the rail roads in Great Britain. This control will be exercised through an Executive Committee composed of general managers of railways which has been formed for some time and has prepared plans with a view to facilitating the working of these provisions of the Act."

TERMS OF REMUNERATION.—The Board of Trade issued the following notice dated September 19th, 1914 —

"The Regulation of the Forces Act 1871, under which His Majesty's Government have

taken possession of most of the railways of Great Britain, provides that full compensation shall be paid to the owners for any loss or injury they may have sustained thereby, the amount of such compensation to be settled by agreement, or if necessary by arbitration.

"His Majesty's Government have agreed with the railway companies concerned that, subject to the undermentioned condition, the compensation to be paid them shall be the sum by which the aggregate net receipts of their railways for the period during which the Government are in possession of them fall short of the aggregate net receipts for the corresponding period of 1913. If, however the net receipts of the companies for the first half of 1914 were less than the net receipts for the first half of 1913, the sum payable is to be reduced in the same proportion." [On April 14th, 1915, the Board of Trade announced that an alteration had been made in this agreement by which the proportionate reduction in net receipts of the companies referred to will not in future be made, but as per cent. of the war bonus granted to railway employees who come within the Railway Conciliation Scheme shall be borne by the railway companies, and not by the Government.]

"This sum, together with the net receipts of the railway companies taken over, is to be distributed amongst those companies in proportion to the net receipts of each company during the period with which comparison is made.

"The compensation to be paid under this arrangement will cover all special services, such as those in connection with Military and Naval transport rendered to the Government by the railway companies concerned, and it will therefore be unnecessary to make any payments in respect of such transport on the railways taken over."

### The Railway Executive Committee.

On behalf of the Government, the control of the railways in Great Britain was vested, as from Aug. 5th, 1914, in a Committee composed of the following General Managers:—

| | | |
|---|---|---|
| Sir J. A. Asphall | .. | L. & Y. Rly |

RAILWAYS IN 1913, 1914 and 1915.

The number of persons employed in working the railways of the United Kingdom in 1914 was 642,135, and there were in use 24,808 locomotive engines, 79,839 coaching vehicles, 739,900 waggons for the conveyance of live stock, minerals, and general merchandise, and 49,629 service vehicles.

*Capital embarked in Railways.*—The total amount of capital authorised by Parliament to be raised for the construction of railways in the United Kingdom amounted on the 31st December, 1915, to £1,447,537,000. Of this sum, £1,347,321,000 (which includes £199,352,000 nominal capital caused by the consolidation or conversion of stocks) exists and forms the capital account of the various railway companies, and shows an increase over the year 1914 of £8,050,000, or a 3 per cent. The £1,347,321,000 is composed of £134,321,000 guaranteed, £353,349,000 debenture, £361,694,000 preferential, and £494,269,000 ordinary stocks and shares, besides a sum of £13,699,000 raised by loans. The net receipts for the year amount to £57,461,378, equal to 3 80 per cent. on the total capital sunk, as compared with £56,899,000 in 1914, with a corresponding capital of £1,449,537,000, which gave a net receipt of 3 80 per cent. It may be seen therefore, from the foregoing figures that the total amount of capital raised at the close of the year was over £1,347,321,000, of which about £199,352,000, or approximately 16 per cent., was due to nominal additions. These nominal additions formed approximately 19 per cent. of the ordinary stock, 14 per cent. of the guaranteed and preference, and 12 per cent. of the loans and debenture stocks. The total amounts of capital at the end of 1915 compared with 1914 show an increase of about £908,000 in the ordinary, an increase of £3,908,000 in the *guaranteed and preference*, and £1,908,000 in the loans and debenture stocks, making a total increase of £6,050,000. Of the total paid-up capital at the end of 1915, ordinary stock formed 37 0 per cent., preferential and guaranteed 35 9 per cent. and loans and debenture stock 27 1 per cent. The average rate of dividend on the ordinary capital was 3 60 per cent. in 1915, as compared with 3 45 per cent. in 1914. The average rate of dividend on the preferential capital fell from 3 36 per cent. in 1914 to 3 32 per cent. in 1915. Those rates are naturally lower than they would have been had there been no nominal additions to the capital of the companies. The average rate of dividend or interest computed on the total capital, as it would have stood if no nominal additions had been made thereto was 4 13 per cent., as compared with the rate of 3 92 per cent. paid on the total capital including nominal additions.

*Gross Earnings of the Railways.*—The earnings for the year 1915 amounted to £144,860,252, as compared with £139,958,000 for the year 1914, which gives an increase of £6,090,000, equal to 4 22 per cent.

The passenger amounts for the year 1915 are as follows:—

| | 1915. | 1914. | Inc or Dec |
|---|---|---|---|
| | £ | £ | £ |

The earnings for the conveyance of parcels, mails, and such other traffic as is generally carried by passenger trains amounted in 1913 to £9,836,000, as compared with £10,026,832 in 1912, being a decrease of £190,832, or 1·1 per cent. The total figures of traffic falling under the heading of "goods" are £66,640,000, as compared with £64,048,874 in 1912—an increase of £2,591,126, or 3·9 per cent. The aggregate is made up of £32,990 from merchandise, £31,972,000 from minerals and £1,676,000 from live stock. The total quantity of goods carried in 1913 was 588,201,000 tons, as compared with 540,279,126 tons in 1912, showing an increase of 47,921,874 tons or 8·4 per cent.

*Expenditure.*—The total working expenses of the whole of the railways for the year 1914 amounted to £68,173,000, equal to 64 per cent. of the gross earnings, as compared with a total of £67,399,000 for the year 1913, equal to 63 per cent. The increase compared with 1913 amounts to £853,000, or 0·9 per cent. The total number of miles travelled by passenger and goods trains during the year 1914 was 430,330,000, or 2,329,000 less than in 1913. Analysing the expenditure, we find the item £28,268,000 for locomotive power, £13,894,000 for repairs and renewals of carriages, &c. £12,362,000 for maintenance of permanent way, stations, &c., and £24,180,000 for traffic expenses.

*Compensation.*—The amount paid for compensation for personal injuries to passengers sustained during the year 1913 amounted to £166,276, and to workmen £298,473. In the movement of goods the companies have paid for damages and losses £542,209, as compared with £573,524 in 1912—an increase of £186,685. We subjoin a statement showing the amounts paid by the principal companies under both heads :—

*Net Result of Working the Railways.*—As regards the actual net earnings of the companies in 1913, the total gross receipts amounted in the year to £144,860,250, and the total working expenditure to £93,398,872. The net receipts therefore, amounted to £51,461,378, as against £50,094,200 in the previous year. The proportion of net earnings to capital was 3·52 per cent., as compared with 3·42 per cent. in 1912. The amount of paid-up capital increased during the year by about 3½. The average rates of dividend paid on the ordinary and preferential capital respectively rose from 3·45 per cent. and 3·32 per cent. in 1912, to 3·89 per cent. and 3·76 per cent. in 1913, the rates on the other classes of capital remaining substantially unchanged.

The following statement compares the average proportion of net earnings to capital in each quinquennial period from 1871–75 to 1911–15 :—

| Years. | Proportion of Total Net Earnings to Capital. Per cent. |
|---|---|
| Average of 1871–75 | 4·38 |
| ,, 1876–80 | 4·09 |
| ,, 1881–85 | 4·02 |
| ,, 1886–90 | 4·07 |
| ,, 1891–95 | 3·80 |
| ,, 1896–1900 | 3·64 |
| ,, 1901–05 | 3·58 |
| ,, 1906–10 | 3·48 |
| ,, 1911–15 | 3·80 |

## RAILWAY ACCIDENTS DURING 1913.

In 1912 and 1913 the cost per passenger train-mile for personal injury was 0·030 and 0·040 respectively. In loss and damage of goods, the cost in 1912 was 0·910 and in 1913 0·930. per goods train-mile. The number of personal accidents on railways to passengers, railway servants, and others reported to the Board of Trade during the year show a total of 1,066 killed and 30,002 injured (as compared with 1,469 killed and 32 740 injured in 1912). We will now proceed to investigate under three distinct heads the various causes from which these accidents arose :—

| | 1st. *Accidents to Passengers*— | *Killed* | *Injured.* |
|---|---|---|---|
| 1 | From accidents to trains, rolling stock permanent way &c | 3 | 390 |
| 2. | From falling between trains and platforms when entering or alighting from trains | 42 | 896 |
| 3. | From falling off platforms and being struck or run over by trains | 18 | 11 |
| 4. | While crossing the lines at stations | 13 | 11 |
| 5. | By the closing of carriage doors | — | 633 |
| 6. | From falling out of carriages during the running of trains | 32 | 64 |
| 7 | Whilst ascending or descending steps at stations | 5 | 290 |
| 8. | By being struck by barriers or falling over packages, &c, on platforms | — | 140 |
| 9 | From falling off platforms on to the ballast | 4 | 128 |
| 10. | By other accidents caused by the movement of trains | 25 | 211 |
| 11. | By other accidents on railway premises not due to train accidents or to the movement of trains | — | 209 |

and, *Accidents to Servants* in the employ of the railway companies or contractors.—The

| 1913 | 22,360,169 | 28,208,647 | 26,971,317 | 5,292,210 | 1,204,998 | 242,829 | 4,924,302 | 78,874,361 |
| 1914 | | | | | | | | 88,173,200 |
| 1915 | | | | | | | | 98,218,800 |

* Includes an amount for each year respectively of £280,191, £300,168, £307,180, £308,191, £309,181, £309,181, £309,181, £309,181, and £309,181 paid to companies under the Workmen's Compensation Acts, the contributions

casualties under this head resulting from accidents to trains, or in which the movement of trains or vehicles used exclusively upon railways is concerned, show that 535 were killed and 7,838 injured during the year, the following being an analysis of such accidents :—

| | Killed. | Injured. |
|---|---|---|
| 1. While coupling or uncoupling vehicles | 16 | 789 |
| 2. By coming in contact, whilst riding on vehicles, with other vehicles, &c., standing on adjacent lines | 17 | 51 |
| 3. While passing over, under, or standing on buffers | 2 | 5 |
| 4. When getting on or off, or falling off, engines, waggons, &c. | 28 | 849 |
| 5. While braking, spragging, or chocking wheels | 23 | 728 |
| 6. While attending to ground points | 3 | 208 |
| 7. While moving vehicles by capstans, turn tables, props, levers, &c. | 3 | 942 |
| 8. By other accidents not included in the preceding | 78 | 924 |
| 9. From falling off trains, engines, &c., in motion | 7 | 43 |
| 10. When getting on or off engines vans, &c., during the running of trains | 7 | 190 |
| 11. By coming in contact with over bridges or erections on the sides of the line | 4 | 53 |
| 12. While attending to the machinery, &c., of engines in motion | 5 | 370 |
| 13. While working on the permanent way, sidings, &c. | 94 | 175 |
| 14. While attending to gates at level crossings | — | 4 |
| 15. While walking, crossing, or standing on the line | | |
| (a) Fog-signalmen | 5 | 4 |
| (b) 1. On duty at stations | 117 | 204 |
| 2. On duty elsewhere | 19 | 20 |
| 3. Going to or from work | 51 | 49 |
| 16. From being caught bet. vehicles | 17 | 283 |
| 17. From falling or being caught between trains and platforms, walls, &c. | 15 | 85 |
| 18. Miscellaneous | 30 | 970 |
| 19. *From accidents to trains, rolling stock, permanent way, &c.* | 8 | 247 |
| Total | 535 | 7,838 |

In addition to these accidents, other casualties, in which the movement of vehicles used exclusively upon the railways are not concerned, have occurred, viz., 23 killed and 4,890 injured whilst loading, unloading, or shunting waggons, 9 killed and 490 injured while working as cranes or capstans, 9 killed and 1,137 injured by falling off platforms, ladders, scaffolds, &c., in addition to a large *number of accidents from various other causes*, either the result of want of caution or misconduct.

3rd. *Accidents to Persons other than Passengers or Servants.*—Under this head is classed casualties *whilst passing* over railways at level crossings, this caused 72 deaths and 24 injuries in 1908 (as compared with 69 deaths and 22 injuries in 1907). There were 228 deaths and 107 injuries resulting from persons trespassing on the railways, and 251 persons committed suicide upon the lines in 1908 (as compared with 233 in 1907).

*The Cheap Trains Act*, 1883, provides that fares not exceeding the rate of one penny per mile shall be exempt from duty, but fares for return or periodical tickets shall be exempt from duty only where the ordinary fare for the single journey does not exceed that rate. Duty shall be payable at a reduced rate of 2 per cent. on fares exceeding the rate of one penny a mile between stations within one urban district. Such district will contain not less than one hundred thousand inhabitants, and must be of a

NOTABLE RAILWAY ACCIDENTS SINCE 1833 RESULTING IN GREAT LOSS OF LIFE.

| Date. | Company | Nature of Accident | At | Number Killed. |

continuous urban as distinguished from a rural or suburban character.

Officers or men in the military or police forces, when travelling on public service, are charged three-fourths or one-half of ordinary passenger rates, according to number travelling. The Act does not extend to Ireland.

*Hiring of Special Trains.*—Although the majority of railway companies have no fixed charges for hire of special trains, the general charges are five shillings per mile, plus the ordinary fare for each passenger according to class of vehicle hired.

*The Workmen's Compensation Act, 1897.*—This Act, which received the Royal assent on August 6, 1897, came into operation on July 1, 1898.

In this table the data is collected of entirely independent concerns, based on the Annual Reports, and such other sources of information. Joint Line figures are given only in respective proportions.

* Included in the South Eastern and Chatham Companies, which see.

### THE RAILWAY CLEARING HOUSE.

This Institution was opened in Jan. 1842, and in addition to the work of clearing through bookings of passenger and luggage traffic, is the medium through which agreements relating to rates and fares, &c., are arrived at. *Chairman*, E. W. L. Harford, *Secretary*, H. Cuff Smart, *Offices*, Seymour Street, N.W.

### IRISH RAILWAY CLEARING HOUSE.

The Irish Railway Clearing House occupies much the same position to the railway system of Ireland as the (London) Clearing House does to the railways of Great Britain. It was established July 1, 1848. *Chairman*, Sir William J. Goulding, Bart., *Secretary*, Joseph Ingram, *Offices*, 5 Kildare Street, Dublin.

## Indian Railways.

THE construction of Railways in India commenced in 1853, and the total length *open* on 31st March, 1918, was 35,833 miles. They are controlled by a Board *consisting* of a Chairman and two members. The present Chairman is Hon. E. W. *Gillan* and the two members are Mr A. R. Anderson and Mr Cowchman. The Administration Reports on Indian Railways formerly published had reference to the working of each calendar year, the last report issued being that for the year 1912. Owing to the adoption, by the principal railway administrations, of the Government financial year for all accounts and statistical purposes, the reports are now published for the Government financial year, which begins on April 1, and the present report accordingly deals with the transactions of the year April 1, 1913, to March 31, 1914. The capital outlay was £383,493,286. The gross receipts for 1913-1914 amounted to £43,108,833, the working expenses to £21,496,332, or 50·09 per cent. of gross receipts. The net *revenue* amounted to £21,180,800, which gave a return of 5·52 per cent. per annum on the capital invested. The net gain to the Government for the years 1913 and 1912 is £1,076,000. The number of passengers conveyed in the year was over 676,000,000, and the total weight of goods carried was 88,728,000 tons. The Indian Railways have in their service 606,980 employees, of whom 5,090 are Europeans, 8,090 Anglo-Indians, and 602,890 Indians. The number of servants killed and injured during the year from all causes was 439 killed and 996 injured; passengers, 297 killed and 824 injured; other persons, 1,320 killed and 380 injured; total, 2,280 killed and 4,200 injured.

# Indian Railways.

## STATEMENT OF CAPITAL, REVENUE, DIVIDENDS, &c., YEAR 1908 AND 1908.

In the year 1849 an Act was passed making it legal for Indian Railway Companies to pay interest out of capital during construction, subject to the Secretary of State's specific sanction, and to certain other conditions.

| Railway | London Office | Date of Opening of Last Line | Miles Open | Gauge | Total Capital outlay to end of Year | Gross Receipts | Working Expenses | Per Cent. # The Mercantile Fleets of the World.

In consequence of the War it has been necessary to omit the statistics and particulars usually included in this Article. Information corrected to June 30, 1916, will be found in WHITAKER'S ALMANACK, 1917 Edition, pp. 847–858.

In the early part of the 18th century numerous inventors propounded schemes for applying steam power to vessels to be run upon rivers and canals. For a chronological list of the first steam boats, pioneer sailings, and earliest steamship lines, see WHITAKER'S ALMANACK, 1917 edition, page 850.

Space being so limited, the evolution of the steamship in the North Atlantic trade is presented in tabular form (page 768).

In 1824 ocean trade was then carried on with sailing ships, mostly under 300 tons each, and all the steamboats in the United Kingdom only numbered 209.

As the size of steamships increased, the heavy cost of construction necessitated the establishment of Corporations, with great strength of capital, which control the principal ocean routes (see below).

In 1826, 99 owners aggregated 4,132 vessels (19,390,000 tons), which exceeded 38½ per cent. of the entire shipping of the world.

The invaluable Register Book which is published by the Committee of Lloyd's Register of British and Foreign Shipping showed that on June 30, 1916, the steamship empire-builders of Greater Britain owned 12,230 vessels, 20,652,862 gross tons, just over 45 per cent of the world's steam tonnage.

Owing to recent inventions passengers enjoy greater immunity from accidents, the majority of passenger steamers being now fitted with installations of wireless telegraphy and with submarine signalling apparatus.

# APPLIED PHOTOGRAPHY.

By H. WHITWORTH HALL.

The first photographs produced in the camera were taken by Daguerre and Niépce in 1839; an advance was made in 1841 by Fox Talbot with the *calotype process*, which was further developed in 1851 by Scott Archer, who introduced the "wet-plate" process. The gelatine-bromide dry plate was invented by Maddox in 1871 and greatly improved by Bennett in 1878.

Photography has made vast strides since, there is scarcely an industry which does not employ its aid. The greatest undertaking which our Empire has ever attempted annely the present war, is supported by photography. When accurate and and reliable information and measurements are essential, photography supplies the necessary figures and facts in permanent picture form to those in command, and the fallibility of the human and personal element is eliminated. The photographic departments of the Aerial Services, laboratories attached to numerous munition works scattered throughout our country and colonies and countries of our Allies, have proved the great aid photography gives to modern warfare.

Turning from war conditions to the victories of Peace in the world fields of industry photography is equally essential and ubiquitous. Wonderful surgical undertakings of the present day owe their possibility and ultimate success to the Röntgen rays and the photographic plate. The success of the illustrated newspaper, which presents pictures of incidents almost directly after they have occurred, testifies to the triumphs of modern photography.

Applied Photography is photography in its most serious mood, but the lighter side of the subject must not be excluded from mention. There can be practically no home where the portrait photograph has not entered. Our men on active service and we at home scarcely appreciate perhaps the great debt we owe to those who discovered photography, and to others who have helped and are helping in its development. Although photography is in daily use in all countries throughout the world, nevertheless the manufacture of photographic plates and papers is confined to a few countries only and Great Britain comes easily first in the list. This does not mean that, in the other countries where the manufacture of photographic materials is carried on, large quantities are not produced, and that the quality is not of a high standard, such a statement would not only be untrue, but would be very unfair to the photographic industry, but it is recognised that the manufacture of photographic materials in Great Britain has reached a high standard of quality, and British photographic materials have the reputation of possessing the best keeping powers in hot climates. To this is due the preference given to British manufactures by overseas users, the leading firms have established abroad branch houses and agencies, and have gained for this country a very large portion of the overseas trade, with every prospect of its being held and considerably increased.

The subject of overseas photography must not be dismissed without mention of the important part played by photography in the exploration of new lands. No modern explorer's equipment would be considered complete if he did not include photographic apparatus in various forms and large quantities of sensitive materials. It would be impossible to accomplish the same amount of picture-record work with the aid of the pen, pencil or brush, if accommodation could be provided, the artists could not work under the conditions which generally prevail, especially in the Arctic and Antarctic regions. Quite apart from this when picture records of probably inestimable value to present and future generations are required, such as Ponting's pictures of the Scott expedition, it is essential that the fallibility of the artist and draughtsman be completely eliminated.

A branch of applied photography which has come much to the front during recent years is that known as "commercial photography," i.e., photography employed as an aid to commercial enterprise. Manufacturers, merchants, and agents in place of written descriptions, artists' sketches, or actual samples now send photographic pictures, prospective buyers, especially if situated in far distant countries, place greater confidence in the clean straight forward photographic reproduction than in the hand-drawn picture, which may, after all, be but an idealised version of the article as imagined by the artist. Commercial travellers often do more business by showing sets of photographic prints than by exhibiting actual examples of the goods, especially if the latter are of a bulky or numerous nature, often the intending purchaser cannot wait while a lot of unpacking takes place, whereas he will generally look through a set of photographs of articles in which he is commercially or otherwise interested. Such is the fascination which the photographic picture possesses for most people.

Commercial photographs effect great saving in many ways—a photograph costs much less than a sample, there is less packing, less labour in handling and less carriage. Commercial photography represents one of the largest fields of applied photography, and will considerably increase during the next few years. Scarcely a day passes without some new use for photography being suggested or found, and one wonders how we managed in the near past without its valuable aid.

And at London, Paris, Calcutta, Bombay, Montreal.

# ASBESTOS.

ASBESTOS is one of the most marvellous products of inorganic nature, and is a paradoxical link between the mineral and vegetable kingdoms, with characteristics of both, yet altogether different from either. It is found in a hard, heavy rock, and when treated, yields fibre as soft as silk and as light as a feather.

The Greeks called this remarkable material Asbestos, indestructible, and amianthus, undefiled, from its resistance to decay under any condition of time, heat or moisture.

Asbestos is found all over the world. It occurs in some parts of England, Scotland and Ireland, but not in quantities that would pay for its working. The principal sources of supply are within the British Empire, Canada producing the greatest quantity, followed by Newfoundland, Australia, South Africa and Siberia.

Asbestos is composed mainly of the silicate of magnesia with a little alumina, and contains varying quantities of iron oxide. The best fibres are long, flexible and white.

One of the first recorded uses of Asbestos was for wicks for the lamps which provided the sacred fires in the temples of the Gods in ancient Greece. The natives of Siberia were using a cloth made from asbestos about 300 years ago, and the principle underlying the process of working up asbestos from the native rock is much the same to-day as was described by Marco Polo in the thirteenth century. They broke up the asbestos rock found in the native serpentine formations and beat it in a mortar to release the fibres from their earthy base. After repeated beating, blowing and sifting, the fibres were spun and then woven in a rough loom into cloth. By modern methods the raw material is first blasted out and the broken rock carefully hand-sorted, and transported to the mills, where it is coibed, run through crushers, and graded according to the length and quality of the fibre. The raw asbestos is crushed and pulverised, after which the material is dried in heated cylinders. It is then re-crushed, screened and fiberised in cyclone mills. The fibre is now ready for the carding engines, which straighten the fibres and places them parallel. It is finally passed through a finisher or condenser, which removes waste material. It is then ready for spinning.

The demand for the raw material is enormous. Prior to the war, the Germans and Austrians made very strenuous efforts to secure not only the British market but also the markets of the Empire and other countries, but, due to the enterprise and courageous efforts made by the principal British manufacturers, their efforts were frustrated, in spite of the fact that the enemy industry was heavily subsidised.

It is very interesting to record that the war has brought about very considerable developments, and asbestos has been found valuable in ways hitherto unthought of, and in all cases the home firms have risen to the occasion.

Much superior goods are now being made than were ever exported to this country by the foreign firms, and at reasonably low prices having regard to the enormously increased cost of production due to the difficulty of obtaining supplies of raw materials, increased freights, etc.

The Asbestos Industry has a great future before it. Electrical engineers and manufacturers of all classes of steam and electric machinery, shipbuilders, armament makers and many others find asbestos absolutely indispensable. To give a tithe of the manufactures would require a long article to do full justice.

The engineer and electrician find many uses for asbestos in their manufactures, the former calling for steam-engine packings and jointings, in the manufacture of which asbestos is pre-eminent owing to its heat-resisting properties. The electrician calls asbestos into use as the only fireproof textile insulator for his various electrical appliances. Asbestos millboard is largely used as an insulator in buildings and as a lining for retorts, gas stoves, etc. In steam-pipe insulation asbestos plays an important part in the prevention of radiation of heat, and the consequent saving of fuel amounts to a large percentage.

In the form of a specially woven cloth and prepared fibre, asbestos is largely used as a filtering medium in breweries, chemical works, etc., and in the treatment of sewage.

Asbestos finds a wide use in the laboratory in the filtration of acids and other liquids. Fireproof curtains are compulsory in theatres. Asbestos paint is extensively used.

From Asbestos combined with the finest quality British Portland Cement, asbestos-cement building sheets and slates are produced. The scientific combination of these materials gives a product of great strength, fireproof, waterproof, and indestructible, and which is extensively used in the erection of factories and workshops of all descriptions, bungalows, schools, barracks, garages, hangars, military huts, hospital and staff quarters, and is invaluable for lining walls, forming ceilings, or partitions.

In the form of large ribbed roofing tiles or sheets, it is rapidly replacing galvanised corrugated iron in the hands of structural engineers, because it does not decay and is of better appearance.

To-day asbestos is indispensable in a hundred British industries, and in one form or another is found in use throughout the civilised world.

ROCHDALE · ENGLAND

# MARINE INSURANCE.

TOWARDS the latter part of the Seventeenth Century, the Commercial Community interested in Shipping collected together at a small Coffee-House kept by a man of the name of Edward Lloyd, first of all in Tower Street and, after 1691, at the corner of Abchurch Lane and Lombard Street, in the City of London. The name of this Coffee-House keeper has come down from generation to generation in connection with the greatest Shipping and Marine Insurance transactions of the World.

Before his time Marine Insurance appears to have been conducted in England by the Lombards, who came from Italy and founded Lombard Street, but from the time that Lloyd established his Coffee-House, where Seafaring men jostled against Merchants, Britons conducted Marine Insurance in England.

There is still preserved at Lloyd's a Policy of Marine Insurance dated January 20th, 1680, upon the Good Ship called the "Golden Fleece," of 250 Tons (Gasper Hicks, Master), for a voyage from Lisbon to Venice, at the rate of Four Pounds per cent.

Edward Lloyd must have been a man of wisdom and enterprise, for he was the founder of that great system of Commercial and Maritime Intelligence which has ever since been carried on by Lloyd's.

In 1696 he started a Newspaper, which gave a List of Ships whose arrivals and sailings had been reported. That Newspaper, which he called "Lloyd's List," succeeded admirably for a short time, but criticism was not much tolerated in those days, and Edward Lloyd ventured to write an Article which called in question the action of the House of Lords with regard to Silks. The House of Lords apparently resented this, they immediately censured Edward Lloyd, and suppressed his Newspaper, and it was not till 30 years later that he was allowed to re-establish it. Since that date "Lloyd's List" has appeared regularly, and is still printed and published as a daily Shipping and Commercial Newspaper at Lloyd's, Royal Exchange, in the City of London.

The frequenters of Lloyd's Coffee-House were not permitted to enjoy for long the monopoly of Marine Insurance, and in the year 1720 Parliament allowed two Marine Insurance Companies to be established in London. These Companies, The Royal Exchange Assurance Corporation and the London Assurance Corporation, are continuing business at the present day.

In the year 1770 those frequenters of Lloyd's Coffee-House whose particular business was Marine Insurance, formed themselves into an alliance, and moved to Pope's Head Alley, taking with them "Lloyd's List." In 1774 they removed to the Royal Exchange, where the Corporation of Lloyd's is still established, and in the same year the Underwriters of Lloyd's found it necessary to have complete information with regard to the construction and condition of the Ships which they insured, and they accordingly established a Register of Shipping. This undertaking grew and prospered, and is still carried on by "Lloyd's Register of Shipping" at 71, Fenchurch Street, E.C.3.

In 1803 the Members of Lloyd's started a Fund for the benefit of sufferers by the War between this Country and Napoleon. This Fund, called "Lloyd's Patriotic Fund," eventually reached a sum of over £883,000, and has rendered much help to the relatives of Sailors and Soldiers who have fought in all our Wars from 1803 down to the present day. In 1915 the Members of Lloyd's subscribed over £115,000 for a similar object in connection with the present Great War, and this sum is administered by the Committee of Lloyd's Patriotic Fund.

Other funds raised at Lloyd's in connection with the Great War are Lloyd's French Ambulance Fund, £28,583, King George's Fund for Sailors, £16,044, Lord Kitchener National Memorial Fund, £12,244, St. Dunstan's Blinded Soldiers' and Sailors' Hostel, £9,969, and the Y.M.C.A. Canteen and Hut Fund, £4,800, besides contributions to many other War Funds.

In the year 1810 a select Parliamentary Committee was appointed to enquire into the monopoly of Marine Insurance, which was held by Lloyd's and the two Marine Insurance Companies referred to above. The Committee recommended that the monopoly should be abolished, but the House of Commons decided that

Lloyd's had rendered a great service to the Country, through the long years of War with France by supplying the Government with information in regard to maritime matters and, together with the Marine Insurance Companies, by insuring the arrival in this Country of Merchant Ships and their valuable cargoes. The House, therefore, resolved that no alteration should be made, but ten years later, in 1820, an Act was passed by which Marine Insurance in this Country was thrown open to the Public.

Since that date many other Marine Insurance Companies have been established, and these Companies together with Lloyd's form the Marine Insurance Market of London and practically of the World

The Marine Insurance Companies, although competitors with the Underwriters at Lloyd's for Insurance business, are yet supporters of the Corporation of Lloyd's and its system of collecting Maritime Intelligence from and diffusing it to all parts of the World.

The Royal Exchange was destroyed by fire on the 10th January, 1838, and by this unfortunate circumstance most of the important records of Lloyd's were lost It was to the Rooms at present occupied by Lloyd's that Queen Victoria came when she opened the new Royal Exchange in 1844.

In the year 1871 Lloyd's was incorporated by Act of Parliament, and this Act has been amended and added to by Lloyd's Act 1888, Lloyd's Signal Station Act 1888 and Lloyd's Act 1911.

Lloyd's, as a Corporation, does not undertake Insurance Business, and the Committee of Lloyd's, as a body, is only interested in the Insurance Business carried on at Lloyd's to the same extent that the Committee of the Stock Exchange is interested in the Business carried on by its Members, namely, the laying down of regulations to safeguard the interests of Members as well as those of the Public

Besides this, the work of Lloyd's, as a Corporation, is to protect the interests of Members of the Society in respect of Shipping, Cargoes, Freights and other Insurance business, and for this purpose it is necessary to obtain early information of the movements of British and Foreign Mercantile Shipping and to be in touch with every Port in the World.

The Corporation of Lloyd's has therefore established Signal Stations and Wireless Stations at many important points on the Coasts of the United Kingdom and Abroad and there is a Lloyd's Agent, or Sub-Agent, at every Port in the World.

Lloyd's Signal and Wireless Stations have proved themselves very valuable not only to Underwriters but also to Shipowners and Merchants, as, besides getting news of her passing, it is frequently necessary that a Vessel should be intercepted off the Coast, either at Home, or in distant Waters, and ordered to a new destination.

Marine Insurance business has always been the principal business at Lloyd's, but for some years past a very considerable Insurance business for War Risks, Fire, Aircraft, Accident, Employers' Liability Jewellery, Motor Cars, Burglary, etc., etc , has been transacted by Members of Lloyd's

All Underwriting Members of Lloyd's deposit with the Committee of Lloyd's Securities and Guarantees in proportion to the amount of business that they transact, and all Underwriters' accounts are audited annually by approved Auditors, who report the result of these Audits to the Committee of Lloyd's. In addition to this, the personal Liability of all Underwriters is unlimited, and the security of a Lloyd's Policy is, therefore, fully safeguarded.

To effect an Insurance at Lloyd's, it is necessary to employ the services of an Insurance Broker, who must be either a Member of, or a Subscribor to, Lloyd's.

---

## LLOYD'S,

ROYAL EXCHANGE, LONDON, E.C. 3.

*Members of Lloyd's do not advertise, but a list of Lloyd's Insurance Brokers, with their addresses, will be forwarded on application to the Secretary of Lloyd's, Royal Exchange, London, E.C. 3.*

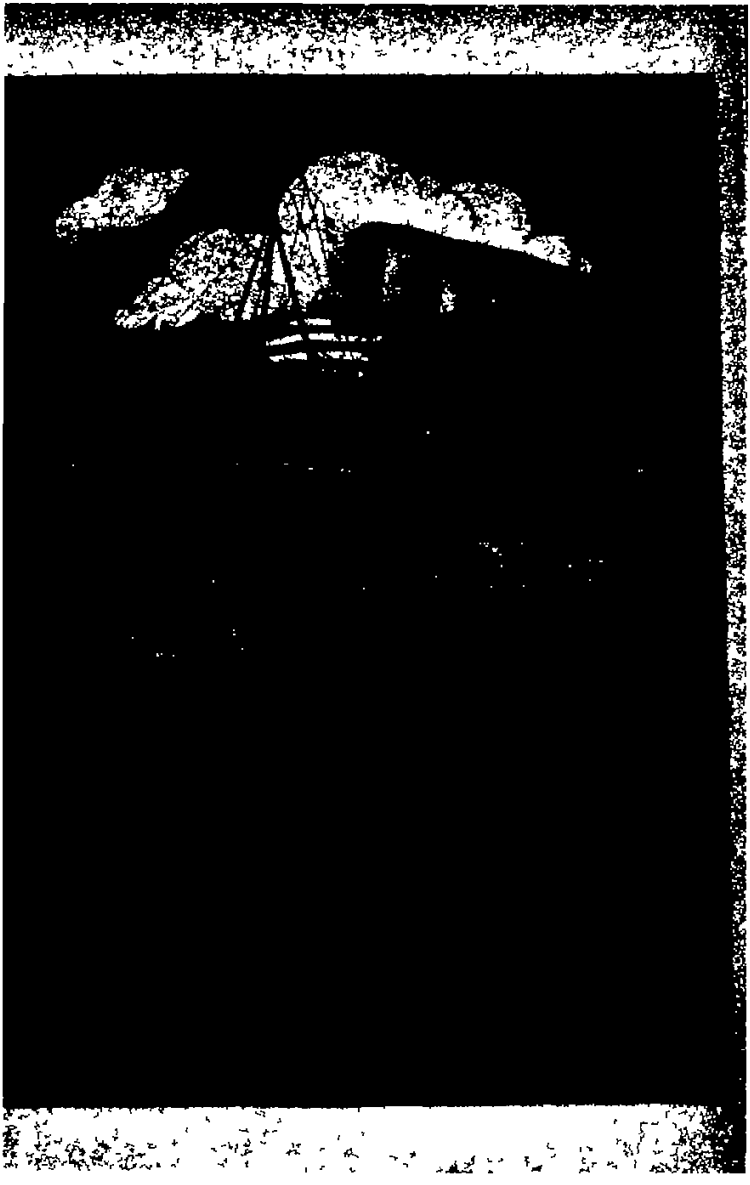
# BRITISH SHIPBUILDING.

By JOSEPH L. CAROZZI, Editor, "Syren and Shipping."

THE United Kingdom contains a much greater number of shipbuilding yards than any other country in the world. Including yacht and boat yards, and excluding Royal Dockyards, there were about 160 of them in pre-war days—67 in Scotland (chiefly on the Clyde), 40 on the North-east coast, 48 elsewhere on the English coast, and 5 in Ireland. During the war the productive capacity of many of the plants has been very greatly increased, and a number of new yards and important extensions of existing yards are definitely projected.

The work which the British industry regularly does is extremely varied, and includes battleships, battle cruisers, light cruisers, destroyers, submarines, fleet auxiliaries, ocean liners, passenger and cargo steamers, cargo steamers, channel packets, coasters, paddle steamers, stern-wheel steamers, bulk-oil-carriers, meat-carrying steamers, dredgers, hopper-barges, yachts, train ferries, and floating docks. A number of firms even specialise in the construction of aircraft.

Before the war British shipbuilders produced more rapidly and at less cost than the most successful of their rivals, and the work they did for foreign owners to some extent reflected that. In the five years, 1910-14, their mercantile work for abroad averaged 22½ per cent. of the total output of merchant ships. In recent years, moreover, they have undertaken the construction of war vessels, including Dreadnoughts, for Brazil, the Argentine, Chile, Russia, Norway, Greece, and Japan.



The productive capacity of the United Kingdom's shipyards has never been greater than it is to-day. For an obvious reason, it is not permissible to be more precise than that. What the post-war power to produce ships will be may be assumed from the facts (1) that in the latest complete year before the outbreak of war—in 1914, that is—something like 2,364,000 tons of mercantile and war shipping was launched, (2) that since then important extensions of plants have been made or definitely projected. Excluding vessels of 100 tons gross and under, the merchant ship proportion of the total was 1,282,153 tons gross. The aggregate for the rest of the world, including British Dominions, compatable with the 2,364,000 tons, was, in round figures, 2,450,000 tons. In 1913 two firms launched between 90,000 and 100,000 tons; four firms between 80,000 and 90,000 tons; three firms between 60,000 and 70,000 tons; nine firms between 40,000 and 50,000 tons; and twenty-one firms between 30,000 and 40,000 tons.

The United Kingdom early took the lead in steel shipbuilding, and it has never lost it. [illegible] construction of leviathan liners. Their *Oceanic*, for the White Star Line, was the first vessel to exceed the length of the *Great Eastern*. The first of the Atlantic greyhounds—the Cunard liner *Blake*—was built on the Clyde; and the speediest vessel in the New York pre-war service—the Cunarder *Mauretania*—on the Tyne. In respect of the comfort and elegance of their accommodation, British-built ships challenge comparison with the best produced anywhere.

The earliest turbine-driven warships and the earliest turbine-driven merchant ships were built in the United Kingdom, so were the first vessels to be propelled by reciprocating engines exhausting into low-pressure turbines, and the first vessel to be driven by geared turbines. Practically all the important developments of Naval Architecture are to the credit of Great Britain. The laborwood system of framing ships longitudinally, instead of transversely, is British. On June 30, 1914, over 470 laborwood vessels of 2,650,000 tons gross had been, or were being, built to the classification of Lloyd's Register. The world's largest bulk-oil-carrying vessels have been built in the United Kingdom—principally on the North-east coast. The steamer with cold-storage accommodation for the transport of perishable cargoes, has been highly developed by British builders. Many ocean-going vessels now hold Lloyd's class for the carriage of refrigerated cargoes. Several of the vessels each bring in a single voyage as much as, roughly, 5,000,000 lbs. of meat.

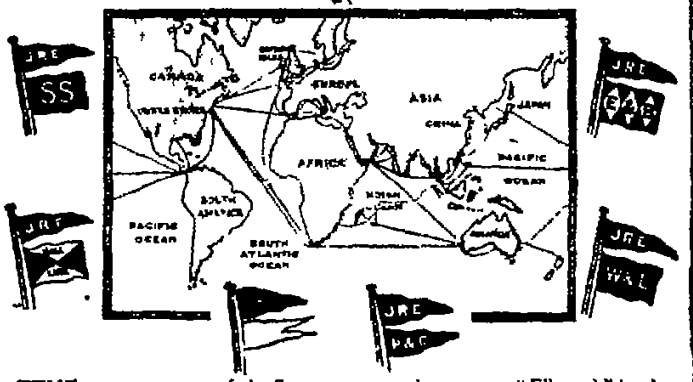
The ordinary cargo steamer is, however, the glory of British shipbuilding, as it is the glory of British shipping. It has been evolved in the doing of the world's work, and is, therefore, ideally suited to it. With trade conditions normal, its first cost is low, and so are its working expenses. With it British owners captured the world's carrying trade. The State's temporary standardised ship policy seems to cut across the course of its further development by taking away the inducement to individual initiative. A number of British firms, however, duplicated cargo steamers in pre-war days, and the only effect of the State's adventure will more than likely be an extension of standardisation along that line.

During the past thirty years foreign countries have done an increasing amount of the world's total shipbuilding. The British industry has nevertheless steadily increased its output. In 1893 it launched 641 merchant vessels of 1,169,000 tons gross; in 1903 [illegible] vessels of 1,427,000 tons gross, and in 1913 [illegible] 693 vessels of 1,932,153 tons gross. [illegible] every type have grown bigger and their speed has appreciably increased. Accommodation for passengers has been vastly improved, the

# BRITISH SHIPOWNING.

## By the Editor of "The Shipping World."

THE war has so profoundly affected the whole course of British shipping, and so completely changed the character of British shipowning, that the pre-war conditions of the industry now appear to be almost historic and of little more than academic interest. During the past three-and-a-half years our shipping has undergone a veritable revolution in ownership. In naval architecture and marine engineering we have been compelled to mark time, there is nothing new in the permanent design and construction of the ships themselves, although to accelerate their output a standard type has been evolved. But in their control and management the urgent war necessities of the State have imposed far reaching changes and restrictions on the shipowner's business, and to all intents and purposes this great international industry, the most important in the world and the one most vital to our continued existence as a nation, has now become a Government-controlled concern. It is no exaggeration to say that the shipping interests of these Islands have sacrificed more than any other key industry. The material wastage from the war has been greater than in any branch of industrial activity. The personal risks have been graver. The war taxation of shipping has been heavier, and ship management has been subjected to a closer degree of supervision than that exercised over any leading business, with the possible exception of our railways.



A few figures will well illustrate the nature and extent of the change that has come over British shipping and shipowning since the out break of hostilities. Before the war the ocean-going vessels on the United Kingdom Register represented between 17,000,000 and 18,000,000 tons gross, and of this total over 15,000,000 tons were regularly employed in trade with the United Kingdom, the remainder being engaged in trades between foreign countries and various parts of the Overseas Dominions. Soon after war was declared, ships engaged in this distant trading were brought home for British trade, with the result that to-day, out of the 15,000,000 tons of ocean-going vessels on the United Kingdom Register, no less than 14,000,000 tons are employed in home service. Of this total, however, only about one-half is available for the regular trade of the country. About 6,000,000 tons are required to satisfy the needs of the Navy, the Army, our Allies, and our Overseas Dominions; while a further million tons is being used for these purposes on the outward voyage, and although available for imports, is lost to our export trade.

It is well known that the services rendered by our merchant navy for the direct purposes of the war are very varied. A considerable number of the high-class vessels possessed of a good turn of speed have been converted into auxiliary cruisers and have already proved their worth, others into floating hospitals, others again into supply ships for the Navy, or carriers of essential foods and materials to the Allied armies and civilian populations, many are transports and hundreds are patrols and mine-sweepers. This radical transition in service has come about gradually, but in now general Government requisition has been followed by Government control over all shipping in order to ensure the employment of every vessel in an equitable a manner as possible and at rates of freight most consistent with the national welfare. A Controller of Shipping has been appointed in Sir Joseph P Maclay, Bart., and a Ministry of shipping is now one of our most important Departments of State. Our Government has requisitioned for hire, at Government rates, about 97 per cent. of the ocean-going "tramps" on the United Kingdom Register, while all British liners without exception have been requisitioned and are being run for Government account. The owners receive hire at fixed Government rates and the private freights they earn go to the State and not to the shipowner. Furthermore, every voyage overseas of a British steamer is now directed by the Government in the national interests, and a limitation of freight rates to the Allied countries is general. Owners have unreservedly placed all their organisation and resources, to say nothing of their experience and knowledge, at the disposal of the Government for running the requisitioned liners, to the neglect of their individual interests at a time when the competition of neutrals in the seaborne trade of the world is particularly keen and strong.

It is not pretended that this state of affairs is one favourable to the future of British shipowning, and in the circumstances we are well entitled to speak of the sacrifices now being made by our shipowners for the benefit of the nation. Very probably the State control of shipping will outlast the war for a length of time perhaps to be measured by years; but shipowners, while accepting the inevitable, are unanimous in their aversion to Government management or to the nationalisation of shipping in any form whatever, and through their two great representative bodies, the Chamber of Shipping and the Liverpool Steam Ship Owners' Association, have roundly declared that it would be a disaster to substitute the principle of State responsibility for the principle of the individual responsibility of the shipowner.

# ELLERMAN LINES LIMITED

Controlled by Sir John R. Ellerman, Bart.

THE carrying capacity of the Steamers serving the numerous "Ellerman" berths throughout the world at present aggregates over 1,000,000 tons, and additional steamers, with an approximate capacity of 200,000 tons, are in course of construction. Powerful and Luxurious Passenger Steamers to suit the various trades are a special feature.

The following are the principal Lines (known collectively as the Ellerman Lines Ltd.) and their trade routes —

# BRITISH MARINE ENGINEERING.

## By the Editor of "Syren and Shipping."

THERE are, including shipbuilders who are also makers of propelling machinery, about 109 marine engineering firms in the United Kingdom 47 in Scotland, 19 on the North-east coast, 31 elsewhere on the English coast, and 3 in Ireland, and in 1913, the last complete pre-war year, their combined output was about 3,000,000 horse-power Two firms had each over 300,000 horse-power to their credit, one between 200,000 and 300,000 horse-power, three between 100,000 and 150,000 horse-power and thirteen between 50,000 and 100,000 horse-power Since the outbreak of war, a considerable number of other firms have been turned on to the construction of marine-engines. The actual productive capacity of the industry is, therefore, much greater than these figures indicate

The pioneers of steam navigation were Britons. The *Comet*, Europe's first successful passenger steamer, was Clyde-built, and from her time forward British marine engineers have led the world. By the steady increase of steam pressures, the adoption of surface condensation, and the compounding, tripling, and quadrupling of expansions they carried the reciprocating engine to a high pitch of efficiency The first warship and the first merchant ship—the Clyde steamer *King Edward*—to be direct-driven by Parsons turbines were British-built, so were the first merchant ship—the New Zealand Company's *Otaki*—to be fitted with reciprocating engines exhausting into low pressure turbines, and the first merchant vessel—the Newcastle cargo boat *Vespasian*—to be driven by geared turbines. The only other embodiment of the turbine idea which has been applied to the propulsion of large vessels is the Curtis—an American arrangement which, in its British form, is known as the Brown-Curtis. Using steam turbines, associated with an electric transmission system, have been installed in two smaller vessels.

Except for a year or two, when the Germans threw out for speed at any price, the blue ribbon of the Atlantic has belonged to a British vessel. The holder at the moment is a Tyne ship—the Cunarder *Mauretania* The speediest cross-Channel packet has generally been British. The Newhaven-Dieppe *Sirdar*—*Paris*—was built at Dumbarton. Some notably fast paddle-boats are to the credit of the Clyde. How British war ships compare in point of speed with those of other countries would be indiscreet to indicate. It may, however, be set down as a fact that no technical interest has played a more important part in the development of the marine steam engine than the British Admiralty.

The economy of British marine steam engines of every type has always been notable, and in the promotion of it auxiliary machinery has played a very large part. British auxiliaries are acknowledged to be the best in the world.

It is not easy exactly to estimate the position of the marine internal combustion engine, as almost immediately after the industry took the Diesel up the war broke out. The Diesel oil-engine is a continental idea, and in, at any rate, its four-cycle form, has made considerable headway there Thanks to the enterprise of Lord Pirrie, a British company is making the most successful of the continent's four-cycle engines—the Burmeister and Wain A British firm—Messrs. Doxford Sunderland—have evolved a two-cycle engine of their own. A number of other British concerns are licensees of Continental makers. On the whole, there does not seem to be any reason to be despondent about Great Britain's Diesel prospects more engines of the type are, in fact, in progress than there have ever been Most of the United Kingdom's surface ignition engines are small. For craft like auxiliary yachts, fishing vessels, ships' lifeboats, naval pinnaces and launches, British-made paraffin engines are preferred to almost any other They also figure, very nearly exclusively, as prime-movers in the emergency lighting and wireless sets of steam-going passenger ships.

Oil burning steamers are naturally less numerous in general trade than they are in trades which run conveniently to liquid fuel sources of supply stations. There are, however, several highly efficient British oil burning systems. Many warships are oil-burners, and a considerable number use it on occasion in conjunction with coal Just before the outbreak of war, one or two important British shipping companies were preparing to convert a selection of their coal-burning steamers to oil-burning.

Steam-turbines, geared down to suitable propeller speeds, were rapidly finding favour when the industry came under control To date, three transmission systems have been tried. In one the turbines generate electricity which is transmitted to motors on the propeller shafts. In another, they drive a centrifugal pump arrangement, which in its turn drives water turbines on the propeller shafts. In the third, mechanical reduction gears are employed. The last-named is far and away the most popular, and an efficiency of 98½ per cent. is claimed for it. The future of marine engineering appears to lie with the geared steam turbine and the Diesel oil-engine.

# OIL TANKERS.

## By ROBERT MACINTYRE.

OWING to the world's heavy normal demand for petroleum and its various products, the sea transport of oil in bulk has become an important and highly profitable branch of shipping. Practically every maritime country has its fleet of tankers, although a majority of the vessels fly the British or the American flag. Exactly how many bulk-oil-carrying vessels there are altogether in different to tell as no figures relating to losses or new construction are available for publication but in May 1915, there were about 6 4 ocean going steamers of the type, representing 1 637,000 tons gross, as well as 67 sailing ships of 99,788 tons gross.

The modern tanker dates from about 1886, the oil having previously been transported in barrels or tins. In 1885 the United States exported 300,000 000 gallons in barrels or tins, and only 1,750,000 gallons in bulk. By 1890 the shipments in barrels or tins had decreased to about 170 000 gallons, and the shipments in bulk increased to 454,000,000 gallons.

An iron sailing vessel, the *Atlantic* was built on the Tyne in 1862 to carry oil in bulk, and a steamer of 1 748 tons gross, the *Vaderland* in 1872. The first vessel to load a bulk cargo of oil in America for Europe was the Norwegian steamer *Star* which sailed from Philadelphia for Rouen in 1878. The pioneer vessels of the type as we know it to-day, were the Tyne-built steamer *Glanaf* of 2,307 tons gross, and the Swedish built *Zoroaster* of 2,307 tons gross, and the Swedish built *Zoet*. They were built in 1885 or 1886 *The Bakuin*, launched a little later at *West Hartlepool*, was *the first British-owned* tanker These were naturally immature embodiments of the idea of carrying oil in holds which are themselves really oil tight tanks but that the idea was sound is abundantly proved by the course which the evolution of the type has taken

The different stages of the progress have been admirably enumerated by Mr Herbert Harringer as follows —(1) The introduction of longitudinal and transverse bulkheads (2) the fitting of expansion trunkways, (3) the provision of coffer dams forward and aft of the cargo tanks, (4) the carriage of oil direct to the skin of the vessel without the use of independent tanks, (5) the abolition of the cellular double-bottom below the cargo tanks (6) the building of pump rooms extending the whole breadth of the vessel and carried down to the bottom plating of the ship and up to the upper deck, (7) the fitting of compound hatches in order to deal with the carriage of other than liquid cargoes (8) the elaboration and improvement of pumping arrangements, (9) the fitting of mechanical ventilation to tanks, (10) the provision of steam heating coils in the cargo tanks, (11) the introduction of liquid fuel in place of coal for steam raising.

The great majority of the large tankers built in the United Kingdom and the United States are constructed with longitudinal frames on the Isherwood system. Some of the vessels have their propelling machinery aft, and some in the ordinary way, amidships. The oil-carrying capacity of the bigger vessels is impressive Between them the Anglo-American Oil Company's Belfast built steamer *Progress* and barge *Aurania*—the steamer tows the barge—carry 18,000 tons of oil. The Eagle Oil Transport Company's *Sea Jermyn* and *Sea Azure*—both of which were built by a well known firm of old-established shipbuilders upon the N E coast—were said at the time they were launched to have a deadweight capacity of 16,500 tons each.

Other types of bulk-oil-carrying vessels are not however unknown. An American vessel has been fitted with cylindrical tanks placed horizontally in the holds the tanks are removable, the idea being to use the ship for carrying either oil or ordinary cargo. Vessels fitted with cylindrical tanks have also been built in the United Kingdom. In their case the tanks stand vertically, and their diameter is nearly the same as the beam of the vessel where they are fitted. To meet the war's demand for more tanker tonnage Lloyd's Register have given classification to ordinary cargo vessels in which the oil is carried in similar tanks

Oil has, as we know, a high value in war and it is, therefore vitally necessary to store it in such a way as to render it safe from attacks by either naval guns or air raft bombs. A Shields firm have designed a large storage tank, 150 ft. long by 30 ft in diameter, with a capacity for 2,400 tons of liquid fuel. It has hemispherical ends, and is *subdivided by* bulkheads of dished form to keep down the weight. Ballasting compartments are provided with efficient arrangements for submerging the tank to the sea bottom and raising it to the surface again when required

The firm have also designed a cylindrical storage vessel 450 ft long with a mean diameter of 40 ft. 9 in and a capacity for 21,000 tons of oil As the oil is pumped out water takes its place so that instead of the barge rising in the water during discharge it gradually sinks but always, within a small margin floats at its loaded draught, a channel in the centre, which runs for the whole length of the vessel, and from which all the valves can be controlled, giving the necessary headway The stability of the vessel is secured by ballasting with pig iron and concrete

This type of floating oil store would be very economical, if used for large volumes, as the steel required for its construction is only a third of that required for an oil tanker, and about half of that required for a cargo vessel of the same deadweight. The replacement of the oil with water, and of the water with oil, ensures an equal distribution of the load, interesting in that way the stresses which a vessel has to endure when the loads are varied in amount and distribution.

# OIL FUEL

By HENRY C. BRAUN, C.E.

ALL oil fuels suitable for industrial purposes are derived from either petroleum, shales, or coal.

The petroleum strata are found distributed over the whole world. In normal times the United States produce nearly 300,000,000 gallons of petroleum annually, Russia and Galicia about a third of this amount, while the East Indies, Rumania, India, Mexico, Japan, Canada, etc. between them provide about 30,000,000 to 90,000,000 gallons a year. Shale oil mainly comes from Scotland. Crude coal tar, creosote oil, as well as crude petroleum and petroleum residues are generally employed as liquid fuel for furnaces for steam, smelting, etc. During the distillation of crude mineral oils, the heat is raised progressively, the first liquids to come off are light spirits while later the lamp oils, lubricating oils, and other denser liquids are distilled off until at last is left a heavy residuum from which nothing further can be distilled. This product has of late years been turned to good account and its utilisation has given birth to a series of inventions of vast and far-reaching importance. The heavier liquid fuels are used mainly in steam boilers, marine and stationary furnaces for smelting metal, and the production of heat for various industrial processes where formerly coal, coke and wood were used. The liquid fuels of lighter density are employed mainly in internal combustion engines. A popular illustration of this system is the use of petrol and paraffin in motor boat, car, and aero engines, which have to be started by external means, such as manual power, compressed air or electricity, etc. The engine sucks into its cylinder a charge of air and fuel, which on the next return stroke of the piston is compressed and, at the right moment ignited by any one of the several means, and the resultant explosive pressure is then used to work the engine, the momentum of the flywheel being relied on to draw in the next charge.

There are three main types of internal combustion engines for utilising the various classes of liquid fuel.

For burning the heavy oil probably the Diesel engine is the best known. In this engine air is compressed to such an extent that an inflammable liquid squirted into it spontaneously ignites so that no external ignition system is required to explode the charge. By the use of coal-tar oil, lately in the Diesel engine, very extraordinary results have been arrived at. In an installation where 4,000 tons of coal were used and over 800 tons of clinkers produced (which had to be carted away) 60 tons of tar-oil is now employed with equal efficiency and enormous economy in running. A home-produced fuel is thus utilised, transport and shipping saved, and coal in its best most economical, and efficient form used.

Engines similar in general construction and design to the popular gas engine found in factories are made to use lamp oils. In these engines the oil is vaporised by external lamps, the heat of the last explosion, or the heat of the exhaust. The vapour is then sucked into the cylinder, together with the proper proportion of air, compressed and ignited by means of a red-hot porcelain or metal tube, or an electric spark.

Shortage of petrol, caused by military requirements, has given rise to many inventions for using common lamp oil for propelling cars and cycles. As in the Hunter paraffin vaporiser the engine is started on petrol, and the heat of the exhaust volatilises the oil before it is delivered to the engine in a truly gaseous vapour, and not merely a current of air holding particles of hydrocarbon in suspension. Twenty to forty per cent. economy is claimed in the running cost by this system. For the lighter liquid fuels, such as petrol, there are engines in infinite variety. The spirit being so volatile no heat is required to vaporise it, a carburettor producing the gaseous mixture which is drawn into the cylinder by the first out-stroke of the piston. The first in-stroke compresses the gas, ignition from an electric sparking plug takes place and the working stroke results. The second in-stroke clears the cylinder and expels the burnt gases.

Even of greater importance in many of the industries are the inventions that have enabled the heavy residual products of the still to be used for producing steam for land and steam boilers. Crude petroleum, shale oil, and the heaviest of petrol-like residues have taken the place of coal, coke, etc., as a fuel in both factories and steamships, and boilers of an aggregate of many million indicated horse-power have already been installed by our well-known British firms alone who have made a speciality of this type of invention.

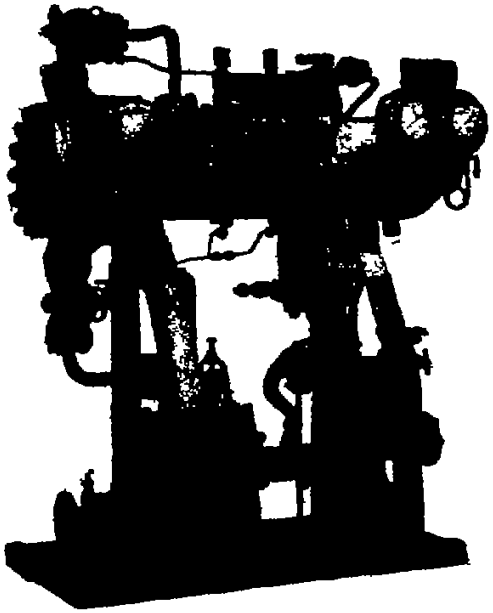
The development of this important branch of industry is largely due to the enterprise and intelligence of British engineers, and although the industry is comparatively in its early stages the results obtained are of the greatest importance. One pioneer company alone has installed in over 300 steamships, some of them up to 14,000 horse-power their system of replacing coal by liquid fuel.

In the Wallsend-Howden patent liquid fuel burning system the heavy oil is injected into the furnaces under pressure by means of special fuel pumps, the liquid passing through heaters and strainers, which raise it to the required temperature and thoroughly filter it. It is then forced into the nozzle situated in the front of the furnace, where it is driven in in the form of a scalpel spray of exceedingly fine particles, which burst into a flame a few inches from the nozzle.

Of course, there is no refuse to accumulate outside the furnaces. In this system there is an annular space around the nozzle in which deflecting plates are fixed. These give a spiral motion to the entering air, and the flame is thus well distributed over the whole of the interior of the furnace.

There is an extraordinary boiler efficiency obtained, as much as 10% per cent. having been arrived at in practice with comparatively low-grade oil fuel.

With this system 16·3 lbs. of water are evaporated per pound of oil burnt, a proof of the extreme efficiency and the cheapness of oil as a fuel.



Apart from the question of economy, oil-burning is the simplest as well as the most pleasing method of steam-raising known.

# OIL MILL MACHINERY

## (The Extraction of Oils from Oleaginous Seeds).

### By R. A. BELLWOOD

VEGETABLE oils have always been of enormous value to the human race used as foods and for medicinal, lighting, lubricating, and a great number of other purposes. More recently an entirely new field has been opened for the use of vegetable oils—in the manufacture of margarine—and the quantities required for this purpose are steadily increasing.

The origin of the oil-milling industry would be difficult indeed to place. By more or less crude methods with native made inefficient plant, oils have been obtained from oil bearing seeds, one might say, since the world began. It is not proposed here to deal with that part of the subject, but to refer briefly to the methods and processes in use to-day.

Until recent years all vegetable oils were expressed (that is the seed after suitable preparation was submitted to pressure and the oil forced out). To-day an alternative method is the extraction of oils by means of chemical solvents is firmly established and in general use.

Generally speaking for expressing oils from seeds there are different types of presses in use. That which has been most favoured in this country is the Anglo-American system, probably on account of the fact that previous to the war the seeds chiefly treated here were cotton seed, linseed and rape seeds which lend themselves more readily to treatment by this system. A standard unit of Anglo-American machinery usually comprises the following:—

A magnetic machine to remove any iron from the seed.

A screen to take out the dirt and foreign matter.

A set of rollers to grind the seed.

A cooker to heat and temper the seed.

A mixer (an iron pan which takes the heated meal from the kettle and moulds it to cake shape for the press).

Four to eight (or more) plate presses, each taking a charge of meal from the moulding machine; these are enclosed in pressbox which retains the solid material and allows the oil to escape.

A paring machine which removes the oily cake from the cake as taken from the presses.

A set of edge runners or mills to grind the paring from the paring machine. The parings are returned to the kettle and mixed with the new seed from the mills.

A set of hydraulic pumps with the necessary valves to operate the presses.

In addition elevators and conveyors are supplied, taking the seed from one part of the plant to another so that the whole works almost automatically. The cakes from the presses are the ordinary oil cake, chiefly used as cattle food.

Another type of press is the "cage" or "perforated box" press of which there are two variations. In what is known as the "tramway system" the extracting boxes of the presses are removable—whereas in the other the extracting boxes are fixed. These extracting boxes are built up of thin staves which have one serrated edge forming a box with innumerable fine perforations these allow the oil to escape under pressure. In the tramway system, the boxes are filled with seed which is then compressed in a preliminary packing press; more seed is placed in the box, and it is again compressed. The boxes are then taken on a truck to a finishing press, where the oil is expressed. In this way more material is packed into the press box than can be done with the stationary type of press. After the seed has been under pressure in the finishing press a given time, the box is taken away to the preliminary press where the cakes are ejected and the box refilled. Preparation, cleaning, grinding and cooking plant is of course required with these presses; this is substantially the same as for the Anglo-American system, modified to suit the particular seed being worked.

Cage presses are usually employed in working up seeds having a high percentage of oil such as palm kernels, copra, ground nuts castor seed, shea nuts, etc. If high class edible or medicinal oils are wanted the cage presses are generally employed but the material is treated in the presses no heat being applied to the seed, and thus results in a better quality of oil being produced known as cold drawn oil. After cold pressing, there is still a considerable percentage of oil remaining in the seed, so that the cakes are ground up, again and may be pressed again hot or better treated by the solvent extraction process by which practically all the oil remaining can be extracted.

The tendency to-day is certainly to deal with practically all seeds by the solvent extraction process, the plant being suitable for seed with either a high or low oil content. There are a few numbered chemical extraction plants already working in this country, and there are likely to be more on account of the demand created by the war for palm kernel and such oils previously to which practically the whole of this trade is in their hands.

The products of the solvent extraction process are oil and meal, the latter being sold as a cattle food or as a fertiliser, according to the seed being treated. At one time there was a strong prejudice against extracted oils and meals but that is rapidly dying out. Oil refining processes have been greatly improved and the oil from chemical extraction plants can readily be used for edible purposes. Chiefly the solvent used in this process is benzine but there is no difficulty in employing other solvents such as trichlorethylene carbon tetrachloride, carbon disulphide, etc.

# THE DIESEL ENGINE

ABOUT the present position of the British Diesel engine industry it is not, for an obvious reason, permissible to be very definite. Relatively to that of our principal enemy it is no worse than it was, and is probably appreciably better. Denmark unmistakably leads the world so far as oil-engines for the propulsion of ocean-going vessels is concerned, but that is in our favour rather than against us, seeing that our most successful makers to date—the Burmeister and Wain (Diesel System) Oil Engine Company, Glasgow—are associated with the most progressive of the Danish concerns, and presumably have access to the records of its experience.

Without detriment to any military or civil interest two important facts may be put on record—(1) the number of the United Kingdom's makers of Diesel engines has very greatly increased since 1914. (2) the country's output of marine machinery of the type has been much more considerable than the man in the street is aware. How much of the experience gained will prove to be genuinely useful remains to be seen, but it is highly probable that the current activity will induce far-reaching enterprise along other lines.

Before the war there were licensees in the United Kingdom of the best-known Continental makers, including German, Belgian, Dutch, Danish, Swiss, Swedish and Italian firms. Not all the European made engines for the propulsion of merchant ships. Swedish, Danish, Dutch and Russian variations of the Diesel idea, adapted by British marine engineers and made for the most part in the United Kingdom, have, however, been installed in British built vessels. Continental Diesels are also to be found in a considerable number of our electrical power stations. A two-cycle four-cylinder Swiss engine of over 4,000 brake horse-power is used to generate a part of the power required by a well-known Belfast firm of shipbuilders.

The Vickers-Diesel, which in one form has been more largely manufactured in the United Kingdom than any other since the outbreak of war, is a native development. So is the Diesel which is made for various land and marine purposes by Messrs. Mirrlees, Bickerton and Day, Manchester. Messrs. Doxford's (of Sunderland) opposed-piston type of two-cycle Diesel, whose performances have very favourably impressed *Lloyd's Register*, is another. About most of the more important British variations of the Diesel idea it would not be expedient to be precise, but the known facts about them, taken altogether, justify the broad conclusion that our technical progress is, at any rate, in places, highly promising.

Diesels which do stationary work on land are, as the records of public and private power-stations show, highly efficient. Their economy over even turbo-generators is in normal circumstances very marked. Just now, of course, with fuel oil very dear and almost unobtainable, their superiority is naturally not so pronounced, but, judging from the testimony of members of the Diesel Engine Users' Association, tar oil promises to be a highly suitable substitute. As tar oil is a home product, there are obviously interesting possibilities in this direction.

In merchant shipping the Diesel has, so far, been applied to the propulsion of only comparatively slow vessels, although it is bound, the advocates of its use claim, eventually to displace the steam engine in all types and sizes of ships. The economy of the Diesel cargo vessel or passenger and cargo vessel, is very marked, especially on routes which are convenient to oil sources or supply stations. The fact that coal is normally cheap in the United Kingdom and oil dear is of less importance than it seems to be, because a Diesel ship can do more work on a less weight and bulk of fuel than a coal burning steamer. It can, in fact, bunker at the cheapest oil port on its route for the round voyage.

The oil consumption per brake horse-power of a marine oil engine of the Diesel type may roughly be assumed to be 0·45lb. at full power. Taking the coal consumption of a modern reciprocating marine steam engine at 1·2lb. per indicated horse-power (or about 1·47lb. per brake horse-power) a Diesel ship would, therefore, be able to do the same work as a steamer of the same dimensions on 33 per cent. of the fuel weight. The Diesel ship's superior economy is not in any degree doubtful, per unit of capital investment her earning power is much greater.

In the early stages of its adaptation to the propulsion of ocean-going merchant vessels there was ground for the criticism that the Diesel was less reliable in the rough and tumble of sea work than the reciprocating steam engine. So far, at any rate, as the best makes are concerned, there is no point in the objection now. British ships propelled by means of British-built four-cycle Diesels have made long runs of thousands of miles in all kinds of weather without a machinery mishap involving an involuntary stoppage. The best Diesels are now, indeed, quite as reliable as the steam engine.

# THE BRITISH AIRCRAFT INDUSTRY.

By E. AUSTIN HURSON.
(The first Aeronautical Editor of "The Daily Mail," Paris.)

THE aircraft industry, as we know it to-day had its inception amidst the stress and turmoil of war. Before then, aeroplanes, and all that appertained thereto, were in the experimental stage, and nobody seemed to be over-anxious to launch out in such a colossal manner to make it possible to lay claim to the possession of a great British industry.

Aeroplane building, strange as it may seem—for time seems to fly swiftly these days—is not quite a decade old. In 1903 the Wrights of America were making successful flights with a motor driven aeroplane but it was not until three years later that the first successful steps were reached by Santos Dumont.

These pioneers if they did not build their own craft with their own hands were largely responsible for their construction and the machine on which Dumont first flew and which is kept as a relic in London shows the amazing strides which have been made since the frail bamboo parts were fitted together for these first epoch making journeys.

The flights of Henri Farman, with his biplane the further successes of the Wrights in France the Channel-crossing by Blériot and the London to Manchester flight by Paulhan brought convincing proof that there was a future for the aircraft industry, but with everything still in the experimental stage there was no great inducement for pioneers to launch out on ambitious undertakings.

In the commercial world something more than patriotism must provide the incentive and the monetary power for a new invention may suddenly revolutionise a young industry and divert into rival channels the moneys which early effort has anticipated.

The war, however showed clearly that the aviation problem was one which must be faced, in spite of all risks and without delay and necessity serving as a goad, the industry sprang into being and made such remarkable strides that to-day it has become one of the most important in our midst and as the future of which is so sure that it can even be regarded as the solvent of more than one of the industrial problems which will arise after the war.

The production of aircraft has reached such a high stage that the elements of risk so far as commercialism is concerned have almost been overcome. The machines now in use, turned out in countless numbers in the great workshops of the country are of trustworthy manufacture easy to handle and manœuvre in the air capable of long distance flights in all weathers, and able to withstand the hard wear and tear of continual use. The organisation of the factories is as perfect as one could well wish them to be, and the great armies of workers who before the war were employed at other trades have been trained to such a high state of efficiency that when the war is over the great work which has been done during the last three and a half years will not only go on smoothly, but will enable us to keep a grip on the lead we have won in aircraft building.

There can be no doubt that immediately the war is over there will be a great boom in aircraft building, and many new companies will be floated. I anticipate no slackening off, for the simple reason that commercial firms who have a considerable lee-way to make up will be among the first to recognise that, in business the firm who gets there first will win the prizes and that the possibilities of the air must be considered.

It is impossible to say exactly how things will shape but the express delivery of small and costly packages will probably be among the first things to be considered and from that the quick carrying up of the passenger service to the continent will only be a step. The naval and military requirements will also have to be met and maintained so that the possibilities of the industry may be said to be practically without limit.

To maintain our superiority in the industry it will be necessary to see that every encouragement is given to all its various branches. In the first place, the realms of invention and experiment must be made easy of access not only to the talent at present in the workshops but to all who show an aptitude for research work. The inventive mind of Great Britain has stood us in good stead during every crisis which has arisen in the war, on the field where the tanks roll successfully up to victory, on the sea where we have striven to combat the U boat menace, and in the air, about which at the present time one can only enlarge.

There is no reason to fear that after the war Great Britain will not still be predominant in scientific genius but bearing in mind that a sudden discovery may bring marvellous changes to the industry it cannot be over emphasised that we must be constantly at work in the experimental laboratories and workshops in our colleges and technical schools to make sure that such a discovery shall be ours. Nor must the workers be disbanded and all need to drift back to the trades from which they have been drawn. Those who are specially skilled, who have become experts, are an asset to a nation on the threshold of a new era, and can help on to join the others who, as the industry develops, will find employment in the great factories which will spring up in the country.

WHITEHEAD
AIRCRAFT
RICHMOND

# COAL AND COMMERCE.

By C. H. CORDINGLEY, Cardiff Representative of "Lloyd's List."

STRANGE as it may seem, it is nevertheless a fact that it has required a world wide war to bring home to us the value of our unrivalled coal supplies. A moment's reflection will show that the war could not have been carried on without the aid of a plentiful supply of this commodity and it is our good fortune to possess the best steam coal in the world. It is the lifeblood of the Allied Navies and the Mercantile Marine. Without fuel, the provision of ships, munitions and guns, and the assemblage of the vast amount of material necessary for the prosecution of the war could not proceed. Coal has been our chief export, and has played an important part in cheapening our incoming goods and maintaining the value of the sovereign. In many ways coal has been more valuable than gold, and has been the chief negotiable instrument utilised by the belligerents with neutrals for supplies of foodstuffs, raw material etc. The cost of supplies for home use has advanced upon pre war figures and averages anything from 20/ to 25 per ton according to quality and locality, but these prices are low compared with 35/ to 47/ for coal in Paris, while Spanish consumers are glad to secure British coal even at the extraordinary cost of £15 to £16.

But vital as the part is which coal has played in the war, *its place in the constructive elements* when peace comes will be equally as prominent and valuable. Reliable statistics of coal production throughout the world are not obtainable for the past three years but it is a self evident fact that so far as the continental countries are concerned the fall in production has been substantial. There is the loss of the Belgian coalfield, and the best collieries in France are in the war zone. In the case of the United Kingdom the output of 287,411,000 tons in 1913 dropped to 256,349,251 tons in 1916, a loss of 31,061,513 tons, and this falling off has become more substantial during 1917. The production in South Wales was less in 1916 as compared with 1913 by nearly 4½ million tons. Men employed in the coalfield of this country numbered 1,110 484 in 1913, but for 1916 the figure was 988,693, a reduction of 112,827, and on the basis of the average production per person in 1913 this means a loss in coal raised of over 29½ million tons. The rapidity with which we regain our pre-war production will depend very largely upon the transport facilities available. The scope for trade will be unprecedented. It is worth noting that in 1913 Germany exported to Italy 902,000 tons of coal, to France 2,342,000 tons, to Russia 2,102,000 tons and to Belgium 5,728,000 tons. Italy also imported some millions of tons from Austria. In the same year, 1913, France in addition to her own production of nearly 40 million tons, imported altogether 22,849 000 tons of which the United Kingdom sent 18,775,000 tons. It is certain that for years after peace is declared France, Belgium, Italy, Russia, Portugal and Spain will look to this country mainly for their fuel supplies.

The stocks of coal abroad are everywhere low. The coaling stations throughout the world will need replenishing. These stations which have been of immeasurable service during hostilities in coaling the Allied Navies and Mercantile Marine, will be increasingly valuable in the future. For trade to resume even its pre-war condition, to say nothing of extension, ships must run and must be coaled, and one of the first operations of coalowners and coal exporters when peace is declared will be to see to the refilling of the various coaling stations throughout the world. Germany recognised the value of these stations before the war and made strenuous efforts to get a footing in the Mediterranean depots at the expense of selling Welsh coal at a loss. That however should not be permitted in future.

Much could be written of the scope for *increased trade with South America*. Great Britain has been unable to keep up her supplies to Argentine, Uruguay, and Brazil, during the past three years, and the total has declined from 4,611,000 tons in 1914 to 1,803,000 tons for 1916, whereas the American owners increased their shipments to the same countries from 476,000 tons to 1,854,000 tons in the same period.

Costs of production have increased enormously in the United Kingdom largely due to higher wages, while as regards material, pitwood which before the war cost 2/ per ton, has risen up to 75/- per ton. The tendency of labour is rather to reduce the output per man. This being so, coalowners will be forced more than ever to make the best of their production and by the provision of up-to-date plant develop the by-product side of the industry.

The Coal Trade of the United Kingdom is likely to be under the control of the Government for some time after the war. How long it is impossible to say, but there is little doubt that it will be an advantage to all concerned, consistent with our obligations to our Allies, that those engaged in the commercial side of the industry should at the earliest opportunity have free scope to exercise initiative and enterprise.

# TUBE MANUFACTURES.

## WROUGHT-IRON AND MILD STEEL TUBES OR PIPES.

By H. J. RHODES.

THERE must be many users of tubes, or pipes as they are just as often called, to whom the history of the industry and the process of manufacture are more or less unknown. The manufacture of tubes from wrought-iron and steel is a comparatively new industry.

At the beginning of last century, gun barrels were made from iron plates or strips by bending them into the rough shape of a tube with the edges overlapping and then welding the edges together—the tube being supported inside by a bar or mandril. It is on record that in 1815 Wm. Murdoch, the pioneer of gas lighting, employed old gun barrels screwed together to convey gas in his works near Birmingham, and for ten years thereafter gun barrels were apparently the only available source of supply for those who required wrought iron tubes.

In many parts of the kingdom to-day gas pipes are still spoken of as gun barrel —an excellent example of how a name can be perpetuated to describe an article which has long since lost all connection with the original. The need of wrought iron pipes grew rapidly, and a quicker and less costly method of manufacture than that of gun-barrel must be had to be sought for, and this was discovered by Cornelius Whitehouse, of Wednesbury, in 1825, when he invented the process of butt-welding with a draw bench and dies.

The principles of his invention have been in use ever since for the manufacture of tubes by the butt-welding process, but, naturally, the methods of application have been very greatly altered and improved.

The production of tubes by the Whitehouse invention did not for long fulfil all the requirements of the new conditions which were arising, and for which larger and stronger tubes became necessary than could be produced by the butt-welding process. The minds of many ingenious men were at work, and it was only after long and costly experimenting that, somewhere about the year 1840, the process known as lap welding was established.

The methods of welding tubes known as butt welding and lapwelding were, until comparatively recently, the only processes employed for the manufacture of wrought-iron and steel tubes, and probably three-fourths of the world's requirements are still manufactured by these two original methods.

The butt-welding process is usually the process by which tubes from ¼-inch to 2-inch bore are manufactured for gas, water, and steam, and like purposes where the pressures are normal.

The strips or hoops are delivered to the tube mill from the iron and steel works of a length, width and thickness suitable for the size of tube to be made. The flat strips or hoops are brought to a welding heat in a regenerative furnace, gripped by tongs, and drawn from the furnace through a bell-shaped die. The die is shaped so as to gradually bring the hoop into the shape of a tube, the edges being forced against together and welded. The tube after being welded passes immediately from the draw-bench through sizing and straightening rolls to give the correct outside diameter and finish to the tubes.

The lap-welding process can be applied to all sizes of tube from ¼ inch upwards.

The strips or plates are first of all planed or scarfed on the edges. The scarfed strips are then heated to a bright red heat in a "turning up" or "bending furnace," from which they are drawn through a die so designed as to bend the plate into a tubular shape with the edges overlapping. The plate, when so shaped, is termed a skelp. The skelp passes into another furnace, where it is raised to a welding heat, and is then put hot out at the front of the furnace into the welding rolls, which are set one above the other, each having a semi-circular groove of a diameter equal to the external diameter of the tube. Between these rolls a mandril is held in position on a long bar, over which the revolving rolls rapidly carry the tube. Thus the weld is made by the pressure exerted on the lapped edges while passing between the roll surfaces and the mandril.

When the use of mild steel became general, a great deal of attention was directed to finding a suitable method of producing tubes direct from solid bars, by which means there would, of course, be no weld. These tubes became known as solid drawn or weldless tubes. A great deal of ingenuity was displayed, but the difficulties to be overcome were so great that it is only within the last few years and after the expenditure of very large sums of money that any of these processes proved a commercial success. By far the greater part of the weldless tubes made to-day are produced by what is known as the hot-rolled process. As a rule, cold-drawn tubes are only produced for certain special purposes, the cost of producing cold-drawn tubes being very much greater. The first operation in the manufacture of hot-rolled weldless steel tubes starts upon a billet of round steel bar, cut to such dimensions as will give the required size and length of tube. After heating, the billet is passed through the piercing machine, the result of this operation being a short thick walled tube, which is then transferred to a rolling mill, where, by a series of passes through the rolls, the tube is gradually rolled out to the required length and thickness.

There are a variety of methods for piercing and rolling weldless tubes, which it is not possible in an article of this length to describe.

The processes of manufacture of wrought-iron and steel tubes briefly described in this short article, viz., the welded and the weldless processes, together constitute the methods by which practically the entire requirements of the world are supplied.

The industry of tube-making has grown to enormous dimensions. There are large works in most European countries, and in Canada and the United States. Great Britain, the pioneer of the industry, is one of the largest producers.

# BRASS FOUNDING.

THE art of recovering metals from their ores and the skill with which they have been applied to the use of man is one which at all times has been intimately associated with the advance of civilisation. The earliest stages of this art date from the era known as the Bronze Age, when the copper-tin alloys or bronzes were the most satisfactory, if not the only, metals that were shaped into tools and weapons. In those remote days iron was either altogether unknown or its properties were not understood. The earliest bronzes were not made by the melting together of the two pure metals copper and tin, but by the reduction of oxidised ores of copper containing tin-stone, or of copper ores intentionally mixed with those of tin. The two metals were in this way simultaneously reduced and bronze obtained in one metallurgical operation. The smelting process was conducted in the most primitive of furnaces, which simply consisted of a hole in the ground into which the metal-bearing materials and fuel were charged, blast being supplied by means of a rude foot blower. Under these conditions the quantity of metal obtained from each melt was not more than a few pounds, and the difficulties were such as to lead to marked variations in the composition of the alloys made. Nevertheless, when the adverse conditions under which the ancients had to work are taken into account the results they obtained are really extraordinarily good. It is quite misleading, however, to credit the early metal workers, as some people do, with a knowledge of hardening and tempering bronze that cannot be reproduced at the present time. As regards sword blades, &c., there is no doubt their method was first to cast the metal to the desired shape and size and then to subject the cutting edges to severe hammering whilst the metal was cold. It is to this hammering or "cold working" of the metal that the comparatively fine cutting edges of the copper and bronze implements must be attributed.

As in the case of bronze, the copper zinc alloys or brasses were not first made by the melting together of metallic copper and zinc. The Romans, who were the first makers of brass, made it by melting granules of copper along with calamine or zinc ore and charcoal. The mixture was first heated to a comparatively low temperature at which the zinc was reduced and this metal being volatile its vapours diffused into the solid copper. When this stage was finished the temperature was raised and the copper permeated with zinc became molten and brass was produced. This method of making brass was in use in England even up to about 1780, although the use of metallic zinc for this purpose was known in this country so far back as 1721.

With the increased industrial demands for more regular and reliable high quality alloys of all kinds, which was brought about during the nineteenth century, it became necessary to pay great attention to the metallurgy of the non-ferrous alloys both for general foundry purposes and for rolled and extruded sections. Stimulated by these demands manufacturers and scientific metallurgists have made many investigations and accumulated valuable information relating to the influence of specially added elements such as phosphorus, manganese, nickel, silicon, iron, aluminium, &c., upon the chemical, physical, and mechanical properties of the bronzes, brasses, aluminium alloys and a wide range of other non-ferrous alloys. Brasses and bronzes containing one or more of the above elements are now very widely used for a variety of special purposes, and the results that are now daily specified and produced are vastly superior to those that could be got only a few years ago. As a natural sequence to the advance which has been made in this connection it has become essential to have stock alloys containing definite percentages of these special elements, and free from objectionable impurities, in such a form that they can be conveniently and economically added to the required mixture. Thus we have alloys containing phosphorus in phosphor-copper and phosphor-tin extensively used in making phosphor-bronze, manganese in manganese-copper for the manganese brasses, and certain aluminium alloys, silicon-copper for silicon-bronze, &c. nickel-copper alloys to be used as such, or for the introduction of nickel to bronzes and aluminium alloys.

Many of the copper alloys are now rolled or extruded into numerous kinds of sections, and in this form they are extremely useful for the rapid production of special articles, when required in large numbers, by automatic machines. Though not fully appreciated by many this question of output is only one, and in many instances by no means the chief, advantage of using rolled or extruded bars; by working with bars of this kind the user obtains a much more reliable and greatly superior article from the point of view of strength than can be got by the ordinary method of casting. Further, the makers of such bars can supply the same material in a variety of conditions covering a wide range of hardness, strength, and ductility.

Leading types of merchandise in which brass and bronze is an essential feature, such as cabinet brass work (door furniture, locks, and general domestic brass work) gas and electric lighting fittings, water and steam fittings, ornaments, and the multitude of other purposes in which copper alloys are the main feature, are some of the British industries that has materially contributed to the development of [illegible] founding.

# CAST IRON INDUSTRY.

By JOHN KING,

Chairman National Light Castings Association.

THE art of melting and casting metals goes back beyond the confines of written history and references in the records of the ancient Egyptians and early Hebrews make it certain that even in those times the art had not only been practised for a very long period but had reached a comparatively high stage of development. These early castings were, of course, of bronze cast iron being then unknown.

In Ironfounding there is a record of steady progress in the methods of manufacture and quality of the products.

Ordinary iron castings were not regularly produced in Great Britain until the year 1700 although such castings had probably been first made in this country as early as 1490. The casting of ordnance dates from the beginning of the sixteenth century a large iron gun having been cast in London in 1516 while one or two of the cannon in the yard of the Tower of London date from about 1529. The skill and experience of English founders in casting ordnance appears to have given them a leading position by the time Elizabeth came to the throne, and during her reign considerable numbers of cast iron cannon were exported to the Continent. Dud Dudley who obtained a patent for iron manufacture from James I. in 1619 was an ironfounder in addition to being an ironmaster.

In 1706 a brassworks known as the Baptist Mills was established at Bristol by Abraham Darby in association with four partners, the workmen being Dutch brass founders, who had been brought over from Holland some time before to make brass castings. Darby induced his workmen to endeavour to make iron castings in sand moulds and as a result considerable loss was incurred in unsuccessful experiments. One night, in association with a young workman named John Thomas Abraham Darby succeeded in casting an iron pot and shortly afterwards he took over the Coalbrookdale Ironworks where for more than one hundred years iron castings were regularly produced by the same process, every precaution being taken to preserve the secret.

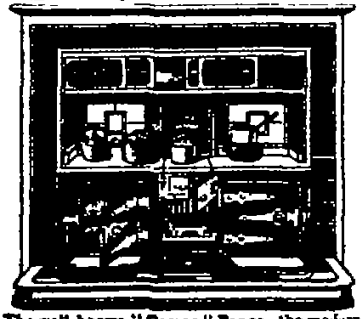
During this period ironfounding experienced an immense development. The first of the great Scottish ironworks had been established by Sir George Hay as early as 1690. The Carron Works were established in 1759 and the Clyde Ironworks in 1786. In all these, in addition to the manufacture of pig iron, cannon and other iron castings were produced. An important branch of the industry which has been actively developed during the past 150 years is the production of castings for the building trades, domestic use, and architectural purposes.

The invention of the steam engine by James Watts marked a new epoch in the iron industry, followed by the development of iron and steel shipbuilding.

Cast iron is now applied to a very wide variety of purposes, and the products of the ironfoundry have played an important part in the industrial development of the last century. Castings for the engineering and shipbuilding trades form the chief output of many important foundries. The manufacture of large cast iron pipes for water supply and sewage schemes was at the beginning centred in Great Britain, and British ironfounders supplied the requirements of the world until a comparatively recent date, when the advent of German and American competition deprived them of a large part of the trade. A large number of foundries devote themselves to the lighter classes of castings for the building trades and domestic purposes, such as cooking ranges and heating stoves, pipes and gutters for the conveyance of rain water, soil and drainage, hot water heating pipes and apparatus, cast iron baths and hollow ware, staircases, verandahs and other constructional work, school fittings and a wide variety of general castings.

Great Britain was the emporium of the world for these products until recently when America and Germany entered into competition. The latter country, especially by cutting prices secured a considerable share of the export trade and had begun a vigorous campaign in the British market immediately prior to the War, the British manufacturers being handicapped Britain having nothing to bargain even with our Colonies, but the Colonies generously gave preferential conditions to the Mother Country.

Had the iron and steel industry been fostered here as it has been in Germany and America, it would have been better for Britain to-day.



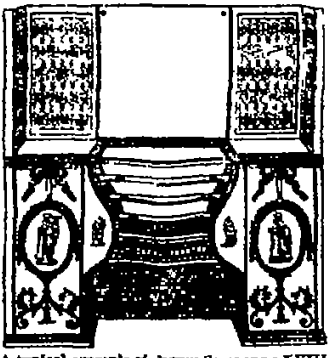
One of the marvels of this war time has been the wonderful adaptation and increased power of production of the Foundries for the production of War appliances, Grenades, Bombs, Fuses and the varied assortment of parts connected with Shells and Bombs, which hitherto had been made in Brass, Copper, and Steel are now made in Cast Iron, and the production is phenomenal.

It is for our Government to see that besides home trade our interests in the export market are so maintained as to enable us to obtain, keep and develop our proper share of the world's trade.

Britain ought to remember that in the eighties she led the world in the production of iron and steel, but in 1913 her total production only amounted to 15 per cent., America and Germany having an output of, roughly, 35 per cent. of the total. Bridlebare, consider! Remember our King's command before this terrible war began—"Wake up, Britain."

By Appointment
CARRON

**CARRON COMPANY, who are the pioneers of the ironfounding industry in Britain, manufacture every conceivable article for which cast-iron can be serviceably used.**



**The well-known "Carron" Range**—the modern Range—introducing all the latest improvements, including inner glass oven door through which the progress of cooking can be watched

They mine their own ore, smelt it with coal from their own Collieries, and carry out all subsequent operations in the making and founding of iron. The name CARRON has stood for over a century and a half, as it stands to-day, for all that is best in every class of iron work. Prominent amongst the Company's Manufactures are:

FIREGRATES (ANTIQUE and MODERN), FIRE-IRONS, RANGES, HEATING STOVES, All kinds of ELECTRIC COOKING and HEATING APPLIANCES, GAS FIRES and COOKERS, COOKING APPARATUS, STABLE FITTINGS, BATHS and LAVATORIES, GARDEN SEATS, ROLLERS, etc. GATES, RAILINGS, VERANDAHS, and Every Description of STRUCTURAL WORK, GENERAL and SPECIAL CASTINGS, etc.

**Write for Free Catalogues, stating goods particularly interested in, and learn more fully the merits of these world-renowned productions.**

A typical example of Carron Company's XVIII Century Design Firegrates, taken from their unique collection of original wood carvings.

CARRON COMPANY
Founded 1759.

**Works: CARRON, Stirlingshire.**
Branch Works:
PHŒNIX FOUNDRY, Sheffield.

Showrooms: LONDON—(City) 15, Upper Thames Street, E.C., (West End) 91, Berners Street, Oxford Street, W., also at LIVERPOOL, GLASGOW, EDINBURGH, BRISTOL, NEWCASTLE-ON-TYNE, and BIRMINGHAM.

# COPPER.

By L. H. QUIN.

THE date of the discovery of copper and of its earliest employment is veiled by the mists of antiquity, but the metal was certainly in use long before the First Dynasty in Egypt, possibly 5,500 B.C., and it is one of the half dozen to which reference is made in the Old Testament where we are told that Tubal Cain was a worker in brass and iron. The copper mines of Mount Sinai are said to be the oldest known, but the Rio Tinto Mines in Spain have been worked on and off about 3,000 years.

The Welsh smelting industry dates from the sixteenth century, and early in the eighteenth century the bulk of the world's copper was derived from British mines, chiefly in Cornwall. The Welsh smelters about the middle of last century drew largely for their raw material from Chili, which country was then developing its mineral resources, but nowadays the greater part of the world's copper comes from North America, and a still greater proportion is refined there. There are great hopes of increased production, especially from African and South American, important schemes being in progress in the latter part of the world, while the developments in progress in Australia should attend to production there. Further to add to increase the importance of the Empire, a Copper Producers' Association has been formed in Australia which will entirely control the output there, hence all chances of the business getting into alien hands has been removed.

The copper industry in North America dates from about 1844 when the metal was discovered in the State of Michigan, and within twenty years or so the Lake Superior mines became the most important producers in the United States. The output of the British Empire last year amounted to about 100,000 tons (45,000 tons from Australasia and 55,000 tons from Canada), or, say, 7 per cent. of the world's supply of nearly 1,400,000 tons. Of this total over one million tons were converted into refined metal in the United States. The capacity of the United States refineries now approaches 1,800,000 tons of refined copper a year and they will probably be fully engaged owing to the enormous ensuing supply of raw material available, thanks to the enormous stimulus to output provided by the high war prices.

The average price of refined copper in 1913 in London was £73, with a world's output of 968,000 tons; in 1914 £68, with an output of 980,000 tons; in 1915, £84, with an output of 1,400,000 tons, and in 1916, £118 with an output of 1,400,000 tons.

The principal grades of copper are as follows: Best selected (refined), averaging 99·75 per cent. pure; Blister and Bessemer (rough copper from refining), running 98 per cent. pure and upwards; Chili bars (rough copper), 95 per cent. to 99 per cent. pure, frequently carrying bullion; Electrolytic (refined), 99·93 per cent. pure upwards; Lake (refined) copper from the Lake Superior mines, Standard practically anything from 99 per cent. pure upwards, and Tough (refined), about 99·26 per cent. pure.

In the years prior to 1914 the electrical trade in its various ramifications was the largest consumer of copper, chiefly in the form of wire for power transmission, lighting and communications, while very big quantities of metal were also absorbed by electrical and general engineers. Since the war there has been an enormous consumption of copper for the manufacture of brass (an alloy of copper and spelter) for cartridge cases and shell fuses, hundreds of thousands of tons a year being absorbed for this purpose, and this is the chief demand to-day.

British manufacturers have always excelled in the production of finished copper and brass goods, and there is not the least doubt that their export trade will be immensely stimulated when business gets upon a peace footing again. They have always held their own in the past, and the close of the war will find them in a stronger position in every way to increase their volume of export business.

The following table taken from *Quin's Metal Handbook and Statistics* shows the position of supplies during recent years:—

| | 1913 | 1914 | 1915 | 1916 |
|---|---|---|---|---|
| Africa ... | 22,510 | 23,765 | 24,000 | 35,000 |
| Australasia ... | 46,500 | 37,600 | 40,000 | 45,000 |
| Canada ... | 34,500 | 33,610 | 48,000 | 55,000 |
| Chili & Bolivia | 87,335 | 85,145 | 93,000 | 70,000 |
| Germany ... | 34,000 | 30,000 | 20,000 | 20,000 |
| Japan ... | 72,000 | 67,000 | 50,000 | 50,000 |

# GALVANIZED IRON.

By JAMES WHITBY, Chairman Metal Trades Section, London Chamber of Commerce.

THE galvanized iron of commerce consists of steel sheets covered with a coating of spelter or zinc, the process being British, and dating from 1846, when it was patented in this country. The object of the process is to render the steel immune from oxidation. An unprotected sheet of steel exposed to the weather would rust and decay rapidly—covered with spelter it will withstand climatic and atmospheric influences for years without deterioration. The word "galvanized" has no real significance in this connection, for galvanizing plays no part in the deposition of spelter upon the steel, and the term seems to have been applied originally because spelter and iron together form a galvanic couple.

In the earlier days of the industry, the basis of the sheets was iron and the term has survived, much as the term "charcoal" lingers in the tinplate trade, though its original significance is only a memory. The original iron sheets were mainly produced in Staffordshire, but under present conditions the steel used was imported partly from Germany, Belgium, France and United States, in the form of what was termed sheet bars. A number of works, however made their own steel and sheet bars. Steel has practically superseded iron for although iron sheets are still made the quantity is negligible.

Under modern practice, after leaving the rolling mill, the steel sheets (then known as black sheets) are pickled in a mixture of hydrochloric or sulphuric acid and water to remove any scale which may be adhering to them, and are then passed through a bath of molten spelter, from which they emerge completely coated.

The sheets in merchantable form are either flat or corrugated. The flat sheets find wide employment in the working-up trades, being used for the manufacture of roofing, ridging, flashing baths cisterns tanks, sanitary shutters, wheel barrows buckets, and farm apparatus such as feeding troughs and the like, while the corrugated sheets, which normally constitute the major part of the output, are used for roofing and fencing purposes, and also for making tanks.

The corrugations impart great strength to the sheets and most sheets have either eight corrugations or ten corrugations, such sheets being known as 8'8" and 10'5" respectively, but other specifications are also made for certain markets for instance, 7'3" 9'3", 11'3" and 12'3".

The sheets range in length from four feet upwards, but the usual specifications are from five to ten feet. The basis thickness is always 24 gauge, which is understood to be taken in the black—that is before the sheet is galvanized but both thinner and thicker sheets are rolled say, from 16 to 30 gauge.

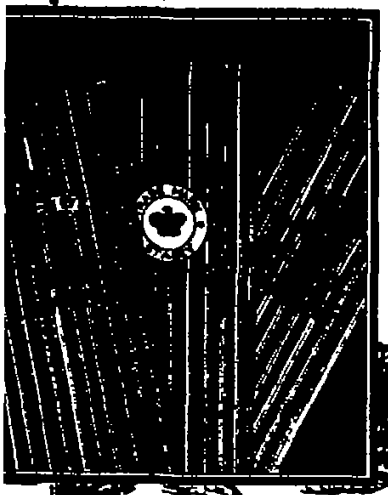
The various export markets have their own peculiarities, both in the sizes and gauges of the sheets, and in the method of packing. For instance, Calcutta takes almost invariably 24 gauge sheets, 10'5", which are packed in bundles, while Bombay will have hardly anything but 8'5" × 24 gauge, packed in skeleton cases. Japan, Straits Settlements and Burmah buy from 24 to 30 gauge, but the latter are in greatest demand.

South America takes in most cases 24 gauge sheets in skeleton cases, but Australia will have nothing but 24 gauge or thinner, packed in close fitting cases, to ensure the goods arriving in the very best condition. Australia also pays a higher price than other markets, as importers there only take best quality sheets.

India is, under normal circumstances, by far the largest market overseas, there being an enormous demand for buildings there, in connection with the tea gardens and estates, and so on, while large quantities are taken by the railway companies for the roofing of sheds, and sheets are used, too, in many other directions.

The "count" is very important in galvanized sheets, retailers' profits being materially affected by the number of sheets to the ton, and the desirability of getting the very utmost number has led to the cutting of the gauge, so that a few extra sheets can be obtained.

In the Eastern markets orders come over in many cases in which the gauge is mentioned, also the number of sheets per ton, but these in most cases do not agree, and the invariable practice is to execute the order in the number of sheets per ton irrespective of gauge.



The galvanized sheet industry is a very important one in the United Kingdom, although, like others, it has been entirely disorganized by the war conditions. Our exports during 1914 were about (68 000 tons, of which over 280,000 tons went to British India, nearly 110 000 tons to Australia, 27,000 tons to the Argentine Republic, 24 000 tons to British South Africa, 17,000 tons to New Zealand, and 12,000 tons to Canada. Our enemy never cut any great figure in the trade, owing apparently to inability to obtain the necessary degree of skill in rolling, whereas the British makers could always get the material very near to the calculated weights. This demands an accuracy in working, which Germany was never able to approach.

The war has, of course, dislocated export trade, and all the big overseas markets are starving for supplies, hence when peace comes, our manufacturers should be assured of a period of unexampled activity. British India for instance, which in 1914 took over 280 000 tons, only had 64,000 tons in 1915, and less than 10 000 tons in 1916. This is an illustration of the gaps which will have to be filled and with which our manufacturers can be relied upon to make every preparation to deal satisfactorily when the time comes.

The following table, taken from "Quin's Metal Handbook and Statistics," shows our total exports and the exports to leading countries, in tons, during recent years —

| | 1914 | 1915 | 1916. |

# SPELTER.

By the Editor of the "Metal Bulletin."

SPELTER is one of the world's most abundant commercial metals, although since the war broke out no complete statistics have been available dealing with the world's production. This, however, must be well over one million tons, compared with about 878,000 tons in 1913, the last year for which returns were compiled.

The metal, which in peace times was used mainly as a preservative for steel, has during the war assumed the important military significance owing to the fact that it is an essential component in brass, of which alloy hundreds of thousands of tons must have been utilised, brass being composed of copper and spelter.

The British galvanized trade alone before the war absorbed about 70,000 tons of spelter a year, but this trade has fallen into quite a secondary position owing to restrictions of one kind and another, and during 1916 it is doubtful whether more than 20,000 to 30,000 tons were utilised in this connection.

The principal countries producing zinc ores are the United States, Germany and Australia. Other countries producing zinc ores in quantities are Spain, Italy and North Africa, while Japan and Tunis are making substantial headway with the development of their resources.

The leading zinc ores are blende and calamine. The Australian ores, which have since the war attracted a very great deal of attention, because during peace conditions they were mainly treated on the Continent, consist of tailings from the Broken Hill Mines, and are a mixture of zinc and lead bearing material. The zinc runs about 47 per cent.

The activity of the search for spelter bearing ores is reflected by the fact that during 1916 the United States imported about 103,000 tons of ore from Australia, 10,000 tons from China, 60,000 tons from Spain, and substantial quantities from Italy, French Africa, and the French West Indies, although the major portion of the imports was derived from Mexico.

Prior to the war the United Kingdom was dependent mainly upon Germany and Belgium for its supplies, and works in both countries, particularly the latter, drew large supplies for their raw material upon Australia. What has been going on in Belgium since the war is a mere matter of conjecture, but it is believed that the German works have been straining every effort to extend their production so as to supply war material to the Central Powers. Sulphuric acid is an important by-product from spelter works.

It is curious [illegible] statistics regarding the British imports of spelter for the period since the war started. It is known, however, that great efforts have been made to render this country less dependent than before upon other countries, and the results of this policy will undoubtedly be felt in the future, even though it may be too soon at present to look for great things. Important extensions are on foot, however, and the foundations have been laid for one or two big schemes. It remains to be seen at what price peace requirements can absorb the world's enormously increased production.

Apart from the developments dealt with in the article in last year's annual, it may be remarked that good progress is being made with the Tasmanian plant which is being erected at the cost of a million pounds sterling, partly by private enterprise and partly by British Government capital, to treat Australian concentrates. A large plant under State auspices is also being erected at Avonmouth with a capital of £600,000, raw material in this case, too, coming from the Broken Hill region.

The development of the spelter industry in the United States is one of the commercial wonders of the last two years. During 1913 the United States produced about 315,000 tons of spelter, and in 1914 about 320,000 tons, the total being increased in 1915 to 437,000 tons and in 1916 to 558,000 tons, of which about 500,000 tons were from United States ores and the remainder from imported raw material. The 1917 output should considerably exceed 600,000 tons, provided nothing occurs to cause a general shutdown of mines and smelters. At the end of 1916 there were 211,000 retorts at United States spelter works, against 114,000 at the end of 1914.

Japan has also gone ahead fast, the production, which was about 7,000 tons in 1914 doubled in 1915 to 16,000 tons and increased in 1916 to about 42,000 tons. Canada too previously a negligible factor turned out in 1916 between 14,000 and 16,000 tons. There can be no doubt that in the new commercial era which is coming the British Empire will constitute a highly important factor as regards the world's supplies of spelter.

Tabulated below are the extreme prices paid here during the last ten years for good ordinary brands of spelter, as given in *Quain's Metal Handbook and Statistics* —

| | | | | | |
|---|---|---|---|---|---|
| 1907 | £19½ | and | £20½ | 1912. | £23 and £27 5 |
| 1908 | 18 | " | 21½ | 1913 | 20½ " 24 |
| 1909 | 17½ | " | 22½ | 1914 | 21½ " 25 |
| 1910.. | 21½ | " | 24½ | 1915 | [illegible] |
| 1911.. | 20½ | " | 23½ | 1916 | [illegible] |

# BRITISH GRANITE QUARRIES.

By H. J. GRACE.

GRANITE primarily consists of quartz and orthoclase, biotite, muscovite, hornblende, augite, and is holocrystalline. Other minerals entering into its composition are plagioclase felspar, oxides of iron, apatite, zircon, garnet, epidote, cordierite, sphene, topaz and tourmaline, calcite, limonite, kaolin and chlorite being among the resultant products of decomposition. Commercially, the term "granites" covers products that evade the strictly correct geological definition, such as syenites, diorites, granophyres, gabbros, greenstones, and in some cases grits.

Aberdeen quarries yield a true and distinctive granite, Peterhead, Kemnay, Dalbeattie, Creetown and Ross of Mull being other deservedly renowned centres of the industry

In England, Leicestershire, Cornwall, Cumberland and Westmoreland are rich in areas of supply, Warwickshire also possesses local sources. Wales has large areas extensively worked in Carnarvonshire. Ireland has a considerable supply in several districts, notably in Newry The Channel Islands produce a large quantity of material, and the Isle of Man has an extensive area, but difficulties of transport hinder the development of the Manx quarries

The first step in the opening of any quarry is the removal of the top soil, or overburden, after which lifts or levels are excavated of varying depths. The accumulation of spring and surface water during the operation of sinking, and afterwards, necessitates almost continuous pumping where the quarries are worked in excavations or pits. The granite having been bored, the faces are divided into sections, averaging usually about 10 yards in width up to about 20 yards, with a set of men to each section. Preparatory to blasting, holes are drilled into the rock by hand or by means of steam drilling machines, the customary depth being from 10 to 12 feet, the deepest about 20 feet, with a top diameter of 3½ to 4 inches. As a rule two to four charges are necessary, the first being so regulated as to be only sufficiently powerful to spring the rocks—that is, to loosen and open out their joints—the final stronger charge completing the work. Stones that remain unworkably large after the explosion are separately bored, charged with blasting powder, and reduced in size. Blocks intended for sundry specific purposes are roughly dressed below, prior to their removal to the surface for monumental, building, kerb or sett-making purposes and for the crushing or breaking mills. The carriage of the deposits to these mills is facilitated by tram-lines and effected by horse and mechanical power In some instances the most up-to-date quarries have successfully adopted for this haulage an aerial power-worked cableway of extraordinarily ingenious design, the system being suggestively known as the Blondin. Steel skips carried along this cableway have each a loading capacity of 50 cwts. and upwards. With clock-like regularity these receptacles are lowered empty, hauled up full, run swiftly overhead to the crushers, into the hoppers of which their contents are deposited, and then return to their starting place, to be again lowered and refilled. In the crushing mills the stones pass through breakers into rollers, falling into elevators and then into screens, which sort out the different sizes, rejections, or tailings, being recrushed.

In the dressing of stones for setts, kerbs, etc., the first or preparatory stage is carried out on the floor of the quarry, where the blockmakers shape them into the rough form in which they reach the settmakers and kerbdressers above. These settmakers exercise a wonderfully accurate judgment in deciding at sight how each block will shape best and with least waste under their hands. Into this judged shape it is wrought by heavy hammers, lighter ones being substituted for the finishing touches. For kerbmaking much larger blocks are used, the dressers wielding a variety of tools. For certain purposes, such as "Durax" setts, a stone-splitting machine of Danish invention, in the working of which a movement of the foot controls the action of steam hammers, has proved serviceable. The bursting of big stones of a size otherwise unwieldy has also to be accomplished by hand. An expert, with a sharp heavy hammer, nicks the line of fracture in about the centre, then draws the great block by striking it smartly at one end. After a varying number of blows it severs at the line made by nicking Stones still larger are divided by what is known as the plug and feather process, the largest of all are drilled and blasted when the former process would be insufficient. A trade is carried on in block or unbroken granite for breaking by hand on roads and in workhouses.

In consequence of the excessive pressure of work in all departments of the Home Office owing to the War, the published statistics of production have been very much curtailed, and the latest available returns are those for 1915, in which year the production of igneous rocks in the United Kingdom, the Isle of Man included, was 6,686,415 tons, with a value of £1,200,212. Limestone was produced to the extent of 11,115,908 tons, valued at £1,206,266. Separate figures for different areas have not been published. During the War, the imports and exports have been reduced to a very small amount. The last official returns prior to the War accounted for about 11,000 tons of granite exported in the year, about 974,000 tons imported.

# THE COAL TAR COLOUR INDUSTRY.

THE coal tar colour industry (ignoring the earlier discovery of the yellow colouring matter "picric acid") is generally regarded as having began with the discovery by the late Sir W. H. Perkin in 1856 of a mauve colouring matter derived from coal tar. A works was started at Greenford Green, in Middlesex, for the manufacture of this colour, and the manufacture of other colours subsequently discovered was in due course undertaken. Scientifically and commercially, therefore, this important industry is of British origin. The industry continued to grow, but, for a number of causes, which cannot be adequately treated in the space at present available, the development took place almost entirely in Germany, and during the two or three decades preceding the outbreak of the present war the various important industries in this country which require synthetic colouring matters were mainly dependent on German sources of supply.

Some idea of the general importance of the industry may be gleaned from the following figures. In 1912 we imported £1,731,000 worth of synthetic dyestuffs from Germany and £146,000 from Switzerland, and it is generally estimated that dyestuffs to the value of about £180,000 were purchased by British consumers from British makers, which figures show a total British consumption of approximately £2,000,000 worth of synthetic dyestuffs. Further, in 1913, £177,000 of British made dyes were exported, which means that the British makers contributed less than £300,000 worth of synthetic dyestuffs to the world's markets (including Germany), whereas the Germans probably contributed more than £10,000,000 worth to the world's markets (excluding Germany). The enormous preponderance of Germany is thus easily recognised. It should be noticed that India and China were amongst the most important of the overseas markets.

It is not, however, the actual value of the dyestuffs which makes the industry so important, as the much greater value of the outputs of industries dependent on synthetic dyestuffs, notably the great textile industries of this country.

It is impossible here to examine in detail the importance of dyestuffs to the various dye-consuming industries, and the example of the cotton industry must suffice. It appears probable from an examination of official statistics that the amount paid by manufacturers of cotton goods in 1913 to firms engaged in bleaching, dyeing, and cognate processes, for operations involving the use of dyestuffs, exceeded £2 600,000, or more than four times the value of the total consumption of dyes in the United Kingdom. This is value of work only, and not the value of the dyed and printed articles. These dyed and printed cotton goods are consumed all the world over, and the value of the exports of dyed goods in 1913 (excluding such articles as hosiery, lace, ribbons, etc.) exceeded £30,000,000. These exports were sent very largely to British and other ports in Asia, where an increasing market is to be anticipated. Taking the dye-consuming industries together, it has been estimated that the value of the goods made in the United Kingdom in a year, the manufacture of which involves the use of synthetic dyestuffs, exceeds £200,000,000.

One of the first results of the declaration of war was the realisation by the Government of the dependence of the vital British textile industries on German dyestuffs, and as a result of the work of a Committee appointed by representatives of the dye users, at a meeting held at the Board of Trade, a new dye-making company was brought into existence which has the character of a national undertaking. Subscriptions were invited from consumers of dyestuffs, and the Government promised to advance as a loan £1 for every £1 subscribed by the public up to a total share capital of £1,000,000 publicly subscribed, and thereafter £1 for every £4 subscribed by the public up to a total share capital of £3,000,000 publicly subscribed. The total capital resources of the company were thus to be £4,500,000. In addition the Government transferred to the Company a loan of £30,000 made to Read Holliday & Sons, Limited, and also promised a grant of £100,000 to be spent on research work during ten years. A report issued to the shareholders in October, 1917, stated that the share capital was £942,000, and the Government loan £1,142,800, making the total capital of the Company over £2,000,000. The Company also as a result of its second year's working paid its maximum dividend of 6 per cent. and wrote off £220,000 from the cost of new construction. The Company also paid the maximum dividend last year.

The Company purchased the undertaking of Read Holliday & Sons, Limited, at Huddersfield, Yorkshire, and large extensions to those works have been made. After careful investigation and inquiry the Directors decided to proceed with the construction of new works in Huddersfield for the manufacture, not only of the finished dyestuffs, but also of the "intermediate products" and basic materials which are required in the industry. The Company appointed a Technical Committee, under the chairmanship of Dr M. O. Forster, F.R.S., and it also possesses a Research Council, consisting of University Professors and technical members of the staff, and presided over by Professor W. H. Perkin, F.R.S. Good progress has been made, and much of the new plant erected is in operation, but the Company's activities are naturally affected by war conditions which place limitations on the supplies of raw materials, new plant and labour.

The difficulties of the problem of establishing a dye-making industry in the United Kingdom should not be underrated, and it is now generally realised that it will take some years to make the industry successful. Dyemaking may be generally divided into three stages (a) the making of the pure basic material (b) the making of the series of compounds known as "intermediate products," and (c) the making of the finished dyestuff. The manufacture of the intermediate products had been concentrated upon by the Germans, and they produced them in large quantities at cheap prices and sold them to dye manufacturers in other countries. The prices charged by German manufacturers for intermediate products delivered to the United Kingdom were frequently cheaper than those at which the British manufacturers could produce. The manufacture of intermediate products was curtailed therefore in England, the dye-maker finding it more profitable to make his dye from imported material. The intermediate product-making is, however, the chief difficulty, and it has been necessary first, therefore, for the new Company to design and erect plant for the manufacture of these products.

# THE COTTON INDUSTRY OF GREAT BRITAIN.

By CHARLES STEWART, Editor of "The Cotton Gazette."

THIS highly important industry is practically carried on in Lancashire, and is mainly controlled by the Liverpool and Manchester markets—the *former city* being the principal port for importing and distributing the raw material, Manchester as a centre being especially identified as the hub of spinning, weaving, and distributing the finished product.

The cotton industry of Great Britain is the largest of its kind in the world. Rather more than 2,000 mills employing 655,000 operatives (under peace conditions) are occupied in housing roundly 60,000,000 spindles and over 800,000 looms, involving an annual consumption of some 4,000,000 bales of cotton of various growths.

The world's *cotton mills number 6,513*, operating 162,000,000 spindles and 2,800,000 looms. The world's cotton operatives number some 3,400,000, and these totals cover the industry of no less than thirty nine countries, our own included.

Great Britain's percentage of the whole in mills is thirty-one her percentage of spindles is thirty, her percentage of looms is twenty-eight, her percentage of operatives is nineteen. These figures apply to normal peace conditions.

The cotton industry of Great Britain commences on the quay or in the dock where bales are first landed from abroad. No less than 748 steamers carried cotton to British ports during the year 1915. And this in war time. No less than 5,049,000 bales were landed, the bulk going up country Note.—4,113,000 bales were landed in 1914, but number of carrying ships not published. There are no conclusive available statistics related to the labour employed in the handling and forwarding of cotton on its arrival in this country, not a bell is grown here. There are no available statistics to show the extent of the labour employed from the ship to the warehouses, to the railway or canal, en route to the mills, but it can easily be imagined that the moving of some 4,000,000 to 5,000,000 of bales of cotton involves extensive handling. Bales do not move by themselves.

London as a market for actual cotton is not now of any consequence. Liverpool and Bootle accommodate about 690 warehouses for practically exclusively cotton storage with an approximate capacity of 2,000,000 to 2,500,000 bales. The largest stock on record held in these warehouses at one time having been 1,980,000 bales.

The Manchester Dock Estate and Bridgewater department of the Ship Canal can warehouse about 215,000 bales, of which, say, 150,000 bales is estimated as representing the greatest quantity which has been as yet accommodated in Manchester and Salford at one time.

A very large proportion of railway, canal, and road motor transits with their attendant labour is all part and parcel of the cotton industry of Great Britain, but to realise the actual widespread cotton interest of this country, the hitherto unthought arteries of machinery, and their manual service must be associated with the industry as a whole, and to appreciate this fully, if it were possible to imagine such a blockade as would prevent a single bale of cotton from being landed in Great Britain in any one year, the paralysis of trade throughout the County Palatine, on every hand, would quickly bring home, not only the extent of the industry itself, but its manifold ramifications. In a lesser degree, the shortage of freights now is a severe object lesson at our doors.

Nor is this by any means all or nearly all.

The Liverpool Cotton Association consists of 538 members of position, embodied in 200 firms, the office staffs of each varying from, say, six to twenty or more, expert responsible salesmen, cashiers, bookkeepers, clerks, and the like. Incidentally no less than 151 officers, non commissioned officers, and men of the staffs of *Liverpool cotton firms* have already laid down their lives for their country and empire.

The bulk of the members of the Manchester Cotton Association are mill-owners, whose main activities are centred in the mills, or other kindred works and factories already enumerated. In addition there are no less than 240 firms in Manchester and Salford in business as cotton yarn agents, 220 as cotton cloth agents and merchants, whose yarn and cloth distributing operations exploit fields in practically every corner of the globe." All these have their warehouses, *offices, and staffs*, and represent the cotton industry just as much as the mills themselves and their first hand operatives. Further, there are enormous works devoted to the manufacture of cotton machinery, employing thousands of the most expert mechanics in the world. Bleachers, dyers and finishers swell the total.

To draw a definite line as to which specific district in Lancashire uses cotton of a particular growth in its conversion from the raw state into yarns and cloth would scarcely convey information of much value to the general public. Those in the trade used no telling. But, roundly speaking, Oldham and its immediate area of many townships spins mostly cotton of American growth, and a very small proportion of East Indian. Time was when the latter growth was extensively used in Lancashire for counts of yarn, which found a ready market in India itself. Bombay spinners and manufacturers now produce their own main requirements to an increasingly important extent from native cotton grown comparatively nearby their own mills, and what little East Indian cotton is used in Great Britain now is mostly for special "mixings" with other growths. The Bolton and South Lancashire areas use principally cotton of Egyptian growth, and long stapled American. Rougher fibres, such as Peruvian, are manipulated in the few Yorkshire and Midland mills, and are largely mixed with wool for hosiery and the like.

The African yields created under the auspices of the British Cotton Growing Association are absorbed variously As yet they are too limited and mixed in character to produce a specific manufactured article by themselves. It is a question of time and financial support, government or otherwise, when this will be remedied.

Awarded the Certificate of the Incorporated Institute of Hygiene.

# WOOLLEN INDUSTRIES.

By R. TALBOT OVERTON.

BRITISH woollen industries, from a remote period in British history, remained the capital source of national wealth until the development of the cotton trade towards the close of the eighteenth century

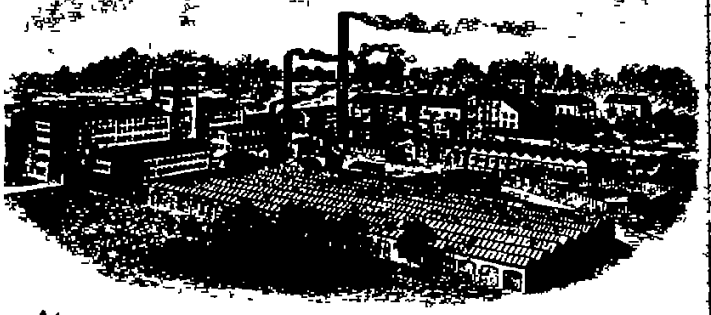
The Colonial developments of the seventeenth, eighteenth and nineteenth centuries, with the invention of the spinning frame and power-loom, supplied an impetus that carried the trade far and quickly ahead.

The chief overseas sources of supply of raw wool are Australia, New Zealand, South America, South Africa and India China, Persia, Russia, Turkey, Egypt, North Africa, Spain, Portugal and other countries also figuring on the list, even Iceland contributing a quota. The supplies from the East and Russia are considerable.

Woollen textiles are divided into three general classes of fabric, in the manufacture of which three principles are operative—the woollen, worsted and "stuffs"—and to a great extent these *principles are localised in practice.* At one time the famous products of the West of England and parts of Scotland were almost wholly those of the first named principle, the output to-day being much more varied While re-manufactured materials, cotton "sweepings," and "rud and "flocks"—the wastes in the manufacture of woollens and worsteds—are used in the making of the cheap cloths of Batley, Dewsbury and the Yeadon districts in Yorkshire, nothing but the genuine material at its best enters into the composition of the unsurpassable best cloths of the "West Country" and certain defined Scottish areas. Leeds and its districts adhere in the main to the woollen principle, Huddersfield to the worsted, and Bradford to the "stuffs." But both Bradford and Leeds make worsted fabrics in large quantities, and Huddersfield, working in part on the woollen principle, turns out cloths with both woollen and worsted properties. The woollen differs from the worsted principle in the construction of the yarn (thread), in the arrangement of the fibres of which the threads are composed. In the "stuffs" trade cotton warps are the rule, though warps of worsted, wool, silk and linen are also in use, the wefts being usually of Botany (the original Australian variety) and English wool, mohair and silk.

A hundred years ago the value of the woollen yarns and piece goods distributed from the manufacturing centres of Great Britain and Ireland was about £17,000,000, as against an average of about £55,000,000 of late years. In 1913 our total imports (including 122,000,000 lbs. of imported woollen rags) amounted to 1,016,000,000 lbs., and our home product to 125,000,000 lbs. In 1914 (the first year of the war) these figures fell respectively to 953,000,000 lbs. and 121,000,000 lbs. but in 1915 the grand total rose to 1,179,000,000 lbs., of which 122,000,000 lbs. was produced at home The weight of foreign wool exported in 1913 was 308,000,000 lbs., and of domestic 20,000,000 lbs., in 1914, 297,000,000 lbs. of foreign and 33,000,000 lbs. of domestic, against 146,000,000 lbs. and 32,000,000 lbs. for 1915. The bulk retained for consumption was thus 804,000,000 lbs. for 1913, 671,000,000 lbs. for 1914, and 1,001,000,000 lbs. for 1915. The woollen yarn exported during these three years weighed 56,000,000 lbs. (1913), 37,000,000 lbs. (1914), and 17,000,000 lbs. (1915), woollen piece goods exported measured 185,000,000 yards, 107,000,000 yards, and 160,000,000 yards. In millions of pounds sterling, the values of woollen exports of all kinds were 34·0 in 1913, 25·3 in 1914, and 31·1 in 1915.

Later statistics of the ordinary kind are wanting, and would be valueless and misleading, the trade in all its ramifications having been temporarily revolutionised by the war-time action of the Government in becoming first-purchaser and controller Governmental requisition of British and Australian wools has extended to their by-products, such as manufacturers waste and shoddy Owing to foreseen probable short age due to freight difficulties, the authorities, after taking what they required, rationed all users *pro rata*, the hours of work being reduced to fifty per week. The prices of wool, both for their own requirements and for civilian purposes, were fixed by Government, which also fixed the prices for all their cloths, based on agreed conversion costs. All makers whose machinery was suitable became makers, more or less, for the British and Allied Governments. Standard cloths were selected for officers wear, and prices fixed for maker, merchant, and maker-up. The abnormal conditions squeezed out the middleman—*i.e.*, the merchant or broker—and dislocated established activities, nearly every manufacturer making articles quite different from those of his normal output, and the civilian trade being very much cut down to meet the shortage of supply



For the purpose of incorporation in the present article the War Office furnished the following statement of quantities of the principal woollen goods purchased by the Army Contracts Department from August 4, 1914 to August 31, 1917, including purchases for Allied Governments. Cloth, woollen, 152,074,000 yards; flannel, 140,328,000 yards; blankets and rugs, 34,398,000; cap comforters, 18,478,000; drawers, woollen and flannel, 28,852,000 pairs; vests, woollen and flannel, 12,448,000; gloves, woollen, 14,764,000 pairs; socks, worsted, 90,338,000 pairs; jerseys and [illegible] 14,980,000.

# THE LINEN INDUSTRY.

By W. H. WEBB, President Linen Merchants' Association.

THE botanical name of flax is "Linum Usitatissimum" (the most useful of fibres). The first books of the Sacred Record contain frequent references to flax and linen, and all other textiles, with the exception of the products of wool, are babes in years as compared with linen

Before Moses wrote the first books of the Sacred Volume, before even the Patriarch Abraham visited Pharaoh, the Egyptians had attained great perfection in the fabrication of linen.

The wonderful strength and durability of the mummy linen found to-day in the tombs of Egypt, and which must have been made at least 4,000 years ago, is striking proof of the outstanding qualities of this fibre.

The earliest record we have of linen being made in Ireland dates back to the thirteenth century, and it was probably introduced by the Norman settlers.

To-day in fabrics for military equipment requiring the greatest strength and durability, linen has again strikingly demonstrated its superiority

After exhaustive experiments, linen was found, owing to its great strength and durability, to be the one satisfactory covering for the wings of aeroplanes, and every available loom in the north of Ireland is engaged in its manufacture.

For the paddings or linings of uniforms and for the thread used in the making of boots and uniforms, the demand has been unlimited, simply because it was found that linen would far outwear that made of any other fibre.

War, the great mover, has placed the superiority of linen in an unassailable position.

Linen possesses other unique properties of considerable value to mankind. Its "absorbency," which far exceeds that of any other fibre, makes it peculiarly suitable for the manufacture of towels.

The smoothness also of the fibre, which does not lend itself to the lodgment of germs, is the reason it is preferred for surgical dressings, and why it is also so desirable for damask table cloths and bed linen.

It is difficult to get definite figures for comparison in the linen industry, as in almost all available records flax, jute and hemp are grouped together

Under this grouped heading the power looms in the United Kingdom in 1875 numbered 41,980, as against 54,440 in 1906, the distribution being:—

| | *Ireland.* | *England & Wales.* | *Scotland.* |
|---|---|---|---|
| 1875 .. | 17,827 | 5,684 | 18,569 |
| 1906 .. | 32,952 | 4,434 | 17,186 |

but for the reasons given these figures, as regards linen, are unreliable.

Little or no jute and hemp are manufactured in Ireland, as this is almost entirely confined to Scotland, therefore one would be safe in saying that by far the greater proportion of the linen produced in the United Kingdom comes from Belfast and district, where it is looked upon as the "staple industry"

The principal manufacturing centres in Scotland are Dundee and Dunfermline.

Broadly speaking, the heavier, coarser linens are made in Scotland, and the medium and finer varieties around Belfast.

Linen manufacturing can only be said to exist in England, a small section of the industry centring around Leeds, where about 600 operatives are employed.

Bleaching and finishing, both in Scotland and Ireland, is principally carried out in the country districts around the manufacturing centres, usually on the banks of some river, as a plentiful supply of water and a clean, pure atmosphere are essential for this operation.

Belfast is peculiarly well adapted to be the centre of the linen trade, as the immense shipyards give employment to the men, leaving a large surplus of women available for employment in the factories.

The total exports of linen goods, including flax yarns, from the United Kingdom in 1913 amounted in value to £9,400,000.

The raw material used in the linen industry is unfortunately not a home production, with the exception of the comparatively small amount grown in Ireland. Russia supplies the bulk, and other imports come from Holland and Belgium.

The Belgian or Courtrai flax is the finest in quality, Irish comes next, then the Dutch, Russia supplying all the coarser fibre.

To-day, however, the Allies depend entirely on the flax grown in Ireland for producing the aeroplane cloth essential for the wing coverings of their aeroplanes, and the farmers, assisted by the higher prices, are rising to the occasion.

An attempt is being made to revive flax growing in England, an experimental station having been started at Selby in Yorkshire, with a view to handling the crop grown by farmers in the district.

The Linen industry, like many others, has suffered severely from the extreme individualism characteristic of our whole industrial system for many years.

The current is now, however, running strongly in the direction of co-operation, and it will emerge at the end of the war highly organised and ready for the bitter industrial struggle which is bound to follow

The question of raw material is receiving attention, plans are well forward for carrying out important research work in connection with the industry, including a fully equipped laboratory in Belfast.

That all-important question of marketing has not been overlooked, and a comprehensive scheme for popularising and increasing the sale and distribution of Irish linen will be ready at the close of hostilities.

The North of Ireland is, from climatic reasons, peculiarly adapted for the making of fine linen, its people are industrious and progressive, and being imperially-minded are ready and anxious to take up the broader, patriotic, more enlightened trade policy, which holds such vast possibilities for our Empire, when this tragic struggle has terminated.

# THE FABRIC GLOVE INDUSTRY.

By W. PINKHAM.

FABRIC Gloves have undoubtedly been worn for a long number of years, probably from the earliest periods of civilisation. It is not, however, to trace the history of the manufacture of Fabric Gloves which is the special point of this article, but rather to show how important an industry it is, and how desirable that the gloves should be manufactured in this country. The writer well remembers the period when Fabric Gloves were made by hand. The introduction of the sewing-machine made a vast difference in this, as in all other industries, and the firms who were the first to introduce machines in the manufacture of their goods did undoubtedly capture the larger portion of the trade. Fabric Glove manufacturers in this country were rather slow in realising the importance of the use of machinery, it is recognised that the larger the output the cheaper the cost of production. In this, as in many other ways, the Germans were quick to realise this great factor in being able to produce the article cheaply, in that way being able to give to the consumer the advantages of cheap production. The Fabric Glove industry, like many others, received a great impetus by this use of machinery thirty-five or forty years ago. At that period a comparatively small quantity of Fabric Gloves were being worn, and certainly none of the fine quality and textures as made in 1914. It is well-known to those who can remember that period, the German manufacturers of that date, who were endeavouring to place their goods on the market, had very few samples and very few qualities to show. Their goods, too, were very crude in their make, very bad in their fit, but in this, as in other things, patience and perseverance will succeed in the end, and the Germans did, undoubtedly, succeed in capturing almost the entire glove trade, not only in this country but the whole world, largely due to the information given them by British buyers of the requirements of the English-speaking races. In addition to this, any invention or new idea in connection with this industry would naturally be carried to the seat of the industry, following out the old adage, "Unto him that hath shall be given," with the result that Fabric-glove makers in other parts of the world, except Saxony, have been almost entirely squeezed out of existence.

The best Milanese machines, for weaving the cloth, are still made chiefly in this country, and were the invention of a Nottingham man. The fine yarn used in weaving the material is still spun in this country from cotton produced by countries in British possession.

Fabric Gloves of a grade and quality superior to the best made in Saxony are made in England, this fact is recognised by the Board of Trade experts. We must realise in this country that one of the great reasons for the success of the German manufacturers was their attention to detail, always striving to make their goods appear to the very best advantage, and also making them appear better than they really are. I think English manufacturers are equally capable, and as full of business energy as the German. There is, therefore, no reason why Fabric Gloves cannot be made in this country, and to compete successfully with those made in Saxony.

The importance of the industry is shown by the fact that the export of Fabric Gloves from Germany during 1913 was just 4½ million dozen pairs, this country importing of the number 2½ million; the United States (an English-speaking race) also importing 1½ million. The amount of Fabric Gloves manufactured in this country before the War did not exceed ½ million dozen pairs, and the number of manufacturers were very few. Since 1914 several new firms have started, with the firm determination to capture the trade, and do not ask for any preference, but just the same consideration as shown to the German manufacturers. I am quite convinced that if they are given that, they will, in the very near future, be able to bring back to this country a very large proportion of the business of the world in Fabric Gloves. Whilst up to the present German gloves have appeared to be better than they really are, British gloves are better than they really look. The Board of Trade, I am convinced, will do all they can to help British manufacturers to turn out the best articles required, and will be only too pleased to give intending purchasers the names of manufacturers in this country who have successfully competed, even before the War, with German makers.

# A NEW BRITISH INDUSTRY.

As a human food the value of milk is fully recognised, but the commercial use of its inedible by-products is less known. Many will find it difficult to believe that a material which is practically entirely composed of a residual product of milk is not only playing an important part in the industrial life of to-day, but also is aiding substantially the allied forces to carry on the great struggle.

Nevertheless it is true, since this wonderful material is not only being employed as an insulator *in nearly every* Wireless and Telephone Installation existing to-day—in Aeroplanes, Motor Vehicles, Magnetos and other Electrical Fittings—but is also in general domestic use in the form of Combs, Beads, Buttons, Hair Prongs, Cigarette Holders, Umbrella Handles, etc.

The credit for the original invention is generally given to a Swiss and a German in partnership. At any rate, the Germans, as in the case of so many by-product industries, were certainly the first to see its possibilities. Recognising that the natural raw materials, Amber, Coral, Ivory, Tortoiseshell, Horn, etc., were scarce and costly, or wasteful or difficult to work, while such compounded products as Celluloid, Vulcanite, etc., had each some serious defect, and feeling that the new product was just what was required to fill a long felt want, a German Company secured a practical monopoly of the process of manufacture, and *more Germanico* did not fail to exploit it to the advantage of themselves particularly and their countrymen generally.

The British manufacturer could only secure his supplies of raw material on terms prohibitive to competition with German and Austrian-made imports, and the British consumer had to use Foreign goods. Much British money was spent in attempting to remedy this, but it was not until the beginning of *1915* that a perfect material was produced by an all-English Company. This material, to which the name "ERINOID" was given, after very severe tests has been finally pronounced by unbiassed writers to be actually superior to the German product, thus supplying one of the very few concrete instances of the production by a wholly British organisation of a material displacing and improving upon what was formerly a wholly German product.

The process of manufacture is partly mechanical, partly chemical, and altogether too complicated for description in detail here. A rough idea, however, may be gathered from the following sketch.

In the initial process at the source, when the essential fats and food products have been extracted from the milk, the residues are solidified by chemical treatment, and the product, after preservative measures have been taken, is sent to the factory. There, by means of specially designed machinery, it is further consolidated into slabs and bars of varying thickness and diameter and of colour according with the dye which has been added. After being immersed in a chemical bath, the chief ingredient of which is Formaldehyde, the product is made thoroughly hygienic, tough, and resilient.

Finally any moisture is removed by hot air, and the material is ready for issue.

In its completed form "ERINOID" is absolutely odourless, and—in general physical characteristics—closely resembles natural Horn. It is, however, more convenient and economical for practical purposes than Horn, owing to the sizes and shapes of the pieces in which it is supplied.

In addition to these recommendations and to its insulating properties, other notable features are —

(1) Non-inflammability — always a desirable attribute, but one especially so in articles intended for children.

(2) An almost unlimited range of colour combinations and effects, and a capacity for adapting itself so admirably to the faithful reproduction of such substances as Tortoiseshell and Buffalo Horn, that the imitation can be detected from the real only with difficulty.

(3) Working qualities, and amongst these especially Turning, for which experts pronounce it ideal. The final polish is easily obtained, and is of remarkable brilliancy and permanence.

Some indications of its uses have been given already, but it is impossible in a short space to cover its full scope of utility. Mention may be made, however, of its value to the musical trade, where, amongst many other uses, it is largely employed for piano keys.

No limit can be set to the field of operations of such a material, and already "ERINOID" has been welcomed by France, Italy, Portugal, Holland, Australia, South Africa, the United States, Japan, India, China.

As some may harbour an impression that this new industry is using material which might be available for food, it should be stated that the Government Authorities have satisfied themselves that such is not the case.

Actually a real benefit has been conferred on farmers in remote districts and countries by the opening of a new market for their waste materials. Formerly, owing to lack of knowledge and means of preparation, the residues of milk frequently found their way into the streams, whereas now by simple scientific processes an important commercial use is provided for all its by-products.

# BRITISH BRUSH MAKING

By T. MARSON TILL, Secretary of the British Brush Manufacturers' Association.

THERE is hardly a household, factory, work shop, or institution that exists where brushes of some kind or other are not used—*yet few* people seem to know how or of what brushes are made

It is perhaps little known that the bristle used for brush making throughout the world is grown on the semi-wild boar in Russia, China, and India.

Although bristle is the most important material used in the industry, brushes are also made from the hair of the horse, bear, goat, badger, squirrel, sable, and other animals—from fibre from the Mexican aloe tree—from piassava (bass), kitool, cocoa, and other fibres from various tropical palms.

The *manufacture of brushes is divided roughly* into five branches :—

1. Brushes "drawn" with wire or thread.
2. Painting and shaving brushes.
3. Brushes and brooms set with pitch, etc.
4. Twisted wire brushes for flues and boilers.
5. Ivory and bone hair and tooth brushes.

WIRE DRAWN BRUSHES

Include toilet, stable, and household brushes, such as scrubs and shoe brushes.

Tufts or knots of bristle or hair of double the length required are placed under loops of wire, which are passed through holes in the back of the brush and then drawn back with the bristle, thus bending them double and causing both ends to stand upright together On the back of the stock is now glued and screwed a piece of decorative wood to cover up the wires and bent tufts showing through. The brush is then finished and polished.

Some of the commoner sorts of "drawn" brushes are made by plugging the "knots" with staples into the board by machinery, and this process has considerably developed during the war

PAINTING AND SHAVING BRUSHES.

There are two classes of *painting brushes*—those for painters and decorators and those for artists.

Before painting and other bristle brushes can be made, the bristle, which is the most expensive part of the brush, has to be sorted and "dressed" into certain lengths from the raw bristle, washed, mixed, and tied into knots of required sizes and stiffness, so that the bend of all the bristles faces inwards, and the tips form concentric rings. The buying of suitable bristles and these operations require much skill and training.

The knots of bristles when so finished are concentric at the roots, and are bound on to the handle by string or wire, or are driven into a socket. A new process under which the roots are set in vulcanised rubber is being developed with success.

*Artists' brushes* are made from hair taken from the tail of the sable, marten, kolinsky, and squirrel, and also from bristles. They are set in quills of various sizes, or in metal. The work is chiefly done by girls. The firms in England who specialise in artists' brushes are few in number

*Shaving brushes.*—The hair from along the saddle of the back of the badger is the best hair from which these brushes are made. Goat hair and bristles are also used and made to imitate badger, and unless the brush is stamped "badger hair" it may generally be taken that the brush is made of a mixture of hairs. The best badger hair is worth to-day about 10s. an ounce

BRUSHES AND BROOMS.

An entirely different process, known as "setting," is employed in the manufacture of these.

A knot of hair, fibre, or bristles is taken and the root end dipped into boiling pitch, bound with a thrum, then dipped again and inserted into a hole already bored in the wooden stock, a slight twist being given in the process to splay the hairs.

TWISTED WIRE BRUSHES FOR FLUES AND BOILERS.

These are chiefly made by special machinery

IVORY AND BONE HAIR AND TOOTH BRUSHES.

This is a distinct branch of the trade, although most of the brushes come under the heading of "drawn" work.

Bone nail brushes are almost now entirely superseded by wooden ones.

Although the antiquity of the brush trade itself is not very great, the following early references to brushes are on record —In the year 1377 A.D., "or wyped it (a coat) with a brusshe. In the year 1519, "Olde men brussheed theyr dusty clothes with cowe tayles as we do with bear brusshes." The painting brush used by artists is probably the oldest type of brush The few hair brushes that were made 130 years ago for the *toilet were constructed on the principle upon* which the modern broom is made—that is, the hairs were set in with pitch.

In the cheaper and commoner kinds of brushes foreign competition made some headway prior to the war, but in the better class of goods the British trade has always more than held its own.

Statistics give the following values of the trade :—

| | Imports. | Exports. | Re-Exports. | Home Trade. |
|---|---|---|---|---|
| | £ | £ | £ | £ |
| 1907 | — | — | — | 1,650,000 |
| 1913 | 456,141 | 237,312 | 23,157 | — |
| 1914 | 364,908 | 216,256 | 18,806 | — |
| 1915 | 277,678 | 187,108 | 14,107 | — |
| 1916 | 432,043 | 236,396 | 19,418 | — |

In the year 1908 the British Brush Manufacturers' Association was formed, with a membership of some seventy leading manufacturers in the country

The Association has standardised the stamping of brushes as to weight and material used, and has established the difference between bristles and hair—bristles now being strictly recognised in the trade as only the hair of the hog, pig, or boar

The Government and Municipal bodies recognise the Association as representing the Trade, and much useful work has been done for the war and in other ways in co-operation with them.

The Scottish and the Irish British Manufacturers' Associations are both affiliated to the B.B.M.A.

# LEATHER INDUSTRY.

By Dr J. GORDON PARKER,

Principal of the Leathersellers' Technical College.

THE manufacture or tanning of leather is in magnitude one of the most important industries of Great Britain, and at the same time one of the most ancient crafts.

The origin of tanning is lost in antiquity, but specimens of leather exist in our museums taken from the ancient temples and tombs of the Pharaohs, showing that good leather was manufactured, and even excellently dyed and finished, some 4,000 years B.C.

It is probable that the earliest form of tanning was the oil and smoke tannage, which consists of rubbing the skin with soft fat and afterwards exposing it to smoke produced by burning green wood, somewhat similar to the process still used by various Indian tribes.

It seems likely that vegetable tanning may have derived its origin from the staining powers possessed by certain wild berries, many of which possess, besides their colouring properties, a certain amount of tanning matters also. It would, therefore, be found that those juices not only coloured the skin but at the same time had a preservative action on the putrescible hide.

The art or craft of tanning has not undergone any radical changes like most other industries. In general, the method of production is very much the same as was practised centuries ago, the main difference being that materials have been introduced which have a more rapid action than the old oak bark method.

Sole leather and the leather used for boots, belting, harness and saddlery, was formerly tanned with oak bark liquor, and the process took, according to the thickness of the skin, from twelve months to even two or three years.

Towards the middle of the nineteenth century other materials were introduced, notably myraboloms from India and valonia from Asia Minor, and these materials were blended with the oak bark in varying proportions. The addition of these resulted in the production of a firmer and better wearing leather of greater strength, and at the same time, because of the nature and strength of these materials, shortened the period of tanning.

In the early 'seventies a French patent was taken out for the extraction, concentration and decolorisation of tanning extracts, and there sprang up in France and Hungary factories where the oak and chestnut wood was extracted and the liquor concentrated in the form of extract containing upwards of 25 per cent. of tannic acid.

The introduction of these extracts had a marked effect upon the tanning industry, reducing the period of tannage and consequently cheapening the production of leather.

Other materials have since been introduced, such as mimosa bark from Australia and South Africa, and quebracho from the Argentine.

Each of the various tanning materials possesses certain characteristics, and the art of tanning leather satisfactorily depends on the blend of the materials used. To-day, although oak bark is still used, practically 90 per cent. of the tanning materials are imported from various parts of the Empire.

Our tanneries are converting 150,000 hides per week into leather, of which number only about 60,000 per week are from our own native cattle. The others come largely from South America and within the Empire.

The industry has been able to produce leather for our own Army's requirements, and also has assisted in supplying our Allies with harness and accoutrement leather, as well as some millions of pairs of boots.

LIGHT AND FANCY LEATHER.—Great Britain has always had a name for the production of first class fancy leather. This is made largely from the skins of sheep, goat, calf and seal. These skins, being much lighter than cattle hides, are tanned with different materials and in a much shorter space of time. Light skins can be transformed into leather in as many days as a hide requires months. Such skins are afterwards dyed, and grained and finished by special skilled workmen for various fancy articles. They form the raw material for the bookbinder, the upholsterer, and the manufacturer of fancy leather articles. This is a branch of the trade which has undergone considerable development during the past four years and which after the war should develop to a much greater extent.

CHROMIUM TANNING.—In 1881 the first patent was taken out for the production of leather by means of chromic acid, although in 1858 a German professor had made public a process which brought about a similar result. The method of chrome tanning almost revolutionised the manufacture of boot upper leather, especially glazed kid and calf. The process of chroming skins is a very rapid one and is highly technical, but the resulting product when properly manufactured is generally considered superior in strength and wearing properties to vegetable tanned leather. It is also lighter and has a smarter appearance.

Certain progress has been made in the chrome tanning of heavy hides for sole leather and belting, also for picker bands and special mechanical leathers for cotton mills, but the British manufacturers have been behind in taking full advantage of this newer process, and it was not until America and Germany had begun to export large quantities of chrome tanned leather to this country that the British manufacturers took up chrome tanning seriously. During the past few years, however, a good deal of leeway has been made up.

There is no doubt that Great Britain possesses many advantages for the production of chrome upper leather, owing to the fact that large quantities of calfskins and kips are produced within the Empire, India alone producing twelve million kips per annum, besides immense quantities of goat.

# BRITISH POTTERY INDUSTRY.

By SYDNEY MALKIN, President of the Hanley Incorporated Chamber of Commerce.

BRITISH pottery is manufactured principally in North Staffordshire in an extensive district comprising the townships of Hanley, Burslem, Tunstall, Stoke, and Longton, which towns have in recent years been federated into the important borough of Stoke-on-Trent—a city which ranks as one of the fifteen largest in Great Britain.

Up to the time of Josiah Wedgwood, this area was wild and uncultivated, without even canal communication or good roads, and was isolated from the great centres of trade and commerce. The ware produced consisted of rough red ware which was chiefly disposed of in the adjacent area. There was very little export trade, and the reputation of the potteries did not extend beyond a few score of miles.

With the advent of Wedgwood, all this was changed. Roads and canals were built, better clays were brought from the South of England, whereby the fine Queen Ware or Ivory was first introduced to public notice and soon became renowned throughout Europe. Local collieries were developed, for it was evident that the coal of North Staffordshire possessed unique calorific value and was admirably adapted for firing pottery, a higher class of labour was utilised and some of the best artists of that day found scope for their genius in supplementing the efforts of the manufacturers, including such well known names as Flaxman, Turner, Whieldon. But it was the superior mechanical perfection of the ware produced by Wedgwood and other potters of that period as well as their remarkable cheapness that laid the foundation of the prosperity of Staffordshire. Ere long it was realised that there were vast possibilities in respect to trade with foreign countries. British china and earthenware was admittedly more perfectly finished than anything that had previously been produced, and the reputation then established has since been maintained and amplified by generations of skilled potters and artists. A few years later, the high class ornamental and decorative China produced at Worcester and Coalport, attained world wide reputation and this has since eclipsed the best efforts of the Continent and the East.

For table ware (whether as dinner sets or tea sets), British pottery is more artistic and more durable than the productions of any other country. These qualities have resulted in the creation of perhaps the largest and most important branch of the trade, viz., that which provides for the requirements of hotels, restaurants, railways, steamships, and institutions of all kinds which require special badging whether trade marks, monograms, crests, or special designs for advertisement purposes. During the last few years, an immense variety of all kinds of other articles for table use have been introduced, including fruit dishes, dessert sets, teapot sets, coffee sets, biscuit jars, savory sets, etc., many of them specially suited to the varying requirements of foreign and colonial markets. Also there has been a remarkable development in artistic jardinieres, pedestals and pots, rose bowls, and other articles for the decoration of the homes of the millions as well as the palaces of the great. At the same time the requirements of modern cookery in respect to culinary articles have been studied from a hygienic standpoint, and as a result a wide variety of new and approved devices have been perfected by some of the leading manufacturers in Staffordshire, whereby a complete range of hygienic fish and milk bowls, household jars, cooking utensils, and other requisites for the kitchen and pantry are available. These are manufactured in pure white "iron-stone" ware of a very hard and durable character such as no other country has succeeded in producing. Hence the trade of the whole world in this class of pottery has naturally gravitated to Staffordshire.

On the other hand, the modern development of utilising high-class toilet ware for the artistic finishing of bedrooms has provided further scope for the genius of English art as applied to pottery, and an unique branch of the industry has been evolved in producing bedroom, toilet, and fireplace sets to harmonize with modern furnishings, so that the decoration of a room can be *en suite* throughout. All the great departmental stores throughout the world find it helpful to keep in touch with British firms who specialize in this direction.

Quite apart from these aspects of the trade (which are more or less of a domestic character), in recent years, through the awakening of sanitary science, a demand has sprung up for large fireclay pieces, including lavatories and public conveniences of all kinds for public works. In this connection, the names of Doulton, Twyford, Howson, and "Caxidon" are known in almost every important city of the British Empire, and indeed throughout the civilized world. For utility and soundness their productions are unrivalled.

About the year 1850, a new branch of the industry was developed in the manufacture of encaustic and fine glazed tiles, of a durability and regularity unequalled by the products of any nation or period. The demand for this class of pottery as a hygienic method of finishing the walls of workshops, tunnels, laboratories, and latterly railway tubes, has given immense impetus to this important section of the industry.

What was originally considered as a luxury for the rich is now looked upon as a commercial necessity in connection with all classes of buildings from the cottage of the artizan to the palace of the prince, from the school of science to the stately church. In recent years the highest art has been introduced in the production of majolica glazed tiles for conservatories, vestibules, and ecclesiastical buildings. Unique features have been produced by Pilkington's, Mawe, The Maruden Tile Co., and other leading firms whereby the renown of English art tiles has been still more firmly established. Undoubtedly a great future will open up for this branch of trade after the War.

Some reference must also be made to the wonderful development there has been in the science of producing pottery suitable for invalids and for hospital use. The present war has caused an immense demand for this class of ware, and it has been ably met by British potters, who have supplied the needs of doctors and nurses, giving the most scientific and approved shapes so that the necessities of the sick room, and the welfare of our wounded soldiers has been met on hygienic lines, and with great advantage to the sufferers.

With the advent of electrical engineering great impetus was given to another and most important branch of the trade—electrical fittings—of which many millions are exported to every part of the world from the factories in North Staffordshire. By the severest tests of high voltage, British [illegible] have proved [illegible] superiority over [illegible]

# LEAD PENCILS.

## By G. H. MEADMORE.

THE manufacture of lead pencils in similar form to the familiar article of to-day dates from a period immediately following the discovery of the once famous Borrowdale mine, situated a few miles from Keswick, in Cumberland, in the year 1564. At a much earlier period metallic lead was used for marking on parchment, paper or other material, and it is doubtless owing to the earlier use of this substance that the erroneous term "black lead" has been applied to plumbago or graphite, the mark produced by the latter being much blacker than that from metallic lead.

The history of the lead pencil, for nearly three centuries, is closely associated with the fortunes of this mine, and it is probable that in no other part of the world has similar graphite been found equal to that found there. Analyses, however, which have been taken of the Borrowdale graphite show that it was not of exceptional purity, but it was the physical condition in which it occurred that gave it its value for pencils. The product was so greatly desired, and was so closely maintained as a monopoly, that in pursuance of an Act of Parliament the mouth of the mine was guarded by an armed force, and to maintain the monopoly and conserve the supply the mine was only worked during six weeks in each year. To prevent pilfering, the mine was closed by flooding. The graphite was sold by public auction in London, and for many years the Cumberland mines were probably the only source of supply for pencil making. The graphite was used in its crude state, being simply cut or sawn into thin sheets, which were again cut into rectangular sticks and enclosed in their wooden casing. This method was not economic, and towards the close of the 18th century, when the deposits began to show signs of exhaustion, and also during the early part of the 19th century, efforts were made to discover a means by which the waste which had accumulated in the factories and the residue from the mine could be utilised. Pulverisation, with the addition of a binding medium such as glue, isinglass, or gum, was tried, but without marked success, and was eventually abandoned in favour of the process originated by Conté, a French chemist, in 1795. By this process the lead was made from finely ground graphite mixed with clay, formed into strips and baked. This invention marks the most important step in the manufacture of the modern pencil, and is the process now in universal use. The richest deposits of the Borrowdale mine were worked out by the middle of the last century.

Graphite, of which there are two distinct types, viz., foliate or crystalline, and compact or amorphous, has since been found in many parts of the world, but that mostly used by the pencil manufacturer comes from Bohemia, Bavaria, and Mexico. Foliate graphite is difficult to grind to the required fineness, and is less brilliant in colour than the amorphous, which, on the other hand, can be ground to a gritless fineness, and is of a nature which combines readily with other materials.

The manufacture of the modern pencil requires considerable technical knowledge, and involves a large number of operations. The graphite, which has already been prepared at the mines, is mixed with clay in a dry state, then moistened and milled to the requisite fineness. Filter presses free the "batch" from an excess of moisture, and it then passes through a series of compressors, from the last of which it is extruded through a hole or holes, slightly larger than the actual thickness required to allow for shrinkage, and the "strip" is thus formed. At this stage it is in plastic form. It is laid out in trays, in lengths of about 22 inches, and after drying is ready for baking. The degrees of hardness are primarily obtained by varying the proportions of clay and graphite.

Nearly all pencils are made of cedar wood, which, owing to its softness, straight grain, and freedom from knots, make it peculiarly adapted for this purpose. The red cedar, or pencil cedar, belongs to the Juniper family, being the *Juniperus virginiana*, which is found in the south eastern states of the U.S.A. The wood is mainly imported in the form of "slats," which are strips about 7½ ins. long, ⅜ ins. thick, and from 2 ply to 6 ply in width, 6 ply being the width of 6 pencils. The slats are grooved, coated with glue, and the strips of lead inserted. Two slats, one of which contains the strips, are glued together, and the blocks thus formed are fed into the shaping machine. This machine cuts a series of semi-circular grooves on each side of the blocks, converting them into shaped pencils. The pencils have then to be sand-papered, coloured and polished, the ends cleaned, and finally stamped and bronzed.

A reference to the Census of Production shows that in the year 1907 pencils to the value of £63,000 were produced in the United Kingdom. Considerable progress has been made since that date, and particularly since the outbreak of the war. New companies have been formed, old established companies have increased their output, and it is estimated that the production in 1916 exceeded 1,800,000 gross, or was at the rate of more than 2½ million pencils per week.

# GLASS BOTTLES.

By A. SIMPSON.

As we know them to-day glass bottles are vastly different to those which were in use in the early ages. The earliest bottles were made from the skins of animals, but the ancient races also used bottles made of stone, ivory, alabaster, porcelain, and glass.

The actual origin of glass manufacture is somewhat obscure, but there is no doubt that the production of vessels to contain liquids, etc., was among the initial efforts of the pioneer glass-makers. The early glass bottles were not made by blowing in moulds as is the case to-day but were formed upon a core of clay or sandy paste attached to a rod, which was dipped into the molten glass, the core being removed after the glass was cold. This method was used about 1400 B.C., and the use of the blowpipe was not adopted until considerably later

From reference to ancient records it appears that the manufacture of glass for domestic and industrial purposes began during the time of the Roman Empire, and at the dawn of the Christian era had been developed to an extraordinary extent.

The earliest reliable record of the manufacture of glass in Great Britain dates from 1230, when we find the industry established on the borders of Sussex and Surrey but in Elizabeth's time it began to decline owing to the restrictions upon the use of timber as a fuel About the year 1610 coal was first used as a fuel for glass furnaces, and the industry gradually expanded until in 1696 we find that there were eighty-eight glass factories in the country of which thirty nine were classified as bottle factories.

In 1745 the industry was in such a prosperous condition that the Government imposed an excise duty on glass manufacture, but this was of such an exorbitant nature that it considerably retarded its progress.

*In 1840 the production of glass bottles in Great Britain* amounted to 525,674 cwts., of which 292,987 cwts. were exported, but in 1845 the tax was repealed, and from that time the industry has gradually grown to its present dimensions.

In making glass bottles by hand the larger varieties are generally made by a gang of five workers, known as a "chair" or "hole." The work performed by each member of the "hole" is as follows the "gatherer" takes the molten glass from the furnace by means of an iron blowpipe and rolls it into shape on a slab of iron or stone. The "blower" takes the glass from the gatherer and places it in a mould and blows down the pipe until the bottle is the required shape. The "wetter-off" next detaches the bottle from the blowpipe with an iron tool called a "snuffet." The "maker" finishes the neck of the bottle with a band of molten glass, which he shapes with a hand tool. The "taker-in" picks up each bottle as it is finished on a long rod and carries it to the annealing furnace or "lehr," where it is cooled gradually The "wetter-off" and "taker-in" are usually boys.

In making small bottles the "hole" generally consists of four workers—two "blowers," a "maker, and a "taker in ' Sometimes, however, the "blower" has an apprentice who acts as gatherer

The introduction of machinery for making glass bottles undoubtedly marks the most important stage in the development of the industry About the year 1876 a machine was designed in Australia to produce pickle bottles, but owing to labour obstruction was never developed. Shortly after this a machine was designed by Ashley in Castleford, Yorkshire, where it was demonstrated at a local works, but this was only partially successful, for although a large company was formed to work the patents it eventually came to grief By this time many people interested in the manufacture of glass bottles in both Europe and America were giving the question of machinery serious thought, and a number of machines were exploited in quick succession, most of which were more or less efficient.

About fifteen years ago Owen designed a machine in U.S.A. which has since been improved This machine is absolutely automatic, and is now capable of producing fifteen quart bottles and twenty four small capacity bottles per minute

Other notable machines are the Forster, Steel, Wilsin, Miller, and O'Neill, all of which should play their part in the struggle for commercial supremacy when the war is over

The British manufacturer of glass bottles has now a great opportunity to supply a larger portion of the world's demands, and the manufacturer that has equipped his works with the most efficient and up-to-date labour saving devices will be in the best position to meet the vast requirements of the overseas markets.

The following statistics show the exports of glass bottles from the United Kingdom to all sources at intervals of ten years from 1853 to 1913 —

| Year | *Quantity* | *Value.* |
|---|---|---|
| 1853 | 457 787 cwts. | £245,456 |
| 1863 | 614,551 ,, | £312,696 |
| 1873 | 997,290 ,, | £461,914 |
| 1883 | 769,137 ,, | £306,406 |
| 1893 | 630,202 ,, | £305,781 |
| 1903 | 806,868 gross | £443,782 |
| 1913 | 974,445 ,, | £606,547 |

Exports at intervals of ten years from 1863 are as follows —

| Year | *Quantity.* | *Value.* |
|---|---|---|
| 1863 | 821,796 gross | £423,855 |
| 1903 | 1,831,935 ,, | £732,208 |
| 1913 | 1,952,671 ,, | £814,488 |

# THE GROWTH OF THE TALKING MACHINE INDUSTRY.

By CHARLES FREDERICK HIGHAM.

IT seems almost incredible that the modern gramophone should ever have originated in a card-board horn talking-machine worked by hand—nevertheless, it is the direct descendant from the first crude attempt at registering sound vibrations vertically on tin-foil, as in the Edison phonograph of 1877, up to the latest lateral gramophone which faithfully reproduces the slightest inflection of the human voice. Shortly after Thomas Edison's first talking-machine, Mr Sumner Tainter and Professor Alexander Bell introduced the method of engraving sound waves on soft wax by means of a needle highly sensitive to sound vibrations, so delicately poised as to cut a groove into the revolving cylinder of wax with every vibration. About the same time Emile Berliner conceived of the idea of engraving on a flat plate instead of on a cylinder, and it is from this revolving disc that the perfect-toned records of to-day have evolved. In 1908 the industry made *big strides forward, developing rapidly* in America and Europe, and coming eventually to England.

Although England was not at first as actively interested in the progress of the industry as France or Germany, for example, at the present day the manufacture of gramophones and records is an important British industry

At first the manufacture of talking-machines was confined exclusively to America, but no great trade was established for some time, owing to the extremely high prices of the instruments. Later, when more serious attention was devoted to furthering the development of the industry, gramophones and talking-machines began to be manufactured in the British Isles. With more skilled workmanship, and consequently larger output, the phonograph and cheaper makes of gramophones were by degrees brought within the reach of the working-class, until ultimately there were but few homes in the British Isles which did not possess a phonograph or a gramophone, and at *the present day the popularity of* the gramophone is immense. The far-reaching influence of the gramophone is forcibly demonstrated by the fact that Sir Ernest Shackleton took a gramophone with him on his first expedition to the Antarctic.

The fundamental principle of the gramophone is not elaborate—it was the developing and perfecting which has taken years to bring up to the present-day standard. The making of a record consists in focussing the waves of sound by the agency of a horn or cone, by singing, talking, or playing into the mouth of which, vibrations are set up on a diaphragm of highly sensitive material, usually glass or mica, at the other end of the cone, from whence these vibrations are transmitted to the stylus, or cutting point, which traces them on the wax disc or cylinder

Music is no longer a transient art, every note may be made permanent, and the music of the world's finest singers immortalised by the gramophone. The student of music in the future will *be able to hear the great musicians and singers* of to-day playing or singing the masterpieces which made their names famous; when he sings their songs or plays their compositions, he will have the opportunity—even as the present-day student has—of studying their technique and expression at leisure and as often as he chooses. The gramophone is the medium by which men and women may hear the world's greatest artists in their own homes. This alone would make the industry worthy of cultivation.

The gramophone *has unique educational* values. Often in America school-children march and drill to music rendered by the gramophone. The art of elocution and foreign languages could be more easily taught by carefully selected records of an expert in the particular subject, than by forcing the students to labour under the often faulty accent of a local teacher The talking machine has already proven its usefulness in numerous business houses in England and America.

The latest *application of* the gramophone is the recording of gun-drill instructions, set to a popular melody, thus rendering them easy to remember Not infrequently lectures have been delivered by the gramophone, and a year or so ago a well-known politician, being unable to personally attend a meeting, recorded his speech on the gramophone, and it was reproduced at the meeting The two great recruiting speeches of the Lord Mayor, a little while ago, were recorded and added to the British Museum's *library of records*, to which go all *the brilliant* performances of the greatest artistes, and speeches by prominent public men. This collection of records will be absolutely invaluable to future generations.

The growth of the talking machine industry deserves to be encouraged, if within thirty years it has developed from a harsh-toned mechanical contrivance to a wonderfully constructed beautiful instrument which reproduces sound without the minutest degree of difference from the original, what immense possibilities future years must hold in store for the talking-machine industry as a whole!

# THE BRITISH PIANO AND THE WAR.

THE position of the British piano trade as a result of the war presents a strange anomaly. On one hand we see that the closing of the market to German-made instruments, which had hitherto enjoyed a high and indeed somewhat exaggerated prestige in the eyes of the public and profession, provided the British maker with an exceptional opportunity to supplant his chief competitor; on the other hand this advantage has been rendered almost nugatory by a scarcity of labour and material. In the early part of 1916 it was seen that the situation with regard to the latter was a most serious one, for the depredations of the German submarine and the increasing demand on tonnage for war purposes led the Board of Trade to place drastic restrictions on the import of materials necessary to the production of pianos. At the same time the Government recognised the necessity of maintaining as far as practicable the export trade in this class of goods, and a system of rationing the musical instrument trade was put into operation on the understanding that the bulk of the material so allotted should be devoted to the production of instruments to be sold in the foreign markets. These rations suffered continual reduction, until by the latter part of 1917 the supplies had become so restricted, especially in regard to copper strings and other metal requirements, that the chief factories found themselves facing the early prospect of a complete stoppage. Such an event would obviously have been to the advantage of the German, as it would have meant that his *goodwill* remained unimpaired, and that at the end of the war his British competitor would find himself seriously handicapped by the lack of capital and with a depleted organization. Fortunately this grave position synchronised with a phase of the war which demanded an enormous increase in aeroplane production, and it was quickly discovered that the type of labour and machinery employed in piano making was eminently suited to the delicate construction of the aeroplane, more especially of the wings and propellers. Many of the leading musical instrument firms entered upon this important work, and were thus enabled not only to keep their organizations intact, but to be placed in a position of readiness to effectively meet the German competition immediately on the completion of hostilities. It also permitted them to continue to make and export the small quantities of pianos which the modest rations of material allowed, although obviously this diversion of their manufacturing energies postponed any serious efforts to replace German pianos by those of British make.

The future of the British piano may reasonably be regarded as bright, for, whilst it is too much to hope that German pianos will never find a market in this and the other Allied countries, there should exist for a considerable period sufficient antagonism against goods emanating from Germany to give the British piano maker a start. This, however, must only be regarded as a transitory advantage, and obviously the extent to which he will eventually benefit depends solely on his ability to offer the same value as the German, whilst this may be rendered easier, so far as the home market is concerned, by a protective tariff it will be a stern test of manufacturing efficiency to produce an instrument which can compete on level terms with the products of Germany and America. It would be foolish to ignore the fact that, partly as a result of cheap labour and large output, the Germans have in the past been enabled to produce excellent pianos at low prices, and also that, even in their cheaper instruments, they have succeeded in producing a pleasing tone. The English piano trade, however, has not been standing still in the past three years, the various firms have effectively combined to consider all questions relating to their trade, and it is to be expected that this unity will enable them not only to offer a stronger opposition to German competition, but will also enable them to secure a greater measure of support from the Government than they have hitherto enjoyed. Moreover, the British maker, temporarily freed from the stress of German competition, has been able to devote time and research to the improvement of his goods, whilst the necessity of carrying on production under war conditions has revealed certain economies and improvements in the methods of production that can advantageously be put into effect after the war. Even before the war, however, makers of the better known English instruments had nothing to learn from the Germans as regards quality, and those who claimed some mysterious superiority of tone for German pianos could only have been inspired by that strange form of prejudice in favour of things un-British which is, or used to be, an idiosyncrasy of the race. The formidable nature of German competition in this trade can be realized from the fact that in the last pre-war year the exports of Germany in this class of goods represented over four times the value of those exported from this country but it may be expected that, if the British maker rises to his opportunity, Germany will fall to the third piano producing country, America ranking first and Britain following.

Whilst no accurate statistics as to the output of pianos of the various countries is obtainable, it is estimated that the world's annual production prior to the war was made up as follows —

| | |
|---|---|
| America | 350,000 |
| Germany | 170,000 |
| England | 75,000 |
| France | 25,000 |
| Austria and Switzerland | 12,000 |
| Russia | 10,000 |
| Spain | 2,500 |
| Italy | 1,500 |

It may be noted with interest that Italy, the country which gave birth to the piano, ranks lowest, she reached her highest production with the pianos of Christofori and other makers in the early eighteenth century, after which date the trade passed to Germany, who maintained her lead until about 1900, when England and France became the chief producers. From the middle of the nineteenth century till the present day, America obtained the lead with Germany for her chief rival, the rapid development of the American piano industry in later years being materially assisted by the invention of the player piano, of which the American piano makers were the pioneers. The British maker is fully alive to the possibilities of the present situation, and is determined to offer advantages in both quality and price that will leave no room for excuse to purchase a foreign made instrument on these scores, and it may safely be asserted that after the war it will be a matter not merely of patriotism but of wisdom to purchase a British made instrument.

# The Weber Small Grand Piano

**combines perfect tone with convenient size.**

The Weber tone is the most perfect tone ever produced in a British made piano, it is surpassed by that of no other piano in the world.

And its distinctive loveliness, its richness, sonority, and liquidity are realized to the highest degree in the Weber Small Grand.

This instrument is an achievement in pianoforte making almost meriting the term revolutionary For it is less than five feet in length—as convenient in size as an upright—yet nothing has been sacrificed in tonal quality

And its exquisite proportions and lines stamp it as one of the most beautiful grands ever produced

# CONCENTRATED FOODS.

## By FRANCIS FRENCH.

THE term "concentrated foods" is one of wide application embracing a larger variety of products than is generally appreciated, and it will be shown in the course of the present article how vast and wide-spread has been the benefit conferred upon the community by the developments in the preparation and manufacture during recent years. In considering the subject, therefore, it is well to call to mind some of the articles which may be included under the above generic heading and immediately we shall think of extracts, evaporated vegetables, the two in combination in the shape of powdered soups, condensed milk, etc., but there must also be included jellies in squares and powders, blancmanges and creams, and numerous beverages in crystal and liquid form. The origin of the preparation of food in a concentrated form is remote. Meat extract, for instance, was first described by a chemist named Proust in 1801, though the manufacture owes its commercial introduction to the great Liebig about a half a century later. It is, however, in the last two decades that really great progress has been made in the production of a diversity of articles. With improvements in manufacture has come a greater appreciation of the advantages and conveniences of food in this form, and the industry has attained a position of very great importance, comprising firms with world wide ramifications and equally wide repute. Indeed, these manufacturers may claim justly that they have had a not unimportant share in the widening of the knowledge of the world and in its progress, for all the great explorers of recent times to a large extent have depended for their sustenance upon the concentrated foods which have made their journeys possible and have contributed in no small share to their success. This has alike been the case in the Polar regions as in the tropics, the portability and highly concentrated form in which the goods have been manufactured enabling a large quantity to be carried, this in turn allowing of the prolongation of the expedition until a successful result has been possible.

It must be remembered that most articles of food are perishable in their natural state, and their concentration and preservation whilst in a state of perfect and uncontaminated freshness before exposure to the decomposing effects of time and the infesting organisms polluting the market place and thoroughfare, is an enormous advantage. To this must be added the benefit of the convenience and economy of the supply in small quantities. Take as an instance soup, which is now being recognised as an invaluable addition to a mid-day or evening meal. Unfortunately the stockpot is not an English institution, but the readily obtainable packet of powdered soup supplied the omission to the great dietetic advantage of those partaking. It is an entire mistake to regard the food value of soup as negligible, on the contrary, the custom of preceding a substantial meal by a small quantity of soup has a physiological warranty. Soup or the extractives contained *in it stimulate the gastric glands and encourage* in a remarkable manner the digestion and assimilation of the more solid repast. When, therefore, soup is merely a first course, clear soups or those slightly thickened are the best, but if the soup is an important part of the meal it should be a thick variety containing peas, beans, or potatoes. Again, further examples of the great convenience to the housewife may be quoted in packet jellies which may be made into a delicate and nutritious dish in a few moments, whilst the preparation from the original ingredients would involve the expenditure of some hours.

Admitting then the great service and advantage of these preparations of concentrated foods to those resident in the homeland, it remains to be said that it is upon the seas and in the countries beyond the seas that the utility of concentrated foods has been more fully realised and appreciated. The question of tonnage is one that looms large in the eyes of the whole world at the time this is being written and the saving of every inch of freight is being forced upon the nations, and here and now it is that concentrated foods have proved their value beyond question or doubt. For our Armies abroad as for our Navy on the high seas our manufacturers have poured forth almost incredible quantities of their satisfying productions which had to be packed into and compressed into the minimum of space. The result has been that, in spite of the colossal nature and *extent of the task, it is an indisputable fact* that never in the history of the world has an army or a navy been so satisfyingly or regularly fed as during the present war. But in peace as in war our concentrated food productions have had their victories. Those in the field of exploration have been mentioned above, those in commerce are happening every day, so that, go to any part of the world you may, little difficulty is experienced in procuring well-known brands of soups, jellies and the other articles already mentioned, an ever-present reminder of the capability and resources of the old country.

# All the year round

SYMINGTON'S SOUPS provide a delicious meal in a few minutes at the minimum of cost Every packet makes a quart of appetising soup, more nourishing than meat, and there is a new variety of soup every day for nearly a fortnight

Made in British factories, Symington's Soups are pure, wholesome, satisfying, highly digestible, and economical Easy to prepare Greatly in demand at the Front.

# SYMINGTON'S SOUPS

Made in 13 varieties Tomato, Oxtail, Mulligatawny, Lentil, Kidney, Hare, Mock Turtle, Green Pea, Celery, Pea, Scotch Broth, Onion, White Vegetable

Symington's manufacture also Ideal Table Creams, Ideal Table Jellies, Jelly Crystals, Custard Powder, Fruit Puddings, Wheat Crystals (to take the place of arrowroot, or cornflour), Lemonade Crystals, Salannaise (a delicious and easily prepared Mayonnaise), Pea Flour, and Granulated Gravy

# MODERN OFFICE APPLIANCES.

By CECIL CHISHOLM, M.A.

FIFTY years ago the London office was a dingy and dusty abode of inefficiency. Business being looked upon as an inferior though necessary occupation, it was felt that any attempt at neatness or comfort was out of place.

But when business became more popular, and some of the impoverished scions of the aristocracy began to spend their days in the City, a change began to be evident. Young gentlemen accustomed to Mayfair standards of comfort refused to put up with the hair-dust chairs and the worm-eaten desks east of Chancery Lane. They caught glimpses of the polished mahogany and other splendours in the offices of company promoters, financiers, and the American invaders, and so the London Houses began to take their appearance more seriously. A period of elaborate office furnishing set in, with the result that to-day the great British offices compare favourably with those of America and other countries. Now comfort is the first, but it is not the last, requirement of a modern office. Comfort and hygienic surroundings the clerks must have, if they are to work efficiently. They require up-to-date equipment as well. Literally, three-fourths of routine office work may now be done by machinery. It has taken British business men a considerable number of years to realise this. Until the outbreak of the European War the desire to avoid dismissing members of the staff, and a distinct aversion to try "new fangled machines," did much to set back the wheels of progress.

In a few months the war changed the whole situation. Almost every manager in the United Kingdom was faced with a large amount of clerical labour, and a sadly depleted and often inexperienced staff to do it. In addition to the almost universal use of the typewriter, every conceivable device that would save time, labour and expense was worth trying. Consequently, to-day British offices are among the best equipped in the world.

How far can mechanism replace hand labour in the average office? Let us follow a normal day's routine and see just where mechanical equipment can step in. The day begins with the opening and assortment of a heavy mail. Probably an envelope opener is used. The clerk picks up a bundle of envelopes, places them in a hidden box, and turns a handle. Immediately an almost invisible shred of the edge of each covering is cut off, leaving the contents ready to drop out on the envelope being inverted and shaken.

After assortment the letters have to be answered. In the case of a large business many of the oft-repeated inquiries or complaints will be answered by the clerk's merely dictating a series of numbers—e.g., 4—16—as his typist. Each number represents a carefully prepared and listed "stock" paragraph which meets the point in the correspondent's letter. These paragraphs are collected together in a "stock paragraph book," so that a very competent typist can frequently compile the letter without any help from the correspondence clerk.

With the aid of a dictaphone letters can be dictated at the office or the home, at a principal's own time and convenience, a clerk afterwards typing from the "records" placed into a receiving cylinder.

When a certain type of inquiry is constantly met with a printable stock letter will be used. These are kept ready, so that only the date and the name and address of the correspondent require to be filled in. Stock letters of this kind are usually prepared by the thousand on a rotary office printing machine. These letters show the full stops through the paper exactly as in a typewritten letter. The letter is set up from actual type by mechanical means and inserted into the form which is made to receive it. The letter once set up is proofed, re-read and O.K'd by the manager responsible. It is then run off by the machine much as a newspaper is run off by a rotary press. The type is inked by a ribbon during the first half of its revolution, and prints a sheet during the second. Some duplicating machines produce thousands of copies of either handwritten or typewritten matter at one hundred copies a minute, which work can be done by an amateur after a few hours' practice. One of these machines inks itself, feeds the paper and counts the number of copies. Some of these machines which print from wax stencils avoid the soiling of the lady operator's hands. Next the individual letters must be copied. This is sometimes done at the time of typing by the use of a carbon or carbons. But unfortunately corrections made while typing do not show on carbon copies. To obviate this difficulty a special mechanical copier is frequently used. The best modern method of copying daily correspondence requires no carbons, water, or damp sheets, four or five copies of handwriting or typewritten matter can be reproduced.

When letters go to a list of names they are folded by one machine, the envelopes are addressed by a second, and stamped by a third.

The letters being duly despatched, the copies must next be filed. The science of filing has now reached extraordinary precision. But there is no golden rule in filing methods. Briefly it may be said that all filing cabinets should be of steel, every drawer should move on ball bearings, so as to prevent sticking and strain on the clerks, and the simplest arrangement is usually the best.

There are three principal filing methods—loose leaf, card index, and vertical filing. Loose-leaf books have numerous advantages, but they tend to be bulky. The card index is neat and orderly, but it requires an extremely intelligent filing clerk if it is to be efficiently operated. The vertical filing system is the most easily operated where the number of letters and documents to be filed is not enormous. During the last few years the vertical filing system has been greatly improved by the introduction of a filing method combining the numerical with the alphabetical system. There are a number of these now on the market, most of which are fairly reliable.

In the counting house a whole series of automatic devices are now at the cashier's command. Chief of these is the calculating machine, which not only adds and subtracts, but multiplies. An intelligent child can with its help do the work of a bookkeeper. Its simpler form the adding machine, is too well known to need comment. But machinery is not used in the modern office merely to save labour. It also ensures accuracy; the calculating machine can never make a mistake. Mechanism has even been invented to ensure the business man against theft. Cheques treated by one specially devised machine cannot by any human ingenuity be successfully tampered with. The coin-counter, a very rapid and handy little device, never makes errors in counting either sixpence or half-crowns.

Finally, we have hand fire extinguishers, and also the sprinkler system, which insures an automatic drenching by the soaking of a cap which lets loose a shower of water.

The modern office can, therefore, be largely staffed by women. The urgent need to-day is for better methods of training both men and women in the supervision of office staffs. Machinery will do much, but it will not think. We have to guarantee more young executives who can.

RONEO

# OFFICE APPLIANCES

are used by thousands of Commercial Houses, Government Offices, Institutions, etc., all over the world.

## THE RONEOTYPE

is an office printing machine, also produces actual typewritten letters from typewriter type through a typewriter ribbon at the rate of 100 per minute

## THE RONEO DUPLICATOR

produces copies of either handwritten or typewritten matter at the rate of 100 copies per minute.

## THE RONEO LETTER COPIER

copies correspondence, etc, without the use of water or wet rags. Can be used in conjunction with the letter book or vertical filing system.

## RONEO STEEL FILING CABINETS

are *fire resisting* They do not shrink or swell.

## RONEO NUMERALPHA FILING SYSTEM

combines all the advantages of the numerical and alphabetical systems. No card index required.

*Branches and Agencies all over the World.*

# PAPER TRADE INDUSTRY.

## By H. P. STEVENS, M.A., F.I.C.

RAW MATERIALS.—The raw materials used in the British Isles for the manufacture of paper consist of (1) vegetable fibres, derived chiefly from wood, esparto, rags and straw, (2) soda, lime and bleaching powder for the purification of the fibres; (3) rosin, glue, gelatine and starch for sizing and giving a finish to the paper; (4) loading materials such as china-clay, chalk, gypsum, etc., to cheapen and render the paper opaque, (5) colours such as ultramarine, coal-tar dyes, the former being used chiefly to counteract the natural yellow tinge in the manufacture of white papers, and (6) waste papers. The manufacture of paper also requires coal for steam raising and a very ample supply of good water.

Rags, which once supplied the bulk of the paper-makers' raw material, are now used for high-grade papers only, and Great Britain is dependent on its Colonies and on foreign countries for the supply of the great bulk of vegetable fibres. Of these wood pulp is the most important. In normal times this comprises four fifths of the amount of our imports of fibrous materials.

Wood pulp is of two varieties—"mechanical" wood pulp and "chemical" wood pulp. The former predominates and consists of wood ground to pulp in a stream of water, the latter consists of wood disintegrated by chemical processes and fetches two or three times as much as the mechanical pulp. The wood used is mostly coniferous (spruce fir) and therefore derived from countries with temperate or cold climates. Norway and Sweden supply the bulk of our requirements, next in importance are Russia (Finland), Canada, Newfoundland and Germany. The cutting off of supplies from the last-named country has not appreciably affected the position, and until the recent restrictive measures came into operation, the British imports of wood pulp had increased rather than diminished. There are ample reserves of wood in Canada and Newfoundland to supply all British requirements.

Esparto is imported in the raw state and converted into pulp in English mills. It is mostly derived from Algeria, the remainder from Spain and parts of the North Coast of Africa. Owing to the war, imports have dropped to two-thirds their original amount.

Rags are largely imported, but the war has reduced the import to one-third of the pre-war figure.

The following figures give the imports of fibrous raw materials for the three years 1913, 1914 and 1915 —

| Description | 1913 Tons. | 1914 Tons. |
|---|---|---|
| Mechanical Wood Pulp | 539 264 | 537 089 |
| Chemical Wood Pulp | 411,923 | 433,239 |
| Esparto | 264,867 | 253,144 |
| Rags | 28,838 | 22,294 |
| Other Materials | 15,288 | 11,856 |
| Totals | 1,259,180 | 1,207 672 |

Of other raw materials the most noticeable feature is the falling off in imports of bleaching powder.

*Imports and Exports of Paper.*—For our purposes the term "paper" must be held to include not only printing, writing and wrapping papers, but also paste board, cardboard, mill board, straw boards, and many specialities.

As regards imports Norway and Sweden supply us with the greater part of the cheaper kinds, such as news and wrapping papers, while Germany's exports of paper to this country were of equal importance, for, although cheap printings, such as newspaper, did not bulk so largely, this was neutralized by the larger quantities of almost every other type. The cutting off of the Germans supplies has not caused as much inconvenience except in the case of some special types, such as vegetable parchment, photographic, grease-proof, and filter papers. Steps have been taken to increase the home supply, which in some cases is already adequate.

The following figures give the quantity and value of the British imports of paper and boards during the last three years —

| Imports. | | | | | |
|---|---|---|---|---|---|
| 1913 | 1914 | 1915 | 1913 | 1914 | 1915 |
| Tons. | Tons. | Tons. | £ | £ | £ |
| 644,057 | 660,571 | 259,322 | 7,274,719 | 6,781,128 | 4,648,888 |

Over one quarter of these quantities is accounted for by straw boards manufactured in countries where straw is plentiful. Great Britain is estimated to produce about 11 per cent. of the world's output of paper and Canada 5 per cent. The United States is by far the largest producer, manufacturing over one-third, and is followed in order by Germany, England, France, Austria, Canada, Italy, Russia, Finland, etc. The British exports of paper for the last three years are given in the following table :—

| Exports. | | | | | |
|---|---|---|---|---|---|
| 1913 | 1914 | 1915 | 1913 | 1914 | 1915 |
| Tons. | Tons. | Tons. | £ | £ | £ |
| 1 4,946 | 134,815 | 157,985 | 2,479,165 | 2,128,930 | 2,897,973 |

*Manufacture of Paper in the British Isles.*—There are 251 paper and cardboard mills in England, sixty-one in Scotland and seven in Ireland. Wood pulp is only manufactured at two mills. There are thirty-seven paper mills in Canada and a large number of wood pulp mills. Some Canadian mills combine the manufacture of both wood pulp and paper. In Newfoundland there are two large establishments, one producing wood pulp and paper and the other wood pulp only. There are seven paper mills in Australia, three in New Zealand and eight in India. Official statistics of the paper output in Great Britain and Ireland were furnished in 1907 for the Census of Production :—

| Paper — | United Kingdom. Quantity Tons. | Value. £ |
|---|---|---|
| Paper for Writing and Drawing and for Envelopes | 194,280 | 3,080,000 |
| Paper for Printing and for Posters, etc | 108,080 | 2,580,000 |
| Packing and Wrapping Paper Bags, etc | 151,200 | 1,962,000 |
| Printing and Coated Papers (not Hangings) | 34 020 | 846,000 |
| Pasteboard, Cardboard and Millboard | 44,460 | 561,000 |
| Other Sorts | 26,730 | 700,000 |
| Paper Bags | 20,340 | 457 000 |
| | 584,330 | |
| All other Products — Recorded by Value only | | 114,000 |
| Total Value | | 12,250,000 |

| | 1912 | 1913 | 1914 | 1915 |
|---|---|---|---|---|
| | Tons. | £ | £ | £ |
| Newsprint | 841 280 | 1,228,598 | 1 201 723 | 1,253,771 |
| Printing, Writing and Wrapping Papers | 888,841 | 3,372,412 | 3,098,378 | 3,781 674 |
| Boards | 137,828 | 623,864 | 520,478 | 641 000 |
| Straw | 11,128 | 378,251 | 257,863 | 141,883 |
| Other Materials | 3,634 | 142,849 | 104,918 | 26 394 |
| Totals | 1 104,881 | 5,870 893 | 5,083,816 | 6,123,761 |

A more recent but unofficial estimate has been kindly supplied me by the Paper Makers' Association. The following figures give the annual pre-war production of paper manufactured in the British Isles —

| | Tons. |
|---|---|
| News, all grades | 377 000 |
| Printing and Writing Paper from Wood Pulp | 284,000 |
| Printing, mostly from Straw (Esparto | 164,000 |
| Brown Papers and Specialities | 228,000 |
| Best Writings and Blottings, mostly from Rags | 19 000 |
| | 1,022,000 |
| Mill Boards, Leather Boards, etc | 68,000 |
| Total quantity | 1,090,000 |

# THE GORDON BOYS' HOME

(THE NATIONAL MEMORIAL TO GENERAL GORDON).

*Patron*—THE KING. *Vice-Patrons*—H.M. THE QUEEN and H.M. QUEEN ALEXANDRA.

THE HOME IS SITUATED AT WEST END, WOKING, NEAR BROOKWOOD.

OFFICES—5, YORK STREET, ST. JAMES'S, S.W.

The Home is constructed to accommodate 500 Boys, chosen from the homeless and destitute, between the ages of 12½ and 15½, and give them a training up to the age of 17 or thereabouts, which will fit them alike for civil life in this country or its Colonies, and for service in the Army, Navy or Mercantile Marine.

Conditions of Admission.—1. The age for admission is from about 12½ to 13½ years. 2. A boy must, in the opinion of the Committee, be really destitute. 3. He must be free from some physical or mental infirmity as would disqualify him for service in the Army or Navy or for civil employment in the Colonies or elsewhere, which would require active bodily exertion. 4. Boys of known bad character are ineligible.

Free admission is given to such number of boys as there are can be provided for out of the general income of the Home. A guaranteed payment of £25 annually during his stay at the Home will give a right of nomination for a lad fulfilling the conditions of admission. Subscriptions and Donations are urgently needed in order that the above number of boys may be maintained.

Subscriptions are received by THE LONDON COUNTY AND WESTMINSTER BANK, 1, St. James's Square, S.W.; by the Treasurer, General the Right Hon. Sir Dighton Probyn, V.C., G.C.B., Marlborough House, S.W.; and by the Secretary, at the Office, 5, York Street, St. James's, S.W., from whom any further information can be obtained.

H. S. MARKHAM, Esq., *Secretary*. [14]

# NEW S.P.C.K. BOOKS

## *EDUCATION.*

# MESSRS. GABBITAS, THRING & CO.,

**36, Sackville Street, Piccadilly, W.,** Tel. 4295 Regent.

have a Department specially organised for advising Parents and Guardians as to the best Educational Establishments for Boys and Girls in the United Kingdom or on the Continent. The Firm have had experience as Educational Agents for forty years, and during their long career have been instrumental in sending Masters and Tutors to the leading Schools and Tutors Establishments, and are in the closest touch with all educational matters. They can give, FREE OF CHARGE, to the Parent or Guardian information and advice as to—

*SCHOOLS FOR BOYS OR GIRLS. TUTORS*
ESTABLISHMENTS. EDUCATIONAL HOMES.
DOMESTIC ECONOMY, AGRICULTURAL, AND
SECRETARIAL COLLEGES.

EITHER AT HOME
OR
ABROAD.

To enable the Firm to advise efficiently it is necessary that *full particulars should be given*, especially as to the age of the Pupil, previous education, and present standard of attainments, special subjects of study, locality, whether a large or small establishment is preferred, and the fees it is intended to pay.

The Firm also can assist in procuring the services of Private Tutors and Governesses, Resident, Travelling, Non-Resident, or Visiting, of whom they always have a large number on their Lists.

**Transfers** of and **Partnerships** in **Boys'** and **Girls' Schools** are also negotiated.

Masters, Tutors, and Governesses seeking Posts can have a Prospectus on application, free of charge.

## WHITAKER'S LIST OF SCHOOLS AND CLIMATES

## HOYLAKE.

The Medical Officer of Health writes:—"Situated facing sea. Subsoil sandy. Rainfall average 29 ins. Very equable temperature—climate excellent for convalescents, for growing boys and girls; air is bracing and very pure." Sunshine (1906), 1,329 hours.

BOYS. **KINGSMEAD SCHOOL.**

Principal - A. T. WATTS, M.A., B.Sc.

Assisted by

J. H. WATTS, B.A., H. WATTS, M.A., and others.

Boarding and Day School (accommodation for thirty Boarders). Exams. taken—Camb. Locals and Matriculation.

Religious Teaching and Influence thoroughly Evangelical.

The School is situated near the Sea and faces south. It stands in own grounds of 4½ acres and is in an open position.

There is a Carpenter's Shop, and separate Gymnasium.

The household arrangements are under Mrs. Arthur Watts, assisted by a Lady Matron.

[illegible] pleasantly situate with all the Hotel Comforts, combines places a special institution for convalescents. Apart from this, Frenchstone seems specially adapted for children. The rapidly-drying soil, the absolutely safe bathing, the magnificent sands for exercise in wet or dry weather, perfect drainage, and splendid water, combine to make it an ideal place for them. The number of schools and the wonderful physical progress of weakly children bear testimony to these advantages."

Golf Links, 18 holes. Pop. 2,521. G. E. Rly.

BOYS. **THE GLEBE HOUSE.**

PREPARATORY SCHOOL FOR THE PUBLIC SCHOOLS AND FOR THE R.N. COLLEGE, OSBORNE.

Headmaster, Mr. H. CAMBRIDGE BARKER, M.A. (*Late Hastings Exhibitioner of Queen's College, Oxford*).

Sanitary arrangements excellent.

*Fees.*—50 guineas per term inclusive.

# MALVERN

(Worcester). The Medical Officer of Health writes:—"Malvern is picturesquely situated on the eastern and western slopes of the range of Malvern Hills, with extensive and magnificent views on both sides. The hills, which rise to an altitude of 1,400 feet, are easily accessible for delicate persons, either on foot or by carriage. The climate has a most beneficial effect on invalids. The houses are so placed as to receive more than the ordinary amount of sunshine. Weekly children, especially those suffering from tubercular glands or continually recurring catarrhs, in nearly all cases do remarkably well here. The rainfall is low, and the soil dries with remarkable rapidity. The water-supply is bountiful and of great purity, and the sanitary state of the district generally of a high standard. The average annual (corrected) death-rate for the past five years is 10·3 per 1,000 of the population. Outbreaks of infectious diseases are few and quickly suppressed, as the Urban Council are provided with every means for promptly dealing with any case that may arise."

Malvern is an inland watering-place and a pretty residential town, consisting mostly of villas standing in own grounds. Assembly rooms (high-class bands and theatrical companies), free library, gentlemen's club, tennis, bowls, croquet, golf links (9 and 18 holes), separate clubs for ladies and gentlemen. Pop. 8,108.

*Fees.*—200 guineas per annum; 170 guineas for boys who enter under 10.

# WESTON-SUPER-MARE.

The Medical Officer of Health writes:—"Lies on the shores of Weston Bay in the Bristol Channel, on the sea-ward of the Mendips, sweeping the southern slopes of Worlebury, and the alluvial and sandy plain at its foot. Well protected from the cold northerly winds by the Weston-Worle ridge, and open to pure invigorating breezes direct from the Atlantic Ocean, the town has an equability of climate through all the seasons of the year difficult to find anywhere else in England. Its climate is equable and dry—bracing in summer, warm in winter, being sheltered against the east wind by the Mendip range. Favoured with a dry sub-soil, a high sunshine record, and remarkably free from infectious diseases, the town is admirably suited for invalids and delicate children, and is pre-eminently delightful as a holiday centre, with numerous beauty spots."

A spacious asphalted marine parade and carriage drive extends for over two miles, protected by a sea wall. The piers of Weston-super-Mare are amongst its chief attractions. Ample opportunities for marine excursions. On Knightstone are swimming baths, and a handsome pavilion, capable of seating 2,500 people, used principally for theatricals. Public Library and Museum. Electric tramcars.

PARKS.—Grove Park, at the base of Worlebury Woods, bandstand. Clarence Park, lawns and flower beds, and recreation ground. Prince Consort Gardens, situated on the slopes of Worlebury Hill, sea views.

WORLEBURY WOODS.—Nearly 300 acres, open to the public.

RECREATIONS.—Golf links (18 holes) on sea front. Cricket, tennis, bowls, archery Rifle range (2 miles), miniature range in Town. River angling.

Sunshine (1906), 1,431 hours. Water supply, constant. Drainage, modern. Soil, sandy Baths, sea water, swimming, Turkish, etc. Bathing, mixed.

---

BOYS. *(Founded 1877.)*

*Deputy-Chairman* RICHARD STEPHENS TAYLOR, Esq.

PURCHASES.—The Society purchases Reversions and Remainders, whether absolute or contingent, Life Interests, whether in possession or deferred, and generally all Interests (in approved property) that depend upon the duration of human life.

LOANS.—The Society also grants Loans on the security of such Interests, either on Ordinary Mortgage or by way of Reversionary Charge. The latter mode meets the convenience of borrowers who do not wish to make any payment for either principal or interest until their Reversionary Property falls into possession. The amount to which the Society will then be entitled is fixed at the outset, and does not depend on the time elapsing between the grant of the Loan and its repayment.

*Forms of Proposal and full information can be obtained at the Society's Offices.*

Favourably reviewed by over 100 Influential Newspapers.

# "HOW TO SELECT A LIFE OFFICE."

## By G. M. DENT, F.S.S.

Extracts from a few Press Opinions.

*MORNING POST*—"Mr. G M Dent, who is a Fellow of the Royal Statistical Society, has written a valuable pamphlet on Life Assurance, in which all the more important questions connected with the subject are discussed by a firm of merchants and an insurance broker There are two carefully-prepared tables."

*PALL MALL GAZETTE*—"Deals very clearly with the main points to be borne in mind in selecting an office, and the tabular matter is very useful Armed with this pamphlet, and blessed with a little commonsense, the ordinary man cannot go very far wrong"

*LAW JOURNAL*—"A cleverly-written dialogue. Both tables are explained with great lucidity"

*STATIST*—"The form of question and answer relieves the work very much from the heavy character of a statistical inquiry" "To those who may contemplate insurance, the expenditure of 1s. on this pamphlet will be a judicious outlay"

*FINANCIAL TIMES*—"Carefully and skilfully compiled"

*POLICY-HOLDER*—"Life Assurance as an Investment, and Endowment Assurance, are both explained in a very attractive way"

*UNITED SERVICE GAZETTE*—"The fact that this pamphlet has now reached its third edition amply demonstrates the value of its contents. Illustrations, proving the great value of life assurance as an investment, accompany the pamphlet, which also shows how to determine the relative merit of Offices, which are not altogether 'much of a muchness' as is generally believed."

*BRADFORD OBSERVER*—"The remarks on Life Assurance as a paying investment, apart from its protection against the misfortune of premature death, deserve to be widely read."

*CARDIFF TIMES*—"In terse and lucid fashion Mr Dent not merely emphasises the utility of Life Assurance as an investment, but also explains how the assurer may obtain the maximum of security and the largest return for money"

*GLASGOW HERALD*—"The pamphlet takes the form of a dialogue, which, together with a series of tables, shows the features to which an intending assurer should direct his attention before selecting a company"

*LIVERPOOL COURIER*—"The dialogue is smartly written, and touches on many of the most important elements that have to be considered before a policy is taken in any office Appended are illustrative tables showing how widely different offices vary in their mode of doing business."

# FRIENDS' PROVIDENT INSTITUTION

## FOR MUTUAL LIFE ASSURANCE

ESTABLISHED 1832

ACCUMULATED FUND - - - - - - - - - **£2,900,000**

ANNUAL INCOME - - - - - - - - - **£300,000**

The Institution was established in 1832 as a Mutual Assurance Association by Members of the Society of Friends (Quakers), and originally confined its operations to Friends and their near relatives, but the Directors now have power and are prepared to grant Assurances to persons who are not connected with Friends.

The Scale of Premiums charged is low, but, owing to the longevity of the class of persons assured and economical management, very satisfactory Bonuses have been realised.

# GENERAL

ACCIDENT FIRE AND LIFE

## ASSURANCE CORPORATION, LIMITED.

*Established* 1885.

**Economy as applied to Fire Insurance.**

In consequence of the War, the cost of building material and labour has increased nearly 50 per cent. All owners of property should therefore increase their Fire Insurances, this they can do at little or no extra cost by taking a Fire Bonus Policy with this Corporation and thus effect a saving of 20 per cent. of each premium.

The Scheme has been in operation since 1908, and thousands of Policies have matured and have been renewed free.

*ALL CLASSES OF INSURANCE BUSINESS TRANSACTED.*

# NORWICH UNION LIFE INSURANCE SOCIETY

**GREAT in Age.** It is a Centenarian in its own right, and, by its absorption of the Amicable Society, the OLDEST LIFE OFFICE IN THE WORLD.

**GREAT in Volume of Business.** Its Annual New Business for many years past has been in excess of that of any other British Life Office not transacting Industrial business.

**GREAT in Profit-Earning Capacity.** The Quinquennial Valuation as at 30th June, 1916, *on exactly the same strong 2½% Reserve basis as in* 1911, disclosed a surplus of £612,552, after the writing off of £806,032 as the full measure of war shrinkage of invested funds and excess war mortality The surplus distributed for the previous quinquennium was £627,504.

**GREAT in Reserve Strength.** After two years of war strain, reserves were set aside on the basis of a strictly net premium valuation at an assumed net interest earning rate of only 2½%, in addition to which a further sum of £383,575 was reserved as a Floating War Contingency Fund

**GREATEST in the Fact** that the Directors at this war juncture maintained reserves on an even more severe basis than the exceptionally strong standard of 1911.

# A Wonderful Record of War Service

The number of torpedoed and mined ships whose crews have been cared for in the Homes and Institutes of the British and Foreign Sailors' Society is considerably more than 600.

The number of Sailor Prisoners of War in Germany whom we have saved from starvation by sending them regular supplies of food is nearly 1,000.

The number of sailors' families to whom we have given prompt and practical assistance when the loss of the breadwinner has left them in poverty is now some hundreds.

Admiral Sir John Jellicoe himself has described our Homes and Institutes throughout the world as "the greatest possible boon to sailors."

If you can spare anything to help forward the Society's great national work, please send your subscription to SIR FREDERICK GREEN, J.P., Wakefield House, 22, Cheapside, London, E.C. 2.

# CHURCH PASTORAL-AID SOCIETY.

*"Our country for Christ."*

Patron HIS MAJESTY THE KING.

Nearly Six Millions of our population live in parishes helped through the Society's Grants. The 1200 Clergy, Lay Agents and Women Workers supported by these Grants strive to help and to win for Christ the poor and all who dwell in the purlieus of our large cities and towns.

**FUNDS ARE URGENTLY NEEDED NOW.**

*Treasurer:* J. F. W. DEACON, Esq., J.P., D.L.
*Secretaries:* Rev. T. C. CHAPMAN, M.A., and A. THOMAS, Esq.
*Offices:* FALCON COURT, 32, FLEET STREET, LONDON, E.C. 4. [183

# CHURCH MISSIONARY SOCIETY

## SALISBURY SQUARE, LONDON, E.C. 4.

*Vice-Patron*—THE ARCHBISHOP OF CANTERBURY
*President*—COL. SIR ROBERT WILLIAMS, BT., M.P
*Honorary Secretary*—THE REV CYRIL C. B. BARDSLEY, M.A

**WORK.** The Society's operations cover large areas in Africa, India, Ceylon, China, Japan, Palestine, Turkish Arabia, Persia, North-West Canada, and *British Columbia*. The Society has upon its *Staff 1,300* European Missionaries, 492 Native Clergy, and 10,719 other Native Christian workers.

**PROGRESS.** In many lands the Native Churches are developing in the direction of self-government, self-extension and self-support. During the past year there were 35,153 baptisms (18,809 being adults), 276,641 scholars attended 3,672 Schools and Colleges, and the mission hospitals received 43,837 in-patients and 1,244,086 out-patients.

**SUPPORT.** Contributions may be sent either to the local secretaries or to the Lay Secretary at the above address. Bequests should be made "to the Church Missionary Society." Cheques and P.O.'s should be made payable to the Society and crossed "Wilhams Deacon."

# Colonial and Continental Church Society.

*Patron*—HIS MAJESTY THE KING

*Vice Patrons*—THE ARCHBISHOPS OF CANTERBURY, YORK, ARMAGH, DUBLIN &c.

*Chairman of Committee*—S. H. GLADSTONE, Esq.

*Secretary*—The Rev. J. D. MULLINS, M.A.

This Society exists for the purpose of supplying the means of grace to our fellow countrymen abroad, especially in those parts of the Empire where they are in danger of drifting into irreligion for lack of the Gospel.

Nearly 50 Colonial Dioceses receive aid from the Society, including those in Canada, Australasia, South Africa, East Africa, the West Indies, and India. Many Colonial Bishops are applying for far more aid than the Society's funds can meet.

Owing to the enormous inrush of settlers to the Colonies, the Society started in 1908 a SPECIAL N.-W. CANADA FUND, and in 1912 an AUSTRALIAN FUND.

240 Clergy and Lay Evangelists have been sent out, 120 Prairie Churches built, and more than £130,000 has been expended in the West. £12,000 per annum is required to maintain the agents in Canada.

Assistance is also given to ministrations among British Artizans, Sailors and others in *Continental cities*, and Services (*self-supporting*) are organized for visitors at *health resorts*.

During the War the Society's Chaplains have rendered devoted service to thousands of British residents, refugees, and sick and wounded soldiers. Three of them, in BRUSSELS, LILLE, and CROIX, remained at their posts, behind the German lines.

# CITY OF LONDON TRUSS SOCIETY

**For the Relief of the RUPTURED POOR throughout the Kingdom.**

*Instituted 1807.*

35, FINSBURY SQUARE, LONDON, E.C. 2.

*Patron*—HIS MAJESTY THE KING.

The average number of poor persons suffering from the dangerous and distressing malady of Hernia or Rupture annually relieved by this charity during the past twenty-five years has been over 8,000. The Patients are of both sexes and from all parts of the Kingdom. The youngest patient relieved was an infant of seven days old; the oldest, a woman of 107 years. Every patient attending at the Institution is treated by the Surgeons of the Society by whom the Truss is applied.

**ADDITIONAL FUNDS ARE URGENTLY NEEDED** to enable the Committee to carry on the beneficent work of the Charity which necessitates an expenditure far in excess of its Income. Annual subscribers of one guinea or more are entitled to recommend their patients within the year for every guinea so subscribed.

**ONE LETTER OF RECOMMENDATION ONLY** is required, however expensive the necessary instrument may be.

W. K. TAUNTON *Secretary*

# GENERAL LYING-IN HOSPITAL,

## York Road, Lambeth, S.E. ESTABLISHED 1765.

*Patrons—H M The Queen and H M Queen Alexandra.*

This Hospital is situated in one of the poorest parts of London, in the district South of the Thames, with a population of nearly two millions.

Married women in indigent circumstances, especially the wives of Soldiers and Sailors, and certain single women (with their first child, after investigation by the Committee), are admitted to the Hospital from all parts of the kingdom, but mainly from the immediate neighbourhood, from which, owing to its poverty, little pecuniary help is obtainable.

*Subscriptions and Donations thankfully received by the Treasurer, or* Miss ROSA E. WHYTE, *the Secretary, at the Hospital.* [146

# THE GIRLS' FRIENDLY SOCIETY.

Patron—HER MAJESTY THE QUEEN, HER MAJESTY QUEEN ALEXANDRA.

The G.F.S. is an Imperial Society which links together in friendly bonds over 300,000 women of all ages and of all ranks of society in all parts of the world for mutual help. Its aim is to set before its Members a high ideal of purity of thought, word, and deed, to help them to be true to that ideal, to be a standing witness to the possibility of purity of life and conduct for every woman and girl in the land, to guard the hundreds of thousands of girls who are growing up to womanhood from acknowledged dangers, and to extend to them the priceless boon of loving Christian fellowship.

The various Departments of G.F.S. work include help for Sick Members, After-care of girls from Poor Law Institutions, Employment and Registry Work, an Invalids' Work Depôt, protection in Migration and in Travelling, the provision of Homes of Rest, Industrial Training, and the encouragement of Temperance and Thrift.

VISCOUNT GOSCHEN, *Treasurer*

SEPTEMBER, 1917 *Bankers*—THE BANK OF ENGLAND. [140

# THE HOSPITAL FOR DISEASES OF THE SKIN,

70, BLACKFRIARS ROAD, S.E.

Telephone: Hop. 1081. ESTABLISHED 1861.

*Patroness*—HER MOST GRACIOUS MAJESTY QUEEN ALEXANDRA.
*Vice-Patron*—THE RIGHT HON. LORD HAVERSHAM. *President*—ROBERT BARCLAY Esq.
*President*—THE RIGHT HON. THE EARL OF KINNOULL.

The Hospital was removed during 1915 to the present site in Blackfriars Road, where the new building has recently been completed. The increased facilities afforded have greatly extended the utility of the Hospital.

Over 250,000 patients have been treated at this Hospital, which was the first and for many years the only Institution in the United Kingdom for the Special Treatment of Cutaneous Diseases.

PATIENTS are admitted on small payment, enabling them to four weeks' treatment, or by Subscriber's letter of Recommendation. Indigent persons are admitted entirely free.

OUT-PATIENTS are seen daily at 2 p.m., and on Friday evenings at 6.30 p.m.

*Medical Men and Students are admitted free to the daily practice on presentation of their cards.*

The Hospital is fully equipped with all modern methods of treatment. The purchase of the new site, the erection and equipment of the new building, have greatly depleted the funds of the Hospital, and therefore Subscriptions and Donations towards the maintenance of the Hospital are earnestly requested and may be sent to

FREDERICK HATTER, *Secretary* [138

# LONDON LOCK HOSPITAL AND RESCUE HOME

Patron - - - H.M. THE KING

***OVERTOWED AND IN GREAT NEED.***

Treasurer: RIGHT HON. LORD KINNAIRD and J. F. W. DEACON, Esq.

Founded in 1746, this Special Hospital has for 170 years devoted all its energies to the treatment and cure of venereal diseases. Thousands of young women and girls from all parts of the kingdom have been relieved of their bodily suffering and helped to regain their self-respect, and thereby enabled to make a fresh start in life. ANNUAL SUBSCRIPTIONS AND DONATIONS ARE EARNESTLY PLEADED FOR, and will be gratefully received by the Secretary

Offices 283, HARROW ROAD, LONDON, W 9.

FORM OF BEQUEST.—I bequeath to the Treasurers for the time being of the London Lock Hospital and Rescue Home, Harrow Road, Paddington, W. and Dean Street, Soho, both in the County of Middlesex, the sum of £ to be applied for the purposes of the Female Hospital, Rescue Home for Male Hospital and Out-patients' Department, as may be desired, and I direct, the said Legacy to be paid free of death duty and as soon as conveniently may be after my death.

Under the Patronage of HIS MAJESTY KING GEORGE V., HER MAJESTY QUEEN MARY, HER MAJESTY QUEEN ALEXANDRA.

# LONDON ORPHAN SCHOOL

***WATFORD***

*(Incorporated as the London Orphan Asylum).*

The Managers earnestly appeal for help towards the maintenance of the 480 Fatherless boys and girls now in the School from all parts of the BRITISH EMPIRE, representing all professions and callings. 7,607 such children have been maintained and educated, the majority having been provided with situations.

The Society is dependent upon **voluntary help for £12,000 annually.** There was unfortunately a deficit of £6,560 in 1915, which was increased by £1,580 in 1916.

Vacancies have been declared for children of Officers or Warrant Officers killed in the War

Annual Subscriptions from 10s. 6d., Life Subscriptions from £5 5s., and

DONATIONS will be gladly received.

# Queen Charlotte's Lying-In Hospital,

## MARYLEBONE ROAD, LONDON, N.W.

*FOUNDED 1739. INCORPORATED BY ROYAL CHARTER, 1885.*

*Patrons*—HER MAJESTY THE QUEEN,
HER MAJESTY QUEEN ALEXANDRA.

*President*—THE VISCOUNT PORTMAN. *Treasurer*—ALFRED C. DE ROTHSCHILD, Esq., C.V.O.
*Chairman of Committee*—SIR SAMUEL SCOTT, Bart., M.P.

### *OBJECTS OF THE CHARITY.*

1. To provide an Asylum for the delivery of Poor Married Women; and also for Deserving Unmarried Women *with their first child.*
2. To provide *skilled Midwives* to attend Poor Married Women in their *Confinements at their own Homes.*
3. The Training of Medical Pupils, Midwives for the Poor, and Monthly Nurses.

Since the foundation of the Hospital **150,000 poor women have been relieved.** Last year **2,078** patients were received into the Hospital, and **2,058** were attended at their own homes.

*ANNUAL EXPENDITURE OF THE CHARITY, £8,000.*
*RELIABLE INCOME, £4,000 ONLY.*

An Annual Subscription of £3 3s., or a Donation of £31 10s., entitles the Contributor to recommend *One In-Patient* and *Three Out-Patients* yearly, *and qualifies for election as a Governor.*

Contributions will be gratefully received by the Bankers, Messrs. COCKS, BIDDULPH & Co., 43, Charing Cross, S.W., or by

ARTHUR WATTS, *Secretary* [196

# ROYAL BLIND PENSION SOCIETY

*Patron*—HIS MAJESTY THE KING
*Honorary Secretaries*—MESSRS. GEORGE POCOCK AND PERCY R. POCOCK.

This Society grants Pensions to the Blind Poor at their own homes in sums ranging from 10s. to 25s. per month. There are upwards of 1,300 pensioners, residing in various parts of the Kingdom, among whom nearly £16,000 is annually distributed.

To be eligible, applicants must be totally blind, above 21 years of age, of good moral character and in receipt of an income not exceeding £50, if single, and £70 if married. No distinction is made in regard to sex or creed; nor is the receipt of parish relief a disqualification.

Application must be made on the printed forms provided by the Society.

Subscribers of 10s. 6d. annually or Donors of Five Guineas, are entitled to One Vote at every election, and multiples thereof in proportion.

Contributions will be gratefully received by the Treasurer or by the BANK OF ENGLAND or Messrs. Barclay and Co.

237 SOUTHWARK BRIDGE ROAD, LONDON. W. ELLIOTT TERRY *Secretary* [199

# ROYAL FEMALE ORPHAN ASYLUM,

## BEDDINGTON (near CROYDON), SURREY.

*Founded at Lambeth, 1758. Incorporated 1800. Removed to Beddington, 1866.*

PATRONS—HIS MOST GRACIOUS MAJESTY THE KING. HER MAJESTY THE QUEEN
PATRONESS—HER MAJESTY QUEEN ALEXANDRA.
PRESIDENT—HIS GRACE THE DUKE OF PORTLAND, K.G.

THIS ancient Asylum maintains and educates Fatherless Girls from all parts of Great Britain. They are admitted between the ages of 7 and 10, and at the age of 16 are placed out in respectable private families. They must in all respects be thoroughly sound and healthy. Elections half-yearly in June and December. Forms of application may be obtained at the Offices. New Subscribers to this old Charity are most earnestly needed.

| | | | |
|---|---|---|---|
| **Life Subscription, 2 Votes** | **£10 10 0** | **Annual Subscription, 2 Votes** | **£1 1 0** |
| **Do. do. 1 Vote** | **5 5 0** | **Do. do. 1 Vote** | **0 10 6** |

A Donation of **50** Guineas in one sum entitles the donor to the immediate presentation of one child. Fatherless girls are also received and paid for at the rate of £16 16s. per annum, with an entrance fee of £6 6s., pending election, or otherwise. Cheques crossed "Messrs. Hoare."

Subscriptions most thankfully received and all information given on application to the Secretary

*Applications for admission to St. Thomas's Home for Paying Patients are to be sent to the Steward.*

[181

# Society for the Abolition of Vivisection

## 22, NORTHUMBERLAND AVENUE, LONDON.

According to the latest Parliamentary Return, the number of experiments made in 1916 was 66,048. A large number of these were inoculation experiments, and, as the report says, "are attended by no considerable, if appreciable, pain"

**The pain does not lie in the operation itself, but in the after effects.**

The animal so innocently operated on may have to live days, weeks or months with no anæsthetics to assuage its sufferings, and nothing but death to relieve.

The following is an example of what may ensue in the dog after the "little needle prick" —

"A dog was inoculated on January 23rd In a few days it began to show signs of wasting, then the head became swelled and dropsical, and also the fore-legs and paws, later on this swelling disappeared, but the dog seemed very ill and weak, and there was a thickening of the membrane of both eyes. Two days before its death it refused food and seemed very thirsty On February 20th it died"— Abridged from the *Journal of Pathology and Bacteriology*, March, 1906

The Society offers to send a Lecturer, free of charge, to Literary Societies, League Meetings, &c [189

(Incorporated by Royal Charter, Nov 1st, 1904.) Supported by Voluntary Contributions.

*Patron*—HIS MAJESTY THE KING.
*President*—His Royal Highness PRINCE ARTHUR OF CONNAUGHT K.G., K.T., G.C.V.O., P.C.
*Treasurer*—Major LIONEL DE ROTHSCHILD, M.P.
*Chairman of Finance Committee*—The Right Hon. LORD ARTHUR HILL, P.C. *Chairman*—GEORGE F. MARSHALL, Esq.

IT needs —£63,000 to carry out the schemes of extension by which provision is made for about 250 beds, and £24,000 annually to maintain the present work of relieving about 2,500 In-Patients and 35,000 Out-Patients. Its endowments yield an annual income of only £800. Wherefore it relies upon voluntary contributions for £23,200 wherewith to meet its annual expenditure of £24,000. For many years past the debt has averaged £10,000.

It is the nearest General Hospital for Hammersmith, Fulham, Acton, Chiswick, Brentford, and for large portions of Kensington and Barnes. The population it serves numbers more than 500,000 persons. It is entitled to receive and hold devises of freehold land or any other property.

# "WHITAKER'S" FIRST APPEARANCE

## Was on 10th December, 1868, for 1869.

### *It was welcomed in the following terms:*

**The Times.**—"It contains an amount of well-arranged matter rarely condensed into a similar space."

**The Guardian.**—"It is a perfect prodigy of information."

**The Christian World.**—"It is the best Almanack we ever saw"

**The Nonconformist.**—"Great pains have evidently been taken to give thorough completeness to this cheap Almanack, which merits a wide circulation."

**John Bull.**—"The best Almanack ever brought out."

**The Standard.**—"Intelligently conceived and well carried out"

**The Morning Advertiser**—"This is indeed worthy the name of Almanack and may be declared, after a careful examination, the most complete, laborious, condensed, useful and perfect compendium"

**The Observer.**—"This Almanack is a book of reference as valuable as it is interesting"

**The European Mail.**—"The most complete work of its kind that has ever appeared in England"

**The Literary Churchman.**—"Infinitely the best thing of the kind we have ever seen"

**The News of the World.**—"There has never been published an Almanack so complete and good as this"

**Rev. C. H. Spurgeon in "Sword and Trowel."**—"This is surely *the* Almanack of the nation, and is altogether unrivalled It contains everything about everything."

---

### *After Half a Century's Existence.*

**The Times.**—"It is a commonplace to say that no reference library is complete without 'Whitaker' One can go much further and remark that a great many people find the Almanack's reference library in itself There is nothing to equal it either in conception, or in the completeness and care with which it is put together and kept up to date."

---

**"Till countermanded" would not appear in some contracts out of every ten did advertisers not recognise that advertising in "Whitaker" pays.**

**Many advertisers have appeared in "Whitaker" since its institution.**

*To Prevent—is the Divine Whisper of the Present."*

## INDOOR WORKERS.

When brainwork, nerve strain and lack of exercise make you feel languid—tired—"blue"—a little

# ENO'S 'FRUIT SALT'

in a glass of cold water will clear your head and tone your nerves

This world famous natural aperient for over 40 years has been the standard remedy for constipation, biliousness, impure blood, and indigestion

It is pleasant and convenient to take, gentle in action, positive in results. The safest and most dependable digestive regulator

It is *not* from what a man swallows, but from what he digests, *that* the blood is made, and remember that the first act of digestion is chewing the food *thoroughly*, and it is only through doing so that you can reasonably expect a good digestion.

Unsuitable food and eating between meals are a main cause of indigestion, &c., because introducing a fresh mass of food into the mass already partly dissolved arrests the healthy action of the stomach, and causes the food first received to lie until incipient fermentation takes place

***"A Little at the Right Time is better than Much and Running Over at the Wrong."***

ENO'S FRUIT SALT IS SOLD BY CHEMISTS AND STORES THROUGHOUT THE WORLD
